The British National Formulary (BNF) is aimed at health professionals involved with prescribing, monitoring, supplying and administering medicines.

Organised for rapid access, the BNF provides essential information on the selection of safe and effective medicines for individual patients. It includes an overview of the drug management of common conditions together with details of the medicines used. The BNF is issued every six months; it is available in print and digital formats.

Latest information from clinical literature, regulatory authorities and professional bodies is used to construct the BNF knowledge base.

Addresses, telephone and fax numbers of manufacturers and suppliers are shown in the Index of Manufacturers.
Material published in the British National Formulary may not be used for any form of advertising, sales or publicity without prior written permission. Each of the classification and the text are protected by copyright and/or database right.
Preface

The BNF is a joint publication of the British Medical Association and the Royal Pharmaceutical Society of Great Britain. It is published biannually under the authority of a Joint Formulary Committee which comprises representatives of the two professional bodies and of the UK Health Departments. The Dental Advisory Group oversees the preparation of advice on the drug management of dental and oral conditions; the Group includes representatives of the British Dental Association. The Nurse Prescribers’ Advisory Group advises on the content relevant to nurses.

The BNF aims to provide prescribers, pharmacists and other healthcare professionals with sound up-to-date information about the use of medicines.

The BNF includes key information on the selection, prescribing, dispensing and administration of medicines. Medicines generally prescribed in the UK are covered and those considered less suitable for prescribing are clearly identified. Little or no information is included on medicines promoted for purchase by the public.

Information on drugs is drawn from the manufacturers’ product literature, medical and pharmaceutical literature, UK health departments, regulatory authorities, and professional bodies. Advice is constructed from clinical literature and reflects, as far as possible, an evaluation of the evidence from diverse sources. The BNF also takes account of authoritative national guidelines and emerging safety concerns. In addition, the editorial team receives advice on all therapeutic areas from expert clinicians; this ensures that the BNF’s recommendations are relevant to practice.

The BNF is designed as a digest for rapid reference and it may not always include all the information necessary for prescribing and dispensing. Also, less detail is given on areas such as obstetrics, malignant disease, and anaesthesia since it is expected that those undertaking treatment will have specialist knowledge and access to specialist literature. *BNF for Children* should be consulted for detailed information on the use of medicines in children. The BNF should be interpreted in the light of professional knowledge and supplemented as necessary by specialised publications and by reference to the product literature. Information is also available from medicines information services (see inside front cover).

It is vital to use the most recent edition of the BNF for making clinical decisions. The more important changes for this edition are listed on p. xi.

The BNF on the internet (bnf.org) includes additional information of relevance to healthcare professionals dealing with medicines. Other digital versions of the BNF—including intranet and personal digital assistant (PDA) versions—are produced in parallel with the paper version.

The BNF welcomes comments from healthcare professionals. Comments and constructive criticism should be sent to:
British National Formulary,
Royal Pharmaceutical Society of Great Britain,
1 Lambeth High Street, London SE1 7JN.

Acknowledgements

The Joint Formulary Committee is grateful to individuals and organisations that have provided advice and information to the BNF.

The principal contributors for this edition were:

Expert advice on the management of oral and dental conditions was kindly provided by M. Addy, P. Coulthard, A. Crichton, M.A.O. Lewis, J.G. Meechan, N.D. Robb, R.A. Seymour, R. Welbury, and J.M. Zakrzewska. S. Kaur provided valuable advice on dental prescribing policy.

Members of the British Association of Dermatologists Therapy Guidelines Subcommittee, H.K. Bell, L.C. Fuller, J. Hughes, S. Lawton, J. Lear, N.J. Levell, A.J. McDonagh, M.J. Tidman, P.D. Yesudian, and M.F.M. Mustapa (Secretariat) have provided valuable advice.

The Joint British Societies’ Coronary Risk Prediction Charts have been reproduced with the kind permission of P.N. Durrington who has also provided the BNF with access to the computer program for assessing coronary and stroke risk.

R. Suvarna and colleagues at the MHRA have provided valuable assistance.

Correspondents in the pharmaceutical industry have provided information on new products and commented on products in the BNF. The Prescription Pricing Division has supplied the prices of products in the BNF.

Numerous doctors, pharmacists, nurses and others have sent comments and suggestions.

The BNF has valuable access to the Martindale data banks by courtesy of S. Sweetman and staff.

J.E. Macintyre and staff provided valuable technical assistance.

Xpage have provided technical assistance with the editorial database and typesetting software.

Owen Lyndon Wade

The BNF would like to acknowledge the valued contribution of Professor Owen Lyndon Wade, the first Chair of the JFC and founding father of the modern British National Formulary, who died on December 10, 2008.

How the BNF is constructed

The BNF is unique in bringing together authoritative, independent guidance on best practice with clinically validated drug information, enabling healthcare professionals to select safe and effective medicines for individual patients.

Information in the BNF has been validated against emerging evidence, best-practice guidelines, and advice from a network of clinical experts.

Hundreds of changes are made between editions, and the most clinically significant changes are listed at the front of each edition (pp. xi–xii).

Joint Formulary Committee

The Joint Formulary Committee (JFC) is responsible for the content of the BNF. The JFC includes doctors appointed by the BMJ Publishing Group, pharmacists appointed by the Royal Pharmaceutical Society of Great Britain, and representatives from the Medicines and Healthcare products Regulatory Agency (MHRA) and the UK health departments. The JFC decides on matters of policy and reviews amendments to the BNF in the light of new evidence and expert advice. The Committee meets quarterly and each member also receives proofs of all BNF chapters for review before publication.

Editorial team

BNF staff editors are pharmacists with a sound understanding of how drugs are used in clinical practice. Each staff editor is responsible for editing, maintaining, and updating specific chapters of the BNF. During the publication cycle the staff editors review information in the BNF against a variety of sources (see below).

Amendments to the text are drafted when the editors are satisfied that any new information is reliable and relevant. The draft amendments are passed to expert advisers for comment and then presented to the Joint Formulary Committee for consideration. Additionally, for each edition, sections are chosen from every chapter for thorough review. These planned reviews aim to verify all the information in the selected sections and to draft any amendments to reflect the current best practice.

Staff editors prepare the text for publication and undertake a number of checks on the knowledge at various stages of the production.

Expert advisers

The BNF uses about 60 expert clinical advisers (including doctors, pharmacists, nurses, and dentists) throughout the UK to help with the production of each edition. The role of these expert advisers is to review existing text and to comment on amendments drafted by the staff editors. These clinical experts help to ensure that the BNF remains reliable by:

- checking draft amendments for appropriate interpretation of any new evidence;
- providing expert opinion in areas of controversy or when reliable evidence is lacking;
- advising on areas where the BNF diverges from summaries of product characteristics;
- providing independent advice on drug interactions, prescribing in hepatic impairment, renal impairment, pregnancy, breast-feeding, children, the elderly, palliative care, and the emergency treatment of poisoning.

In addition to consulting with regular advisers, the BNF calls on other clinical specialists for specific developments when particular expertise is required.

The BNF also works closely with a number of expert bodies that produce clinical guidelines. Drafts or pre-publication copies of guidelines are routinely received for comment and for assimilation into the BNF.

Sources of BNF information

The BNF uses a variety of sources for its information; the main ones are shown below.

Summaries of product characteristics The BNF receives summaries of product characteristics (SPCs) of all new products as well as revised SPCs for existing products. The SPCs are the principal source of product information and are carefully processed, despite the ever-increasing volume of information being issued by the pharmaceutical industry. Such processing involves:

- verifying the approved names of all relevant ingredients including 'non-active' ingredients (the BNF is committed to using approved names and descriptions as laid down by the Medicines Act);
- comparing the indications, cautions, contra-indications, and side-effects with similar existing drugs. Where these are different from the expected pattern, justification is sought for their inclusion or exclusion;
- seeking independent data on the use of drugs in pregnancy and breast-feeding;
- incorporating the information into the BNF using established criteria for the presentation and inclusion of the data;
- checking interpretation of the information by two staff editors before submitting to a senior editor; changes relating to doses receive an extra check;
- identifying potential clinical problems or omissions and seeking further information from manufacturers or from expert advisers;
- careful validation of any areas of divergence of the BNF from the SPC before discussion by the Committee (in the light of supporting evidence);
- constructing, with the help of expert advisers, a comment on the role of the drug in the context of similar drugs.

Much of this processing is applicable to the following sources as well.

Expert advisers The role of expert clinical advisers in providing the appropriate clinical context for all BNF information is discussed above.
Literature  Staff editors monitor core medical and pharmaceutical journals. Research papers and reviews relating to drug therapy are carefully processed. When a difference between the advice in the BNF and the paper is noted, the new information is assessed for reliability and relevance to UK clinical practice. If necessary, new text is drafted and discussed with expert advisers and the Joint Formulary Committee. The BNF enjoys a close working relationship with a number of national information providers.

Systematic reviews  The BNF has access to various databases of systematic reviews (including the Cochrane Library and various web-based resources). These are used for answering specific queries, for reviewing existing text and for constructing new text. Staff editors receive training in critical appraisal, literature evaluation, and search strategies. Reviews published in Clinical Evidence are used to validate BNF advice.

Consensus guidelines  The advice in the BNF is checked against consensus guidelines produced by expert bodies. A number of bodies make drafts or pre-publication copies of the guidelines available to the BNF; it is therefore possible to ensure that a consistent message is disseminated. The BNF routinely processes guidelines from the National Institute for Health and Clinical Excellence (NICE), the Scottish Medicines Consortium (SMC), and the Scottish Intercollegiate Guidelines Network (SIGN).

Reference sources  Textbooks and reference sources are used to provide background information for the review of existing text or for the construction of new text. The BNF team works closely with the editorial team that produces Martindale: The Complete Drug Reference. The BNF has access to Martindale information resources and each team keeps the other informed of significant developments and shifts in the trends of drug usage.

Statutory information  The BNF routinely processes relevant information from various Government bodies including Statutory Instruments and regulations affecting the Prescription only Medicines Order. Official compendia such as the British Pharmacopoeia and its addenda are processed routinely to ensure that the BNF complies with the relevant sections of the Medicines Act. The BNF itself is named as an official compendium in the Medicines Act.

The BNF maintains close links with the Home Office (in relation to controlled drug regulations) and the Medicines and Healthcare products Regulatory Agency (including the British Pharmacopoeia Commission). Safety warnings issued by the Commission on Human Medicines (CHM) and guidelines on drug use issued by the UK health departments are processed as a matter of routine.

Relevant professional statements issued by the Royal Pharmaceutical Society of Great Britain are included in the BNF as are guidelines from bodies such as the Royal College of General Practitioners.

The BNF reflects information from the Drug Tariff, the Scottish Drug Tariff, and the Northern Ireland Drug Tariff.

Pricing information  The Prescription Pricing Division provides information on prices of medicinal products and appliances in the BNF. The BNF also receives and processes price lists from product suppliers.

Comments from readers  Readers of the BNF are invited to send in comments. Numerous letters and emails are received during the preparation of each edition. Such feedback helps to ensure that the BNF provides practical and clinically relevant information. Many changes in the presentation and scope of the BNF have resulted from comments sent in by users.

Comments from industry  Each manufacturer is provided with a complimentary copy of the BNF and invited to comment on it. Close scrutiny of the BNF by the manufacturers provides an additional check and allows them an opportunity to raise issues about the BNF’s presentation of the role of various drugs; this is yet another check on the balance of the BNF’s advice. All comments are looked at with care and, where necessary, additional information and expert advice are sought.

Virtual user groups  The BNF has set up virtual user groups across various healthcare professions (e.g. doctors, pharmacists, nurses, dentists). The aim of these groups will be to provide feedback to the editors and publishers to ensure that BNF publications continue to serve the needs of its users.

Market research  Market research is conducted at regular intervals to gather feedback on specific areas of development, such as drug interactions or changes to the way information is presented in digital formats.

The BNF is an independent professional publication that is kept up-to-date and addresses the day-to-day prescribing information needs of healthcare professionals. Use of this resource throughout the health service helps to ensure that medicines are used safely, effectively, and appropriately.
How to use the BNF

Notes on conditions, drugs and preparations

The main text consists of classified notes on clinical conditions, drugs and preparations. These notes are divided into 15 chapters, each of which is related to a particular system of the body or to an aspect of medical care. Each chapter is then divided into sections which begin with appropriate notes for prescribers. These notes are intended to provide information to doctors, dental surgeons, pharmacists, nurses, and other healthcare professionals to facilitate the selection of suitable treatment. Guidance on dental and oral conditions is identified by means of a relevant heading (e.g. Dental and Orofacial pain) in the appropriate sections of the BNF. The notes are followed by details of relevant drugs and preparations which can be prescribed by dental surgeons using NHS form FP10D (GP14 in Scotland, WP10D in Wales) are identified within the BNF by means of a note headed Dental Prescribing on NHS.

For information available since publication of this edition see bnf.org

Guidance on prescribing

This part includes information on prescription writing, controlled drugs and dependence, prescribing for children and the elderly, and prescribing in palliative care. Advice is given on the reporting of adverse reactions. The BNF also includes advice on medical emergencies

Drugs

Drugs appear under pharmacopoeial or other non-proprietary titles. When there is an appropriate current monograph (Medicines Act 1968, Section 65) preference is given to a name at the head of that monograph; otherwise a British Approved Name (BAN), if available, is used (see also Name changes). The symbol \( \hat{U} \) is used to denote those preparations that are considered by the Joint Formulary Committee to be less suitable for prescribing. Although such preparations may not be considered as drugs of first choice, their use may be justifiable in certain circumstances.

Prescription-only medicines \( \hat{P} \)

This symbol has been placed against those preparations that are available only on a prescription issued by an appropriate practitioner. For more detailed information see Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available).

The symbol \( \hat{C} \) indicates that the preparation is subject to the prescription requirements of the Misuse of Drugs Act. For regulations governing prescriptions for such preparations see p. 7.

Preparations not available for NHS prescription \( \hat{D} \)

This symbol has been placed against those preparations included in the BNF that are not prescribable under the NHS. Those prescribable only for specific disorders have a footnote specifying the condition(s) for which the preparation remains available. Some preparations which are not prescribable by brand name under the NHS may nevertheless be dispensed using the brand name providing that the prescription shows an appropriate non-proprietary name.

Prices

Prices have been calculated from the basic cost used in pricing NHS prescriptions dispensed in November 2008, see also Prices in the BNF p. x for details.
and other medical problems in dental practice, together with a review of the oral side-effects of drugs. An index of conditions relevant to dental surgeons is included.

Emergency treatment of poisoning

This chapter provides information on the management of acute poisoning when first seen in the home, although aspects of hospital-based treatment are mentioned.

Appendixes and indexes

The appendixes include information on interactions, liver disease, renal impairment, pregnancy, breast-feeding, intravenous additives, borderline substances, wound management products, and cautionary and advisory labels for dispensed medicines. They are designed for use in association with the main body of the text. The Dental Practitioners’ List and the Nurse Prescribers’ List are also included in this section. The indexes consist of the Index of Manufacturers and the Main Index.

Patient packs

Directive 92/27/EEC specifies the requirements for the labelling of medicines and outlines the format and content of patient information leaflets to be supplied with every medicine; the directive also requires the use of Recommended International Non-proprietary Names for drugs (see p. xiii).

All medicines have approved labelling and patient information leaflets; anyone who supplies a medicine is responsible for providing the relevant information to the patient (see also Appendix 9).

Many medicines are available in manufacturers’ original packs complete with patient information leaflets. Where patient packs are available, the BNF shows the number of dose units in the packs. In particular clinical circumstances, where patient packs need to be split or medicines are provided in bulk dispensing packs, manufacturers will provide additional supplies of patient information leaflets on request.

During the revision of each edition of the BNF careful note is taken of the information that appears on the patient information leaflets. Where it is considered appropriate to alert a prescriber to some specific limitation appearing on the patient information leaflet (for example, in relation to pregnancy) this advice now appears in the BNF.

The patient information leaflet also includes details of all inactive ingredients in the medicine. A list of common E numbers and the inactive ingredients to which they correspond is now therefore included in the BNF (see inside back cover).

PACT and SPA

PACT (Prescribing Analyses and Cost) and SPA (Scottish Prescribing Analysis) provide prescribers with information about their prescribing.

The PACT Standard Report, or in Scotland SPA Level 1 Report, is sent to all general practitioners on a quarterly basis. The PACT Standard Report contains an analysis of the practitioner’s prescribing and the practice prescribing over the last 3 months, and gives comparisons with the local Primary Care Trust equivalent practice and with a national equivalent. The report also contains details of the practice prescribing for a specific topic; a different topic is chosen each quarter.

The PACT Catalogue, or in Scotland SPA Level 2 Report, provides a full inventory of the prescriptions issued by a prescriber. The PACT catalogue is available on request for periods between 1 and 24 months. To allow the prescriber to target specific areas of prescribing, a Catalogue may be requested to cover individual preparations, BNF sections, or combinations of BNF chapters.

PACT is also available electronically (ePACT:net). This system gives users on-line access through NHSnet to the 3 years’ prescribing data held on the Prescription Pricing Division’s database; tools for analysing the data are also provided.

Prices in the BNF

Basic net prices are given in the BNF to provide an indication of relative cost. Where there is a choice of suitable preparations for a particular disease or condition the relative cost may be used in making a selection. Cost-effective prescribing must, however, take into account other factors (such as dose frequency and duration of treatment) that affect the total cost. The use of more expensive drugs is justified if it will result in better treatment of the patient or a reduction of the length of an illness or the time spent in hospital.

Prices have generally been calculated from the net cost used in pricing NHS prescriptions dispensed in November 2008. Unless an original pack is available these prices are based on the largest pack size of the preparation in use in community pharmacies. The price for an extemporaneously prepared preparation has been omitted where the net cost of the ingredients used to make it would give a misleadingly low impression of the final price. In Appendix 8 prices stated are per dressing or bandage.

The unit of 20 is still sometimes used as a basis for comparison, but where suitable original packs or patient packs are available these are priced instead.

Gross prices vary as follows:
1. Costs to the NHS are greater than the net prices quoted and include professional fees and overhead allowances;
2. Private prescription charges are calculated on a separate basis;
3. Over-the-counter sales are at retail price, as opposed to basic net price, and include VAT.

BNF prices are NOT, therefore, suitable for quoting to patients seeking private prescriptions or contemplating over-the-counter purchases.

A fuller explanation of costs to the NHS may be obtained from the Drug Tariff. Separate drug tariffs are applicable to England and Wales, Scotland, and Northern Ireland; prices in the different tariffs may vary.
Significant changes

The BNF is revised twice yearly and numerous changes are made between issues. All copies of BNF No. 56 (September 2008) should therefore be withdrawn and replaced by BNF No. 57 (March 2009). Significant changes have been made in the following sections for BNF No. 57:

- Salicylate poisoning [updated advice], Emergency treatment of poisoning
- Heavy metal poisoning [updated advice], Emergency treatment of poisoning
- Fistulating Crohn's disease, section 1.5
- Irritable bowel syndrome, section 1.5
- Aminosalicylates [monitoring of renal function], section 1.5
- Cardiovascular risk charts [change to estimated risk for non-diabetic men aged 50–59 years who are non-smokers], inside back cover
- Chronic obstructive pulmonary disease [oxygen alert card], section 3.1
- Oxygen [new text], section 3.6
- Antipsychotic drugs [prescribing for elderly], section 4.2.1

Dose changes

Changes in dose statements introduced into BNF No. 57:

- Aciclovir [herpes simplex, prevention of recurrence], p. 344
- Adenosine, p. 81
- Betaine, p. 549
- Bromocriptine, p. 265
- Buprenorphine [opioid dependence], p. 279
- Cabergoline, p. 265
- Chloroquine [treatment of benign malaria], p. 354 and [prophylaxis of malaria], p. 357
- Doxycycline [syphilis], p. 304
- EMLA®, p. 704
- Etanercept [plaque psoriasis], p. 637
- Fentanyl injection, p. 696
- Flixotide® Accuhaler, p. 166
- Flixotide® Diskhaler, p. 166
- Flixotide® Evohaler, p. 166
- Lisinopril [renal complications of diabetes mellitus], p. 103
- Memantine, p. 282
- Methotrexate [psoriasis], p. 636
- Midazolam [premedication by intravenous injection and dose for induction of anaesthesia], p. 694
- Naloxone hydrochloride [overdose with opioids], p. 31
- Omeprazole [severe peptic ulcer bleeding], p. 49
- Pergolide, p. 265
- Phosphate infusion, p. 535
- Prednisolone [inflammatory bowel disease], p. 57
- Propofol [maintenance of anaesthesia], p. 689
- Rufinamide, p. 256
- Trimethoprim, p. 316
Classification changes
Classification changes have been made in the following sections for BNF No. 57:
Section 1.5.1 Aminosalicylates [new sub-section]
Section 1.5.2 Corticosteroids [new sub-section]
Section 1.5.3 Drugs affecting the immune response [new sub-section]
Section 1.5.4 Food allergy [new sub-section]
Section 1.6.6 Peripheral opioid-receptor antagonist [new sub-section]
Section 3.4.3 Allergic emergencies [section re-organised]
Section 5.1.2 Cephalosporins, carbapenems, and other beta-lactams [title change]
Section 5.1.2.1 Cephalosporins [new sub-section]
Section 5.1.2.2 Carbapenems [new sub-section]
Section 5.1.2.3 Other beta-lactam antibiotics [new subsection]
Section 6.1.6 Oral glucose tolerance test [sub-section title change]

Discontinued preparations
Preparations discontinued during the compilation of BNF No. 57:
Aerobec® preparations
Agenerase®
Amprenavir
Benztropine
Clinoril®
Daclizumab
Dynepo®
Efcortelan®
Epoetin delta
Fletchers’® enemas
Graneodin®
Gyno-Daktarin® pessaries
Idrolax®
Intal® spincaps
Kloref®
Locoid C®
Navoban®
Nilopress® Retard
Nisolipine
Nystan® cream and ointment
Procainamide
Pulmicort® LS aerosol inhaler
Senokot® granules
Syscor MR®
Tri-Adcortyl® cream and ointment
Tropisetron
Volmax®
Zenapax®

Late additions
Siklos® (Nordic) ▼ [HRA]
Tablets, f/c, hydroxycarbamide 1 g, net price 30-tab pack = £500.00
BNF section 9.1.3. For prophylaxis of recurrent painful vaso-occlusive crises including acute chest syndrome in patients with sickle-cell disease
Name changes

European Law requires use of the Recommended International Non-proprietary Name (rINN) for medicinal substances. In most cases the British Approved Name (BAN) and rINN were identical. Where the two differed, the BAN was modified to accord with the rINN.

The following list shows those substances for which the former BAN has been modified to accord with the rINN. Former BANs have been retained as synonyms in the BNF.

**Adrenaline and noradrenaline** Adrenaline and noradrenaline are the terms used in the titles of monographs in the European Pharmacopoeia and are thus the official names in the member states. For these substances, BP 2008 shows the European Pharmacopoeia names and the rINNs at the head of the monographs; the BNF has adopted a similar style.

</table>
Guidance on prescribing

General guidance

Medicines should be prescribed only when they are necessary, and in all cases the benefit of administering the medicine should be considered in relation to the risk involved. This is particularly important during pregnancy, when the risk to both mother and fetus must be considered (for further details see Prescribing in Pregnancy, Appendix 4).

It is important to discuss treatment options carefully with the patient to ensure that the patient is content to take the medicine as prescribed (see also Taking Medicines to Best Effect, below). In particular, the patient should be helped to distinguish the adverse effects of prescribed drugs from the effects of the medical disorder. When the beneficial effects of the medicine are likely to be delayed, the patient should be advised of this.

Taking medicines to best effect Difficulties in compliance with drug treatment occur regardless of age. Factors contributing to poor compliance with prescribed medicines include:

- prescription not collected or not dispensed;
- purpose of medicine not clear;
- perceived lack of efficacy;
- real or perceived side-effects;
- patients’ perception of the risk and severity of side-effects may differ from that of the prescriber;
- instructions for administration not clear;
- physical difficulty in taking medicines (e.g. with swallowing the medicine, with handling small tablets, or with opening medicine containers);
- unattractive formulation (e.g. unpleasant taste);
- complicated regimen.

The prescriber and the patient should agree on the health outcomes that the patient desires and on the strategy for achieving them (‘concordance’). The prescriber should be sensitive to religious, cultural, and personal beliefs that can affect patients’ acceptance of medicines.

Taking the time to explain to the patient (and relatives) the rationale and the potential adverse effects of treatment may improve compliance. Reinforcement and elaboration of the physician’s instructions by the pharmacist also helps. Advising the patient of the possibility of alternative treatments may encourage the patient to seek advice rather than merely abandon unacceptable treatment.

Simplifying the drug regimen may help; the need for frequent administration may reduce compliance, although there appears to be little difference in compliance between once-daily and twice-daily administration. Combination products reduce the number of drugs taken but this may be at the expense of the ability to titrate individual doses.

Biosimilar medicines A biosimilar medicine is a new biological product that is similar to a medicine that has already been authorised to be marketed (the biological reference medicine) in the European Union. The active substance of a biosimilar medicine is similar, but not identical, to the biological reference medicine. Biological products are different from standard chemical products in terms of their complexity and although theoretically there should be no important differences between the biosimilar and the biological reference medicine in terms of safety or efficacy, when prescribing biological products, it is good practice to use the brand name. This will ensure that substitution of a biosimilar medicine does not occur when the medicine is dispensed.

Biosimilar medicines have black triangle status (▼) at the time of initial marketing. It is important to report suspected adverse reactions to biosimilar medicines using the Yellow Card Scheme (p. 11). For biosimilar medicines, adverse reaction reports should clearly state the brand name of the suspected medicine.

Complementary and alternative medicine An increasing amount of information on complementary and alternative medicine is becoming available. The scope of the BNF is restricted to the discussion of conventional medicines but reference is made to complementary treatments if they affect conventional therapy (e.g. interactions with St John’s wort—see Appendix 1). Further information on herbal medicines is available at www.mhra.gov.uk.

Abbreviation of titles In general, titles of drugs and preparations should be written in full. Unofficial abbreviations should not be used as they may be misinterpreted.

Non-proprietary titles Where non-proprietary (‘generic’) titles are given, they should be used in prescribing. This will enable any suitable product to be dispensed, thereby saving delay to the patient and sometimes expense to the health service. The only exception is where bioavailability problems are so important that the patient should always receive the same brand; in such cases, the brand name or the manufacturer should be stated. Non-proprietary titles should not be invented for the purposes of prescribing generically since this can lead to confusion, particularly in the case of compound and modified-release preparations.

Titles used as headings for monographs may be used freely in the United Kingdom but in other countries may be subject to restriction.

Many of the non-proprietary titles used in this book are titles of monographs in the European Pharmacopoeia, British Pharmacopoeia, or British Pharmaceutical Codex 1973. In such cases the preparations must comply with the standard (if any) in the appropriate publication, as required by the Medicines Act (Section 65).

Proprietary titles Names followed by the symbol® are or have been used as proprietary names in the United Kingdom. These names may in general be applied only to products supplied by the owners of the trade marks.

Marketing authorisation and BNF advice In general the doses, indications, cautions, contra-indications, and side-effects in the BNF reflect those in the manufacturers’ data sheets or Summaries of Product Characteristics (SPCs) which, in turn, reflect those in the corresponding marketing authorisations (formerly known as Product Licences). The BNF does not generally include propri-
Summary of Product Characteristics or when the marketing authorisation holder has not been able to supply essential information. When a preparation is available from more than one manufacturer, the BNF reflects advice that is the most clinically relevant regardless of any variation in the marketing authorisations. Unlicensed products can be obtained from ‘special-order’ manufacturers or specialist importing companies, see p. 939.

Where an unlicensed drug is included in the BNF, this is indicated in square brackets after the entry. Where the BNF suggests a use (or route) that is outside the licensed indication of a product (‘off-label’ use), this too is indicated. Unlicensed use of medicines becomes necessary if the clinical need cannot be met by licensed medicines; such use should be supported by appropriate evidence and experience.

The doses stated in the BNF are intended for general guidance and represent, unless otherwise stated, the usual range of doses that are generally regarded as being suitable for adults.

**Prescribing medicines outside the recommendations of their marketing authorisation alters (and probably increases) the prescriber’s professional responsibility and potential liability. The prescriber should be able to justify and feel competent in using such medicines.**

**Oral syringes** An oral syringe is supplied when oral liquid medicines are prescribed in doses other than multiples of 5 mL. The oral syringe is marked in 0.5-mL divisions from 1 to 5 mL to measure doses of less than 5 mL. (other sizes of oral syringe may also be available). It is provided with an adaptor and an instruction leaflet. The 5-mL spoon is used for doses of 5 mL (or multiples thereof).

To avoid inadvertent intravenous administration of oral liquid medicines, only an appropriate oral or enteral syringe should be used to measure an oral liquid medicine (if a medicine spoon or graduated measure cannot be used); these syringes should not be compatible with intravenous or other parenteral devices. Oral or enteral syringes should be clearly labelled ‘Oral’ or ‘Enteral’ in a large font size; it is the healthcare practitioner’s responsibility to label the syringe with this information if the manufacturer has not done so.

**Strengths and quantities** The strength or quantity to be contained in capsules, lozenges, tablets, etc. should be stated by the prescriber.

If a pharmacist receives an incomplete prescription for a systemically administered preparation and considers it would not be appropriate for the patient to return to the doctor, the following procedures will apply:

(a) an attempt must always be made to contact the prescriber to ascertain the intention;

(b) if the attempt is successful the pharmacist must, where practicable, subsequently arrange for details of quantity, strength where applicable, and dosage to be inserted by the prescriber on the incomplete form;

(c) where, although the prescriber has been contacted, it has not proved possible to obtain the written intention regarding an incomplete prescription, the pharmacist may endorse the form ‘p.c.’ (prescriber contacted) and add details of the quantity and strength where applicable of the preparation supplied, and of the dose indicated. The endorsement should be initialed and dated by the pharmacist;

(d) where the prescriber cannot be contacted and the pharmacist has sufficient information to make a professional judgement the preparation may be dispensed. If the quantity is missing the pharmacist may supply sufficient to complete up to 5 days’ treatment, except that where a combination pack (i.e. a proprietary pack containing more than one medicinal product) or oral contraceptive is prescribed by name only, the smallest pack shall be dispensed. In all cases the prescription must be endorsed ‘p.n.c.’ (prescriber not contacted), the quantity, the dose, and the strength (where applicable) of the preparation supplied must be indicated, and the endorsement must be initialed and dated;

(e) if the pharmacist has any doubt about exercising discretion, an incomplete prescription must be referred back to the prescriber.

**Excipients** Branded oral liquid preparations that do not contain fructose, glucose, or sucrose are described as ‘sugar-free’ in the BNF. Preparations containing hydro-génated glucose syrup, mannitol, maltitol, sorbitol, or xylitol are also marked ‘sugar-free’ since there is evidence that they do not cause dental caries. Patients receiving medicines containing cariogenic sugars should be advised of appropriate dental hygiene measures to prevent caries. Sugar-free preparations should be used whenever possible.

Where information on the presence of aspartame, gluten, sulphites, tartrazine, arachis (peanut) oil or sesame oil is available, this is indicated in the BNF against the relevant preparation. Information is provided on selected excipients in skin preparations (section 13.1.3), in vaccines (section 14.1), and on selected preservatives and excipients in eye drops and injections. Pressurised metered aerosols containing chlorofluorocarbons (CFCs) have also been identified throughout the BNF (see section 3.1.1.1).

The presence of benzyl alcohol and polyoxyl castor oil (polyethoxylated castor oil) in injections is indicated in the BNF. Benzyl alcohol has been associated with a fatal toxic syndrome in preterm neonates, and therefore, parenteral preparations containing the preservative should not be used in neonates. Polyoxyl castor oils, used as vehicles in intravenous injections, have been associated with severe anaphylactoid reactions.

The presence of propylene glycol in oral or parenteral medicines is indicated in the BNF; it can cause adverse effects if its elimination is impaired, e.g. in renal failure, in neonates and young children, and in slow metabolisers of the substance. It may interact with disulphiram and metronidazole.

**In the absence of information on excipients in the BNF and in the product literature, contact the manufacturer (see Index of Manufacturers) if it is essential to check details.**

**Extemporaneous preparation** A product should be dispensed extemporaneously only when no product with a marketing authorisation is available.

The BP direction that a preparation must be freshly prepared indicates that it must be made not more than 24 hours before it is issued for use. The direction that a
Non-proprietary names of compound preparations

Which appear in the BNF are those that have been compiled by the British Pharmacopoeia Commission or another recognised body; whenever possible they reflect the names of the active ingredients.

Prescribers should avoid creating their own compound names for the purposes of generic prescribing: such names do not have an approved definition and can be misinterpreted.

Special care should be taken to avoid errors when prescribing compound preparations; in particular the hyphen in the prefix 'co-' should be retained. Special care should also be taken to avoid creating generic names for modified-release preparations where the use of these names could lead to confusion between formulations with different lengths of action.

Security and validity of prescriptions

The Council of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine by certain prescribers. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

BNF 57 General guidance

General guidance

Preparation should be recently prepared indicates that deterioration is likely if the preparation is stored for longer than about 4 weeks at 15–25 °C.

The term water used without qualification means either potable water freshly drawn direct from the public supply and suitable for drinking or freshly boiled and cooled purified water. The latter should be used if the public supply is from a local storage tank or if the potable water is unsuitable for a particular preparation (Water for injections, section 9.2.2).

Drugs and driving

Prescribers should advise patients if treatment is likely to affect their ability to drive motor vehicles. This applies especially to drugs with sedative effects; patients should be warned that these effects are increased by alcohol. General information about a patient’s fitness to drive is available from the Driver and Vehicle Licensing Agency at www.dvla.gov.uk (see also Appendix 9).

Patents

In the BNF, certain drugs have been included notwithstanding the exercise of actual or potential patent rights. In so far as such substances are protected by Letters Patent, their inclusion in this Formulary neither conveys, nor implies, licence to manufacture.

Health and safety

When handling chemical or biological materials particular attention should be given to the possibility of allergy, fire, explosion, radiation, or poisoning. Substances such as corticosteroids, some antmicrobials, phenothiazines, and many cytotoxics, are irritant or very potent and should be handled with caution. Contact with the skin and inhalation of dust should be avoided.

Safety in the home

Patients must be warned to keep all medicines out of the reach of children. All solid dose and all oral and external liquid preparations must be dispensed in a reclosable child-resistant container unless:

- the medicine is in an original pack or patient pack such as to make this inadvisable;
- the patient will have difficulty in opening a child-resistant container;
- a specific request is made that the product shall not be dispensed in a child-resistant container;
- no suitable child-resistant container exists for a particular liquid preparation.

All patients should be advised to dispose of unwanted medicines by returning them to a supplier for destruction.

Name of medicine

The name of the medicine should appear on the label unless the prescriber indicates otherwise.

(a) The strength is also stated on the label in the case of tablets, capsules, and similar preparations that are available in different strengths.

(b) If it is the wish of the prescriber that a description such as ‘The Sedative Tablets’ should appear on the label, the prescriber should write the desired description on the prescription form.

(c) The arrangement will extend to approved names, proprietary names or titles given in the BP, BPC, BNF, DPF, or NPF.

(d) The name written on the label is that used by the prescriber on the prescription.

(e) When a prescription is written other than on an NHS prescription form the name of the prescribed preparation will be stated on the label of the dispensed medicine unless the prescriber indicates otherwise.

(f) The Council of the Royal Pharmaceutical Society advises that the labels of dispensed medicines should indicate the total quantity of the product dispensed in the container to which the label refers. This requirement applies equally to solid, liquid, internal, and external preparations. If a product is dispensed in more than one container, the reference should be to the amount in each container.

Security and validity of prescriptions

The Councils of the British Medical Association and the Royal Pharmaceutical Society have issued a joint statement on the security and validity of prescriptions. In particular, prescription forms should:

- not be left unattended at reception desks;
- not be left in a car where they may be visible; and
- when not in use, be kept in a locked drawer within the surgery and at home.

Where there is any doubt about the authenticity of a prescription, the pharmacist should contact the prescriber. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.

Patient group direction (PGD)

In most cases, the most appropriate clinical care will be provided on an individual basis by a prescriber to a specific individual patient. However, a Patient Group Direction for supply and administration of medicines by other healthcare professionals can be used where it would benefit patient care without compromising safety.

A Patient Group Direction is a written direction relating to the supply and administration (or administration only) of a licensed prescription-only medicine by certain prescribers. If this is done by telephone, the number should be obtained from the directory rather than relying on the information on the prescription form, which may be false.
Prescription writing

Shared care
In its guidelines on responsibility for prescribing (circular EL (91) 127) between hospitals and general practitioners, the Department of Health has advised that legal responsibility for prescribing lies with the doctor who signs the prescription.

Prescriptions should be written legibly in ink or otherwise so as to be indelible, should be dated, should state the full name and address of the patient, and should be signed in ink by the prescriber. The age and the date of birth of the patient should preferably be stated, and it is a legal requirement in the case of prescription-only medicines to state the age for children under 12 years.

The following should be noted:
(a) The unnecessary use of decimal points should be avoided, e.g. 3 mg, not 3.0 mg.

Quantities of 1 gram or more should be written as 1 g etc.
Quantities less than 1 gram should be written in milligrams, e.g. 500 mg, not 0.5 g.
Quantities less than 1 mg should be written in micrograms, e.g. 100 micrograms, not 0.1 mg.

When decimals are unavoidable a zero should be written in front of the decimal point where there is no other figure, e.g. 0.5 mL, not .5 mL.
(b) ‘Micrograms’ and ‘nanograms’ should not be abbreviated. Similarly ‘units’ should not be abbreviated.

(c) The term ‘millilitre’ (ml or mL) is used in medicine and pharmacy, and cubic centimetre, c.c., or cm should not be used.

(d) Dose and dose frequency should be stated; in the case of preparations to be taken ‘as required’ a minimum dose interval should be specified.

When doses other than multiples of 5 mL are prescribed for oral liquid preparations the dose-volume will be provided by means of an oral syringe, see p. 2 (except for preparations intended to be measured with a pipette).

Suitable quantities:
- Elixirs, Linctuses, and Paediatric Mixtures (5-mL dose), 50, 100, or 150 mL
- Adult Mixtures (10-mL dose), 200 or 300 mL
- Ear Drops, Eye drops, and Nasal Drops, 10 mL (or the manufacturer’s pack)
- Eye Lotions, Gargles, and Mouthwashes, 200 mL

For suitable quantities of dermatological preparations, see section 13.1.2.

(f) The names of drugs and preparations should be written clearly and not abbreviated, using approved titles only (see also advice in box on p. 3 to avoid creating generic titles for modified-release preparations).

(g) The quantity to be supplied may be stated by indicating the number of days of treatment required in the box provided on NHS forms. In most cases the exact amount will be supplied. This does not apply to items directed to be used as required—if the dose and frequency are not given then the quantity to be supplied needs to be stated.

When several items are ordered on one form the box can be marked with the number of days of treatment provided the quantity is added for any item for which the amount cannot be calculated.

(h) Although directions should preferably be in English without abbreviation, it is recognised that some Latin abbreviations are used (for details see Inside Back Cover).

(i) Medical and dental practitioners may prescribe unlicensed medicines (i.e. those without marketing authorisation) or withdrawn medicines. The prescriber should inform the patient or the patient’s carer that the product does not have a marketing authorisation.

Prescribing by dental surgeons
Until new prescribing arrangements are in place for NHS prescriptions, dental surgeons should use form FP10D (GP14 in Scotland, WP10D in Wales) to prescribe only those items listed in the Dental Practitioners’ Formulary.

1. These recommendations are acceptable for prescription-only medicines (POM). For items marked (R) see also Controlled Drugs and Drug Dependence, p. 7.
2. It is permissible to issue carbon copies of NHS prescriptions as long as they are signed in ink.
3. Computer-generated facsimile signatures do not meet the legal requirement.
4. The use of capital ‘L’ in mL is a printing convention throughout the BNF; both ‘mL’ and ‘ml’ are recognised SI abbreviations.
The Act and Regulations do not set any limitations upon the number and variety of substances which the dental surgeon may administer to patients in the surgery or may order by private prescription—provided the relevant legal requirements are observed the dental surgeon may use or order whatever is required for the clinical situation. There is no statutory requirement for the dental surgeon to communicate with a patient’s medical practitioner when prescribing for dental use. There are, however, occasions when this would be in the patient’s interest and such communication is to be encouraged.

For legal requirements relating to prescriptions for Controlled Drugs, see p. 7.

### Computer-issued prescriptions

For computer-issued prescriptions the following advice, based on the recommendations of the Joint GP Information Technology Committee, should also be noted:

1. The computer must print out the date, the patient’s surname, one forename, other initials, and address, and may also print out the patient’s title and date of birth. The age of children under 12 years and of adults over 60 years must be printed in the box available; the age of children under 5 years should be printed in years and months. A facility may also exist to print out the age of patients between 12 and 60 years.

2. The doctor’s name must be printed at the bottom of the prescription form; this will be the name of the doctor responsible for the prescription (who will normally sign it). The doctor’s surgery address, reference number, and Primary Care Trust (PCT) are also necessary. In addition, the surgery telephone number should be printed.

3. When prescriptions are to be signed by general practitioner registrars, assistants, locums, or depu-tising doctors, the name of the doctor printed at the bottom of the form must still be that of the responsible principal.

4. Names of medicines must come from a dictionary held in the computer memory, to provide a check on the spelling and to ensure that the name is written in full. The computer can be programmed to recognise both the non-proprietary and the proprietary name of a particular drug and to print out the preferred choice, but must not print out both names. For medicines not in the dictionary, separate checks are required—the user must be warned that no check was possible and the entire prescription must be entered in the lexicon.

5. The dictionary may contain information on the usual doses, formulations, and pack sizes to produce standard predetermined prescriptions for common preparations, and to provide a check on the validity of an individual prescription on entry.

6. The prescription must be printed in English without abbreviation; information may be entered or stored in abbreviated form. The dose must be in numbers, the frequency in words, and the quantity in numbers in brackets, thus: 40 mg four times daily (112). It must also be possible to prescribe by indicating the length of treatment required, see (h) above.

7. The BNF recommendations should be followed as in (a), (b), (c), (d), and (e) above.

8. Checks may be incorporated to ensure that all the information required for dispensing a particular drug has been filled in. For instructions such as ‘as directed’ and ‘when required’, the maximum daily dose should normally be specified.

9. Numbers and codes used in the system for organising and retrieving data must never appear on the form.

10. Supplementary warnings or advice should be written in full, should not interfere with the clarity of the prescription itself, and should be in line with any warnings or advice in the BNF; numerical codes should not be used.

11. A mechanism (such as printing a series of non-specific characters) should be incorporated to cancel out unused space, or wording such as ‘no more items on this prescription’ may be added after the last item. Otherwise the doctor should delete the space manually.

12. To avoid forgery the computer may print on the form the number of items to be dispensed (somewhere separate from the box for the pharmacist). The number of items per form need be limited only by the ability of the printer to produce clear and well-demarcated instructions with sufficient space for each item and a spacer line before each fresh item.

13. Handwritten alterations should only be made in exceptional circumstances—it is preferable to print out a new prescription. Any alterations must be made in the doctor’s own handwriting and countersigned; computer records should be updated to fully reflect any alteration. Prescriptions for drugs used for contraceptive purposes (but which are not promoted as contraceptives) may need to be marked in handwriting with the symbol \( \text{‡} \) (or endorsed in another way to indicate that the item is prescribed for contraceptive purposes).

14. Prescriptions for controlled drugs can be printed from the computer, but the prescriber’s signature must be handwritten^2^.

15. The strip of paper on the side of the FP10SS may be used for various purposes but care should be taken to avoid including confidential information. It may be advisable for the patient’s name to appear at the top, but this should be preceded by ‘confidential’.

16. In rural dispensing practices prescription requests (or details of medicines dispensed) will normally be entered in one surgery. The prescriptions (or dispensed medicines) may then need to be delivered to another surgery or location; if possible the computer should hold up to 10 alternatives.

17. Prescription forms that are reprinted or issued as a duplicate should be labelled clearly as such.

---

1. Health Board in Scotland, Local Health Board in Wales.
2. See Controlled Drugs and Drug Dependence p. 7; the prescriber may use a date stamp.
3. GP10SS in Scotland, WP10SS in Wales.
Emergency supply of medicines

Emergency supply requested by member of the public

Pharmacists are sometimes called upon by members of the public to make an emergency supply of medicines. The Prescription Only Medicines (Human Use) Order 1997 allows exemptions from the Prescription Only requirements for emergency supply to be made by a person lawfully conducting a retail pharmacy business provided:

(a) that the pharmacist has interviewed the person requesting the prescription-only medicine and is satisfied:
   (i) that there is immediate need for the prescription-only medicine and that it is impracticable in the circumstances to obtain a prescription without undue delay;
   (ii) that treatment with the prescription-only medicine has on a previous occasion been prescribed by a doctor, a supplementary prescriber, a community practitioner nurse prescriber (formerly a district nurse or health visitor prescriber), a nurse independent prescriber, or a pharmacist independent prescriber, for the person requesting it;
   (iii) as to the dose that it would be appropriate for the person to take;
(b) that no greater quantity shall be supplied than will provide 5 days' treatment except when the prescription-only medicine is:
   (i) insulin, an ointment or cream, or a preparation for the relief of asthma in an aerosol dispenser when the smallest pack can be supplied;
   (ii) an oral contraceptive when a full cycle may be supplied;
   (iii) an antibiotic in liquid form for oral administration when the smallest quantity that will provide a full course of treatment can be supplied;
(c) that an entry shall be made by the pharmacist in the prescription book stating:
   (i) the date of supply;
   (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   (iii) the name and address of the patient;
   (iv) the nature of the emergency;
(d) that the container or package must be labelled to show:
   (i) the date of supply;
   (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   (iii) the name of the patient;
   (iv) the words 'Emergency supply';
   (v) the words 'Keep out of the reach of children' (or similar warning);
(e) that the prescription-only medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available).

Emergency supply requested by prescriber

Emergency supply of a prescription-only medicine may also be made at the request of a doctor, a supplementary prescriber, a community practitioner nurse prescriber (formerly a district nurse or health visitor prescriber), a nurse independent prescriber, or a pharmacist independent prescriber provided:

(a) that the pharmacist is satisfied that the prescriber by reason of some emergency is unable to furnish a prescription immediately;
(b) that the prescriber has undertaken to furnish a prescription within 72 hours;
(c) that the medicine is supplied in accordance with the directions of the prescriber requesting it;
(d) that the medicine is not a substance specifically excluded from the emergency supply provision, and does not contain a Controlled Drug specified in Schedules 1, 2, or 3 to the Misuse of Drugs Regulations 2001 except for phenobarbital or phenobarbital sodium for the treatment of epilepsy: for details see Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available);
(e) that an entry shall be made in the prescription book stating:
   (i) the date of supply;
   (ii) the name, quantity and, where appropriate, the pharmaceutical form and strength;
   (iii) the name and address of the practitioner requesting the emergency supply;
   (iv) the name and address of the patient;
   (v) the date on the prescription;
   (vi) when the prescription is received the entry should be amended to include the date on which it is received.

Royal Pharmaceutical Society's Guidelines

1. The pharmacist should consider the medical consequences of not supplying a medicine in an emergency.
2. If the pharmacist is unable to make an emergency supply of a medicine the pharmacist should advise the patient how to obtain essential medical care.

For conditions that apply to supplies made at the request of a patient see Medicines, Ethics and Practice, No. 32, London Pharmaceutical Press, 2008 (and subsequent editions).
Controlled Drugs and drug dependence

The Misuse of Drugs Act, 1971 prohibits certain activities in relation to 'Controlled Drugs', in particular their manufacture, supply, and possession. The penalties applicable to offences involving the different drugs are graded broadly according to the harmfulness attributable to a drug when it is misused and for this purpose the drugs are defined in the following three classes:

Class A includes: alfentanil, cocaine, diamorphine (heroin), dipipanone, lysergide (LSD), methadone, methylenedioxymethamphetamine (MDMA, 'ecstasy'), morphine, opium, pethidine, phenylcyclidine, remifentanil, and class B substances when prepared for injection

Class B includes: oral amphetamines, barbiturates, cannabis, cannabis resin, codeine, ethylmorphine, glutethimide, pentazocine, phentemazine, and pholcodine

Class C includes: certain drugs related to the anabolics such as benzotriamidone and chlorphentermine, buprenorphine, diethylpropion, mazindol, meprobamate, pemoline, pipradrol, most benzodiazepines, zolpidem, androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin

The Misuse of Drugs Regulations 2001 define the classes of person who are authorised to supply and possess controlled drugs while acting in their professional capacities and lay down the conditions under which these activities may be carried out. In the regulations drugs are divided into five schedules each specifying the requirements governing such activities as import, export, production, supply, possession, prescribing, and record keeping which apply to them.

Schedule 1 includes drugs such as cannabis and lysergide which are not used medicinally. Possession and supply are prohibited except in accordance with Home Office authority.

Schedule 2 includes drugs such as diamorphine (heroin), morphine, remifentanil, pethidine, seco-barbital, glutethimide, amfetamine, and cocaine and are subject to the full controlled drug requirements relating to prescriptions, safe custody (except for seco-barbital), the need to keep registers, etc. (unless exempted in Schedule 5).

Schedule 3 includes the barbiturates (except seco-barbital, now Schedule 2), buprenorphine, diethylpropion, mazindol, meprobamate, midazolam, pentazocine, pethidine, and temazepam. They are subject to the special prescription requirements (except for temazepam) but not to the safe custody requirements (except for buprenorphine, diethylpropion, and temazepam) nor to the need to keep registers (although there are requirements for the retention of invoices for 2 years).

Schedule 4 includes in Part I benzodiazepines (except temazepam and midazolam, which are in Schedule 3) and zolpidem, which are subject to minimal control. Part II includes androgenic and anabolic steroids, clenbuterol, chorionic gonadotrophin (HCG), non-human chorionic gonadotrophin, somatotropin, somatrem, and somatropin. Controlled drug prescription requirements do not apply and Schedule 4 Controlled Drugs are not subject to safe custody requirements.

Schedule 5 includes those preparations which, because of their strength, are exempt from virtually all Controlled Drug requirements other than retention of invoices for two years.

Prescriptions Preparations in Schedules 2 and 3 of the Misuse of Drugs Regulations 2001 (and subsequent amendments) are identified throughout the BNF by the symbol (©) (Controlled Drug). The principal legal requirements relating to medical prescriptions are listed below (see also Department of Health Guidance, p. 8).

Prescription requirements

Prescriptions for Controlled Drugs that are subject to prescription requirements must be indelible, and must be signed by the prescriber, be dated, and specify the prescriber’s address. The prescription must always state:

- the name and address of the patient;
- in the case of a preparation, the form and where appropriate the strength of the preparation;
- either the total quantity (in both words and figures) of the preparation, or the number (in both words and figures) of dosage units, as appropriate, to be supplied; in any other case, the total quantity (in both words and figures) of the Controlled Drug to be supplied;
- the dose;
- the words 'for dental treatment only' if issued by a dentist.

A pharmacist is not allowed to dispense a Controlled Drug unless all the information required by law is given on the prescription. In the case of a prescription for a Controlled Drug in Schedule 2 or 3, a pharmacist can amend the prescription if it specifies the total quantity only in words or in figures or if it contains minor typographical errors, provided that such amendments are indelible and clearly attributable to the pharmacist. Failure to comply with the regulations concerning the writing of prescriptions will result in inconvenience to patients and delay in supplying the necessary medicine.

1. All preparations in Schedules 2 and 3, except temazepam.
2. A machine-written prescription is acceptable. The prescriber’s signature must be handwritten.
3. The dosage form (e.g. tablets) must be included on a Controlled Drugs prescription irrespective of whether it is implicit in the proprietary name (e.g. MST Continus) or whether only one form is available.
4. When more than one strength of a preparation exists the strength required must be specified.
5. The Home Office has advised that quantities of liquid preparations, such as methadone oral solution, should be written in millilitres.
6. The instruction 'one as directed' constitutes a dose but ‘as directed’ does not.
Instalments and ‘repeats’ A prescription may order a Controlled Drug to be dispensed by instalments; the amount of instalments and the intervals to be observed must be specified. Prescriptions ordering ‘repeats’ on the same form are not permitted for Controlled Drugs in Schedules 2 or 3. A prescription for a Controlled Drug in Schedules 2, 3, or 4 is valid for 28 days from the date stated thereon.

Private prescriptions Private prescriptions for Controlled Drugs in Schedules 2 and 3 must be written on specially designated forms provided by Primary Care Trusts in England, Health Boards in Scotland, Local Health Boards in Wales, or the Northern Ireland Central Services Agency; in addition, prescriptions must specify the prescriber’s identification number. Prescriptions to be supplied by a pharmacist in hospital are exempt from the requirements for private prescriptions.

Department of Health guidance Guidance (June 2006) issued by the Department of Health in England on prescribing and dispensing of Controlled Drugs requires:

- In general, prescriptions for Controlled Drugs in Schedules 2, 3, and 4 to be limited to a supply of up to 30 days’ treatment; exceptionally, to cover a justifiable clinical need and after consideration of any risk, a prescription can be issued for a longer period, but the reasons for the decision should be recorded on the patient’s notes;

- the patient’s identifier to be shown on NHS and private prescriptions for Controlled Drugs in Schedules 2 and 3.

Further information is available at www.dh.gov.uk/controlleddrugs.

Dependence and misuse The most serious drugs of addiction are cocaine, diamorphine (heroin), morphine, and the synthetic opioids. For arrangements for prescribing of diamorphine, dipipanone, or cocaine for addicts, see p. 10.

Despite marked reduction in the prescribing of amphetamines there is concern that abuse of illicit amphetamine and related compounds is widespread.

The benzodiazepine temazepam has commonly been associated with misuse. The misuse of barbiturates is now less common, in line with declining prescription numbers.

Cannabis (Indian hemp) has no approved medicinal use and cannot be prescribed by doctors. Its use is illegal but has become widespread. Cannabis is a mild hallucinogen seldom accompanied by a desire to increase the dose; withdrawal symptoms are unusual.

Lysergide (lysergic acid diethylamide, LSD) is a much more potent hallucinogen; its use can lead to severe psychotic states which can be life-threatening.

Prescribing drugs likely to cause dependence or misuse The prescriber has three main responsibilities:

- To avoid creating dependence by introducing drugs to patients without sufficient reason. In this context, the proper use of the morphine-like drugs is well understood. The dangers of other Controlled Drugs are less clear because recognition of dependence is not easy and its effects, and those of withdrawal, are less obvious.

- To see that the patient does not gradually increase the dose of a drug, given for good medical reasons, to the point where dependence becomes more likely. This tendency is seen especially with hypnotics and anxiolytics (for CSM advice see section 4.1). The prescriber should keep a close eye on the amount prescribed to prevent patients from accumulating stocks. A minimal amount should be prescribed in the first instance, or when seeing a new patient for the first time.

- To avoid being used as an unwitting source of supply for addicts. Methods include visiting more than one doctor, fabricating stories, and forging prescriptions.

Patients under temporary care should be given only small supplies of drugs unless they present an unequivocal letter from their own doctors. Doctors should also remember that their own patients may be attempting to collect prescriptions from other prescribers, especially in hospitals. It is sensible to reduce dosages steadily or to issue weekly or even daily prescriptions for small amounts if it is apparent that dependence is occurring.
The stealing and misuse of prescription forms could be minimised by the following precautions:

- do not leave unattended if called away from the consulting room or at reception desks; do not leave in a car where they may be visible; when not in use, keep in a locked drawer within the surgery and at home;
- draw a diagonal line across the blank part of the form under the prescription;
- write the quantity in words and figures when prescribing drugs prone to abuse; this is obligatory for controlled drugs (see Prescriptions, above);
- alterations are best avoided but if any are made they should be clear and unambiguous; add initials against altered items;
- if prescriptions are left for collection they should be left in a safe place in a sealed envelope.

Travelling abroad
Prescribed drugs listed in Schedule 4 Part II (CD Anab) and Schedule 5 of the Misuse of Drugs Regulations 2001 are not subject to export or import licensing. However, patients intending to travel abroad for more than 3 months carrying any amount of drugs listed in Schedules 2, 3, or 4 Part I (CD Benz) will require a personal export/import licence. Further details can be obtained at www.drugs.homeoffice.gov.uk/drugs-laws/licensing/personal, or from the Home Office by contacting the Home Office, Drugs Licensing, Peel Building, 2 Marsham Street, London, SW1P 4DF. Alternatively, completed application forms can be emailed to licensing_enquiry.aadu@homeoffice.gsi.gov.uk with a scanned copy of the covering letter from the prescriber. A minimum of two weeks should be allowed for processing the application.

Patients travelling for less than 3 months do not require a personal export/import licence for carrying Controlled Drugs, but are advised to carry a letter from the prescribing doctor. Those travelling for more than 3 months are advised to make arrangements to have their medication prescribed by a practitioner in the country they are visiting.

Doctors who want to take Controlled Drugs abroad while accompanying patients may similarly be issued with licences. Licences are not normally issued to doctors who want to take Controlled Drugs abroad solely in case a family emergency should arise.

Personal export/import licences do not have any legal status outside the UK and are issued only to comply with the Misuse of Drugs Act and to facilitate passage through UK Customs and Excise control. For clearance in the country to be visited it is necessary to approach that country’s consulate in the UK.

Notification of drug misusers
Doctors should report cases of drug misuse to their regional or national drug misuse database or centre—see below for contact telephone numbers. The National Drugs Treatment Monitoring System (NDTMS) was introduced in England in April 2001; regional (NDTMS) centres replace the Regional Drug Misuse Databases. A similar system has been introduced in Wales.

Notification to regional (NDTMS) or national centre should be made when a patient starts treatment for drug misuse. All types of problem drug misuse should be reported including opioid, benzodiazepine, and CNS stimulant.

The regional (NDTMS) or national centres are now the only national and local source of epidemiological data on people presenting with problem drug misuse; they provide valuable information to those working with drug misusers and those planning services for them. The databases cannot, however be used as a check on multiple prescribing for drug addicts because the data are anonymised.

Enquiries about the regional (NDTMS) or national centres (including information on how to submit data) can be made to one of the centres listed below:

Prescribing of diamorphine (heroin), dipipanone, and cocaine for addicts

The Misuse of Drugs (Supply to Addicts) Regulations 1997 require that only medical practitioners who hold a special licence issued by the Home Secretary may prescribe, administer, or supply diamorphine, dipipanone (*Diconal*®), or cocaine in the treatment of drug addiction; other practitioners must refer any addict who requires these drugs to a treatment centre. Whenever possible the addict will be introduced by a member of staff from the treatment centre to a pharmacist whose agreement has been obtained and whose pharmacy is conveniently sited for the patient. Prescriptions for weekly supplies will be sent to the pharmacy by post and will be dispensed on a daily basis as indicated by the doctor. If any alterations of the arrangements are requested by the addict, the portion of the prescription affected must be represcribed and not merely altered.

General practitioners and other doctors do not require a special licence for prescribing diamorphine, dipipanone, and cocaine for patients (including addicts) for relieving pain from organic disease or injury.

For guidance on prescription writing, see p. 7.
Adverse reactions to drugs

Any drug may produce unwanted or unexpected adverse reactions. Rapid detection and recording of adverse reactions is of vital importance so that recognised hazards are identified promptly and appropriate regulatory action is taken to ensure that medicines are used safely. Doctors, dentists, coroners, pharmacists, and nurses (see also self-reporting below) are urged to report suspected adverse reactions directly to the Medicines and Healthcare products Regulatory Agency (MHRA) through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk. Alternatively, prepay Yellow Cards for reporting are available from the address below and are also bound in this book (inside back cover).

Meditines and Healthcare products Regulatory Agency
CHM
Freepost
London SW8 5BR
Tel: 0800 731 6789

Suspected adverse reactions to any therapeutic agent should be reported, including drugs (self-medication as well as those prescribed), blood products, vaccines, radiographic contrast media, complementary and herbal products.

A 24-hour Freephone service is available to all parts of the UK for advice and information on suspected adverse drug reactions; contact the National Yellow Card Information Service at the MHRA on 0800 731 6789. Outside office hours a telephone-answering machine will take messages.

The following Yellow Card Centres may follow up reports:

Yellow Card Centre Mersey
Freepost
Liverpool L3 3AB
Tel: (0151) 794 8206

Yellow Card Centre Wales
Freepost
Cardiff CF4 1ZZ
Tel: (029) 2074 4181
(direct line)

Yellow Card Centre Northern & Yorkshire
Freepost
Newcastle upon Tyne NE1 1BR
Tel: (0191) 232 1525
(direct line)

Yellow Card Centre Scotland
CARDS
Freepost NAT3271
Edinburgh EH16 4BR
Tel: (0131) 242 2919

The MHRA’s database facilitates the monitoring of adverse drug reactions.

More detailed information on reporting and a list of products currently under intensive monitoring can be found on the MHRA website: www.mhra.gov.uk.

Self-reporting

Patients, parents, and carers can also report suspected adverse reactions to the MHRA. Reports can be submitted directly to the MHRA through the Yellow Card Scheme using the electronic form at www.yellowcard.gov.uk or by telephone on 0800 100 3352. Alternatively, patient Yellow Cards are available from pharmacies.

Prescription-event monitoring

In addition to the MHRA’s Yellow Card Scheme, an independent scheme monitors the safety of new medicines using a different approach. The Drug Safety Research Unit identifies patients who have been prescribed selected new medicines and collects data on clinical events in these patients. The data are submitted on a voluntary basis by general practitioners on green forms. More information about the scheme and the Unit’s educational material is available from www.dsru.org.

Newer drugs and vaccines

Only limited information is available from clinical trials on the safety of new medicines. Further understanding about the safety of medicines depends on the availability of information from routine clinical practice.

The black triangle symbol (▼) identifies newly licensed medicines that are monitored intensively by the MHRA. Such medicines include new active substances, biosimilar medicines, medicines that have been licensed for administration by a new route or drug delivery system, or for significant new indications which may alter the established risks and benefits of that drug, or that contain a new combination of active substances. There is no standard time for which products retain a black triangle; safety data are usually reviewed after 2 years.

Spontaneous reporting is particularly valuable for recognising possible new hazards rapidly. For medicines showing the black triangle symbol, the MHRA asks that all suspected reactions (including those considered not to be serious) are reported through the Yellow Card Scheme. An adverse reaction should be reported even if it is not certain that the drug has caused it, or if the reaction is well recognised. Exam- ples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions.

Established drugs and vaccines

Doctors, dentists, coroners, pharmacists and nurses are asked to report all serious suspected reactions, including those that are fatal, life-threatening, disabling, incapacitating, or which result in or prolong hospitalisation; they should be reported even if the effect is well recognised. Examples include anaphylaxis, blood disorders, endocrine disturbances, effects on fertility, haemorrhage from any site, renal impairment, jaundice, ophthalmic disorders, severe CNS effects, severe skin reactions, reactions in pregnant women, and any drug interactions. Reports of serious adverse reactions are required to enable comparison with other drugs of a similar class. Reports of overdoses (deliberate or accidental) can complicate the assessment of adverse drug reactions, but provide important information on the potential toxicity of drugs.

For established drugs there is no need to report well-known, relatively minor side-effects, such as dry mouth with tricyclic antidepressants or constipation with opioids.
Adverse reactions to medical devices

Suspected adverse reactions to medical devices including dental or surgical materials, intra-uterine devices, and contact lens fluids should be reported. Information on reporting these can be found at: www.mhra.gov.uk.

Side-effects in the BNF

The BNF includes clinically relevant side-effects for most drugs; an exhaustive list is not included for drugs that are used by specialists (e.g. cytotoxic drugs and drugs used in anaesthesia). Where causality has not been established, side-effects in the manufacturers’ literature may be omitted from the BNF.

Recognising that hypersensitivity reactions can occur with virtually all medicines, this effect is not generally listed, unless the drug carries an increased risk of such reactions. The BNF also omits effects that are likely to have little clinical consequence (e.g. transient increase in liver enzymes).

Side-effects are generally listed in order of frequency and arranged broadly by body systems. Occasionally a rare side-effect might be listed first if it is considered to be particularly important because of its seriousness.

In the product literature the frequency of side-effects is generally described as follows:

- **Very common**: greater than 1 in 10
- **Common**: 1 in 100 to 1 in 10
- **Uncommon** (‘less commonly’ in BNF): 1 in 1000 to 1 in 100
- **Rare**: 1 in 10 000 to 1 in 1000
- **Very rare**: less than 1 in 10 000

### Special problems

#### Delayed drug effects

Some reactions (e.g. cancers, chloroquine retinopathy, and retroperitoneal fibrosis) may become manifest months or years after exposure. Any suspicion of such an association should be reported directly to the MHRA through the Yellow Card Scheme.

#### The elderly

Particular vigilance is required to identify adverse reactions in the elderly.

#### Congenital abnormalities

When an infant is born with a congenital abnormality or there is a malformed aborted fetus doctors are asked to consider whether this might be an adverse reaction to a drug and to report all drugs (including self-medication) taken during pregnancy.

#### Children

Particular vigilance is required to identify and report adverse reactions in children, including those resulting from the unlicensed use of medicines; all suspected reactions should be reported directly to the MHRA through the Yellow Card Scheme.

### Prevention of adverse reactions

Adverse reactions may be prevented as follows:

- never use any drug unless there is a good indication. If the patient is pregnant do not use a drug unless the need for it is imperative;
- allergy and idiosyncrasy are important causes of adverse drug reactions. Ask if the patient had previous reactions;
- ask if the patient is already taking other drugs including self-medication drugs, health supplements, complementary and alternative therapies; interactions may occur;
- age and hepatic or renal disease may alter the metabolism or excretion of drugs, so that much smaller doses may be needed. Genetic factors may also be responsible for variations in metabolism, notably of isoniazid and the tricyclic antidepressants;
- prescribe as few drugs as possible and give very clear instructions to the elderly or any patient likely to misunderstand complicated instructions;
- whenever possible use a familiar drug; with a new drug, be particularly alert for adverse reactions or unexpected events;
- warn the patient if serious adverse reactions are liable to occur.

### Oral side-effects of drugs

Drug-induced disorders of the mouth may be due to a local action on the mouth or to a systemic effect manifested by oral changes. In the latter case urgent referral to the patient’s medical practitioner may be necessary.

#### Oral mucosa

Medicaments left in contact with or applied directly to the oral mucosa can lead to inflammation or ulceration; the possibility of allergy should also be borne in mind. 

Aspirin tablets allowed to dissolve in the sulcus for the treatment of toothache can lead to a white patch followed by ulceration.

Flavouring agents, particularly essential oils, may sensitise the skin, but mucosal swelling is not usually prominent.

The oral mucosa is particularly vulnerable to ulceration in patients treated with cytotoxic drugs, e.g. methotrexate. Other drugs capable of causing oral ulceration include captopril (and other ACE inhibitors), gold, nicorandil, NSAIDs, pancreatic, penicillamine, proguanil, and protease inhibitors.

*Erythema multiforme* (including Stevens-Johnson syndrome) may follow the use of a wide range of drugs including antibiotics, antiretrovirals, sulphamamide derivatives, and anticonvulsants; the oral mucosa may be extensively ulcerated, with characteristic target lesions on the skin. Oral lesions of toxic epidermal necrolysis (Lyell’s syndrome) have been reported with a similar range of drugs.

Lichenoid eruptions are associated with ACE inhibitors, NSAIDs, methyldopa, chloroquine, oral anti-diabetics, thiazide diuretics, and gold.

*Candidiasis* can complicate treatment with antibiotics and immunosuppressants and is an occasional side-effect of corticosteroid inhalers, see also p. 163.

### Teeth and Jaw

Brown staining of the teeth frequently follows the use of chlorhexidine mouthwash, spray or gel, but can readily be removed by polishing. Iron salts in liquid form can stain the enamel black. Superficial staining has been reported rarely with co-amoxiclav suspension.
**Intrinsic staining** of the teeth is most commonly caused by **tetracyclines**. They will affect the teeth if given at any time from about the fourth month *in utero* until the age of twelve years; they are contra-indicated in pregnancy, breast-feeding women, and in children under 12 years. All tetracyclines can cause permanent, unsightly staining in children, the colour varying from yellow to grey.

Excessive ingestion of **fluoride** leads to *dental fluorosis* with mottling of the enamel and areas of hypoplasia or pitting; fluoride supplements occasionally cause mild mottling (white patches) if the dose is too large for the child's age (taking into account the fluoride content of the local drinking water and of toothpaste).

**Gingival overgrowth** (gingival hyperplasia) is a side-effect of **phenytoin** and sometimes of **ciclosporin** or of **nifedipine** (and some other calcium-channel blockers). **Thrombocytopenia** may be drug related and may cause bleeding at the gingival margins, which may be spontaneous or may follow mild trauma (such as toothbrushing).

**Salivary glands**

The most common effect that drugs have on the salivary glands is to *reduce flow* (xerostomia). Patients with a persistently dry mouth may have poor oral hygiene; they are at an increased risk of dental caries and oral infections (particularly candidiasis). Many drugs have been implicated in xerostomia, particularly **antimuscarinics** (anticholinergics), **antidepressants** (including tricyclic antidepressants, and selective serotonin re-uptake inhibitors), **alpha-blockers**, **antihistamines**, **antipsychotics**, **baclofen**, **bupropion**, **clonidine**, **SHT agonists**, **opioids**, **sibutramine**, and **tizanidine**. Excessive use of **diuretics** can also result in xerostomia.

Some drugs (e.g. clozapine, neostigmine) can *increase saliva production* but this is rarely a problem unless the patient has associated difficulty in swallowing.

Pain in the salivary glands has been reported with some **antihypertensives** (e.g. clonidine, methyldopa) and with **vinca alkaloids**.

Swelling of the salivary glands can occur with **iodides**, **antithyroid drugs**, **phenothiazines**, **ritodrine**, and **sulphonamides**.

**Taste**

There can be decreased taste acuity or alteration in taste sensation. Drugs implicated include **amiodarone**, **calcitonin**, **captopril** (and other ACE inhibitors), **carbamazepine**, **clarithromycin**, **gold**, **griseofulvin**, **lithium salts**, **metformin**, **metronidazole**, **penicillamine**, **phenindione**, **propafenone**, **protease inhibitors**, **terbinafine**, and **zopiclone**.

**Defective medicines**

During the manufacture or distribution of a medicine an error or accident may occur whereby the finished product does not conform to its specification. While such a defect may impair the therapeutic effect of the product and could adversely affect the health of a patient, it should not be confused with an *Adverse Drug Reaction* where the product conforms to its specification.

The Defective Medicines Report Centre assists with the investigation of problems arising from licensed medicinal products thought to be defective and co-ordinates any necessary protective action. Reports on suspect defective medicinal products should include the brand or the non-proprietary name, the name of the manufacturer or supplier, the strength and dosage form of the product, the product licence number, the batch number or numbers of the product, the nature of the defect, and an account of any action already taken in consequence. The Centre can be contacted at:

**Prescribing for children**

For detailed advice on medicines used for children, consult *BNF for Children*

Children, and particularly neonates, differ from adults in their response to drugs. Special care is needed in the neonatal period (first 30 days of life) and doses should always be calculated with care. At this age, the risk of toxicity is increased by reduced drug clearance and differing target organ sensitivity.

Whenever possible, intramuscular injections should be **avoided** in children because they are painful.

Where possible, medicines for children should be prescribed within the terms of the marketing authorisation (product licence). However, many children may require medicines not specifically licensed for paediatric use.

Although medicines cannot be promoted outside the limits of the licence, the Medicines Act does not prohibit the use of unlicensed medicines. It is recognised that the informed use of unlicensed medicines or of licensed medicines for unlicensed applications (‘off-label’ use) is often necessary in paediatric practice.
Prescribing for children

Dosage in children

Children's doses in the BNF are stated in the individual drug entries as far as possible, except where paediatric use is not recommended, information is not available, or there are special hazards.

Doses are generally based on body-weight (in kilograms) or the following age ranges:

- first month (neonate)
- up to 1 year (infant)
- 1–5 years
- 6–12 years

Unless the age is specified, the term ‘child’ in the BNF includes persons aged 12 years and younger.

Dose calculation

Many children’s doses are standardised by weight (and therefore require multiplying by the body-weight in kilograms to determine the child’s dose); occasionally, the doses have been standardised by body-surface area (in m²). These methods should be used rather than attempting to calculate a child’s dose on the basis of doses used in adults.

For most drugs the adult maximum dose should not be exceeded. For example if the dose is stated as 8 mg/kg (max. 300 mg), a child weighing 10 kg should receive 80 mg but a child weighing 40 kg should receive 300 mg (rather than 320 mg).

Young children may require a higher dose per kilogram than adults because of their higher metabolic rates. Other problems need to be considered. For example, calculation by body-weight in the overweight child may result in much higher doses being administered than necessary; in such cases, dose should be calculated from an ideal weight, related to height and age (see inside back cover).

Body-surface area (BSA) estimates are more accurate for calculation of paediatric doses than body-weight since many physiological phenomena correlate better with body-surface area. Body-surface area can be estimated from weight by means of a table. For more information, refer to BNF for Children.

Where the dose for children is not stated, prescribers should consult BNF for Children or seek advice from a medicines information centre.

Dose frequency

Antibacterials are generally given at regular intervals throughout the day. Some flexibility should be allowed in children to avoid waking them during the night. For example, the night-time dose may be given at the parent’s bedtime.

Where new or potentially toxic drugs are used, the manufacturers’ recommended doses should be carefully followed.

Adverse drug reactions in children

The reporting of all suspected adverse drug reactions in children is strongly encouraged through the Yellow Card Scheme (see p. 11) even if the intensive monitoring symbol (▼) has been removed, because experience in children may still be limited.

The identification and reporting of adverse reactions to drugs in children is particularly important because:

- the action of the drug and its pharmacokinetics in children (especially in the very young) may be different from that in adults;
- drugs are not extensively tested in children;
- many drugs are not specifically licensed for use in children and are used ‘off-label’;
- suitable formulations may not be available to allow precise dosing in children;
- the nature and course of illnesses and adverse drug reactions may differ between adults and children.

Prescription writing

Prescriptions should be written according to the guidelines in Prescription Writing (p. 4). Inclusion of age is a legal requirement in the case of prescription-only medicines for children under 12 years of age, but it is preferable to state the age for all prescriptions for children.

It is particularly important to state the strengths of capsules or tablets. Although liquid preparations are particularly suitable for children, they may contain sugar which encourages dental decay. Sugar-free medicines are preferred for long-term treatment.

Many children are able to swallow tablets or capsules and may prefer a solid dose form; involving the child and parents in choosing the formulation is helpful.

When a prescription for a liquid oral preparation is written and the dose ordered is smaller than 5 mL an oral syringe will be supplied (for details, see p. 2). Parents should be advised not to add any medicines to the infant’s feed, since the drug may interact with the milk or other liquid in it; moreover the ingested dosage may be reduced if the child does not drink all the contents.

Parents must be warned to keep all medicines out of reach of children, see Safety in the Home, p. 3.

Rare paediatric conditions

Information on substances such as biotin and sodium benzoate used in rare metabolic conditions is included in BNF for Children; further information can be obtained from:

Prescribing in palliative care

Palliative care is the active total care of patients whose disease is not responsive to curative treatment. Control of pain, of other symptoms, and of psychological, social and spiritual problems, is paramount to provide the best quality of life for patients and their families. Careful assessment of symptoms and needs of the patient should be undertaken by a multidisciplinary team.

Specialist palliative care is available in most areas as day hospice care, home-care teams (often known as Macmillan teams), in-patient hospice care, and hospital teams. Many acute hospitals and teaching centres now have consultative, hospital-based teams.

Hospice care of terminally ill patients has shown the importance of symptom control and psychosocial support of the patient and family. Families should be included in the care of the patient if they wish.

Many patients wish to remain at home with their families. Although some families may at first be afraid of caring for the patient at home, support can be provided by community nursing services, social services, voluntary agencies and hospices together with the general practitioner. The family may be reassured by the knowledge that the patient will be admitted to a hospital or hospice if the family cannot cope.

Drug treatment The number of drugs should be as few as possible, for even the taking of medicine may be an effort. Oral medication is usually satisfactory unless there is severe nausea and vomiting, dysphagia, weakness, or coma, when parenteral medication may be necessary.

Pain Analgesics are more effective in preventing pain than in the relief of established pain; it is important that they are given regularly.

The non-opioid analgesic paracetamol (section 4.7.1) or a NSAID (section 10.1.1) given regularly will often make the use of opioids unnecessary. A NSAID may also control the pain of bone secondaries; if necessary, flurbiprofen or indomethacin can be given rectally. Radiotherapy, bisphosphonates (section 6.6.2), and radioactive isotopes of strontium (Metastron® available from GE Healthcare) may also be useful for pain due to bone metastases.

An opioid analgesic (section 4.7.2) such as codeine (p. 235), alone or in combination with a non-opioid analgesic at adequate dosage, may be helpful in the control of moderate pain if non-opioids alone are not sufficient. Alternatively, tramadol (p. 241) can be considered for moderate pain. If these preparations do not control the pain, morphine (p. 238) is the most useful opioid analgesic. Alternatives to morphine, including hydrocodone (p. 238), methadone (p. 238), oxycodone (p. 240), and transdermal fentanyl (see below and p. 236) are best initiated by those with experience in palliative care. Initiation of an opioid analgesic should not be delayed by concern over a theoretical likelihood of psychological dependence (addiction).

Prescribing in palliative care

Equivalent single doses of opioid analgesics

These equivalences are intended only as an approximate guide; patients should be carefully monitored after any change in medication and dose titration may be required.

<td>5 mg</td>
</tr>
</tbody>
</table>

Oral route Morphine (p. 238) is given by mouth as an oral solution or as standard (‘immediate release’) tablets every 4 hours, the initial dose depending largely on the patient’s previous treatment. A dose of 5–10 mg is enough to replace a weaker analgesic (such as paracetamol), but 10–20 mg or more is required to replace a strong one (comparable to morphine itself). If the first dose of morphine is no more effective than the previous analgesic, the next dose should be increased by 50%, the aim being to choose the lowest dose that prevents pain. The dose should be adjusted with careful assessment of the pain, and the use of adjuvant analgesics (such as NSAIDs) should also be considered. Although morphine in a dose of 5–20 mg is usually adequate there should be no hesitation in increasing it stepwise according to response to 100 mg or occasionally up to 500 mg or higher if necessary. It may be possible to omit the overnight dose if double the usual dose is given at bedtime.

If pain occurs between regular doses of morphine (‘breakthrough pain’), an additional dose (‘rescue dose’) should be given. An additional dose should also be given 30 minutes before an activity that causes pain (e.g. wound dressing). Fentanyl lozenges are also licensed for breakthrough pain.

When the pain is controlled and the patient’s 24-hour morphine requirement is established, the daily dose can be given as a modified-release preparation in a single dose or in two divided doses.

Preparations suitable for twice-daily administration include Morphgesic® SR tablets (p. 239), MST Continus® tablets or suspension (p. 239), and Zomorph® capsules (p. 239). MXI® capsules (p. 239) allow administration of the total daily morphine requirement as a single dose. The starting dose of modified-release morphine preparations designed for twice daily administration is usually 10–20 mg every 12 hours if no other analgesic (or only paracetamol) has been taken previously, but to replace a weaker opioid analgesic (such as co-codamol) the starting dose is usually 20–30 mg every 12 hours. Increments should be made to the dose, not to the frequency of administration, which should remain at every 12 hours.

The effective dose of modified-release preparations can alternatively be determined by giving the oral solution of morphine every 4 hours in increasing doses until the pain has been controlled, and then transferring the patient to the same total 24-hour dose of morphine given as the modified-release preparation (divided into two portions for 12-hourly administration). The first
Prescribing in palliative care

Dose of the modified-release preparation is given 4 hours after the last dose of the oral solution. Morphine, as oral solution or standard formulation tablets, should be prescribed for breakthrough pain; the dose should be about one-sixth of the total daily dose of oral morphine repeated every 4 hours if necessary (review pain management if analgesic required more frequently).

Oxycodone (p. 240) can be used in patients who require an opioid but cannot tolerate morphine. If the patient is already receiving an opioid, oxycodone should be started at a dose equivalent to the current analgesic (see Equivalent Single Doses of Opioid Analgesics table, p. 15).

Levomepromazine (methotrimeprazine, p. 195) is licensed to treat pain in palliative care, and may be of benefit in some patients. It should be reserved for use in conjunction with strong opioid analgesics in distressed patients with severe pain unresponsive to other measures.

Parenteral route If the patient becomes unable to swallow, the equivalent intramuscular dose of morphine is half the oral solution dose; in the case of the modified-release tablets it is half the total 24-hour dose (which is then divided into 6 portions to be given every 4 hours). Diamorphine is preferred for injection because, being more soluble, it can be given in a smaller volume. The equivalent intramuscular (or subcutaneous) dose is approximately a third of the oral dose of morphine. Subcutaneous infusion of diamorphine via syringe driver can be useful (for details, see p. 17).

If the patient can resume taking medicines by mouth, then oral morphine may be substituted for subcutaneous or intramuscular injection in a dose of 200 micrograms every 4 hours. Alternatively glycopyrronium can be given by subcutaneous or intramuscular injection in a dose of 0.2 mg every 4 hours. Must be taken to avoid the discomfort of dry mouth.

Gastro-intestinal pain The pain of bowel colic may be reduced by loperamide 2–4 mg 4 times daily. Hyoscine hydrobromide (section 4.6) may also be helpful, given sublingually at a dose of 300 micrograms 3 times daily as Kwell® tablets. For the dose by subcutaneous infusion using a syringe driver, see p. 18).

Gastric distension pain due to pressure on the stomach may be helped by a preparation incorporating an antacid with an antiflatulent (section 1.1.1) and by domperidone 10 mg 3 times daily before meals.

Muscle spasm The pain of muscle spasm can be helped by a muscle relaxant such as diazepam 5–10 mg daily or baclofen 5–10 mg 3 times daily.

Neuropathic pain Patients with neuropathic pain (section 4.7.3) may benefit from a trial of a tricyclic antidepressant for several weeks. An anticonvulsant may be added or substituted if pain persists; gabapentin and pregabalin (both section 4.8.1) are licensed for neuropathic pain.

Pain due to nerve compression may be reduced by a corticosteroid such as dexamethasone 8 mg daily, which reduces oedema around the tumour, thus reducing compression. Nerve blocks can be considered when pain is localised to a specific area. Transcutaneous electrical nerve stimulation (TENS) may also help.

Miscellaneous conditions

Unlicensed indications or routes
Several recommendations in this section involve unlicensed indications or routes.

Raised intracranial pressure Headache due to raised intracranial pressure often responds to a high dose of a corticosteroid, such as dexamethasone 16 mg daily for 4 to 5 days, subsequently reduced to 4–6 mg daily if possible; dexamethasone should be given before 6 p.m. to reduce the risk of insomnia.

Intractable cough Intractable cough may be relieved by moist inhalations or by regular administration of oral morphine in an initial dose of 5 mg every 4 hours. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

Dyspnoea Breathlessness at rest may be relieved by regular oral morphine in carefully titrated doses, starting at 5 mg every 4 hours. Diazepam 5–10 mg daily may be helpful for dyspnoea associated with anxiety. A corticosteroid, such as dexamethasone 4–8 mg daily, may also be helpful if there is bronchospasm or partial obstruction.

Excessive respiratory secretion Excessive respiratory secretion (death rattle) may be reduced by subcutaneous injection of hyoscine hydrobromide 400–600 micrograms every 4 to 8 hours; however, care must be taken to avoid the discomfort of dry mouth. Alternatively glycopyrronium can be given by subcutaneous or intramuscular injection in a dose of 200 micrograms every 4 hours. For the dose by subcutaneous infusion using a syringe driver, see p. 18.

Restlessness and confusion Restlessness and confusion may require treatment with haloperidol 1–3 mg by mouth every 8 hours. Levomepromazine (methotrimeprazine) is also used occasionally for restlessness. For the dose by subcutaneous infusion using a syringe driver, see p. 18.

Reference

1. Studies have indicated that administration of the last dose of the oral solution with the first dose of the modified-release tablets is not necessary.
Hiccups Hiccups due to gastric distension may be helped by a preparation incorporating an antacid with an anti-flatulent (section 1.1.1). If this fails, metoclopramide 10 mg every 6 to 8 hours by mouth or by subcutaneous or intramuscular injection can be added; if this also fails, baclofen 5 mg twice daily, or nifedipine 10 mg three times daily, or chlorpromazine 10–25 mg every 6 to 8 hours can be tried.

Anorexia Anorexia may be helped by prednisolone 15–30 mg daily or dexamethasone 2–4 mg daily.

Constipation Constipation is a very common cause of distress and is almost invariably after administration of an opioid. It should be prevented if possible by the regular administration of laxatives; a faecal softener with a peristaltic stimulant (e.g. co-danthramer) or lactulose solution with a senna preparation should be used (section 1.6.2 and section 1.6.3). Methyl-naltrexone (section 1.6.6) is licensed for the treatment of opioid-induced constipation.

Fungating tumours Fungating tumours can be treated by regular dressing and antibacterial drugs; systemic treatment with metronidazole (section 5.11) is often required but topical metronidazole (section 13.10.1.2) is also used.

Capillary bleeding Capillary bleeding can be treated with tranexamic acid (section 2.11) by mouth; treatment is usually discontinued one week after the bleeding has stopped, or, if necessary, it can be continued at a reduced dose. Alternatively, gauze soaked in tranexamic acid 100 mg/mL or adrenaline (epinephrine) solution 1 mg/mL (1 in 1000) can be applied to the affected area.

Dry mouth Dry mouth may be relieved by good mouth care and measures such as the sucking of ice or pine-apple chunks or the use of artificial saliva (section 12.3.5); dry mouth associated with candidiasis can be treated by oral preparations of nystatin or miconazole (section 12.3.2); alternatively, fluconazole can be given by mouth (section 5.2). Dry mouth may be caused by certain medications including opioids, antimuscarinic drugs (e.g. hyoscine), antidepressants and some antileukemic; if possible, an alternative preparation should be considered.

Pruritus Pruritus, even when associated with obstructive jaundice, often responds to simple measures such as application of emollients (section 13.2.1). In the case of obstructive jaundice, further measures include administration of colchicine (section 1.9.2).

Convulsions Patients with cerebral tumours or uraemia may be susceptible to convulsions. Prophylactic treatment with phenytoin or carbamazepine (section 4.8.1) should be considered. When oral medication is no longer possible, diazepam as suppositories 10–20 mg every 4 to 8 hours, or phenobarbital by injection 50–200 mg twice daily is continued as prophylaxis. For the use of midazolam by a preparation incorporating an antacid with an anti-flatulent (section 1.9.2). If this fails, metoclopramide 10 mg every 6 to 8 hours can be tried.

Dysphagia A corticosteroid such as dexamethasone 8 mg daily may help, temporarily, if there is an obstruction due to tumour. See also under Dry Mouth.

Nausea and vomiting Nausea and vomiting are common in patients with advanced cancer. Ideally, the cause should be determined before treatment with an antiemetic (section 4.6) is started. Nausea and vomiting may occur with opioid therapy particularly in the initial stages but can be prevented by giving an antiemetic such as haloperidol or metoclopramide. An antiemetic is usually necessary only for the first 4 or 5 days and therefore combined preparations containing an opioid with an antiemetic are not recommended because they lead to unnecessary antiemetic therapy (and associated side-effects when used long-term). Metoclopramide has a prokinetic action and is used in a dose of 10 mg 3 times daily by mouth for nausea and vomiting associated with gastritis, gastric stasis, and functional bowel obstruction. Drugs with antimuscarinic effects antagonise prokinetic drugs and, if possible, should not be used concurrently.

Haloperidol is used by mouth in an initial dose of 1.5 mg once or twice daily (can be increased if necessary to 5–10 mg daily in divided doses) for most metabolic causes of vomiting (e.g. hypercalcaemia, renal failure).

Cyclizine is given in a dose of 50 mg up to 3 times daily by mouth. It is used for nausea and vomiting due to mechanical bowel obstruction, raised intracranial pressure, and motion sickness.

Antiemetic therapy should be reviewed every 24 hours; it may be necessary to substitute the antiemetic or to add another one.

Levomepromazine (methotrimeprazine) can be used if first-line antiemetics are inadequate; it is given by mouth in a dose of 6–50 mg daily (6-mg tablets available from ‘special-order’ manufacturers or specialist importing companies; see p. 939) in 1–2 divided doses. For the dose by subcutaneous infusion, see p. 18. Dexamethasone 8–16 mg daily by mouth can be used as an adjunct.

For the administration of antiemetics by subcutaneous infusion using a syringe driver, see below.

For the treatment of nausea and vomiting associated with cancer chemotherapy, see section 8.1.

Insomnia Patients with advanced cancer may not sleep because of discomfort, cramps, night sweats, joint stiffness, or fear. There should be appropriate treatment of these problems before hypnotics are used. Benzodiazepines, such as temazepam (section 4.1.1), may be useful.

Hypercalcaemia See section 9.5.1.2.

Syringe drivers

Although drugs can usually be administered by mouth to control the symptoms of advanced cancer, the parenteral route may sometimes be necessary. Repeated administration of intramuscular injections can be difficult in a cachectic patient. This has led to the use of a portable syringe driver to give a continuous subcutaneous infusion, which can provide good control of symptoms with little discomfort or inconvenience to the patient.

Syringe driver rate settings Staff using syringe drivers should be adequately trained and different rate settings should be clearly identified and differentiated; incorrect use of syringe drivers is a common cause of drug errors.
Indications for the parenteral route are:

- the patient is unable to take medicines by mouth owing to nausea and vomiting, dysphagia, severe weakness, or coma;
- there is malignant bowel obstruction in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube);
- occasionally when the patient does not wish to take regular medication by mouth.

Nausea and vomiting

Diamorphine is the preferred opioid of choice for stopped. Midazolam is the benzodiazepine antiepileptic medication should not be
uraemia) antiepileptic medication should not be used in patients for whom further surgery is inappropriate (avoiding the need for an intravenous infusion or for insertion of a nasogastric tube).

Midazolam is a sedative and an antiepileptic that may

Cyclizine is particularly likely to precipitate if mixed with diamorphine or other drugs (see under Mixing and Compatibility, below); it is given in a subcutaneous infusion dose of 150 mg/24 hours.

Metoclopramide can cause skin reactions; it is given in a subcutaneous infusion dose of 30–100 mg/24 hours.

Hyoscine butylbromide is effective in bowel colic, is less sedative than hyoscine hydrobromide, but is not always adequate for the control of respiratory secretions; it is given in a subcutaneous infusion dose of 20–60 mg/24 hours (important: this dose of hyoscine butylbromide must not be confused with the much lower dose of hyoscine hydrobromide, above).

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL, either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used to avoid precipitation.

The following can be mixed with diamorphine:

- Cyclizine
- Dexamethasone
- Haloperidol
- Hyoscine butylbromide
- Midazolam

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers

The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

- if a patient has previously been receiving an antiepileptic drug or has a primary or secondary cerebral tumour or is at risk of convulsion (e.g. owing to uraemia) antiepileptic medication should not be stopped. Midazolam is the benzodiazepine antiepileptic of choice for continuous subcutaneous infusion, and it is given initially in a dose of 20–40 mg/24 hours.

Pain control

Diamorphine is the preferred opioid since its high solubility permits a large dose to be given in a small volume (see under Mixing and Compatibility, below). The table on p. 19 shows approximate equivalent doses of morphine and diamorphine.

Mixing and compatibility

The general principle that injections should be given into separate sites (and should not be mixed) does not apply to the use of syringe drivers in palliative care. Provided that there is evidence of compatibility, selected injections can be mixed in syringe drivers. Not all types of medication can be used in a subcutaneous infusion. In particular, chlorpromazine, prochlorperazine, and diazepam are contra-indicated as they cause skin reactions at the injection site; to a lesser extent cyclizine and levomepromazine (methotrimeprazine) also sometimes cause local irritation.

In theory injections dissolved in water for injections are more likely to be associated with pain (possibly owing to their hypotonicity). The use of physiological saline (sodium chloride 0.9%) however increases the likelihood of precipitation when more than one drug is used; moreover subcutaneous infusion rates are so slow (0.1–0.3 mL/hour) that pain is not usually a problem when water is used as a diluent.

Diamorphine can be given by subcutaneous infusion in a strength of up to 250 mg/mL; up to a strength of 40 mg/mL, either water for injections or physiological saline (sodium chloride 0.9%) is a suitable diluent—above that strength only water for injections is used (to avoid precipitation).

Subcutaneous infusion solution should be monitored regularly both to check for precipitation (and discoloration) and to ensure that the infusion is running at the correct rate.

Problems encountered with syringe drivers

The following are problems that may be encountered with syringe drivers and the action that should be taken:

- if the subcutaneous infusion runs too quickly check the rate setting and the calculation;
- if the subcutaneous infusion runs too slowly check the start button, the battery, the syringe driver, the cannula, and make sure that the injection site is not inflamed;
- if there is an injection site reaction make sure that the site does not need to be changed—firmness or swelling at the site of injection is not in itself an indication for change, but pain or obvious inflammation is.

1. Cyclizine may precipitate at concentrations above 10 mg/mL or in the presence of sodium chloride 0.9% or as the concentration of diamorphine relative to cyclizine increases; mixtures of diamorphine and cyclizine are also likely to precipitate after 24 hours.
2. Special care is needed to avoid precipitation of dexamethasone when preparing it.
3. Mixtures of haloperidol and diamorphine are likely to precipitate after 24 hours if haloperidol concentration is above 2 mg/mL.
4. Under some conditions infusions containing metoclopramide become discoloured; such solutions should be discarded.
Prescribing for the elderly

Old people, especially the very old, require special care and consideration from prescribers. Medicines for Older People, a component document of the National Service Framework for Older People, describes how to maximise the benefits of medicines and how to avoid excessive, inappropriate, or inadequate consumption of medicines by older people.

Appropriate prescribing Elderly patients often receive multiple drugs for their multiple diseases. This greatly increases the risk of drug interactions as well as adverse reactions, and may affect compliance (see Taking medicines to best effect under General guidance).

The balance of benefit and harm of some medicines may be altered in the elderly. Therefore, elderly patients’ medicines should be reviewed regularly and medicines which are not of benefit should be stopped.

Non-pharmacological measures may be more appropriate for symptoms such as headache, sleeplessness, and lightheadedness when associated with social stress as in widowhood, loneliness, and family dispersal.

In some cases prophylactic drugs are inappropriate if they are likely to complicate existing treatment or introduce unnecessary side-effects, especially in elderly patients with poor prognosis or with poor overall health. However, elderly patients should not be denied medicines which may help them, such as anticoagulants or antiplatelet drugs for atrial fibrillation, anti-hypertensives, statins, and drugs for osteoporosis.

Form of medicine Frail elderly patients may have difficulty swallowing tablets; if left in the mouth, ulceration may develop. They should always be encouraged to take their tablets or capsules with enough fluid, and whilst in an upright position to avoid the possibility of oesophageal ulceration. It can be helpful to discuss with the patient the possibility of taking the drug as a liquid if available.

Manifestations of ageing In the very old, manifestations of normal ageing may be mistaken for disease and lead to inappropriate prescribing. In addition, age-related muscle weakness and difficulty in maintaining balance should not be confused with neurological disease. Disorders such as lightheadedness not associated with postural or postprandial hypotension are unlikely to be helped by drugs.

Sensitivity The nervous system of elderly patients is more sensitive to many commonly used drugs, such as opioid analgesics, benzodiazepines, antipsychotics, and antiparkinsonian drugs, all of which must be used with caution. Similarly, other organs may also be more susceptible to the effects of drugs such as antihypertensives and NSAIDs.

---

**Equivalent doses of morphine sulphate and diamorphine hydrochloride**

These equivalences are approximate only and should be adjusted according to response.

If breakthrough pain occurs give a subcutaneous (preferable) or intramuscular injection equivalent to one-sixth of the total 24-hour subcutaneous infusion dose. It is kinder to give an intermittent bolus injection subcutaneously—absorption is smoother so that the risk of adverse effects at peak absorption is avoided (an even better method is to use a subcutaneous butterfly needle).

To minimise the risk of infection no individual subcutaneous infusion solution should be used for longer than 24 hours.
Pharmacokinetics
Pharmacokinetic changes can markedly increase the tissue concentration of a drug in the elderly, especially in debilitated patients. The most important effect of age is reduced renal clearance. Many aged patients thus excrete drugs slowly, and are highly susceptible to nephrotoxic drugs. Acute illness can lead to rapid reduction in renal clearance, especially if accompanied by dehydration. Hence, a patient stabilised on a drug with a narrow margin between the therapeutic and the toxic dose (e.g. digoxin) can rapidly develop adverse effects in the aftermath of a myocardial infarction or a respiratory-tract infection. The metabolism of some drugs is reduced in the elderly.

Adverse reactions
Adverse reactions often present in the elderly in a vague and non-specific fashion. Confusion is often the presenting symptom (caused by almost any of the commonly used drugs). Other common manifestations are constipation (with antimuscarinics and many tranquillisers) and postural hypotension (with diuretics and many psychotropics).

Hypnotics Many hypnotics with long half-lives have serious hangover effects, including drowsiness, unsteady gait, slurred speech, and confusion. Hypnotics with short half-lives should be used but they too can present problems (section 4.1.1). Short courses of hypnotics are occasionally useful for helping a patient through an acute illness or some other crisis but every effort must be made to avoid dependence. Benzodiazepines impair balance, which can result in falls.

Diuretics Diuretics are overprescribed in old age and should not be used on a long-term basis to treat simple gravitational oedema which will usually respond to increased movement, raising the legs, and support stockings. A few days of diuretic treatment may speed the clearing of the oedema but it should rarely need continued drug therapy.

NSAIDs Bleeding associated with aspirin and other NSAIDs is more common in the elderly who are more likely to have a fatal or serious outcome. NSAIDs are also a special hazard in patients with cardiac disease or renal impairment which may again place older patients at particular risk.

Owing to the increased susceptibility of the elderly to the side-effects of NSAIDs the following recommendations are made:

- for osteoarthritis, soft-tissue lesions, and back pain, first try measures such as weight reduction (if obese), warmth, exercise, and use of a walking stick;
- for osteoarthritis, soft-tissue lesions, back pain, and pain in rheumatoid arthritis, paracetamol should be used first and can often provide adequate pain relief;
- alternatively, a low-dose NSAID (e.g. ibuprofen up to 1.2 g daily) may be given;
- for pain relief when either drug is inadequate, paracetamol in a full dose plus a low-dose NSAID may be given;
- if necessary, the NSAID dose can be increased or an opioid analgesic given with paracetamol;
- do not give two NSAIDs at the same time.

For advice on prophylaxis of NSAID-induced peptic ulcers if continued NSAID treatment is necessary, see section 1.3.

Other drugs Other drugs which commonly cause adverse reactions are antiparkinsonian drugs, anti-hypertensives, psychotropics, and digoxin. The usual maintenance dose of digoxin in very old patients is 125 micrograms daily (62.5 micrograms in those with renal disease); lower doses are often inadequate but toxicity is common in those given 250 micrograms daily. Drug-induced blood disorders are much more common in the elderly. Therefore drugs with a tendency to cause bone marrow depression (e.g. co-trimoxazole, mianserin) should be avoided unless there is no acceptable alternative.

The elderly generally require a lower maintenance dose of warfarin than younger adults; once again, the outcome of bleeding tends to be more serious.

Guidelines
Always consider whether a drug is indicated at all.

Limit range It is a sensible policy to prescribe from a limited range of drugs and to be thoroughly familiar with their effects in the elderly.

Reduce dose Dosage should generally be substantially lower than for younger patients and it is common to start with about 50% of the adult dose. Some drugs (e.g. long-acting anti-diabetic drugs such as glibenclamide and chlorpropamide) should be avoided altogether.

Review regularly Review repeat prescriptions regularly. In many patients it may be possible to stop some drugs, provided that clinical progress is monitored. It may be necessary to reduce the dose of some drugs as renal function declines.

Simplify regimens Elderly patients benefit from simple treatment regimens. Only drugs with a clear indication should be prescribed and whenever possible given once or twice daily. In particular, regimens which call for a confusing array of dosage intervals should be avoided.

Explain clearly Write full instructions on every prescription (including repeat prescriptions) so that containers can be properly labelled with full directions. Avoid imprecisions like ‘as directed’. Child-resistant containers may be unsuitable.

Repeats and disposal Instruct patients what to do when drugs run out, and also how to dispose of any that are no longer necessary. Try to prescribe matching quantities.

If these guidelines are followed most elderly people will cope adequately with their own medicines. If not then it is essential to enrol the help of a third party, usually a relative or a friend.
Prescribing in dental practice

The following is a list of topics of particular relevance to dental surgeons.

Advice on the drug management of dental and oral conditions has been integrated into the BNF. For ease of access, guidance on such conditions is usually identified by means of a relevant heading (e.g. Dental and Orofacial Pain) in the appropriate sections of the BNF.

Changes to Dental Practitioners’ Formulary, p. 918

Medical emergencies in dental practice
This section provides guidelines on the management of the more common medical emergencies which may arise in dental practice. Dental surgeons and their staff should be familiar with standard resuscitation procedures, but in all circumstances it is advisable to summon medical assistance as soon as possible. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

The drugs referred to in this section include:
Adrenaline Injection (Epinephrine Injection), adrenaline 1 in 1000, (adrenaline 1 mg/mL as acid tartrate), 1-mL amps
Aspirin Dispersible Tablets 300 mg
Glucagon Injection, glucagon (as hydrochloride), 1-unit vial (with solvent)
Glucose (for administration by mouth)
Glyceryl Trinitrate Spray
Midazolam Buccal Liquid, midazolam 10 mg/mL or Midazolam Injection, midazolam (as hydrochloride) 2 mg/mL, 5-mL amps, or 5 mg/mL, 2-mL amps
Oxygen
Salbutamol Aerosol Inhalation, salbutamol 100 micrograms/metered inhalation

Adrenal insufficiency
Adrenal insufficiency may follow prolonged therapy with corticosteroids and can persist for years after stopping. A patient with adrenal insufficiency may become hypotensive under the stress of a dental visit (important: see also p. 390 for details of corticosteroid cover before dental surgical procedures under general anaesthesia).

Management
• Lay the patient flat
• Give oxygen (see section 3.6)
• Transfer patient urgently to hospital

Anaphylaxis
A severe allergic reaction may follow oral or parenteral administration of a drug. Anaphylactic reactions in dentistry may follow the administration of a drug or contact with substances such as latex in surgical gloves. In general, the more rapid the onset of the reaction the more profound it tends to be. Symptoms may develop within minutes and rapid treatment is essential.

Anaphylactic reactions may also be associated with additives and excipients in foods and medicines (see Excipients, p. 2). Refined arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils (including those for topical application, particularly if they are intended for use in the mouth or for application to the nasal mucosa).
**Symptoms and signs**
- Paraesthesia, flushing, and swelling of face
- Generalised itching, especially of hands and feet
- Bronchospasm and laryngospasm (with wheezing and difficulty in breathing)
- Rapid weak pulse together with fall in blood pressure and pallor; finally cardiac arrest

**Management**
First-line treatment includes securing the airway, restoration of blood pressure (laying the patient flat and raising the feet, or in the recovery position if unconscious or nauseous and at risk of vomiting), and administration of adrenaline (epinephrine) injection. This is given intramuscularly in a dose of 500 micrograms (0.5 mL adrenaline injection 1 in 1000); a preparation delivering a dose of 300 micrograms (0.3 mL adrenaline injection 1 in 1000) is available for immediate intramuscular injection also increases the risk of local bleeding. Oxygen administration is also of primary importance (see section 3.6). Arrangements should be made to transfer the patient to hospital urgently.

**Asthma**
Patients with asthma may have an attack while at the dental surgery. Most attacks will respond to 2 puffs of the patient’s short-acting beta agonist inhaler such as salbutamol 100 micrograms/puff; further puffs are required if the patient does not respond rapidly. If the patient is unable to use the inhaler effectively, further puffs should be given through a large-volume spacer device (or, if not available, through a plastic or paper cup with a hole in the bottom for the inhaler mouthpiece). If the response remains unsatisfactory, or if further deterioration occurs, then the patient should be transferred urgently to hospital. Whilst awaiting transfer, oxygen (section 3.6) should be given with salbutamol 2.5–5 mg by nebuliser. If a nebuliser is unavailable, then 4–10 puffs of salbutamol 100 micrograms/metered inhalation should be given (preferably by a large-volume spacer), and repeated every 10–20 minutes if necessary. If asthma is part of a more generalised anaphylactic reaction, an intramuscular injection of adrenaline (as detailed under Anaphylaxis above) should be given. For a table describing the management of Acute Asthma, see p. 150

Patients with severe chronic asthma or whose asthma has deteriorated previously during a dental procedure may require an increase in their prophylactic medication before a dental procedure. This should be discussed with the patient’s medical practitioner and may include increasing the dose of inhaled or oral corticosteroid.

**Cardiac emergencies**
If there is a history of angina the patient will probably carry glyceryl trinitrate spray or tablets (or isosorbide dinitrate tablets) and should be allowed to use them. Hospital admission is not necessary if symptoms are mild and resolve rapidly with the patient’s own medication. See also Coronary Artery Disease on p. 24.

**Symptoms and signs of myocardial infarction**
- Progressive onset of severe, crushing pain across front of chest; pain may radiate towards the shoulder and down arm, or into neck and jaw
- Skin becomes pale and clammy
- Nausea and vomiting are common
- Pulse may be weak and blood pressure may fall
- Breathlessness

**Initial management of myocardial infarction**
Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered (see section 3.6). Sublingual glyceryl trinitrate may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug. Reassure the patient as much as possible to relieve further anxiety. If available, aspirin in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see p. 135.

If the patient collapses and loses consciousness attempt standard resuscitation measures. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

**Epileptic seizures**
Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

**Symptoms and signs**
- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

**Arrhythmias** may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers, p. 24.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease on p. 24

**Initial management of myocardial infarction**
Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered (see section 3.6).

Sublingual glyceryl trinitrate may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see p. 135.

If the patient collapses and loses consciousness attempt standard resuscitation measures. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

**Epileptic seizures**
Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

**Symptoms and signs**
- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)

- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while

**Arrhythmias** may lead to a sudden reduction in cardiac output with loss of consciousness. Medical assistance should be summoned. For advice on pacemaker interference, see also Pacemakers, p. 24.

The pain of myocardial infarction is similar to that of angina but generally more severe and more prolonged. For general advice see also Coronary Artery Disease on p. 24

**Initial management of myocardial infarction**
Call immediately for medical assistance and an ambulance, as appropriate.

Allow the patient to rest in the position that feels most comfortable; in the presence of breathlessness this is likely to be sitting position, whereas the syncopal patient should be laid flat; often an intermediate position (dictated by the patient) will be most appropriate. Oxygen may be administered (see section 3.6).

Sublingual glyceryl trinitrate may relieve pain. Intramuscular injection of drugs should be avoided because absorption may be too slow (particularly when cardiac output is reduced) and pain relief is inadequate. Intramuscular injection also increases the risk of local bleeding into the muscle if the patient is given a thrombolytic drug.

Reassure the patient as much as possible to relieve further anxiety. If available, aspirin in a single dose of 300 mg should be given. A note (to say that aspirin has been given) should be sent with the patient to the hospital. For further details on the initial management of myocardial infarction, see p. 135.

If the patient collapses and loses consciousness attempt standard resuscitation measures. For an algorithm of the procedure for cardiopulmonary resuscitation, see inside back cover.

**Epileptic seizures**
Patients with epilepsy must continue with their normal dosage of anticonvulsant drugs when attending for dental treatment. It is not uncommon for epileptic patients not to volunteer the information that they are epileptic but there should be little difficulty in recognising a tonic-clonic (grand mal) seizure.

**Symptoms and signs**
- There may be a brief warning (but variable)
- Sudden loss of consciousness, the patient becomes rigid, falls, may give a cry, and becomes cyanotic (tonic phase)
- After 30 seconds, there are jerking movements of the limbs; the tongue may be bitten (clonic phase)
- There may be frothing from mouth and urinary incontinence
- The seizure typically lasts a few minutes; the patient may then become flaccid but remain unconscious. After a variable time the patient regains consciousness but may remain confused for a while
Management
During a convulsion try to ensure that the patient is not at risk from injury but make no attempt to put anything in the mouth or between the teeth (in mistaken belief that this will protect the tongue). Give oxygen (section 3.6) to support respiration if necessary.

Do not attempt to restrain convulsive movements.

After convulsive movements have subsided place the patient in the coma (recovery) position and check the airway.

After the convulsion the patient may be confused (‘post-ictal confusion’) and may need reassurance and sympathy. The patient should not be sent home until fully recovered. Seek medical attention or transfer the patient to hospital if it was the first episode of epilepsy, or if the convulsion was atypical, prolonged (or repeated), or if injury occurred.

Medication should only be given if convulsive seizures are prolonged (convulsive movements lasting 5 minutes or longer) or repeated rapidly.

Either midazolam buccal liquid or midazolam injection solution can be given by the buccal route [unlicensed use] in a single dose of 10 mg. For further details on the management of status epilepticus, including details of paediatric doses of midazolam, see p. 263.

Partial seizures similarly need very little active management (in an automatism only a minimum amount of restraint should be applied to prevent injury). Again, the patient should be observed until post-ictal confusion has completely resolved.

Hypoglycaemia
Insulin-treated diabetic patients attending for dental treatment under local anaesthesia should inject insulin and eat meals as normal. If food is omitted the blood glucose will fall to an abnormally low level (hypoglycaemia). Patients can often recognise the symptoms themselves and this state responds to sugar in water (or a cup of sweet tea).

Symptoms and signs
- Shaking and trembling
- Sweating
- ‘Pins and needles’ in lips and tongue
- Hunger
- Palpitation
- Headache (occasionally)
- Double vision
- Difficulty in concentration
- Slurring of speech
- Confusion
- Change of behaviour; truculence
- Convulsions
- Unconsciousness

Management
Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Glucose 10 g is available from 2 teaspoons sugar, 3 sugar lumps, GlucoGel® (formerly known as Hypostop® Gel; glucose 10 g/25 g tube, available from BBI Healthcare), and non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 90 mL, Ribena® Original 15 mL (to be diluted). If necessary this may be repeated in 10–15 minutes.

If glucose cannot be given by mouth, if it is ineffective, or if the hypoglycaemia causes unconsciousness, glucagon 1 mg (1 unit) should be given by intramuscular (or subcutaneous) injection; a child under 8 years or of body-weight under 25 kg should be given 500 micrograms. Once the patient regains consciousness oral glucose should be administered as above. If glucagon is ineffective or contra-indicated, the patient should be transferred urgently to hospital. The patient must also be admitted to hospital if hypoglycaemia is caused by an oral antidiabetic drug.

Syncope
Insufficient blood supply to the brain results in loss of consciousness. The commonest cause is a vasovagal attack or simple faint (syncope) due to emotional stress.

Symptoms and signs
- Patient feels faint
- Low blood pressure
- Pallor and sweating
- Yawning and slow pulse
- Nausea and vomiting
- Dilated pupils
- Muscular twitching

Management
- Lay the patient as flat as is reasonably comfortable and, in the absence of associated breathlessness, raise the legs to improve cerebral circulation
- Loosen any tight clothing around the neck
- Once consciousness is regained, give sugar in water or a cup of sweet tea

Other possible causes
Postural hypotension can be a consequence of rising abruptly or of standing upright for too long; antihypertensive drugs predispose to this. When rising, susceptible patients should take their time. Management is as for a vasovagal attack.

Under stressful circumstances, some patients hyperventilate. This gives rise to feelings of faintness but does not usually result in syncope. In most cases reassurance is all that is necessary; rebreathing from cupped hands or a bag may be helpful but calls for careful supervision.

Adrenal insufficiency or arrhythmias are other possible causes of syncope, see p. 21 and p. 24.

Medical problems in dental practice
Individuals presenting at the dental surgery may also suffer from an unrelated medical condition; this may require modification to the management of their dental condition. If the patient has systemic disease or is taking other medication, the matter may need to be discussed with the patient’s general practitioner or hospital consultant.

For advice on adrenal insufficiency, anaphylaxis, asthma, cardiac emergencies, epileptic seizures, hypoglycaemia and syncope see under Medical Emergencies in Dental Practice.
Allergy
Patients should be asked about any history of allergy; those with a history of atopic allergy (asthma, eczema, hay fever, etc.) are at special risk. Those with a history of a severe allergy or of anaphylactic reactions are at high risk—it is essential to confirm that they are not allergic to any medication, or to any dental materials or equipment (including latex gloves). See also Anaphylaxis on p. 703.

Arrhythmias
Patients, especially those who suffer from heart failure or who have sustained a myocardial infarction, may have irregular cardiac rhythm. Atrial fibrillation is a common arrhythmia even in patients with normal hearts and is of little concern except that dental surgeons should be aware that such patients may be receiving anticoagulant therapy. The patient's medical practitioner should be asked whether any special precautions are necessary. Premedication (e.g. with temazepam) may be useful in some instances for very anxious patients.

See also Cardiac emergencies, p. 22 and Dental Anaesthesia, p. 703.

Cardiac prostheses
For an account of the risk of infective endocarditis in patients with prosthetic heart valves, see Infective Endocarditis, below. For advice on patients receiving anticoagulants, see Thromboembolic disease, below.

Coronary artery disease
Patients are vulnerable for at least 4 weeks following a myocardial infarction or following any sudden increase in the symptoms of angina. It would be advisable to check with the patient's medical practitioner before commencing treatment. See also Cardiac Emergencies on p. 22.

Treatment with low-dose aspirin (75 mg daily), clopidogrel, or dipyridamole should not be stopped routinely nor should the dose be altered before dental procedures.

A Working Party of the British Society for Antimicrobial Chemotherapy has not recommended antibiotic prophylaxis for patients following coronary artery bypass surgery.

Cyanotic heart disease
Patients with cyanotic heart disease are at risk in the dental chair, particularly if they have pulmonary hypertension. In such patients a syncopal reaction increases the shunt away from the lungs, causing more hypoxia which worsens the syncopal reaction—a vicious circle that may prove fatal. The advice of the cardiologist should be sought on any patient with congenital cyanotic heart disease. Treatment in hospital is more appropriate for some patients with this condition.

Hypertension
Patients with hypertension are likely to be receiving antihypertensive drugs such as those described in section 2.5. Their blood pressure may fall dangerously low under general anaesthesia, see also under Dental Anaesthesia on p. 703.

Immunosuppression and indwelling intraperitoneal catheters
See Table 2, section 5.1

Infective endocarditis
While almost any dental procedure can cause bacteraemia, there is no clear association with the development of infective endocarditis. Routine daily activities such as tooth brushing also produce a bacteraemia and may present a greater risk of infective endocarditis than a single dental procedure.

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures. Such prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Reduction of oral bacteraemia
Patients at risk of endocarditis should be advised to maintain the highest possible standards of oral hygiene in order to reduce the:
- need for dental extractions or other surgery;
- chances of severe bacteraemia if dental surgery is needed;
- possibility of ‘spontaneous’ bacteraemia.

Postoperative care
Patients at risk of endocarditis should be warned to report to the doctor or dental surgeon any unexplained illness that develops after dental treatment. Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

Patients on anticoagulant therapy
For general advice on dental surgery in patients receiving oral anticoagulant therapy see Thromboembolic Disease, below.

Joint prostheses
See Table 2, section 5.1

Liver disease
Liver disease may alter the response to drugs and drug prescribing should be kept to a minimum in patients with severe liver disease. Problems are likely mainly in patients with jaundice, ascites, or evidence of encephalopathy.

For a table of drugs to be avoided or used with caution in liver disease see Appendix 2.

Pacemakers
Pacemakers prevent asystole or severe bradycardia. Some ultrasonic scalers, electronic apex locators, electro-analgesic devices, and electrocautery devices interfere with the normal function of pacemakers (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.

1. Patients at risk of endocarditis include those with valve replacement, acquired valvar heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.
manufacturer’s literature should be consulted whenever possible. If severe bradycardia occurs in a patient fitted with a pacemaker, electrical equipment should be switched off and the patient placed supine with the legs elevated. If the patient loses consciousness and the pulse remains slow or is absent, cardiopulmonary resuscitation (see inside back cover) may be needed. Call immediately for medical assistance and an ambulance, as appropriate.

**Pregnancy**

Drugs taken during pregnancy can be harmful to the fetus and should be prescribed only if the expected benefit to the mother is thought to be greater than the risk to the fetus; all drugs should be avoided if possible during the first trimester.

Appendix 4 includes information on drug treatment during pregnancy.

**Breast-feeding**

Some drugs taken by the mother whilst breast-feeding can be transferred to the breast milk, and may affect the infant.

Appendix 5 includes information on drug treatment during breast-feeding.

**Renal impairment**

The use of drugs in patients with reduced renal function can give rise to many problems. Many of these problems can be avoided by reducing the dose or by using alternative drugs.

Special care is required in renal transplantation and immunosuppressed patients; if necessary such patients should be referred to specialists.

For a table of drugs to be avoided or used with caution in renal impairment see Appendix 3.

**Thromboembolic disease**

Patients receiving **heparin** or oral anticoagulants such as **warfarin**, **acenocoumarol** (nicoumalone), **phenindione**, **dabigatran etexilate**, or **rivaroxaban** may be liable to excessive bleeding after extraction of teeth or other dental surgery. Often dental surgery can be delayed until the anticoagulant therapy has been completed.

For a patient requiring long-term therapy with warfarin, the patient’s medical practitioner should be consulted and the International Normalised Ratio (INR) should be assessed 72 hours before the dental procedure. This allows sufficient time for dose modification if necessary. In those with an unstable INR (including those who require weekly monitoring of their INR, or those who have had some INR measurements greater than 4.0 in the last 2 months), the INR should be assessed within 24 hours of the dental procedure. Patients requiring minor dental procedures (including extractions) who have an INR below 4.0 may continue warfarin without dose adjustment. There is no need to check the INR for a patient requiring a non-invasive dental procedure.

If possible, a single extraction should be done first; if this goes well further teeth may be extracted at subsequent visits (two or three at a time). Measures should be taken to minimise bleeding during and after the procedure. This includes the use of sutures and a haemostatic such as oxidised cellulose, collagen sponge or resorbable gelatin sponge. Scaling and root planing should initially be restricted to a limited area to assess the potential for bleeding.

For a patient on long-term warfarin, the advice of the clinician responsible for the patient’s anticoagulation should be sought if:
- the INR is unstable, or if the INR is greater than 4.0;
- the patient has thrombocytopenia, haemophilia, or other disorders of haemostasis, or suffers from liver impairment, alcoholism, or renal failure;
- the patient is receiving antiplatelet drugs, cytotoxic drugs or radiotherapy.

Intramuscular injections are **contra-indicated** in patients on anticoagulant therapy, and in those with any disorder of haemostasis.

A local anaesthetic containing a vasoconstrictor should be given by infiltration, or by intraligamentary or mental nerve injection if possible. If regional nerve blocks cannot be avoided the local anaesthetic should be given cautiously using an aspirating syringe.

Drugs which have potentially serious interactions with anticoagulants include aspirin and other NSAIDs, carbamazepine, imidazole and triazole antifungals (including miconazole), erythromycin, clarithromycin, and metronidazole; for details of these and other interactions with anticoagulants, see Appendix 1 (dabigatran etexilate, heparin, phenindione, rivaroxaban, and coumarins).

Although studies have failed to demonstrate an interaction, common experience in anticoagulant clinics is that the INR can be altered following a course of an oral broad-spectrum antibiotic, such as ampicillin or amoxicillin.

Information for dental patients who take anticoagulants is available at www.npsa.nhs.uk/patientsafety/alerts-and-directives/alerts/anticoagulant.
Drugs and sport

UK Sport advises that athletes are personally responsible should a prohibited substance be detected in their body. Information and advice, including the status of specific drugs in sport, can be obtained from UK Sport’s Drug Information Database at www.didglobal.com. An advice card listing examples of permitted and prohibited substances is available from:

Drug-Free Sport
UK Sport
40 Bernard Street
London WC1N 1ST
Tel: 0800 528 0004
drug-free@uksport.gov.uk
www.uksport.gov.uk

A similar card detailing classes of drugs and doping methods prohibited in football is available from the Football Association.

General Medical Council’s advice

Doctors who prescribe or collude in the provision of drugs or treatment with the intention of improperly enhancing an individual’s performance in sport contravene the GMC’s guidance, and such actions would usually raise a question of a doctor’s continued registration. This does not preclude the provision of any care or treatment where the doctor’s intention is to protect or improve the patient’s health.
Emergency treatment of poisoning

These notes provide only an overview of the treatment of poisoning, and it is strongly recommended that either TOXBASE or the UK National Poisons Information Service (see below) be consulted when there is doubt about the degree of risk or about management.

Hospital admission Patients who have features of poisoning should generally be admitted to hospital. Patients who have taken poisons with delayed action should also be admitted, even if they appear well. Delayed-action poisons include aspirin, iron, paracetamol, tricyclic antidepressants, and co-phenotrope (diphenoxylate with atropine, Lomotil®): the effects of modified-release preparations are also delayed. A note of all relevant information, including what treatment has been given, should accompany the patient to hospital.

Further information and advice

TOXBASE, the primary clinical toxicology database of the National Poisons Information Service, is available on the internet to registered users at www.toxbase.org. It provides information about routine diagnosis, treatment, and management of patients exposed to drugs, household products, and industrial and agricultural chemicals.

Specialist information and advice on the treatment of poisoning is available day and night from the UK National Poisons Information Service on the following number:
Tel: 0844 892 0111

Advice on laboratory analytical services can be obtained from TOXBASE or from the National Poisons Information Service.
Help with identifying capsules or tablets may be available from a regional medicines information centre (see inside front cover).

General care

It is often impossible to establish with certainty the identity of the poison and the size of the dose. Fortunately this is not usually important because only a few poisons (such as opioids, paracetamol, and iron) have specific antidotes; few patients require active removal of the poison. In most patients, treatment is directed at managing symptoms as they arise. Nevertheless, knowledge of the type and timing of poisoning can help in anticipating the course of events. All relevant information should be sought from the poisoned individual and from carers or parents. However, such information should be interpreted with care because it may not be complete or entirely reliable. Sometimes symptoms arise from other illnesses and patients should be assessed carefully. Accidents may involve domestic and industrial products (the contents of which are not generally known). The National Poisons Information Service should be consulted when there is doubt about any aspect of suspected poisoning.

Respiration

Respiration is often impaired in unconscious patients. An obstructed airway requires immediate attention. In the absence of trauma, the airway should be opened with simple measures such as chin lift or jaw thrust. An oropharyngeal or nasopharyngeal airway may be useful in patients with reduced consciousness to prevent obstruction, provided ventilation is adequate. Intubation and ventilation should be considered in patients whose airway cannot be protected or who have respiratory acidosis because of inadequate ventilation; such patients should be monitored in a critical care area. Most poisons that impair consciousness also depress respiration. Assisted ventilation (either mouth-to-mouth or using a bag-valve-mask device) may be needed. Oxygen is not a substitute for adequate ventilation, although it should be given in the highest concentration possible in poisoning with carbon monoxide and irritant gases.

Respiratory stimulants do not help and should be avoided.

Blood pressure

Hypotension is common in severe poisoning with central nervous system depressants. A systolic blood pressure of less than 70 mmHg may lead to irreversible brain damage or renal tubular necrosis. Hypotension should be corrected initially by tilting down the head of the bed and administration of either sodium chloride intravenous infusion or a colloidal infusion. Vasconstrictor sympathomimetics (section 2.7.2) are rarely required and their use may be discussed with the National Poisons Information Service.

Fluid depletion without hypotension is common after prolonged coma and after aspirin poisoning due to vomiting, sweating, and hyperpnoea. Hypertension, often transient, occurs less frequently than hypotension in poisoning: it may be associated with sympathomimetic drugs such as amphetamines, phencyclidine, and cocaine.

Heart

Cardiac conduction defects and arrhythmias can occur in acute poisoning, notably with tricyclic antidepressants, some antipsychotics, and some antihistamines. Arrhythmias often respond to correction of underlying hypoxia, acidosis, or other biochemical abnormalities. Ventricular arrhythmias that cause serious hypotension require treatment. If the QT interval is prolonged, specialist advice should be sought because the use of some anti-arrhythmic drugs may be inappropriate. Supraventricular arrhythmias are seldom life-threatening and drug treatment is best withheld until the patient reaches hospital.
Body temperature

Hyperthermia may develop in patients of any age who have been deeply unconscious for some hours, particularly following overdose with barbiturates or phenothiazines. It may be missed unless core temperature is measured using a low-reading rectal thermometer or by some other means. Hyperthermia is best treated by wrapping the patient (e.g. in a ‘space blanket’) to conserve body heat.

Hyperthermia can develop in patients taking CNS stimulants; children and the elderly are also at risk when taking therapeutic doses of drugs with antimuscarinic properties. Hyperthermia is initially managed by removing all unnecessary clothing and using a fan. Sponging with tepid water will promote evaporation; iced water should not be used. Advice should be sought from the National Poisons Information Service on the management of severe hyperthermia resulting from conditions such as the serotonin syndrome.

Both hyperthermia and hyperthermia require urgent hospitalisation for assessment and supportive treatment.

Convulsions

Single short-lived convulsions do not require treatment. If convulsions are protracted or recur frequently, lorazepam 4 mg or diazepam (preferably as emulsion) 10 mg should be given by slow intravenous injection into a large vein (section 4.8.2). Benzodiazepines should not be given by the intramuscular route for convulsions. If the intravenous route is not readily available, diazepam can be administered as a rectal solution or midazolam (unlicensed use) can be given by the buccal route (section 4.8.2).

Removal and elimination

Prevention of absorption

Given by mouth, activated charcoal can bind many poisons in the gastro-intestinal system, thereby reducing their absorption. The sooner it is given the more effective it is, but it may still be effective up to 1 hour after ingestion of the poison—longer in the case of modified-release preparations or of drugs with antimuscarinic (anticholinergic) properties. It is relatively safe and is particularly useful for the prevention of absorption of poisons that are toxic in small amounts, such as antidepressants.

For the use of charcoal in active elimination techniques, see below.

Active elimination techniques

Repeated doses of activated charcoal by mouth enhance the elimination of some drugs after they have been absorbed; repeated doses are given after overdosage with:

- Carbamazepine
- Dapsone
- Phenobarbital

The usual dose of activated charcoal in adults and children over 12 years of age is 50 g initially then 50 g every 4 hours. Vomiting should be treated (e.g. with an antiemetic drug) since it may reduce the efficacy of charcoal treatment. In cases of intolerance, the dose may be reduced and the frequency increased (e.g. 25 g every 2 hours or 12.5 g every hour) but this may compromise efficacy.

In children under 12 years of age, activated charcoal is given in a dose of 1 g/kg (max. 50 g) every 4 hours; the dose may be reduced and the frequency increased if not tolerated.

Other techniques intended to enhance the elimination of poisons after absorption are only practicable in hospital and are only suitable for a small number of severely poisoned patients. Moreover, they only apply to a limited number of poisons. Examples include:

- haemodialysis for salicylates, phenobarbital, methyl alcohol (methanol), ethylene glycol, and lithium;
- alkalisation of the urine for salicylates and phenoxycetate herbicides (e.g. 2,4-dichloro-phenoxycetic acid). Forced diuresis is potentially harmful and no longer recommended.

Removal from the gastro-intestinal tract

Gastric lavage is rarely required; for substances that cannot be removed effectively by other means (e.g. iron), it should be considered only if a life-threatening amount has been ingested within the previous hour. It should be carried out only if the airway can be protected adequately. Gastric lavage is contra-indicated if a corrosive substance or a petroleum distillate has been ingested, but it may occasionally be considered in patients who have ingested drugs that are not adsorbed by charcoal, such as iron or lithium. Induction of emesis (e.g. with ipecacuanha) is not recommended because there is no evidence that it affects absorption and it may increase the risk of aspiration.

Whole bowel irrigation (by means of a bowel cleansing solution) has been used in poisoning with certain modified-release or enteric-coated formulations, in severe poisoning with iron and lithium salts, and if illicit drugs are carried in the gastro-intestinal tract (‘body-packing’). However, it is not clear that the procedure improves outcome and advice should be sought from the National Poisons Information Service.
Acetone is a painkiller and is often used in the treatment of pain. It is known to have serious side effects, including respiratory depression, hypotension, and cardiac arrest. Aspirin is a non-steroidal anti-inflammatory drug (NSAID) that is commonly used to relieve pain, reduce inflammation, and lower fever. It is known to have serious side effects, including gastrointestinal bleeding, ulceration, and perforation. NSAIDs are commonly used to relieve pain, reduce inflammation, and lower fever. They are known to have serious side effects, including gastrointestinal bleeding, ulceration, and perforation.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

**Analgesics (non-opioid)**

**Aspirin** The chief features of salicylate poisoning are hyperventilation, tinnitus, deafness, vasodilatation, and sweating. Coma is uncommon but indicates very severe poisoning. The associated acid-base disturbances are complex.

Treatment must be in hospital where plasma salicylate, pH, and electrolytes can be measured; absorption of aspirin may be slow and the plasma-salicylate concentration may continue to rise for several hours, requiring repeated measurement of plasma-salicylate concentration. Plasma-salicylate concentration may not correlate with clinical severity in the young and the elderly, and clinical and biochemical assessment is necessary. Generally, the clinical severity of poisoning is low below a plasma-salicylate concentration of 500 mg/litre (3.6 mmol/litre). Activated charcoal can be given within 1 hour of ingesting more than 125 mg/kg of aspirin. Fluid losses should be replaced and intravenous sodium bicarbonate may be given to enhance urinary salicylate excretion (optimum urinary pH 7.5–8.5).

Haemodialysis is the treatment of choice for severe salicylate poisoning and should be considered when the plasma-salicylate concentration exceeds 700 mg/litre (5.1 mmol/litre) or in the presence of severe metabolic acidosis.

**NSAIDs** Mefenamic acid has important consequences in overdosage because it can cause convulsions, which if prolonged or recurrent require treatment, see p. 28.

Overdosage with ibuprofen may cause nausea, vomiting, epigastric pain, and tinnitus, but more serious toxicity is very uncommon. Activated charcoal followed by symptomatic measures are indicated if more than 400 mg/kg has been ingested within the preceding hour.

**Paracetamol** Single or repeated doses totalling as little as 10–15 g (20–30 tablets) or 150 mg/kg of paracetamol taken within 24 hours may cause severe hepato-cellular necrosis and, much less frequently, renal tubular necrosis. Patients at high-risk of liver damage, including those taking enzyme-inducing drugs or who are malnourished (see below), may develop liver toxicity with as little as 75 mg/kg of paracetamol (equivalent to approx. 5 g (10 tablets) in a 70-kg patient) taken within 24 hours. Nausea and vomiting, the only early features of poisoning, usually settle within 24 hours. Persistence beyond this time, often associated with the onset of right subcostal pain and tediumness, usually indicates development of hepatic necrosis. Liver damage is maximal 3–4 days after ingestion and may lead to encephalopathy, haemorrhage, hypoglycaemia, cerebral oedema, and death.

Therefore, despite a lack of significant early symptoms, patients who have taken an overdose of paracetamol should be transferred to hospital urgently. Administration of activated charcoal should be considered if paracetamol in excess of 150 mg/kg or 12 g, whichever is the smaller, is thought to have been ingested within the previous hour.

Acetylcysteine protects the liver if infused within 24 hours of ingesting paracetamol. It is most effective if given within 8 hours of ingestion, after which effectiveness declines sharply; if more than 24 hours have elapsed advice should be sought from the National Poisons Information Service or from a liver unit on the management of serious liver damage. In remote areas, methionine by mouth is an alternative if acetylcysteine cannot be given promptly. Once the patient reaches hospital the need to continue treatment with the antidote will be assessed from the plasma-paracetamol concentration (related to the time from ingestion).

Patients at risk of liver damage and therefore requiring treatment can be identified from a single measurement of the plasma-paracetamol concentration, related to the time from ingestion, provided this time interval is not less than 4 hours; earlier samples may be misleading. The concentration is plotted on a paracetamol treatment graph, with a reference line (‘normal treatment line’) joining plots of 200 mg/litre (1.32 mmol/litre) at 4 hours and 6.25 mg/litre (0.04 mmol/litre) at 24 hours (see p. 30). Those whose plasma-paracetamol concentration is above the normal treatment line are treated with acetylcysteine by intravenous infusion (or, if acetylcysteine is not available, with methionine by mouth, provided the overdose has been taken within 10–12 hours and the patient is not vomiting).

Patients taking enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, alcohol, and St John’s wort), or who are malnourished (e.g. in anorexia, in alcoholism, or those who are HIV-positive), or following a few days of acute starvation, may develop toxicity at lower plasma-paracetamol concentration and should be treated if the concentration is above the high-risk treatment line (which joins plots that are at 50% of the plasma-paracetamol concentrations of the normal treatment line).

The prognostic accuracy of plasma-paracetamol concentration taken after 15 hours is uncertain, but a concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage. The plasma-paracetamol concentration may be difficult to interpret when paracetamol has been ingested over
several hours. If there is doubt about timing or the need for treatment then the patient should be treated with an antidote.

**ACETYLCYSTEINE**

**Indications** paracetamol overdosage, see notes above  
**Cautions** asthma (see side-effects below but do not delay acetylcysteine treatment)  
**Side-effects** hypersensitivity-like reactions managed by reducing infusion rate or suspending until reaction settled—contact the National Poisons Information Service if reaction severe (rash also managed by giving antihistamine; acute asthma managed by giving nebulised short-acting beta agonist)

**Dose**  
- By intravenous infusion, **ADULT** and **CHILD**, initially 150 mg/kg (max. 16.5 g) over 15 minutes, then 50 mg/kg (max. 5.5 g) over 4 hours then 100 mg/kg (max. 11 g) over 16 hours  
**Administration** Dilute requisite dose in glucose intravenous infusion 5% as follows: **ADULT** and **CHILD** over 12 years, initially 200 mL given over 15 minutes, then 500 mL over 4 hours, then 1 litre over 16 hours; **CHILD** under 12 years, body-weight over 20 kg, initially 100 mL given over 15 minutes, then 250 mL over 4 hours, then 500 mL over 16 hours; **CHILD** body-weight under 20 kg, initially 3 mL/kg given over 15 minutes, then 7 mL/kg over 4 hours, then 14 mL/kg over 16 hours  
**Note** Manufacturer also recommends other infusion fluids, but glucose 5% is preferable

Patients whose plasma-paracetamol concentrations are above the **normal treatment line** should be treated with acetylcysteine by intravenous infusion (or, if acetylcysteine cannot be used, with methionine by mouth, provided the overdose has been taken within 10–12 hours and the patient is not vomiting).

Patients on enzyme-inducing drugs (e.g. carbamazepine, phenobarbital, phenytoin, primidone, rifampicin, alcohol, and St John’s wort) or who are malnourished (e.g. in anorexia, in alcoholism, or those who are HIV-positive) should be treated if their plasma-paracetamol concentration is above the **high-risk treatment line**.

The prognostic accuracy after 15 hours is uncertain but a plasma-paracetamol concentration above the relevant treatment line should be regarded as carrying a serious risk of liver damage.

Emergency treatment of poisoning

**Analgesics (opioid)**

Opioids (narcotic analgesics) cause coma, respiratory depression, and pinpoint pupils. The specific antidote naloxone is indicated if there is coma or bradypnoea. Since naloxone has a shorter duration of action than many opioids, close monitoring and repeated injections are necessary according to the respiratory rate and depth of coma. When repeated administration of naloxone is required, it can be given by continuous intravenous infusion instead and the rate of infusion adjusted according to response (see above) and infused over 1 hour.

**Indications**

overdose with opioids; postoperative respiratory depression (section 15.1.7)

**Cautions**

- physical dependence on opioids
- cardiac failure, cardiac conduction defects, and arrhythmias.

**Dose**

- By intravenous injection, 0.4–2 mg repeated at intervals of 2–3 minutes to a max. of 10 mg if respiratory function does not improve (then question diagnosis); CHILD 10 micrograms/kg; if no response give subsequent dose of 100 micrograms/kg (then question diagnosis), further doses may be required if respiratory function deteriorates
- By subcutaneous or intramuscular injection, ADULT and CHILD dose as for intravenous injection but use only if intravenous route not feasible (onset of action slower)
- By continuous intravenous infusion using an infusion pump, 4 mg diluted in 20 mL intravenous infusion solution [unlicensed concentration] at a rate adjusted according to response (initial rate may be set at 60% of initial intravenous injection dose (see above) and infused over 1 hour). Important Doses used in acute opioid overdose may not be appropriate for the management of opioid-induced respiratory depression and sedation in those receiving palliative care and in chronic opioid use; see also section 15.1.7 for management of postoperative respiratory depression

**Antidepressants**

Tricyclic and related antidepressants Tricyclic and related antidepressants cause dry mouth, coma of varying degree, hypotension, hypothermia, hyperreflexia, extensor plantar responses, convulsions, respiratory failure, cardiac conduction defects, and arrhythmias. Dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Transfer to hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment and activated charcoal can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic disturbances.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

**NALOXONE HYDROCHLORIDE**

**Indications**

overdose with opioids; postoperative respiratory depression (section 15.1.7)

**Cautions**

physical dependence on opioids; cardiac irritability; naloxone is short-acting, see notes above

**Dose**

- By intravenous injection, 0.4–2 mg repeated at intervals of 2–3 minutes to a max. of 10 mg if respiratory function does not improve (then question diagnosis); CHILD 10 micrograms/kg; if no response give subsequent dose of 100 micrograms/kg (then question diagnosis), further doses may be required if respiratory function deteriorates
- By subcutaneous or intramuscular injection, ADULT and CHILD dose as for intravenous injection but use only if intravenous route not feasible (onset of action slower)
- By continuous intravenous infusion using an infusion pump, 4 mg diluted in 20 mL intravenous infusion solution [unlicensed concentration] at a rate adjusted according to response (initial rate may be set at 60% of initial intravenous injection dose (see above) and infused over 1 hour).

**METHIONINE**

**Indications**

paracetamol overdose, see notes above

**Cautions**

hepatic impairment (Appendix 2)

**Side-effects**

- nausea, vomiting, drowsiness, irritability
- dilated pupils and urinary retention also occur. Metabolic acidosis may complicate severe poisoning; delirium with confusion, agitation, and visual and auditory hallucinations are common during recovery.

Transfer to hospital is strongly advised in case of poisoning by tricyclic and related antidepressants but symptomatic treatment and activated charcoal can be given before transfer. Supportive measures to ensure a clear airway and adequate ventilation during transfer are mandatory. Intravenous lorazepam or intravenous diazepam (preferably in emulsion form) may be required to treat convulsions. Although arrhythmias are worrying, some will respond to correction of hypoxia and acidosis. The use of anti-arrhythmic drugs is best avoided, but intravenous infusion of sodium bicarbonate can arrest arrhythmias or prevent them in those with an extended QRS duration. Diazepam given by mouth is usually adequate to sedate delirious patients but large doses may be required.

**Selective serotonin re-uptake inhibitors (SSRIs)**

Symptoms of poisoning by selective serotonin re-uptake inhibitors include nausea, vomiting, agitation, tremor, nystagmus, drowsiness, and sinus tachycardia; convulsions may occur. Rarely, severe poisoning results in the serotonin syndrome, with marked neuropsychiatric effects, neuromuscular hyperactivity, and autonomic disturbances.

1. Restrictions do not apply where administration is for saving life in emergency
Emergency treatment of poisoning

Activated charcoal should be considered if the patient presents within 1 hour of overdose with a calcium-channel blocker; repeated doses of activated charcoal are considered if a modified-release preparation is involved. In patients with significant features of poisoning, calcium chloride or calcium gluconate (section 9.5.1.1) is given by injection; atropine is given to correct symptomatic bradyarrhythmias. For the management of hypotension, the choice of inotropic sympathomimetic depends on whether hypotension is secondary to vaso-dilatation or to myocardial depression and advice should be sought from the National Poisons Information Service.

Antimalarials

Overdose with quinine, chloroquine, or hydroxychloroquine is extremely hazardous and difficult to treat. Urgent advice from the National Poisons Information Service is essential. Life-threatening features include arrhythmias (which can have a very rapid onset) and convulsions (which can be intractable).

Beta-blockers

Therapeutic overdosages with beta-blockers may cause lightheadedness, dizziness, and possibly syncope as a result of bradycardia and hypotension; heart failure may be precipitated or exacerbated. These complications are most likely in patients with conduction system disorders or impaired myocardial function. Bradyarrhythmia is the most common arrhythmia caused by beta-blockers, but sotalol may induce ventricular tachyarrhythmias (sometimes of the torsade de pointes type). The effects of massive overdose can vary from one beta-blocker to another; propranolol overdose in particular may cause coma and convulsions.

Acute massive overdose must be managed in hospital and expert advice should be obtained. Maintenance of a clear airway and adequate ventilation is mandatory. An intravenous injection of atropine is required to treat bradycardia and hypotension (3 mg for an adult, 40 micrograms/kg (max. 3 mg) for a child). Cardiogenic shock unresponsive to atropine is probably best treated with an intravenous injection of glucagon 2–10 mg (CHILD 50–150 micrograms/kg) [unlicensed indication (section 9.1.3)] is given by injection; atropine is given to correct symptomatic bradyarrhythmias. If glucagon is not available, intravenous isoprenaline (available from ‘special-order’ manufacturers or specialist importing companies, see p. 28) should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine should be given immediately without waiting for the result of the serum-iron measurement.

Iron salts

Iron poisoning is commonest in childhood and is usually accidental. The symptoms are nausea, vomiting, abdominal pain, diarrhoea, haematemesis, and rectal bleeding. Hypotension, coma, and hepatocellular necrosis can occur later.

Advice should be sought from the National Poisons Information Service if a significant quantity of iron has been ingested within the previous hour.

Mortality is reduced by intensive and specific therapy with desferrioxamine, which chelates iron. The serum-iron concentration is measured as an emergency and intravenous desferrioxamine given to chelate absorbed iron in excess of the expected iron binding capacity. In severe toxicity intravenous desferrioxamine should be given immediately without waiting for the result of the serum-iron measurement.

Calcium-channel blockers

Features of calcium-channel blocker poisoning include nausea, vomiting, dizziness, agitation, confusion, and coma in severe poisoning. Metabolic acidosis and hyperglycaemia may occur. Verapamil and diltiazem have a profound cardiac depressant effect causing hypotension and arrhythmias, including complete heart block and asystole. The dihydropyridine calcium-channel blockers cause severe hypotension secondary to profound peripheral vasodilatation.
Lithium

Most cases of lithium intoxication occur as a complication of long-term therapy and are caused by reduced excretion of the drug due to a variety of factors including dehydration, deterioration of renal function, infections, and co-administration of diuretics or NSAIDs (or other drugs that interact). Acute deliberate overdoses may also occur with delayed onset of symptoms (12 hours or more) owing to slow entry of lithium into the tissues and continuing absorption from modified-release formulations.

The early clinical features are non-specific and may include apathy and restlessness which could be confused with mental changes arising from the patient’s depressed illness. Vomiting, diarrhoea, ataxia, weakness, dystarthis, muscle twitching, and tremor may follow. Severe poisoning is associated with convulsions, coma, renal failure, electrolyte imbalance, dehydration, and hypotension.

Therapeutic lithium concentrations are within the range of 0.4–1.0 mmol/litre; concentrations in excess of 2.0 mmol/litre are usually associated with serious toxicity and such cases may need treatment with haemodialysis if neurological symptoms or renal failure are present. In acute overdosage much higher serum-lithium concentrations may be present without features of toxicity and all that is usually necessary is to take measures to increase urine output (e.g. by increasing fluid intake but avoiding diuretics). Otherwise, treatment is supportive with special regard to electrolyte balance, renal function, and control of convulsions. The stomach should be emptied by gastric lavage if it can be performed within 1 hour of ingesting significant quantities of lithium. Whole-bowel irrigation should be considered for significant ingestion, but advice should be sought from the National Poisons Information Service, p. 27.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night.

Phenothiazines and related drugs

Phenothiazines cause less depression of consciousness and respiration than other sedatives. Hypotension, hypothermia, sinus tachycardia, and arrhythmias may complicate poisoning. Dystonic reactions can occur with therapeutic doses (particularly with prochlorperazine and trifluoperazine), and convulsions may occur in severe cases. Arrhythmias may respond to correction of hypoxia, acidosis, and other biochemical abnormalities, but specialist advice should be sought if arrhythmias result from a prolonged QT interval; the use of some anti-arrhythmic drugs can worsen such arrhythmias. Dystonic reactions are rapidly abolished by injection of drugs such as procyclidine (section 4.9.2) or diazepam (section 4.8.2, emulsion preferred).

Atypical antipsychotic drugs

Features of poisoning by atypical antipsychotic drugs include drowsiness, convulsions, extrapyramidal symptoms, hypotension, and ECG abnormalities (including prolongation of the QT interval). Management is supportive. Activated charcoal can be given within 1 hour of ingesting a significant quantity of atypical antipsychotic drug.

Stimulants

Amphetamines These cause wakefulness, excessive activity, paranoia, hallucinations, and hypertension followed by exhaustion, convulsions, hyperthermia, and coma. The early stages can be controlled by diazepam or lorazepam; advice should be sought from the National Poisons Information Service (p. 27) on the management of hypertension. Later, tepid sponging, anticonvulsants, and artificial respiration may be needed.

Cocaine Cocaine stimulates the central nervous system, causing agitation, dilated pupils, tachycardia, hypertension, hallucinations, hyperthermia, hypertonia, and hyperreflexia; cardiac effects include chest pain, myocardial infarction, and arrhythmias.

Initial treatment of cocaine poisoning involves intravenous administration of diazepam to control agitation and cooling measures for hyperthermia (see Body temperature, p. 28); hypertension and cardiac effects require specific treatment and expert advice should be sought.

Ecstasy Ecstasy (methylenthiolxymethamphetamine, MDMA) may cause severe reactions, even at doses that were previously tolerated. The most serious effects are delirium, coma, convulsions, ventricular arrhythmias, hyperthermia, rhabdomyolysis, acute renal failure, acute hepatitis, disseminated intravascular coagulation, adult respiratory distress syndrome, myocardial infarction, and arrhythmias. Severe hypokalemia has also been associated with ecstasy use.

Treatment of methylenthiolxymethamphetamine poisoning is supportive, with diazepam to control severe agitation or persistent convulsions and close monitoring including ECG. Self-induced water intoxication should be considered in patients with ecstasy poisoning.

‘Liquid ecstasy’ is a term used for sodium oxybate (gamma-hydroxybutyrate, GHB), which is a sedative.

Theophylline

Theophylline and related drugs are often prescribed as modified-release formulations and toxicity can therefore be delayed. They cause vomiting (which may be severe and intractable), agitation, restlessness, dilated pupils, sinus tachycardia, and hyperglycaemia. More serious effects are haematemesis, convulsions, and supraventricular and ventricular arrhythmias. Severe hypokalaemia may develop rapidly.

Repeated doses of activated charcoal can be used to eliminate theophylline even if more than 1 hour has elapsed after ingestion and especially if a modified-release preparation has been taken (see also under Active Elimination Techniques, p. 28). Ondansetron (section 4.6) may be effective for severe vomiting that is resistant to other antiemetics [unlicensed indication]. Hypokalaemia is corrected by intravenous infusion of potassium chloride and may be so severe as to require 60 mmol/hour (high doses require ECG monitoring). Convulsions should be controlled by intravenous administration of lorazepam or diazepam (emulsion pre-
Emergency treatment of poisoning

Indications

Poisoning with cyanides (used in conjunction with sodium thiosulphate)

Side-effects

flushing and headache due to vasodilatation

Dose

- By intravenous injection over 5–20 minutes (as sodium nitrite injection 30 mg/mL), 300 mg; CHILD 4–10 mg/kg (max. 300 mg)

1 Sodium Nitrite (RM)

Injection, sodium nitrite 3% (30 mg/mL) in water for injections

Available from ‘special-order’ manufacturers or specialist importing companies, see p. 939

Other poisons

Consult either the National Poisons Information Service day and night or TOXBASE, see p. 27.

The National Poisons Information Service (Tel: 0844 892 0111) will provide specialist advice on all aspects of poisoning day and night

Cyanides

Oxygen should be administered to patients with cyanide poisoning. The choice of antidote depends on the severity of poisoning, certainty of diagnosis, and the cause. Dicobalt edetate is the antidote of choice when there is a high clinical suspicion of severe cyanide poisoning. Dicobalt edetate itself is toxic, associated with anaphylactic reactions, and is potentially fatal if administered in the absence of cyanide poisoning. A regimen of sodium nitrite followed by sodium thiosulphate is an alternative if dicobalt edetate is not available.

Hydroxocobalamin can be considered for victims of smoke inhalation who show signs of significant cyanide poisoning. The usual dose is 5 g (70 mg/kg in children) by intravenous infusion (given once or twice according to severity). Cyanokit® provides hydroxocobalamin 2.5 g/bottle—contact the National Poisons Information Service for advice.

Dicobalt edetate

Indications

severe poisoning with cyanides

Cautions

owing to toxicity to be used only for definite cyanide poisoning when patient tending to lose, or has lost, consciousness; not to be used as a precautionary measure

Side-effects

hypotension, tachycardia, and vomiting; anaphylactic reactions including facial and laryngeal oedema and cardiac abnormalities

Dose

- By intravenous injection, ADULT 300 mg over 1 minute (5 minutes if condition less serious) followed immediately by 50 mL of glucose intravenous infusion 50%; if response inadequate a second dose of both may be given, but risk of cobalt toxicity; CHILD consult the National Poisons Information Service

1 Dicobalt Edetate (Cambridge) (RM)

Injection, dicobalt edetate 15 mg/mL, net price 20 mL (300 mg) amp = £13.75

Sodium nitrite

Indications

poisoning with cyanides (used in conjunction with sodium thiosulphate)

1. RM restriction does not apply where administration is for saving life in emergency

Ethylene glycol and methanol

Ethanol (by mouth or by intravenous infusion) is used for the treatment of ethylene glycol or methanol (methyl alcohol) poisoning. Fomepizole (available from ‘special-order’ manufacturers or specialist importing companies, see p. 939) has also been used for the treatment of ethylene glycol or methanol poisoning. Advice on the treatment of ethylene glycol or methanol poisoning should be obtained from the National Poisons Information Service.

Heavy metals

Heavy metal antidotes include dimercaprol and sodium calcium edetate. Other antidotes include succimer (DMSA) and unithiol (DMPS) [both unlicensed]; they may be useful in certain cases of heavy metal poisoning but the advice of the National Poisons Information Service should be sought.

Dimercaprol

Indications

poisoning by antimony, arsenic, bismuth, gold, mercury

Cautions

hypertension, renal impairment (discontinue or use with extreme caution if impairment develops during treatment), elderly, pregnancy and breastfeeding; interactions: Appendix 1 (dimercaprol)

Contra-indications

not indicated for iron, cadmium, or selenium poisoning; severe hepatic impairment (unless due to arsenic poisoning)

Side-effects

hypertension, tachycardia, malaise, nausea, vomiting, salivation, laceration, sweating, burning sensation (mouth, throat, and eyes), feeling of constriction of throat and chest, headache, muscle
spasm, abdominal pain, tingling of extremities; pyrexia in children; local pain and abscess at injection site

**Dose**

- **By intramuscular injection, ADULT** and **CHILD** 2.5–3 mg/kg every 4 hours for 2 days, 2–4 times on the third day, then 1–2 times daily for 10 days or until recovery

**Dimercaprol** (Sovereign) (PHN)

**Injection**, dimercaprol 50 mg/mL. Net price 2-mL amp = £42.73

**Note** Contains arachis (peanut) oil as solvent

---

**SODIUM CALCIUM EDETATE**

(Sodium Calciumedetate)

**Indications** lead poisoning

**Cautions** renal impairment

**Side-effects** nausea, diarrhoea, abdominal pain, pain at site of injection, thrombophlebitis if given too rapidly, renal damage particularly in overdosage; hypotension, lacerimation, myalgia, nasal congestion, sneezing, malaise, thirst, fever, chills, headache also reported

**Dose**

- **By intravenous infusion, ADULT** and **CHILD** 40 mg/kg twice daily for up to 5 days; if necessary, a second course can be given at least 7 days after the first course, a third course can be given at least 7 days after the second course

**Ledclair** (Durbin) (PHN)

**Injection**, sodium calcium edetate 200 mg/mL, net price 5-mL amp = £7.29

---

**Noxious gases**

**Carbon monoxide** Carbon monoxide poisoning is usually due to inhalation of smoke, car exhaust, or fumes caused by blocked flues or incomplete combustion of fuel gases in confined spaces.

Immediate treatment of carbon monoxide poisoning is essential. The person should be moved to fresh air, the airway cleared, and oxygen 100% administered through a tight-fitting mask with an inflated face seal. Artificial respiration should be given as necessary and continued until adequate spontaneous breathing starts, or stopped only after persistent and efficient treatment of cardiac arrest has failed. The patient should be admitted to hospital because complications may arise after a delay of hours or days. Cerebral oedema should be anticipated in severe poisoning and is treated with an intravenous infusion of mannitol (section 2.2.5). Referral for hyperbaric oxygen treatment should be discussed with the National Poisons Information Service if the victim is or has been unconscious, or has psychiatric or neurological features other than a headache, or has myocardial ischaemia or an arrhythmia, or has a blood carboxyhaemoglobin concentration of more than 20%, or is pregnant.

**Sulphur dioxide, chlorine, phosgene, ammonia**

All of these gases can cause upper respiratory tract and conjunctival irritation. Pulmonary oedema, with severe breathlessness and cyanosis may develop suddenly up to 36 hours after exposure. Death may occur. Patients are kept under observation and those who develop pulmonary oedema are given oxygen. Assisted ventilation may be necessary in the most serious cases.

---

**CS Spray**

CS spray, which is used for riot control, irritates the eyes (hence ‘tear gas’) and the respiratory tract; symptoms normally settle spontaneously within 15 minutes. If symptoms persist, the patient should be removed to a well-ventilated area, and the exposed skin washed with soap and water after removal of contaminated clothing. Contact lenses should be removed and rigid ones washed (soft ones should be discarded). Eye symptoms should be treated by irrigating the eyes with physiological saline (or water if saline is not available) and advice sought from an ophthalmologist. Patients with features of severe poisoning, particularly respiratory complications, should be admitted to hospital for symptomatic treatment.

---

**Nerve agents**

Treatment of nerve agent poisoning is similar to organophosphorus insecticide poisoning (see below), but advice must be sought from the National Poisons Information Service. The risk of cross-contamination is significant; adequate decontamination and protective clothing for healthcare personnel are essential. In emergencies involving the release of nerve agents, kits (‘NAAS pods’) containing pralidoxime can be obtained through the Ambulance Service from the National Blood Service (or the Welsh Blood Service in South Wales or designated hospital pharmacies in Northern Ireland and Scotland—see TOXBASE for list of designated centres).

---

**Pesticides**

**Organophosphorus insecticides** Organophosphorus insecticides are usually supplied as powders or dissolved in organic solvents. All are absorbed through the bronchi and intact skin as well as through the gut and inhibit cholinesterase activity, thereby prolonging and intensifying the effects of acetylcholine. Toxicity between different compounds varies considerably, and onset may be delayed after skin exposure.

Anxiety, restlessness, dizziness, headache, miosis, nausea, hypersalivation, vomiting, abdominal colic, diarrhoea, bradycardia, and sweating are common features of organophosphorus poisoning. Muscle weakness and fasciculation may develop and progress to generalised flaccid paralysis, including the ocular and respiratory muscles. Convulsions, coma, pulmonary oedema with copious bronchial secretions, hypopxia, and arrhythmias occur in severe cases. Hyperglycaemia and glycosuria without ketonuria may also be present.

Further absorption of the organophosphorus insecticide should be prevented by moving the patient to fresh air, removing soiled clothing, and washing contaminated skin. In severe poisoning it is vital to ensure a clear
Emergency treatment of poisoning

Emergency treatment of poisoning

Airway, frequent removal of bronchial secretions, and adequate ventilation and oxygenation; gastric lavage may be considered provided that the airway is protected. **Atropine** will reverse the muscarinic effects of acetylcholine and is given in a dose of 2 mg (20 micrograms/kg (max. 2 mg) in a child) as atropine sulphate (intramuscularly or intravenously according to the severity of poisoning) every 5 to 10 minutes until the skin becomes flushed and dry, the pupils dilate, and tachycardia develops.

**Pralidoxime chloride**, a cholinesterase reactivator, is used as an adjunct to atropine in moderate or severe poisoning. It improves muscle tone within 30 minutes of administration. Pralidoxime chloride is continued until the patient has not required atropine for 12 hours. Pralidoxime chloride can be obtained from designated centres, the names of which are held by the National Poisons Information Service (see p. 27).

### Pralidoxime Chloride

**Indications** adjacent to atropine in the treatment of poisoning by organophosphorus insecticide or nerve agent

**Cautions** renal impairment, myasthenia gravis

**Contra-indications** poisoning with carbamates or with organophosphorus compounds without anti-cholinesterase activity

**Side-effects** drowsiness, dizziness, disturbances of vision, nausea, tachycardia, headache, hyperventilation, and muscular weakness

**Dose**

- By intravenous infusion, **ADULT** and **CHILD** initially 30 mg/kg over 20 minutes, followed by 8 mg/kg/hour; usual max. 12 g in 24 hours

**Note** The loading dose may be administered by intravenous injection (diluted to a concentration of 50 mg/mL with water for injections) over at least 5 minutes if pulmonary oedema is present or if it is not practical to administer an intravenous infusion; pralidoxime chloride doses in BNF may differ from those in product literature

1. **Pralidoxime chloride**

   **Injection**, powder for reconstitution, pralidoxime chloride 1 g/vial

   Available as Prostigmin (from designated centres for organophosphorus insecticide poisoning or from the National Blood Service and the Welsh Blood Service for nerve agent poisoning—see TOXBASE for list of designated centres)

   **Note** restriction does not apply where administration is for saving life in emergency

Early anaphylactoid symptoms should be treated with **adrenaline** (epinephrine) (section 3.4.3). Indications for antivenom treatment include systemic envenoming, especially hypotension (see above), ECG abnormalities, vomiting, haemostatic abnormalities, and marked local envenoming such that after bites on the hand or foot, swelling extends beyond the wrist or ankle within 4 hours of the bite. For both adults and children, the contents of one vial (10 mL) of **European viper venom antiserum** (available from Movianto) is given by intravenous injection over 10–15 minutes or by intravenous infusion over 30 minutes after diluting in sodium chloride intravenous infusion 0.9% (use 5 mL diluent/kg bodyweight). The dose can be repeated in 1–2 hours if symptoms of systemic envenoming persist. Adrenaline (epinephrine) injection must be immediately to hand for treatment of anaphylactoid reactions to the antivenom (for the management of anaphylaxis, see section 3.4.3). Antivenom is available for bites by certain foreign snakes and spiders, stings by scorpions and fish. For information on identification, management, and for supply in an emergency, telephone:

- Liverpool (School of Tropical Medicine) (0151) 708 9393
- Liverpool (Royal Liverpool University Hospital) (emergency supply only) (0151) 706 2096
- London (emergency supply only) (020) 7771 5394

### Insect stings

Stings from ants, wasps, hornets, and bees cause local pain and swelling but seldom cause severe direct toxicity unless many stings are inflicted at the same time. If the sting is in the mouth or on the tongue local swelling may threaten the upper airway. The stings from these insects are usually treated by cleaning the area with a topical antiseptic. Bee stings should be removed as quickly as possible. Anaphylactic reactions require immediate treatment with intramuscular adrenaline (epinephrine): self-administered intramuscular adrenaline (e.g. EpiPen®) is the best first-aid treatment for patients with severe hypersensitivity. An inhaled bronchodilator should be used for asthmatic reactions. For the management of anaphylaxis, see section 3.4.3. A short course of an oral antihistamine or a topical corticosteroid may help to reduce inflammation and relieve itching. A vaccine containing extracts of bee and wasp venom can be used to reduce the risk of anaphylaxis and systemic reactions in patients with systemic hypersensitivity to bee or wasp stings (section 3.4.2).

### Marine stings

The severe pain of weeverfish (**Trachinus draco**) and Portuguese man-o’-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). People stung by jellyfish and Portuguese man-o’-war around the UK coast should be removed from the sea as soon as possible. Adherent tentacles should be lifted off carefully (wearing gloves or using tweezers) or washed off with seawater. Alcoholic solutions, including suntan lotions, should not be applied because they can cause further discharge of stinging hairs. Ice packs will reduce pain and a slurry of baking soda (sodium bicarbonate), but not vinegar, may be useful for treating stings from UK species.

### Snake bites and animal stings

**Snake bites** Envenoming from snake bite is uncommon in the UK. Many exotic snakes are kept, some illegally, but the only indigenous venomous snake is the adder (*Vipera berus*). The bite may cause local and systemic effects. Local effects include pain, swelling, bruising, and tender enlargement of regional lymph nodes. Systemic effects include early anaphylactoid symptoms (transient hypotension with syncope, angioedema, urticaria, abdominal colic, diarrhoea, and vomiting), with later persistent or recurrent hypotension, ECG abnormalities, spontaneous systemic bleeding, coagulopathy, adult respiratory distress syndrome, and acute renal failure. Fatal envenoming is rare but the potential for severe envenoming must not be underestimated.

**Marine stings** The severe pain of weeverfish (*Trachinus draco*) and Portuguese man-o’-war stings can be relieved by immersing the stung area immediately in uncomfortably hot, but not scalding, water (not more than 45°C). 1.8 Stoma care

1.9 Drugs affecting intestinal secretions

1.9.2 Bile acid sequestrants

1.9.3 Aprotinin

1.9.4 Pancreatin

Dyspepsia

Dyspepsia covers pain, fullness, early satiety, bloating, and nausea. It can occur with gastric and duodenal ulceration (section 1.3) and gastric cancer but most commonly it is of uncertain origin.

Urgent endoscopic investigation is required if dyspepsia is accompanied by ‘alarm features’ (e.g. bleeding, dysphagia, recurrent vomiting, or weight loss). Urgent investigation should also be considered for patients over 55 years with unexplained dyspepsia that has not responded to treatment.

Patients with dyspepsia should be advised about lifestyle changes (see Gastro-oesophageal reflux disease, below). Some medications may cause dyspepsia—these should be stopped, if possible. Antacids may provide some symptomatic relief.

If symptoms persist in uninvestigated dyspepsia, treatment involves a proton pump inhibitor (section 1.3) for 4 weeks. A proton pump inhibitor can be used intermittently to control symptoms long-term. Patients with uninvestigated dyspepsia, who do not respond to an initial trial with a proton pump inhibitor, should be tested for Helicobacter pylori and given eradication therapy (section 1.3) if H. pylori is present. Alternatively, particularly in populations where H. pylori infection is more likely, the ‘test and treat’ strategy for H. pylori can be used before a trial with a proton pump inhibitor.
If *H. pylori* is present in patients with functional (investigated, non-ulcer) dyspepsia, eradication therapy should be provided. However, most patients with functional dyspepsia do not benefit symptomatically from *H. pylori* eradication. If symptoms persist, treatment with either a proton pump inhibitor (section 1.3.5) or a histamine H*-receptor antagonist* (section 1.3.1) can be given for 4 weeks. These antisecretory drugs can be used intermittently to control symptoms long-term.

### Gastro-oesophageal reflux disease

Gastro-oesophageal reflux disease (including non-erosive gastro-oesophageal reflux and erosive oesophagitis) is associated with heartburn, acid regurgitation, and sometimes, difficulty in swallowing (dysphagia); oesophageal inflammation (oesophagitis), ulceration, and stricture formation may occur and there is an association with asthma.

The management of gastro-oesophageal reflux disease includes drug treatment, lifestyle changes and, in some cases, surgery. Initial treatment is guided by the severity of symptoms and treatment is then adjusted according to response. The extent of healing depends on the severity of the disease, the treatment chosen, and the duration of therapy.

Patients with gastro-oesophageal reflux disease should be advised about lifestyle changes (avoidance of excess alcohol and of aggravating foods such as fats); other measures include weight reduction, smoking cessation, and raising the head of the bed.

For mild symptoms of gastro-oesophageal reflux disease, initial management may include the use of antacids and alginites. Alginate-containing antacids can form a ‘raft’ that floats on the surface of the stomach contents to reduce reflux and protect the oesophageal mucosa.

**Histamine H*-receptor antagonists** (section 1.3.1) may relieve symptoms and permit reduction in antacid consumption. However, proton pump inhibitors (section 1.3.5) provide more effective relief of symptoms than H*-receptor antagonists. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by giving treatment intermittently).

For severe symptoms of gastro-oesophageal reflux disease or for patients with a proven or severe pathology (e.g. oesophagitis, oesophageal ulceration, oesophagopharyngeal reflux, Barrett’s oesophagus), initial management involves the use of a proton pump inhibitor (section 1.3.5); patients need to be reassessed if symptoms persist despite treatment for 4–6 weeks with a proton pump inhibitor. When symptoms abate, treatment is titrated down to a level which maintains remission (e.g. by reducing the dose of the proton pump inhibitor or by giving it intermittently, or by substituting treatment with a histamine H*-receptor antagonist). However, for endoscopically confirmed erosive, ulcerative, or strictureting disease, as Barrett’s oesophagus, treatment with a proton pump inhibitor usually needs to be maintained at the minimum effective dose.

A prokinetic drug such as metoclopramide (section 4.6) may improve gastro-oesophageal sphincter function and accelerate gastric emptying.

**Children** Gastro-oesophageal reflux disease is common in infancy but most symptoms resolve without treatment between 12 and 18 months of age. In infants, mild or moderate reflux without complications can be managed initially by changing the frequency and volume of feed; a feed thickener or thickened formula feed can be used (with advice of a dietitian—see Appendix 7 for suitable products). If necessary, a suitable alginate-containing preparation can be used instead of thickened feeds. For older children, life-style changes similar to those for adults (see above) may be helpful followed if necessary by treatment with an alginate-containing preparation.

Children who do not respond to these measures or who have problems such as respiratory disorders or suspected oesophagitis need to be referred to hospital; an H*-receptor antagonist (section 1.3.1) may be needed to reduce acid secretion. If the oesophagitis is resistant to H*-receptor blockade, the proton pump inhibitor omeprazole (section 1.3.5) can be tried.

### 1.1.1 Antacids and simeticone

Antacids (usually containing aluminium or magnesium compounds) can often relieve symptoms in ulcer dyspepsia and in non-erosive gastro-oesophageal reflux (see also section 1.1); they are also sometimes used in functional (non-ulcer) dyspepsia but the evidence of benefit is uncertain. Antacids are best given when symptoms occur or are expected, usually between meals and at bedtime, 4 or more times daily; additional doses may be required up to once an hour. Conventional doses e.g. 10 mL 3 or 4 times daily of liquid magnesium–aluminium antacids promote ulcer healing, but less well than antisecretory drugs (section 1.3); proof of a relationship between healing and neutralising capacity is lacking. Liquid preparations are more effective than tablet preparations.

**Aluminium- and magnesium-containing** antacids (e.g. aluminium hydroxide, and magnesium carbonate, hydroxide and trisilicate), being relatively insoluble in water, are long-acting if retained in the stomach. They are suitable for most antacid purposes. Magnesium-containing antacids tend to be laxative whereas aluminium-containing antacids may be constipating; antacids containing both magnesium and aluminium may reduce these colonic side-effects. Aluminium accumulation does not appear to be a risk if renal function is normal (see also Appendix 3). The acid-neutralising capacity of preparations that contain more than one antacid may be the same as simpler preparations. Complexes such as hydrotalcite confer no special advantage.

**Sodium bicarbonate** should no longer be prescribed alone for the relief of dyspepsia but it is present as an ingredient in many indigestion remedies. However, it retains a place in the management of urinary-tract disorders (section 7.4.3) and acidosis (section 9.2.1.3 and section 9.2.2). Sodium bicarbonate should be avoided in patients on salt-restricted diets.

**Bismuth-containing** antacids (unless chelates) are not recommended because absorbed bismuth can be neurotoxic, causing encephalopathy; they tend to be constipating. **Calcium-containing** antacids (section 1.1.2) can induce rebound acid secretion; with modest doses the clinical significance is doubtful, but prolonged high doses also cause hypercalcaemia and alkalosis, and can precipitate the milk-alkali syndrome.
Simeticone (activated dimeticone) is added to an antacid as an antifoaming agent to relieve flatulence. These preparations may be useful for the relief of hiccup in palliative care. Alginates, added as protectants, may be useful in gastro-oesophageal reflux disease (section 1.1 and section 1.1.2). The amount of additional ingredient or antacid in individual preparations varies widely, as does their sodium content, so that preparations may not be freely interchangeable.

See also section 1.3 for drugs used in the treatment of peptic ulceration.

**Interactions** Antacids should preferably not be taken at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings at the same time as other drugs since they may impair absorption. Antacids may also damage enteric coatings at the same time as other drugs since they may impair absorption.

**Aluminium- and magnesium-containing antacids**

### Aluminium Hydroxide

**Indications** dyspepsia; hyperphosphataemia (section 9.5.2.2)

**Cautions** see notes above; renal impairment (Appendix 3); interactions: Appendix 1 (antacids)

**Contra-indications** hypophosphataemia

**Side-effects** diarrhoea; belching due to liberated carbon dioxide

#### Aluminium-only preparations

**Aluminium Hydroxide** (Non-proprietary)

- **Tablets**, dried aluminium hydroxide 500 mg. Net price $20 = $28p
- **Dose** 1–2 tablets chewed 4 times daily and at bedtime or as required

Altacite

#### Alu-Cap

- **Capsules**, green/red, dried aluminium hydroxide 475 mg (low Na⁺). Net price £2.75
- **Dose** 1 capsule 4 times daily and at bedtime; **CHILD** not recommended for antacid therapy

**Co-magaldrox**

Co-magaldrox is a mixture of aluminium hydroxide and magnesium hydroxide; the proportions are expressed in the form x/y where x and y are the strengths in milligrams per unit dose of magnesium hydroxide and aluminium hydroxide respectively.

- **Maalox®** (Sanofi-Aventis)
  - **Suspension**, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na⁺)). Net price 500 mL = £2.79
  - **Dose** **ADULT** and **CHILD** over 14 years, 10–20 mL 20–60 minutes after meals, and at bedtime or when required

- **Mucogel®** (Chemidex)
  - **Suspension**, sugar-free, co-magaldrox 195/220 (magnesium hydroxide 195 mg, dried aluminium hydroxide 220 mg/5 mL (low Na⁺)). Net price 500 mL = £1.71
  - **Dose** **ADULT** and **CHILD** over 12 years, 10–20 mL 3 times daily, 20–60 minutes after meals, and at bedtime or when required

**Magnesium Carbonate**

**Indications** dyspepsia

**Cautions** renal impairment (Appendix 3); see also notes above; interactions: Appendix 1 (antacids)

**Contra-indications** hypophosphataemia

**Side-effects** diarrhoea; belching due to liberated carbon dioxide

### Magnesium Trisilicate

**Indications** dyspepsia

**Cautions** see under Magnesium Carbonate

**Contra-indications** see under Magnesium Carbonate

**Side-effects** diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Magnesium Trisilicate Tablets, Compound, BP**

#### Tablets, magnesium trisilicate 250 mg, dried aluminium hydroxide 120 mg

- **Dose** 1–2 tablets chewed when required

**Magnesium Trisilicate Mixture, BP**

#### (Magnesium Trisilicate Oral Suspension)

**Indications** dyspepsia

**Cautions** see under Magnesium Carbonate

**Contra-indications** see under Magnesium Carbonate

**Side-effects** diarrhoea; belching due to liberated carbon dioxide; silica-based renal stones reported on long-term treatment

**Magnesium Trisilicate Mixture Tablets, Compound, BP**

- **Dose** 10–20 mL in water 3 times daily or as required; **CHILD** 5–12 years, 5–10 mL in water 3 times daily or as required

For preparations also containing aluminium, see above and section 1.1.2.

**Aluminium-magnesium complexes**

### Hydropticarbonate

**Indications** dyspepsia

**Cautions** see notes above; interactions: Appendix 1 (antacids)

**Side-effects** see notes above

**Hydrotalcite**

**Indications** dyspepsia

**Cautions** see notes above; interactions: Appendix 1 (antacids)

**Side-effects** see notes above

**Hydrotalcite Suspension**, hydrotalcite 500 mg/5 mL (low Na⁺). Net price 500-mL pack = £1.96

- **Dose** **ADULT** and **CHILD** over 12 years, 10–20 mL 3 times daily, 20–60 minutes after meals, and at bedtime or when required

**Note** The brand name Altacite® is used for hydrotalcite suspension; for Altacite Plus suspension, see below
1 Gastro-intestinal system

Alginate Raft-forming Oral Suspension, BP

... contains sodium alginate, sodium bicarbonate, and calcium carbonate in a suitable flavoured vehicle, and conform to the specification for Alginate Raft-forming Oral Suspension, BP.

**Antacid preparations containing simeticone**

**Alalcite Plus®** (Peckforton)

**Suspension**, sugar-free, co-simalcicte 125/500 (simeticone 125 mg, hydrocortisone 500 mg)/5 mL (low Na+).

Net price 500 mL = £1.96

**Dose** 10 mL between meals and at bedtime when required; CHILD 8–12 years 5 mL between meals and at bedtime when required

**Asilone®** (Thornton & Ross)

**Suspension**, sugar-free, dried aluminium hydroxide 420 mg, simeticone 135 mg, light magnesium oxide 70 mg/5 mL (low Na+).

Net price 500 mL = £1.95

**Dose** ADULT over 12 years, 5–10 mL after meals and at bedtime or when required up to 4 times daily

**Maalox Plus®** (Sanofi-Aventis)

**Suspension**, sugar-free, dried aluminium hydroxide 220 mg, simeticone 25 mg, magnesium hydroxide 195 mg/5 mL (low Na+).

Net price 500 mL = £2.79

**Dose** 5–10 mL 4 times daily (after meals and at bedtime) or when required, CHILD under 5 years 5 mL 3 times daily, over 5 years appropriate proportion of adult dose

**Simeticone alone**

Simeticone (activated dimeticone) is an antifoaming agent. It is licensed for infantile colic but evidence of benefit is uncertain.

**Dentinox®** (DDD)

**Colic drops** (= emulsion), simeticone 21 mg/2.5-mL dose.

Net price 100 mL = £1.73

**Dose** colic or wind pains, NEONATE and INFANT 2.5 mL with or after each feed (max. 6 doses in 24 hours); may be added to bottle feed

**Note** The brand name Dentinox is also used for other preparations including teething gel

**Infacol®** (Forest)

**Liquid**, sugar-free, simeticone 40 mg/mL (low Na+).

Net price 50 mL = £2.26. Counselling, use of dropper

**Dose** colic or wind pains, NEONATE and INFANT 0.5–1 mL before feeds

**Acidex®** (Pinewood)

**Liquid**, sugar-free, sodium alginate 250 mg, sodium bicarbonate 133.5 mg, calcium carbonate 80 mg/5 mL. Contains about 3 mmol Na+/5 mL. Net price 500 mL (aniseed- or peppermint-flavour) = £1.70

**Dose** 10–20 mL after meals and at bedtime; CHILD 6–12 years 5–10 mL after meals and at bedtime

**Peptac®** (IVAX)

**Suspension**, sugar-free, sodium bicarbonate 133.5 mg, sodium alginate 250 mg, calcium carbonate 80 mg/5 mL. Contains 3.1 mmol Na+/5 mL. Net price 500 mL (aniseed- or peppermint-flavoured) = £2.16

**Dose** 10–20 mL after meals and at bedtime; CHILD 6–12 years 5–10 mL after meals and at bedtime

**Other compound alginate preparations**

**Gastrocote®** (Actavis)

**Tablets**, alginic acid 200 mg, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium bicarbonate 70 mg. Contains about 1 mmol Na+/tablet.

Net price 100-tablet pack = £3.51

**Cautions** diabetes mellitus (high sugar content)

**Dose** ADULT and CHILD over 6 years, 1–2 tablets chewed 4 times daily (after meals and at bedtime)

**Liquid**, sugar-free, peach-coloured, dried aluminium hydroxide 80 mg, magnesium trisilicate 40 mg, sodium alginate 220 mg, sodium bicarbonate 70 mg/5 mL. Contains 2.13 mmol Na+/5 mL. Net price 500 mL = £2.67

**Dose** ADULT and CHILD over 6 years, 5–15 mL 4 times daily (after meals and at bedtime)

**Gaviscon® Advance** (R&C)

**Tablets**, sugar-free, sodium alginate 500 mg, potassium bicarbonate 100 mg. Contains 2.25 mmol Na+,

1 mmol K+/tablet.

Net price 60-tab pack (peppermint-flavoured) = £3.24

**Excipients** include aspartame (section 9.4.1)

**Dose** ADULT and CHILD over 12 years, 1–2 tablets to be chewed after meals and at bedtime; CHILD 6–12 years, 1 tablet to be chewed after meals and at bedtime (under medical advice only)

**Suspension**, sugar-free, aniseed- or peppermint flavour, sodium alginate 500 mg, potassium bicarbonate 100 mg/5 mL. Contains 2.3 mmol Na+, 1 mmol K+/5 mL.

Net price 250 mL = £2.70, 500 mL = £5.40

**Dose** ADULT and CHILD over 12 years, 5–10 mL after meals and at bedtime; CHILD 2–12 years, 2.5–5 mL after meals and at bedtime (under medical advice only)

**Gaviscon Infant®** (R&C)

**Oral powder**, sugar-free, sodium alginate 225 mg, magnesium alginate 87.5 mg, with colloidal silica and mannitol/dose (half dual-sachet). Contains 0.92 mmol Na+/dose.

Net price 15 dual-sachets (30 doses) = £2.46

**Dose** INFANT body-weight under 4.5 kg, 1 ‘dose’ (half dual-sachet) mixed with feeds (or water in breast-fed infants) when required (max. 6 times in 24 hours); body-weight over 4.5 kg, 2 ‘doses’ (1 dual-sachet) mixed with feeds (or water in breast-fed infants) when required (max. 6 times in 24 hours); CHILD 2 ‘doses’ (1 dual-sachet) in water after each meal (max. 6 times in 24 hours)

**Note** Not to be used in preterm neonates, or where excessive water loss likely (e.g. fever, diarrhoea, vomiting, high room temperature), or if intestinal obstruction. Not to be used with other preparations containing thickeners agents

**Important** Each half of the dual-sachet is identified as ‘one dose’. To avoid errors prescribe as ‘dual-sachet’ with directions in terms of ‘dose’
1.2 Antispasmodics and other drugs altering gut motility

Drugs in this section include antimuscarinic compounds and drugs believed to be direct relaxants of intestinal smooth muscle. The smooth muscle relaxant properties of antimuscarinic and other antispasmodic drugs may be useful in irritable bowel syndrome and in diverticular disease.

The dopamine-receptor antagonists metoclopramide and domperidone (section 4.6) stimulate transit in the gut.

Antimuscarinics

Antimuscarinics (formerly termed ‘anticholinergics’) reduce intestinal motility. They are used for the management of irritable bowel syndrome and diverticular disease. However, their value has not been established and response varies. Other indications for antimuscarinic drugs include arthritides (section 2.3.1), asthma and airways disease (section 3.1.2), motion sickness (section 4.6), parkinsonism (section 4.9.2), urinary incontinence (section 7.4.2), mydriasis and cycloplegia (section 11.5), premedication (section 15.1.3) and as an antidote to organophosphorus poisoning (p. 36).

Antimuscarinics that are used for gastro-intestinal smooth muscle spasm include the tertiary amines atropine sulphate and dicycloverine hydrochloride (dicyclomine hydrochloride) and the quaternary ammonium compounds propantheline bromide and hyoscyamine butylbromide. The quaternary ammonium compounds are less lipid soluble than atropine and may also have antimuscarinic action than atropine and may also have antimuscarinic action than atropine and may also have reduced bronchial secretions, urinary urgency and retention, dilatation of the pupils with loss of accommodation, photophobia, dry mouth, flushing and dryness of the skin. Side-effects that occur occasionally include confusion (particularly in the elderly), nausea, vomiting, and giddiness; very rarely, angle-closure glaucoma may occur.

Contra-indications Antimuscarinics are contra-indicated in myasthenia gravis (but may be used to decrease muscarinic side-effects of anticholinesterases—section 10.2.1), paralytic ileus, pyloric stenosis and prostatic enlargement.

Side-effects Side-effects of antimuscarinics include constipation, transient bradycardia (followed by tachycardia, palpitation and arrhythmias), reduced bronchial secretions, urinary urgency and retention, dilatation of the pupils with loss of accommodation, photophobia, dry mouth, flushing and dryness of the skin. Side-effects that occur occasionally include confusion (particularly in the elderly), nausea, vomiting, and giddiness; very rarely, angle-closure glaucoma may occur.

Antimuscarinics should be used with caution in Down’s syndrome, in children and in the elderly; they should also be used with caution in gastro-oesophageal reflux disease, diarrhoea, ulcerative colitis, acute myocardial infarction, hypertension, conditions characterised by tachycardia (including hyperthyroidism, cardiac insufficiency, cardiac surgery), pyrexia, pregnancy (Appendix 4), and in individuals susceptible to angle-closure glaucoma. Interactions: Appendix 1 (antimuscarinics).

Antimuscarinics are less well absorbed from the gastro-intestinal tract. Dicycloverine hydrochloride has a much less marked antimuscarinic action than atropine and may also have some direct action on smooth muscle. Hyoscine butylbromide is advocated as a gastro-intestinal antispasmodic, but it is poorly absorbed; the injection is useful in endoscopy and radiology. Atropine and the belladonna alkaloids are outmoded treatments, any clinical virtues being outweighed by atropinic side-effects.

Excipients include propylene glycol

Cautions Antimuscarinics should be used with caution in Down’s syndrome, in children and in the elderly; they should also be used with caution in gastro-oesophageal reflux disease, diarrhoea, ulcerative colitis, acute myocardial infarction, hypertension, conditions characterised by tachycardia (including hyperthyroidism, cardiac insufficiency, cardiac surgery), pyrexia, pregnancy (Appendix 4), and in individuals susceptible to angle-closure glaucoma. Interactions: Appendix 1 (antimuscarinics).
Gastro-intestinal system

1.2 Antispasmodics and other drugs altering gut motility

**HYOSCINE BUTYLBROMIDE**

**Indications** symptomatic relief of gastro-intestinal or genito-urinary disorders characterised by smooth muscle spasm; bowel colic and excessive respiratory secretions (see Prescribing in Palliative Care, p. 18)

**Cautions** see notes above; also breast-feeding (Appendix 5)

**Contra-indications** see notes above; also hepatic and renal impairment; pregnancy (Appendix 4); avoid in acute porphyria (section 9.8.2.)

**Side-effects** rarely allergic reactions (including rash, urticaria, angioedema)

**Dose**
- **ADULT** over 12 years 10–20 mg 1–3 times daily
- **CHILD** over 12 years 5 mg 1–3 times daily

**Buscopan** (Boehringer Ingelheim)

- **Tablets**, coated, hyoscine butylbromide 10 mg. Net price 56-tab pack = £2.59
  - Note Hyoscine butylbromide tablets can be sold to the public provided single dose does not exceed 20 mg, daily dose does not exceed 80 mg, and pack does not contain a total of more than 240 mg

- **Injection**, hyoscine butylbromide 20 mg/mL. Net price 1 mL amp = 20p

**PROPANThELINE BROMIDE**

**Indications** symptomatic relief of gastro-intestinal disorders characterised by smooth muscle spasm; urinary frequency (section 7.4.2); gustatory sweating (section 6.1.5)

**Cautions** see notes above; also hepatic and renal impairment; breast-feeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- **ADULT** and **CHILD** over 12 years, 15 mg 3 times daily at least 1 hour before meals and 30 mg at night, max. 120 mg daily
- **CHILD** 6–18 years, 2–10 mg 4 times daily

**Mebeverine Hydrochloride**

**Indications** adjunct in gastro-intestinal disorders characterised by smooth muscle spasm

**Cautions** pregnancy (Appendix 4); avoid in acute porphyria (section 9.8.2.)

**Contra-indications** paralytic ileus

**Side-effects** nausea; headache; dizziness; pruritus; rash; hepatitis also reported

**Dose**
- **ADULT** and **CHILD** over 12 years 10–20 mg 4 times daily

**Spasmonal** (Norgine)

- **Capsules**, alverine citrate 60 mg (blue/grey), net price 100-cap pack = £11.95; 120 mg (Spasmonal® Forte, blue/grey), 60-cap pack = £13.80

**ALVERINE CITRATE**

**Indications** adjunct in gastro-intestinal disorders characterised by smooth muscle spasm; dysmenorrhoea

**Cautions** pregnancy; breast-feeding (Appendix 5)

**Contra-indications** paralytic ileus

**Side-effects** nausea; headache; dizziness; pruritus; rash; hepatitis also reported

**Dose**
- **ADULT** and **CHILD** over 12 years, 60–120 mg 1–3 times daily

**Colofac** (Solvay)

- **Tablets**, mebeverine hydrochloride 135 mg. Net price 20 = £2.21

**Oral suspension**, mebeverine hydrochloride (as mebeverine embonate) 50 mg/5 mL, net price 300 mL = £107.00

**Compound preparations**

**1. Fybogel® Mebeverine** (R&C)

- **Granules**, buff, effervescent, ispaghula husk 3.5 g, mebeverine hydrochloride 135 mg/sachet. Contains 2.5 mmol K+/sachet, net price 10 sachets = £2.50. Label: 13, 22, counselling, see below

**Excipients** include aspartame (section 9.4.1)

**Dose**
- **ADULT** and **CHILD** over 12 years, 1 sachet in water, morning and evening 30 minutes before food, an additional sachet may also be taken before the midday meal if necessary

**Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

- **1. 10-sachet pack can be sold to the public**

**Other antispasmodics**

Alverine, mebeverine, and peppermint oil are believed to be direct relaxants of intestinal smooth muscle and may relieve pain in *irritable bowel syndrome* and *diverticular disease*. They have no serious adverse effects but, like all antispasmodics, should be avoided in paralytic ileus. Peppermint oil occasionally causes heartburn.
Peptic ulceration commonly involves the stomach, duodenum, and lower oesophagus; after gastric surgery it involves the gastro-enterostomy stoma.

**Indications** relief of abdominal colic and distension, particularly in irritable bowel syndrome

**Cautions** sensitivity to menthol

**Side-effects** heartburn, perianal irritation; rarely, allergic reactions (including rash, headache, bradycardia, muscle tremor, ataxia)

**Local irritation** Capsules should not be broken or chewed because peppermint oil may irritate mouth or oesophagus

**Dose**
- See preparations

Colpermin® (McNeil)

Capsules, m/r, e/c, light blue/dark blue, blue band, peppermint oil 0.2 mL. Net price 100-cap pack = £12.05. Label: 5, 22, 25

Excipients include arachis (peanut) oil

Dose: ADULT over 15 years, 1–2 capsules, swallowed whole with water, 3 times daily for up to 3 months if necessary

Mintec® (Shire)

Capsules, e/c, green/ivory, peppermint oil 0.2 mL. Net price 84-cap pack = £7.04. Label: 5, 22, 25

Dose: ADULT over 15 years, 1–2 capsules swallowed whole with water, 3 times daily before meals for up to 2–3 months if necessary

**Motility stimulants**

Metoclopramide and domperidone (section 4.6) are dopamine receptor antagonists which stimulate gastric emptying and small intestinal transit, and enhance the strength of oesophageal sphincter contraction. They are used in some patients with functional dyspepsia that has not responded to a proton pump inhibitor or a H₂-receptor antagonist. Metoclopramide is also used to speed the transit of barium during intestinal follow-through examination, and as accessory treatment for gastro-oesophageal reflux disease. For the management of gastroparesis in patients with diabetes, see section 6.1.5. Metoclopramide and domperidone are useful in non-specific and in cytotoxic-induced nausea and vomiting. Metoclopramide and occasionally domperidone can cause acute dystonic reactions, particularly in young women and children—for further details of this and other side-effects, see section 4.6.

**Helicobacter pylori infection**

Eradication of Helicobacter pylori reduces recurrence of gastric and duodenal ulcers and the risk of rebleeding. The presence of H. pylori should be confirmed before starting eradication treatment. Acid inhibition combined with antibacterial treatment is highly effective in the eradication of H. pylori; reinfection is rare. Antibiotic-induced colitis is an uncommon risk.

For initial treatment, a one-week triple-therapy regimen that comprises a proton pump inhibitor, clarithromycin, and either amoxicillin or metronidazole can be used. However, if a patient has been treated with metronidazole for other infections, a regimen containing a proton pump inhibitor, amoxicillin and clarithromycin is preferred for initial therapy. If a patient has been treated with clarithromycin for other infections, a regimen containing a proton pump inhibitor, amoxicillin and metronidazole is preferred for initial therapy. These regimens eradicate H. pylori in about 85% of cases. There is usually no need to continue antisecretory treatment (with a proton pump inhibitor or H₂-receptor antagonist), however, if the ulcer is large, or complicated by haemorrhage or perforation, then antisecretory treatment is continued for a further 3 weeks. Treatment failure usually indicates antibacterial resistance or poor compliance. Resistance to amoxicillin is rare. However, resistance to clarithromycin and metronidazole is common and can develop during treatment.

Two-week triple-therapy regimens offer the possibility of higher eradication rates compared to one-week regimens, but adverse effects are common and poor compliance is likely to offset any possible gain.

Two-week dual-therapy regimens using a proton pump inhibitor and a single antibacterial are licensed, but produce low rates of H. pylori eradication and are not recommended.

Tinidazole is also used occasionally for H. pylori eradication as an alternative to metronidazole; tinidazole should be combined with antisecretory drugs and other antibacterials.

A two-week regimen comprising a proton pump inhibitor (e.g. omeprazole 20 mg twice daily) plus tripotassium dicitratobismuthate 120 mg four times daily, plus tetracycline 500 mg four times daily, plus metronidazole 400 mg three times daily can be used for eradication failure. Alternatively, the patient can be referred for endoscopy and treatment based on the results of culture and sensitivity testing.

For the role of H. pylori eradication therapy in patients starting or taking a NSAID, see NSAID-associated Ulcers, p. 44. For H. pylori eradication in patients with dyspepsia, see also section 1.1.

### Test for *Helicobacter pylori*

C-Urea breath test kits are available for the diagnosis of gastro-duodenal infection with *Helicobacter pylori*. The test involves collection of breath samples before and after ingestion of an oral solution of C-urea; the samples are sent for analysis by an appropriate laboratory. The test should not be performed within 4 weeks of treatment with an antibacterial or within 2 weeks of treatment with an antisecretory drug. A specific C-urea breath test kit for children (Helicobacter Test INFAI for children of the age 3–11) is available. However, the appropriateness of testing for *H. pylori* infection in children has not been established.

**diabact UBT® (MDE)**

- **Tablets**, C-urea 50 mg, net price 1 kit (including 1 tablet, 4 breath-sample containers, straws) = £19.95 (analysis included), 10-kit pack (hosp. only) = £74.50 (analysis not included)

**Helicobacter Test INFAI® (Infai)**

- **Oral powder**, C-urea 75 mg, net price 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included), 1 kit (including 2 breath bags) = £14.20 (spectrometric analysis not included), 50-test set = £855.00 (spectrometric analysis included); 45 mg (*Helicobacter Test INFAI for children of the age 3–11*), 1 kit (including 4 breath-sample containers, straws) = £19.20 (spectrometric analysis included)

**Pylobactell® (Torbet)**

- **Soluble tablets**, C-urea 100 mg, net price 1 kit (including 6 breath-sample containers, 30-mL mixing and administration vial, straws) = £20.75 (analysis included)

### NSAID-associated ulcers

Gastro-intestinal bleeding and ulceration can occur with NSAID use (section 10.1.1). The risk of serious upper gastro-intestinal side-effects varies between individual NSAIDs (see CSM advice, p. 554). Wherever possible, the NSAID should be withdrawn if an ulcer occurs.

Patients at high risk of developing gastro-intestinal complications include those aged over 65 years, those with a history of peptic ulcer disease or serious gastro-intestinal complication, those taking other medicines that increase the risk of gastro-intestinal side-effects, or those with serious co-morbidity. In those at risk of ulceration, a proton pump inhibitor can be considered for protection against gastric and duodenal ulcers associated with non-selective NSAIDs; a H₂-receptor antagonist such as ranitidine given at twice the usual dose or misoprostol are alternatives. Colic and diarrhoea may limit the dose of misoprostol.

NSAID use and *H. pylori* infection are independent risk factors for gastro-intestinal bleeding and ulceration. In patients already taking a NSAID, eradication of *H. pylori* is unlikely to reduce the risk of NSAID-induced bleeding or ulceration. However, in patients with dyspepsia or a history of gastric or duodenal ulcer, who are *H. pylori* positive, and who are about to start long-term treatment with a non-selective NSAID, eradication of *H. pylori* may reduce the overall risk of ulceration. If the NSAID can be discontinued in a patient who has developed an ulcer, a proton pump inhibitor usually produces the most rapid healing, but the ulcer can be treated with a H₂-receptor antagonist or misoprostol.

If treatment with a non-selective NSAID needs to continue, the following options are suitable:

- Treat ulcer with a proton pump inhibitor and on healing continue the proton pump inhibitor (dose not normally reduced because asymptomatic ulcer recurrence may occur);
- Treat ulcer with a proton pump inhibitor and on healing switch to misoprostol for maintenance therapy (colic and diarrhoea may limit the dose of misoprostol);
- Treat ulcer with a proton pump inhibitor and switch non-selective NSAID to a cyclo-oxygenase-2 selective inhibitor, but see NSAIDs and Cardiovascular Events, p. 553; on healing, continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.
If treatment with a cyclo-oxygenase-2 selective inhibitor needs to continue, treat ulcer with a proton pump inhibitor; on healing continuation of the proton pump inhibitor in patients with a history of upper gastro-intestinal bleeding may provide further protection against recurrence.

1.3.1 H₂-receptor antagonists

Histamine H₂-receptor antagonists heal gastric and duodenal ulcers by reducing gastric acid output as a result of histamine H₂-receptor blockade; they are also used to relieve symptoms of gastro-oesophageal reflux disease (section 1.1). H₂-receptor antagonists should not normally be used for Zollinger–Ellison syndrome because proton pump inhibitors (section 1.3.5) are more effective.

Maintenance treatment with low doses for the prevention of peptic ulcer disease has largely been replaced in Helicobacter pylori positive patients by eradication regimens (section 1.3). H₂-receptor antagonists are used for the treatment of functional dyspepsia (section 1.1). Treatment of uninvestigated dyspepsia with H₂-receptor antagonists used regularly or on an intermittent basis, may be acceptable in younger patients but care is required in older people because of the possibility of gastric cancer in these patients.

H₂-receptor antagonist therapy can promote healing of NSAID-associated ulcers (particularly duodenal) (section 1.3).

Treatment with a H₂-receptor antagonist has not been shown to be beneficial in haematemeses and melena, but prophylactic use reduces the frequency of bleeding from gastroduodenal erosions in hepatic coma, and possibly in other conditions requiring intensive care. H₂-receptor antagonists also reduce the risk of acid aspiration in obstetric patients at delivery (Mendelson’s syndrome).

Cautions H₂-receptor antagonists should be used with caution in renal impairment (Appendix 3), pregnancy (Appendix 4), and in breast-feeding (Appendix 5). H₂-receptor antagonists might mask symptoms of gastric cancer; particular care is required in those whose symptoms change and in those who are middle-aged or older.

Side-effects Side-effects of the H₂-receptor antagonists include diarrhoea and other gastro-intestinal disturbances, altered liver function tests (rarely liver damage), headache, dizziness, rash, and tiredness. Rare side-effects include acute pancreatitis, bradycardia, AV block, confusion, depression, and hallucinations particularly in the elderly or the very ill, hypersensitivity reactions (including fever, arthralgia, myalgia, anaphylaxis), blood disorders (including agranulocytosis, leucopenia, pancycopenia, thrombocytopenia), and skin reactions (including erythema multiforme and toxic epidermal necrolysis). There have been occasional reports of gynaecomastia and impotence.

Interactions Cimetidine retards oxidative hepatic drug metabolism by binding to microsomal cytochrome P450. It should be avoided in patients stabilised on warfarin, phenytoin, and theophylline (or aminophylline), but other interactions (see Appendix 1) may be of less clinical relevance. Famotidine, nizatidine, and ranitidine do not share the drug metabolism inhibitory properties of cimetidine.

Cimetidine

Indications benign gastric and duodenal ulceration, stomal ulcer, reflux oesophagitis, Zollinger–Ellison syndrome, other conditions where gastric acid reduction is beneficial (see notes above and section 1.9.4)

Cautions see notes above; also hepatic impairment (Appendix 2); interactions: Appendix 1 (histamine H₂-antagonists) and notes above

Side-effects see notes above; also alopecia; very rarely tachycardia, interstitial nephritis

Dose
- 400 mg twice daily (with breakfast and at night) or 800 mg at night (benign gastric and duodenal ulceration) for at least 4 weeks (6 weeks in gastric ulceration, 8 weeks in NSAID-associated ulceration); when necessary the dose may be increased to 400 mg 4 times daily; INFANT under 1 year 20 mg/kg daily in divided doses has been used; CHILD 1–12 years, 25–30 mg/kg daily in divided doses; max. 400 mg 4 times daily
- Maintenance, 400 mg at night or 400 mg morning and night
- Reflux oesophagitis, 400 mg 4 times daily for 4–8 weeks
- Zollinger–Ellison syndrome (but see notes above), 400 mg 4 times daily or occasionally more (max. 2.4 g daily)
- Prophylaxis of stress ulceration, 200–400 mg every 4–6 hours
- Gastric acid reduction (prophylaxis of acid aspiration; do not use syrup), obstetrics 400 mg at start of labour, then up to 400 mg every 4 hours if required (max. 2.4 g daily); surgical procedures 400 mg 90–120 minutes before induction of general anaesthesia
- Short-bowel syndrome, 400 mg twice daily (with breakfast and at bedtime) adjusted according to response
- To reduce degradation of pancreatic enzyme supplements, 0.8–1.6 g daily in 4 divided doses 1–1½ hours before meals

1 Cimetidine (Non-proprietary) Tablets, cimetidine 200 mg, net price 60-tab pack = £1.48; 400 mg, 60-tab pack = £1.61; 800 mg, 30-tab pack = £1.88 Oral solution, cimetidine 200 mg/5 mL, net price 300 mL = £14.24 Excipients may include propylene glycol (see Excipients, p. 2)

1. Cimetidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity (max. single dose 200 mg, max. daily dose 800 mg), and for the prophylactic management of nocturnal heartburn (single night-time dose 100 mg)

Tagamet® (Chemidex) Tablets, all green, f/c, cimetidine 200 mg, net price 120-tab pack = £19.58; 400 mg, 60-tab pack = £22.62; 800 mg, 30-tab pack = £22.62

Syrup, orange, cimetidine 200 mg/5 mL. Net price 600 mL = £28.49 Excipients include propylene glycol 10% (see Excipients, p. 2)
FAMOTIDINE

Indications  see under Dose

Cautions  see notes above; interactions: Appendix 1 (histamine H-antagonists) and notes above

Side-effects  see notes above; also very rarely anorexia, cholestatic jaundice, interstitial pneumonia, anxiety, paraesthesia, insomnia, decreased libido, dry mouth, and taste disturbances

Dose
- Benign gastric and duodenal ulceration, treatment, 40 mg at night for 4–8 weeks; maintenance (duodenal ulceration), 20 mg at night
- Reflux oesophagitis, 20–40 mg twice daily for 6–12 weeks; maintenance, 20 mg twice daily
- Zollinger–Ellison syndrome (but see notes above), 20 mg every 6 hours (higher dose in those who have previously been receiving another H-receptor antagonist); up to 800 mg daily in divided doses has been used
- CHILD not recommended

Famotidine (Non-proprietary)  
Tablets, famotidine 20 mg, net price 28-tab pack = £4.11; 40 mg, 28-tab pack = £5.20

1. Famotidine can be sold to the public for adults and children over 16 years (provided packs do not contain more than 2 weeks’ supply) for the short-term symptomatic relief of heartburn, dyspepsia, and hyperacidity, and for the prevention of these symptoms when associated with consumption of food or drink including when they cause sleep disturbance (max. single dose 10 mg, max. daily dose 20 mg)

NIZATIDINE

Indications  see under Dose

Cautions  see notes above; also avoid rapid intravenous injection (risk of arrhythmias and postural hypotension); hepatic impairment (Appendix 2); interactions: Appendix 1 (histamine H-antagonists) and notes above

Side-effects  see notes above; also sweating; rarely hyperuricaemia

Dose
- By mouth, benign gastric, duodenal or NSAID-associated ulceration, treatment, 300 mg in the evening or 150 mg twice daily for 4–8 weeks; maintenance, 150 mg at night
- Gastro-oesophageal reflux disease, 150–300 mg twice daily for up to 12 weeks
- By intravenous infusion, for short-term use in peptic ulcer as alternative to oral route (for hospital inpatients), by intermittent intravenous infusion over 15 minutes, 100 mg 3 times daily, or by continuous intravenous infusion, 10 mg/hour, max. 480 mg daily
- CHILD not recommended

1. Nizatidine (Non-proprietary)  
Capsules, nizatidine 150 mg, net price 30-cap pack = £3.82; 300 mg, 30-cap pack = £6.18

1. Nizatidine can be sold to the public for the prevention and treatment of symptoms of food-related heartburn and meal-induced indigestion in adults and children over 16 years; max. single dose 75 mg, max. daily dose 150 mg for max. 14 days

Axid® (Flynn)  
Capsules, nizatidine 150 mg (pale yellow/dark yellow), net price 28-cap pack (hosp. only) = £6.87, 30-cap pack = £7.97; 300 mg (pale yellow/brown), 30-cap pack = £15.80

Injection, nizatidine 25 mg/mL. For dilution and use as an intravenous infusion. Net price 4-mL amp = £1.14

RANITIDINE

Indications  see under Dose, other conditions where reduction of gastric acidity is beneficial (see notes above and section 1.9.4)

Cautions  see notes above; also acute porphyria; interactions: Appendix 1 (histamine H-antagonists) and notes above

Side-effects  see notes above; also rarely tachycardia, agitation, visual disturbances, alopecia, vasculitis; very rarely interstitial nephritis

Dose
- By mouth, benign gastric and duodenal ulceration, chronic episodic dyspepsia, ADULT and CHILD over 12 years, 150 mg twice daily or 300 mg at night for 4–8 weeks in benign gastric and duodenal ulceration, up to 6 weeks in chronic episodic dyspepsia, and up to 8 weeks in NSAID-associated ulceration (in duodenal ulcer 300 mg can be given twice daily for 4 weeks to achieve a higher healing rate); CHILD 3–12 years, (benign gastric and duodenal ulceration) 2–4 mg/kg (max. 150 mg) twice daily for 4–8 weeks Prophylaxis of NSAID-associated gastric or duodenal ulcer (unlicensed dose), ADULT and CHILD over 12 years, 300 mg twice daily
- Gastro-oesophageal reflux disease, ADULT and CHILD over 12 years, 150 mg twice daily or 300 mg at night for up to 8 weeks or if necessary 12 weeks (moderate to severe, 600 mg daily in 2–4 divided doses for up to 12 weeks); long-term treatment of healed gastro-oesophageal reflux disease, 150 mg twice daily; CHILD 3–12 years, 2.5–5 mg/kg (max. 300 mg) twice daily Zollinger–Ellison syndrome (but see notes above), ADULT and CHILD over 12 years, 150 mg 3 times daily; doses up to 6 g daily in divided doses have been used Gastric acid reduction (prophylaxis of acid aspiration) in obstetrics, ADULT and CHILD over 12 years, by mouth, 150 mg at onset of labour, then every 6 hours; surgical procedures, by intramuscular or slow intravenous injection, 50 mg 45–60 minutes before induction of anaesthesia (intravenous injection diluted to 20 mL and given over at least 2 minutes), or by mouth, 150 mg 2 hours before induction of anaesthesia and also when possible on the preceding evening
- By intramuscular injection, 50 mg every 6–8 hours
- By slow intravenous injection, ADULT and CHILD over 12 years, 50 mg diluted to 20 mL and given over at least 2 minutes; may be repeated every 6–8 hours
- By intravenous infusion, 25 mg/hour for 2 hours; may be repeated every 6–8 hours
- Prophylaxis of stress ulceration, ADULT and CHILD over 12 years, initial slow intravenous injection of 50 mg (as above) then continuous infusion, 125–250 micrograms/kg/hour (may be followed by 150 mg twice daily by mouth when oral feeding commences)
1.3.2 Selective antimuscarinics

Pirenzepine is a selective antimuscarinic drug which was used for the treatment of gastric and duodenal ulcers. It has been discontinued.

1.3.3 Chelates and complexes

Tripotassium dicitratobismuthate is a bismuth chelate effective in healing gastric and duodenal ulcers. For the role of tripotassium dicitratobismuthate in a Helicobacter pylori eradication regimen for those who have not responded to first-line regimens, see section 1.3.

The bismuth content of tripotassium dicitratobismuthate is low but absorption has been reported; encephalopathy (described with older high-dose bismuth preparations) has not been reported.

Sucralfate may act by protecting the mucosa from acid-pepsin attack in gastric and duodenal ulcers. It is a complex of aluminium hydroxide and sulphated sucrose but has minimal antacid properties. It should be used with caution in patients under intensive care (important: reports of bezoar formation, see CSM advice below).

TRIPOTASSIUM DICRATOBISMUTHATE

Indications benign gastric and duodenal ulceration; see also Helicobacter pylori infection, section 1.3

Cautions see notes above; interactions: Appendix 1 (tripotassium dicitratobismuthate)

Contra-indications renal impairment (avoid if creatinine clearance less than 10 mL/minute); pregnancy (Appendix 4)

Side-effects may darken tongue and blacken faeces; less commonly nausea, vomiting, diarrhoea, constipation, rash, and pruritus reported

De-Noltab® (Astellas)

Tablets, £/c, tripotassium dicitratobismuthate 120 mg. Contains 2 mmol K+ /tablet. Net price 112-tab pack = £7.27. Counselling, see below

Dose 2 tablets twice daily or 1 tablet 4 times daily, taken for 28 days followed by further 28 days if necessary; maintenance not indicated but course may be repeated after interval of 1 month; CHILD not recommended

Counselling To be swallowed with half a glass of water; twice-daily dosage to be taken 30 minutes before breakfast and main evening meal, four-times-daily dosage to be taken as follows: one dose 30 minutes before breakfast, midday meal and main evening meal, and one dose 2 hours after main evening meal; milk should not be drunk by itself during treatment but small quantities may be taken in tea or coffee or on cereal; antacids, fruit, or fruit juice should not be taken half an hour before or after a dose; may darken tongue and blacken faeces

SUCRALFATE

Indications see under Dose

Cautions renal impairment (Appendix 3); pregnancy and breast-feeding; administration of sucralfate and enteral feeds should be separated by 1 hour; interactions: Appendix 1 (sucralfate)

Bezoar formation Following reports of bezoar formation associated with sucralfate, the CSM has advised caution in seriously ill patients, especially those receiving concomitant enteral feeds or those with predisposing conditions such as delayed gastric emptying

Side-effects constipation; less frequently diarrhoea, nausea, indigestion, flatulence, gastric discomfort, back pain, dizziness, headache, drowsiness, bezoar formation (see above), dry mouth and rash

Dose
• Benign gastric and duodenal ulceration and chronic gastritis, ADULT and CHILD over 15 years, 2 g twice daily (on rising and at bedtime) or 1 g 4 times daily 1 hour before meals and at bedtime, taken for 4–6 weeks or in resistant cases up to 12 weeks; max. 8 g daily
• Prophylaxis of stress ulceration, ADULT and CHILD over 15 years, 1 g 6 times daily; max. 8 g daily
• CHILD under 15 years, see BNF for Children

Antepsin® (Chugai) (FR)

Tablets, scored, sucralfate 1 g, net price 50-tab pack = £4.81. Label: 5

Note Crushed tablets may be dispersed in water

Suspension, sucralfate 1 g/5 mL, net price 250 mL (aniseed- and caramel-flavoured) = £4.81. Label: 5

1.3.4 Prostaglandin analogues

Misoprostol, a synthetic prostaglandin analogue has antisecretory and protective properties, promoting healing of gastric and duodenal ulcers. It can prevent NSAID-associated ulcers, its use being most appropriate for the frail or very elderly from whom NSAIDs cannot be withdrawn.

For comment on the use of misoprostol to induce abortion or labour [unlicensed indications], see section 7.1.1.
1.3.5 Proton pump inhibitors

Proton pump inhibitors inhibit gastric acid secretion by blocking the hydrogen-potassium adenosine triphosphatase enzyme system (the ‘proton pump’) of the gastric parietal cell. Proton pump inhibitors are effective short-term treatments for gastritis and duodenal ulcers; they are also used in combination with antibacterials for the eradication of *Helicobacter pylori* (see eradication regimens on p. 43). Following endoscopic treatment of severe peptic ulcer bleeding, an intravenous, high-dose proton pump inhibitor reduces the risk of rebleeding and the need for surgery (unlicensed use). Proton pump inhibitors can be used for the treatment of dyspepsia and gastro-oesophageal reflux disease (section 1.1).

Proton pump inhibitors are also used for the prevention and treatment of NSAID-associated ulcers (see p. 44). In patients who need to continue NSAID treatment after an ulcer has healed, the dose of proton pump inhibitor should normally not be reduced because asymptomatic ulcer deterioration may occur.

A proton pump inhibitor can be used to control excessive secretion of gastric acid in Zollinger–Ellison syndrome; high doses are often required.

**Cautions** Proton pump inhibitors should be used with caution in patients with liver disease (Appendix 2), in pregnancy (Appendix 4) and in breast-feeding (Appendix 5). Proton pump inhibitors may mask the symptoms of gastric cancer; particular care is required in those presenting with ‘alarm features’ (see p. 37), in such cases gastric malignancy should be ruled out before treatment.

**Side-effects** Side-effects of the proton pump inhibitors include gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, flatulence, diarrhoea, constipation), and headache. Less frequent side-effects include dry mouth, peripheral oedema, dizziness, sleep disturbances, fatigue, paraesthesia, arthralgia, myalgia, rash, and pruritus. Other side-effects reported rarely or very rarely include taste disturbance, stomatitis, hepatitis, jaundice, hypersensitivity reactions (including anaphylaxis, bronchospasm), fever, depression, hallucinations, confusion, gynaecomastia, interstitial nephritis, haemoptoama, blood disorders (including leucopenia, leucocytosis, pancytopenia, thrombocytopenia), visual disturbances, sweating, photosensitivity, alopecia, Stevens–Johnson syndrome, and toxic epidermal necrolysis. By decreasing gastric acidity, proton pump inhibitors may increase the risk of gastro-intestinal infections (including *Clostridium difficile* infection).

**ESOMEPROZOLE**

**Indications** see under Dose

**Cautions** see notes above; renal impairment (Appendix 3); interactions: Appendix 1 (proton pump inhibitors)

**Side-effects** see notes above

**Dose**

- *By mouth* duodenal ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 43 NSAID-associated gastric ulcer, *ADULT* over 18 years, 20 mg once daily for 4–8 weeks; prophylaxis in patients with an increased risk of gastroduodenal complications who require continued NSAID treatment, 20 mg daily
- *Gastro-oesophageal reflux disease, ADULT* and *CHILD* over 12 years, 40 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed or symptoms persist; maintenance 20 mg daily; symptomatic treatment in the absence of oesophagitis, 20 mg daily for up to 4 weeks, then in *ADULTS* over 18 years 20 mg daily when required
- Zollinger–Ellison syndrome, *ADULT* over 18 years, initially 40 mg twice daily, adjusted according to response; usual range 80–160 mg daily (above 80 mg in 2 divided doses)

**Counselling** Do not chew or crush tablets, swallow whole or disperse in water

- *By intravenous injection* over at least 3 minutes or by intravenous infusion, *ADULT* over 18 years, gastro-oesophageal reflux disease, 40 mg once daily; symptomatic reflux disease without oesophagitis, treatment of NSAID-associated gastric ulcer, prevention of NSAID-associated gastric or duodenal ulcer, 20 mg daily; continue until oral administration possible

**Nexium®** *(AstraZeneca)*

**Tablets, f/c, esomeprazole (as magnesium trihydrate) 20 mg (light pink)*, net price 28-tab pack = £18.50 (also 7-tab pack, hosp. only); 40 mg (pink), 28-tab pack =
£25.19 (also 7-tab pack, hosp. only). Counselling, administration

Injection, powder for reconstitution, esomeprazole (as sodium salt), net price 40-mg vial = £5.21

### LANSOPRAZOLE

**Indications** see under Dose

**Cautions** see notes above; interactions: Appendix 1 (proton pump inhibitors)

**Side-effects** see notes above; also glossitis, pancreatitis, anorexia, restlessness, tremor, impotence, petechiae, and purpura; very rarely colitis, raised serum cholesterol or triglycerides

**Dose**

- Benign gastric ulcer, 30 mg daily in the morning for 8 weeks
- Duodenal ulcer, 30 mg daily in the morning for 4 weeks; maintenance 15 mg daily
- NSAID-associated duodenal or gastric ulcer, 30 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis, 15–30 mg once daily
- Eradication of *Helicobacter pylori* associated with duodenal ulcer or ulcer-like dyspepsia, see eradication regimens on p. 43
- Zollinger–Ellison syndrome (and other hypersecretory conditions), initially 60 mg once daily adjusted according to response; daily doses of 120 mg or more given in two divided doses
- Gastro-oesophageal reflux disease, 30 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed; maintenance 15–30 mg daily
- Acid-related dyspepsia, 15–30 mg daily in the morning for 2–4 weeks
- **CHILD** under 18 years, see *BNF for Children*

**Note** Lansoprazole doses in BNF may differ from those in product literature

### Lansoprazole

#### (Non-proprietary) *OMEPRAZOLE*

**Capsules,** enclosing e/c granules, lansoprazole 15 mg, net price 28-cap pack = £1.71; 30 mg, 28-cap pack = £3.06. Label: 5, 22, 25

**Dental prescribing on NHS** Lansoprazole capsules may be prescribed

#### Zoton® (Wyeth) *OMEPRAZOLE*

**Capsules** utilise MUPS® technology, lansoprazole 15 mg, net price 28-cap pack = £5.97; 30 mg, 7-cap pack = £2.74, 14-cap pack = £5.47, 28-cap pack = £11.00. Label: 5, 22, counselling, administration

**Excipients** include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed, or may be swallowed whole with a glass of water. Alternatively, tablets can be dispersed in a small amount of water and administered by an oral syringe or nasogastric tube

### OMEPRAZOLE

**Indications** see under Dose

**Cautions** see notes above; interactions: Appendix 1 (proton pump inhibitors)

**Side-effects** see notes above; also agitation and impotence

**Dose**

- **By mouth,** benign gastric and duodenal ulcers, 20 mg once daily for 4 weeks in duodenal ulceration or 8 weeks in gastric ulceration; in severe or recurrent cases increase to 40 mg daily; maintenance for recurrent duodenal ulcer, 20 mg once daily; prevention of relapse in duodenal ulcer, 10 mg daily increasing to 20 mg once daily if symptoms return
- NSAID-associated duodenal or gastric ulcer and gastroduodenal erosions, 20 mg once daily for 4 weeks, continued for further 4 weeks if not fully healed; prophylaxis in patients with a history of NSAID-associated duodenal or gastric ulcers, gastroduodenal lesions, or dyspeptic symptoms who require continued NSAID treatment, 20 mg once daily
- Duodenal or benign gastric ulcer associated with *Helicobacter pylori*, see eradication regimens on p. 43
- Zollinger–Ellison syndrome, initially 60 mg once daily; usual range 20–120 mg daily (above 80 mg in 2 divided doses)
- Gastric acid reduction during general anaesthesia (prophylaxis of acid aspiration), 40 mg on the preceding evening then 40 mg 2–6 hours before surgery
- Gastro-oesophageal reflux disease, 20 mg once daily for 4 weeks, continued for further 4–8 weeks if not fully healed; 40 mg once daily has been given for 8 weeks in gastro-oesophageal reflux disease refractory to other treatment; maintenance 20 mg once daily
- Acid reflux disease (long-term management), 10 mg daily increasing to 20 mg once daily if symptoms return
- Acid-related dyspepsia, 10–20 mg once daily for 2–4 weeks according to response
- Severe ulcerating reflux oesophagitis, **CHILD** over 1 year, body-weight 10–20 kg, 10 mg once daily increased if necessary to 20 mg once daily for 4–12 weeks; body-weight over 20 kg, 20 mg once daily increased if necessary to 40 mg once daily for 4–12 weeks; to be initiated by hospital paediatrician
- **By intravenous injection** over 5 minutes or **by intravenous infusion** over 20–30 minutes, prophylaxis of acid aspiration, 40 mg completed 1 hour before surgery
- Benign gastric ulcer, duodenal ulcer and gastro-oesophageal reflux, 40 mg once daily until oral administration possible
- Severe peptic ulcer bleeding [unlicensed indication], initial intravenous infusion of 80 mg then by continuous intravenous infusion, 8 mg/hour for 72 hours (then change to oral therapy)

**Counselling** Swallow whole, or disperse MUPS® tablets in water, or oral suspension, or MUPS® tablets with fruit juice or yoghurt. Preparations consisting of an e/c tablet within a capsule should not be opened

### Omeprazole

#### (Non-proprietary) *OMEPRAZOLE*

**Capsules** utilise MUPS® technology, omeprazole 10 mg, net price 28-cap pack = £1.87; 20 mg, 28-cap pack = £1.75; 40 mg, 7-cap pack = £2.04, 28-cap pack = £5.08. Counselling, administration

**Note** Some preparations consist of an e/c tablet within a capsule; brands include Mepradec

**Dental prescribing on NHS** Gastro-resistant omeprazole capsules may be prescribed

Tablets, e/c, omeprazole 10 mg, net price 28-tab pack = £5.13; 20 mg, 28-tab pack = £5.37; 40 mg, 7-tab pack = £5.08. Label: 25

**Intravenous infusion,** powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.21

1. Omeprazole 10 mg tablets can be sold to the public for the short-term relief of reflux-like symptoms (e.g. heartburn) in adults over 18 years, max. daily dose 20 mg for max. 4 weeks, and a pack size of 28 tablets
1.4 Acute diarrhoea

Losec® (AstraZeneca) [PHI]  
Pants® [multiple-unit pellet system = dispersible tablets], 1/c, omeprazole 10 mg (light pink), net price 28-tab pack = £19.34; 20 mg (pink), 28-tab pack = £29.22; 40 mg (red-brown), 7-tab pack = £14.61. Counselling, administration
Capsules, enclosing e/c granules, omeprazole 10 mg (pink), net price 28-cap pack = £19.34; 20 mg (pink/brown), 28-cap pack = £29.22; 40 mg (brown), 7-cap pack = £14.61. Counselling, administration
Intravenous infusion, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial = £5.41
Injection, powder for reconstitution, omeprazole (as sodium salt), net price 40-mg vial (with solvent) = £5.41

1.4 Antimotility drugs

RABEPRAZOLE SODIUM  
Indications see under Dose  
Cautions see notes above; interactions: Appendix 1 (proton pump inhibitors)  
Side-effects see notes above; also cough, influenza-like syndrome, and rhinitis; less commonly chest pain and nervousness; rarely anorexia and weight gain

Dose
- Benign gastric ulcer; 20 mg daily in the morning for 6 weeks, continued for further 6 weeks if not fully healed  
- Duodenal ulcer, 20 mg daily in the morning for 4 weeks, continued for further 4 weeks if not fully healed  
- Gastro-oesophageal reflux disease, 20 mg once daily for 4–8 weeks; maintenance 10–20 mg daily; symptomatic treatment in the absence of oesophagitis, 10 mg daily for up to 4 weeks, then 10 mg daily when required  
- Duodenal and benign gastric ulcer associated with Helicobacter pylori, see eradication regimens on p. 43  
- Zollinger–Ellison syndrome, initially 60 mg once daily adjusted according to response (max. 120 mg daily); doses above 100 mg daily given in 2 divided doses  
- CHILD not recommended

Pariet® (Janssen-Cilag, Eisai) [PHI]  
Tablets, e/c, rabeprazole sodium 10 mg (pink), net price 28-tab pack = £11.56; 20 mg (yellow), 28-tab pack = £21.16. Label: 25

1.4.1 Adsorbents and bulk-forming drugs

1.4.2 Antimotility drugs

The priority in acute diarrhoea, as in gastro-enteritis, is the prevention or reversal of fluid and electrolyte depletion. This is particularly important in infants and in frail and elderly patients. For details of oral rehydration preparations, see section 9.2.1.2. Severe depletion of fluid and electrolytes requires immediate admission to hospital and urgent replacement.

Antimotility drugs (section 1.4.2) relieve symptoms of acute diarrhoea. They are used in the management of uncomplicated acute diarrhoea in adults; fluid and electrolyte replacement may be necessary in case of dehydration. However, antimotility drugs are not recommended for acute diarrhoea in young children. Antispasmodics (section 1.2) are occasionally of value in treating abdominal cramp associated with diarrhoea but they should not be used for primary treatment. Antispasmodics and antiemetics should be avoided in young children with gastro-enteritis because they are rarely effective and have troublesome side-effects.

Antibacterial drugs are generally unnecessary in simple gastro-enteritis because the complaint usually resolves quickly without them, and infective diarrhoeas in the UK often have a viral cause. Systemic bacterial infection does, however, need appropriate systemic treatment; for drugs used in campylobacter enteritis, shigellosis, and salmonellosis, see Table 1, section 5.1. Ciprofloxacin is occasionally used for prophylaxis against travellers' diarrhoea, but routine use is not recommended. Lacto-
bacillus preparations have not been shown to be effective.

Colestyramine (cholestyramine, section 1.9.2), binds unabsorbed bile salts and provides symptomatic relief of diarrhoea following ileal disease or resection.

1.4.1 Adsorbents and bulk-forming drugs

Adsorbents such as kaolin are not recommended for acute diarrhoea. Bulk-forming drugs, such as ispaghula, methylcellulose, and sterculia (section 1.6.1) are useful in controlling diarrhoea associated with diverticular disease.

KAOLIN, LIGHT

Indications diarrhoea but see notes above

Cautions interactions: Appendix 1 (kaolin)

Kaolin Mixture, BP

(Kaolin Oral Suspension)

Oral suspension, light kaolin or light kaolin (natural) 20%, light magnesium carbonate 5%, sodium bicarbonate 5% in a suitable vehicle with a peppermint flavour.

Dose 10–20 mL every 4 hours

1.4.2 Antimotility drugs

Antimotility drugs have a role in the management of uncomplicated acute diarrhoea in adults but not in young children; see also section 1.4. However, in severe cases, fluid and electrolyte replacement (section 9.2.1.2) are of primary importance.

For comments on the role of antimotility drugs in chronic bowel disorders see section 1.5. For their role in stoma care see section 1.8.

Loperamide can be used for faecal incontinence [unlicensed indication] after the underlying cause of incontinence has been addressed.

CODEINE PHOSPHATE

Indications see notes above; cough suppression (section 3.9.1); pain (section 4.7.2)

Cautions see section 4.7.2; tolerance and dependence may occur with prolonged use; interactions: Appendix 1 (opioid analgesics)

Contra-indications see section 4.7.2; also conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in acute diarrhoeal conditions such as acute ulcerative colitis or antibiotic-associated colitis

Side-effects see section 4.7.2

Dose

- See preparations

Codeine Phosphate (Non-proprietary) Tablets, codeine phosphate 15 mg, net price 28 = £1.08; 30 mg, 28 = £1.24; 60 mg, 28 = £1.73. Label: 2

Dose ADULT and CHILD over 12 years, acute diarrhoea, 30 mg 3–4 times daily (range 15–60 mg)

Note As for schedule 2 controlled drugs, travellers needing to take codeine phosphate tablets abroad may require a doctor’s letter explaining why codeine is necessary.

CO-PHENOTROPE

A mixture of diphenoxylate hydrochloride and atropine sulphate in the mass proportions 100 parts to 1 part respectively

Indications adjunct to rehydration in acute diarrhoea (but see notes above); control of faecal consistency after colostomy or ileostomy (section 1.8)

Cautions see under Codeine Phosphate (section 4.7.2); also young children are particularly susceptible to overdosage and symptoms may be delayed and observation is needed for at least 48 hours after ingestion; presence of subclinical doses of atropine may give rise to atropine side-effects in susceptible individuals or in overdosage (section 1.2); interactions: Appendix 1 (antimuscarinics, opioid analgesics)

Contra-indications see under Antimuscarinics (section 1.2) and Codeine Phosphate (section 4.7.2); also jaundice

Side-effects see under Antimuscarinics (section 1.2) and Codeine Phosphate (section 4.7.2); also fever

Dose

- See preparations

Co-phenotrope (Non-proprietary) Tablets, co-phenotrope 2.5/0.025 (diphenoxylate hydrochloride 2.5 mg, atropine sulphate 25 micrograms), net price 20 = £1.79

Brands include Lomotil

Dose initially 4 tablets, followed by 2 tablets every 6 hours until diarrhoea controlled, CHILD under 4 years see BNF for Children, 4–9 years 1 tablet 3 times daily, 9–12 years 1 tablet 4 times daily, 12–16 years 2 tablets 3 times daily, but see also notes above

Note Co-phenotrope 2.5/0.025 can be sold to the public for adults and children over 16 years (provided packs do not contain more than 20 tablets) as an adjunct to rehydration in acute diarrhoea (max. daily dose 10 tablets)

LOPERAMIDE HYDROCHLORIDE

Indications symptomatic treatment of acute diarrhoea; adjunct to rehydration in acute diarrhoea in adults and children over 4 years (but see notes above); chronic diarrhoea in adults only

Cautions see notes above; also liver disease; pregnancy (Appendix 4); interactions: Appendix 1 (loperamide)

Contra-indications conditions where inhibition of peristalsis should be avoided, where abdominal distension develops, or in conditions such as active ulcerative colitis or antibiotic-associated colitis

Side-effects abdominal cramps, dizziness, drowsiness, and skin reactions including urticaria; paralytic ileus and abdominal bloating also reported

Dose

- Acute diarrhoea, 4 mg initially followed by 2 mg after each loose stool for up to 5 days; usual dose 6–8 mg daily; max. 16 mg daily; CHILD under 4 years not recommended; 4–8 years, 1 mg 3–4 times daily for up to 3 days only; 8–12 years, 2 mg 4 times daily for up to 5 days

- Chronic diarrhoea in adults, initially, 4–8 mg daily in divided doses, subsequently adjusted according to response and given in 2 divided doses for maintenance; max. 16 mg daily; CHILD under 18 years see BNF for Children

- Faecal incontinence [unlicensed indication], initially 500 micrograms daily, adjusted according to response; max. 16 mg daily in divided doses
Loperamide (Non-proprietary) ( council compliance)
Capsules, loperamide hydrochloride 2 mg, net price 30- cap pack = £1.07
Tablets, loperamide hydrochloride 2 mg, net price 30- tab pack = £2.15

Brands include Norimode

Note Loperamide can be sold to the public, for adults and children over 12 years, provided it is licensed and labelled for the treatment of acute diarrhoea

Imodium® (Janssen-Cilag) ( PH)
Capsules, green/grey, loperamide hydrochloride 2 mg. Net price 30-cap pack = £1.13
Syrup, red, sugar-free, loperamide hydrochloride 1 mg/5 mL. Net price 100 mL = 98p

Compound preparations
Imodium Plus (McNeil)
Caplets (= tablets), loperamide hydrochloride 2 mg, simeticone 125 mg, net price 6-tab pack = £2.14, 12- tab pack = £3.40

Dose acute diarrhoea with abdominal colic; initially 2 tablets or caplets (CHILD 12–18 years 1 tablet or caplet) then 1 tablet or caplet after each loose stool; max. 4 tablets or caplets daily for up to 2 days; CHILD under 12 years not recommended

MORPHINE

Indications see notes above; cough in terminal disease (section 3.9.1); pain (section 4.7.2)

Cautions see notes above and under Morphine Salts (section 4.7.2)

Contra-indications see notes above and under Morphine Salts (section 4.7.2)

Side-effects see notes above and under Morphine Salts (section 4.7.2); sedation and the risk of dependence are greater

Dose
• See preparation

Kaolin and Morphine Mixture, BP (Kaolin and Morphine Oral Suspension)
Oral suspension, light kaolin or light kaolin (natural) 20%, sodium bicarbonate 5%, and chloroform and morphine tincture 4% in a suitable vehicle. Contains anhydrous morphine 550–800 micrograms/10 mL.
Dose 10 mL every 6 hours in water

1.5 Chronic bowel disorders

Once tumours are ruled out individual symptoms of chronic bowel disorders need specific treatment including dietary manipulation as well as drug treatment and the maintenance of a liberal fluid intake.

Inflammatory bowel disease

Chronic inflammatory bowel diseases include ulcerative colitis and Crohn’s disease. Effective management requires drug therapy, attention to nutrition, and in severe or chronic active disease, surgery.

Aminosalicylates (balsalazide, mesalazaine, olsalazine, and sulfasalazine), and corticosteroids (hydrocortisone, budesonide, and prednisolone) form the basis of drug treatment.

Treatment of acute ulcerative colitis and Crohn’s disease

Acute mild to moderate disease affecting the rectum (proctitis) or the recto-sigmoid (distal colitis) is treated initially with local application of an aminosalicylate; alternatively, a local corticosteroid can be used but it is less effective. Foam preparations and suppositories are especially useful when patients have difficulty retaining liquid enemas.

Diffuse inflammatory bowel disease or disease that does not respond to local therapy requires oral treatment. Mild disease affecting the colon can be treated with an oral aminosalicylate alone; a combination of a local and an oral aminosalicylate may be used in distal colitis. Refractory or moderate inflammatory bowel disease usually requires adjunctive use of an oral corticosteroid such as prednisolone (section 1.5.2) for 4–8 weeks. Modified-release budesonide is licensed for Crohn’s disease affecting the ileum and the ascending colon; it causes fewer systemic side-effects than oral prednisolone but may be less effective. Beclometasone dipropionate by mouth is licensed as an adjunct to mesalazine for mild to moderate ulcerative colitis, but it is not known whether it is as effective as other corticosteroids.

Severe inflammatory bowel disease calls for hospital admission and treatment with an intravenous corticosteroid (such as hydrocortisone or methylprednisolone, section 6.3.2); other therapy may include intravenous fluid and electrolyte replacement, and possibly parenteral nutrition. Specialist supervision is required for patients who fail to respond adequately to these measures. Patients with severe ulcerative colitis that has not responded to intravenous corticosteroids, may benefit from a short course of intravenous ciclosporin [unlicensed indication] (section 1.5.3). Patients with unre sponsive or chronically active Crohn’s disease may benefit from azathioprine (section 1.5.3), mercaptopurine (section 1.5.3), or once-weekly methotrexate (section 1.5.3) [all unlicensed indications].

Infliximab is licensed for the management of severe active Crohn’s disease and moderate to severe ulcerative colitis in patients whose condition has not responded adequately to treatment with a corticosteroid and a conventional immunosuppressant or who are intolerant of them.

NICE guidance

Infliximab for Crohn’s disease (April 2002)
Infliximab is recommended for the treatment of severe active Crohn’s disease (with or without fistulae) when treatment with immunomodulating drugs and corticosteroids has failed or is not tolerated and when surgery is inappropriate. Treatment may be repeated if the condition responded to the initial course but relapsed subsequently. Infliximab should be prescribed only by a gastroenterologist.

NICE guidance

Infliximab for subacute manifestations of ulcerative colitis (April 2008)
Infliximab is not recommended for the treatment of subacute manifestations of moderate to severe active ulcerative colitis that would normally be managed in an outpatient setting.

Adalimumab is licensed for the treatment of severe active Crohn’s disease in patients whose condition has
not responded adequately to treatment with a cortisone and a conventional immunosuppressant, or who are intolerant of them. For inducing remission, adalimumab should be used in combination with a corticosteroid, but it may be given alone if a corticosteroid is inappropriate or is not tolerated. Adalimumab may also be used for Crohn’s disease in patients who have relapsed while taking infliximab or who cannot tolerate infliximab because of hypersensitivity reactions.

**Maintenance of remission of acute ulcerative colitis and Crohn’s disease** Smoking cessation (section 4.10) may reduce the risk of relapse in Crohn’s disease. Aminosalicylates are of great value in the maintenance of remission of ulcerative colitis. They are of less value in the maintenance of remission of Crohn’s disease; an oral formulation of mesalazine is licensed for the long-term management of ileal disease. Corticosteroids are not suitable for maintenance treatment because of their side-effects. In resistant or frequently relapsing cases either azathioprine (section 1.5.3) [unlicensed indication] or mercaptopurine (section 1.5.3) [unlicensed indication], given under close supervision may be helpful. Methotrexate (section 1.5.3) is tried in Crohn’s disease if azathioprine or mercaptopurine cannot be used [unlicensed indication]. Maintenance therapy with infliximab should be considered for patients with Crohn’s disease or ulcerative colitis who respond to the initial induction course of infliximab; fixed-interval dosing is superior to intermittent dosing. Adalimumab is licensed for maintenance therapy in Crohn’s disease.

**Fistulating Crohn’s disease** Treatment may not be necessary for simple, asymptomatic perianal fistulas. Metronidazole (section 5.1.11) or ciprofloxacin (section 5.1.12) may be beneficial for the treatment of fistulating Crohn’s disease [unlicensed indication]. Metronidazole by mouth is used at a dose of 10–20 mg/kg daily in divided doses (usual dose 400–500 mg 3 times daily); it is usually given for 1 month but no longer than 3 months because of concerns about developing peripheral neuropathy. Ciprofloxacin by mouth is given at a dose of 500 mg twice daily, usually for 2–3 weeks. Other antibacterials should be given if specifically indicated (e.g. sepis associated with fistulas and perianal disease) and for managing bacterial overgrowth in the small bowel. Fistulas may also require surgical exploration and local drainage.

Either azathioprine or mercaptopurine is used as a second-line treatment for fistulating Crohn’s disease and continued for maintenance [unlicensed indication]. Infliximab is used for fistulating Crohn’s disease refractory to conventional treatments and it can be continued as maintenance therapy. Adalimumab can be used if there is intolerance to infliximab [unlicensed indication].

**Adjunctive treatment of inflammatory bowel disease** Due attention should be paid to diet; high-fibre or low-residue diets should be used as appropriate. Irritable bowel syndrome during remission of ulcerative colitis calls for avoidance of a high-fibre diet and possible treatment with an antispasmodic (section 1.2). Antimotility drugs such as codeine and loperamide, and antispasmodic drugs may precipitate paralytic ileus and megacolon in active ulcerative colitis; treatment of the inflammation is more logical. Laxatives may be required in proctitis. Diarrhoea resulting from the loss of bile-salt absorption (e.g. in terminal ileal disease or bowel resection) may improve with colestyramine (section 1.9.2), which binds bile salts.

**Clostridium difficile infection** Antibiotic-associated colitis is caused by colonisation of the colon with *Clostridium difficile* which may follow antibiotic therapy. It is usually of acute onset, but may run a chronic course; it is a particular hazard of clindamycin but few antibiotics are free of this side-effect. Oral metronidazole (see section 5.1.11) or oral vancomycin (see section 5.1.7) are used as specific treatment; vancomycin may be preferred for very sick patients. Metronidazole can be given by intravenous infusion if oral treatment is inappropriate.

**Diverticular disease** Diverticular disease is treated with a high-fibre diet, bran supplements, and bulk-forming drugs (section 1.6.1). Antispasmodics may provide symptomatic relief when colic is a problem (section 1.2). Antibacterials are used only when the diverticula in the intestinal wall become infected (specialist referral). Antimotility drugs which slow intestinal motility, e.g. codeine, diphenoxylate, and loperamide could possibly exacerbate the symptoms of diverticular disease and are contra-indicated.

**Irritable bowel syndrome** Irritable bowel syndrome can present with pain, constipation, or diarrhea. In some patients there may be important psychological aggravating factors which respond to reassurance and possibly specific treatment e.g. with an antidepressant.

The fibre intake of patients with irritable bowel syndrome should be reviewed. If an increase in dietary fibre is required, soluble fibre (e.g. ispaghula husk, sterculia, or oats) is recommended; insoluble fibre (e.g. bran) should be avoided. A laxative (section 1.6) can be used to treat constipation. An osmotic laxative, such as a macrogol, is preferred; lactulose may cause bloating. Loperamide (section 1.4.2) may relieve diarrhoea and antispasmodic drugs (section 1.2) may relieve pain. Opioids with a central action, such as codeine, are better avoided because of the risk of dependence.

A tricyclic antidepressant (section 4.3.1) can be used for abdominal pain or discomfort [unlicensed indication] in patients who have not responded to laxatives, loperamide, or antispasmodics. Low doses of a tricyclic antidepressant are used (e.g. amitriptyline, initially 5–10 mg each night, increased if necessary in steps of 10 mg at intervals of at least 2 weeks to max. 30 mg each night). A selective serotonin reuptake inhibitor (section 4.3.3) may be considered in those who do not respond to a tricyclic antidepressant [unlicensed indication].

**Malabsorption syndromes** Individual conditions need specific management and also general nutritional consideration. Coeliac disease (gluten enteropathy) usually needs a gluten-free diet and pancreatic insufficiency needs pancreatin supplements (section 1.9.4)

For further information on foods for special diets (ACBS), see Appendix 7.
1.5.1 Aminosalicylates

Sulfasalazine is a combination of 5-aminosalicylic acid (‘5-ASA’) and sulfapyridine; sulfapyridine acts only as a carrier to the colonic site of action but still causes side-effects. In the newer aminosalicylates, mesalazine (5-aminosalicylic acid), balsalazide (a prodrug of 5-aminosalicylic acid) and olsalazine (a dimer of 5-aminosalicylic acid) which cleaves in the lower bowel), the sulfonamide-related side-effects of sulfasalazine are avoided, but 5-aminosalicylic acid alone can still cause side-effects including blood disorders (see recommendation below) and lupus-like syndrome also seen with sulfasalazine.

Cautions Renal function should be monitored before starting an oral aminosalicylate, at 3 months of treatment, and then annually during treatment (more frequently in renal impairment). Aminosalicylates should be used with caution in renal impairment (Appendix 3); blood disorders can occur (see recommendation below) and during pregnancy (Appendix 4) and breast-feeding (Appendix 5); blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, peripheral neuropathy, blood disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

Contra-indications Aminosalicylates should be avoided in salicylate hypersensitivity.

Side-effects Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

Blood disorders Patients receiving aminosalicylates should be advised to report any unexplained bleeding, bruising, purpura, sore throat, fever or malaise that occurs during treatment. A blood count should be performed and the drug stopped immediately if there is suspicion of a blood dyscrasia.

Contra-indications Aminosalicylates should be avoided in salicylate hypersensitivity.

Side-effects Side-effects of the aminosalicylates include diarrhoea, nausea, vomiting, abdominal pain, exacerbation of symptoms of colitis, headache, hypersensitivity reactions (including rash and urticaria); side-effects that occur rarely include acute pancreatitis, hepatitis, myocarditis, pericarditis, lung disorders (including eosinophilia and fibrosing alveolitis), peripheral neuropathy, blood disorders (including agranulocytosis, aplastic anaemia, leucopenia, methaemoglobinemia, neutropenia, and thrombocytopenia—see also recommendation above), renal dysfunction (interstitial nephritis, nephrotic syndrome), myalgia, arthralgia, skin reactions (including lupus erythematosus-like syndrome, Stevens-Johnson syndrome), alopecia.

BALSALAZIDE SODIUM

Indications treatment of mild to moderate ulcerative colitis and maintenance of remission

Cautions see notes above; also history of asthma; interactions: Appendix 1 (aminosalicylates)

Blood disorders See recommendation above

Contra-indications see notes above; also severe hepatic impairment

Side-effects see notes above; also severe hepatic impairment

Dose

- Acute attack, 2.25 g 3 times daily until remission occurs or for up to max. 12 weeks
- Maintenance, 1.5 g twice daily, adjusted according to response (max. 6 g daily)
- CHILD under 18 years, see BNF for Children

Colazide® (Shire) Tablets, beige, balsalazide sodium 750 mg. Net price 130-cap pack = £39.00. Label: 21, 25, counselling, blood disorder symptoms (see recommendation above)

MESALAZINE

Indications treatment of mild to moderate ulcerative colitis and maintenance of remission; see also under preparations

Cautions see notes above; elderly; interactions: Appendix 1 (aminosalicylates)

Blood disorders See recommendation above

Contra-indications see notes above; also severe hepatic impairment (Appendix 2)

Side-effects see notes above

Dose

- See under preparations, below

Note The delivery characteristics of oral mesalazine preparations may vary; these preparations should not be considered interchangeable

Asacol® (Procter & Gamble Pharm.) Foam enema, mesalazine 1 g/ metered application, net price 14-application canister with disposable applicators and plastic bags = £28.37. Counselling, blood disorder symptoms (see recommendation above)

Excipients include disodium edetate, hydroxybenzoates (parabens), polysorbate 20, sodium metabisulphite

Dose acute attack affecting the rectosigmoid region, 1 metered application (mesalazine 1 g) into the rectum daily for 4–6 weeks; acute attack affecting the descending colon, 2 metered applications (mesalazine 2 g) once daily for 4–6 weeks; CHILD 12–18 years, see BNF for Children

Suppositories, mesalazine 250 mg, net price 20-suppos pack = £5.12; 500 mg, 10-suppos pack = £5.12. Counselling, blood disorder symptoms (see recommendation above)

Dose acute attack or maintenance, by rectum 0.75–1.5 g daily in divided doses, with last dose at bedtime; CHILD 12–18 years, see BNF for Children

Asacol® MR (Procter & Gamble Pharm.) Tablets, red, e/c, mesalazine 400 mg, net price 90-tab pack = £31.22, 120-tab pack = £41.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ulcerative colitis, acute attack, 2.4 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see BNF for Children

Suppositories, red-brown, e/c, mesalazine 800 mg, net price 180-tab pack = £124.86. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ADULT over 18 years, ulcerative colitis, acute attack, 2.4–4.8 g daily in divided doses; maintenance of remission of ulcerative colitis and Crohn’s ileo-colitis, up to 2.4 g daily in divided doses

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine

Ipolcol® (Sandoz) Tablets, e/c, mesalazine 400 mg, net price 120-tab pack = £41.62. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose acute attack, 2.4 g daily in divided doses; maintenance, 1.2–2.4 g daily in divided doses; CHILD 12–18 years, see BNF for Children

Note Preparations that lower stool pH (e.g. lactulose) may prevent release of mesalazine
Mesren® MR (IvAX) Tablets, red-brown, e/c, mesalazine 400 mg; net price 90-tab pack = £20.29, 120-tab pack = £27.05. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ADULT and CHLD over 12 years, acute attack, 2.4 g daily in divided doses, maintenance, 1.2–2.4 g daily in divided doses

Mezavant® XL (Shire) Tablets, m/r, red-brown, e/c, mesalazine 1.2 g; net price 60-tab pack = £62.44. Label: 21, 25, counselling, blood disorder symptoms (see recommendations above)

Dose ADULT over 18 years, acute attack, 2.4 g once daily, increase if necessary to 4.8 g once daily (review treatment at 8 weeks); maintenance, 2.4 g once daily

Pentasa® (Ferring) Tablets, m/r, scored, mesalazine 500 mg (grey), net price 100-tab pack = £25.48. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 15 years, acute attack, up to 4 g daily in 2–3 divided doses; maintenance, 1.5 g daily in 2–3 divided doses; tablets may be dispersed in water, but should not be chewed; CHILD 5–15 years see BNF for Children

Granules, m/r, pale brown, mesalazine 1 g/sachet, net price 50-sachet pack = £30.02; 2 g/sachet, 60-sachet pack = £72.05. Counselling, administration, see dose, blood disorder symptoms (see recommendation above)

Dose acute attack, up to 4 g daily in 2–4 divided doses; maintenance, 2 g once daily; granules should be placed on tongue and washed down with water or orange juice without chewing; CHILD 5–12 years see BNF for Children

Retention enema, mesalazine 1 g in 100-mL pack. Net price 7 enemas = £18.09. Counselling, blood disorder symptoms (see recommendation above)

Dose by rectum 1 enema at bedtime; CHILD not recommended

Suppositories, mesalazine 1 g. Net price 28-suppos pack = £41.55. Counselling, blood disorder symptoms (see recommendation above)

Dose by rectum ulcerative proctitis, ADULT and CHILD over 15 years, acute attack, 1 g daily for 2–4 weeks; maintenance, 1 g daily; CHILD 12–15 years see BNF for Children

Salofalk® (Dr Falk) Tablets, e/c, yellow, mesalazine 250 mg. Net price 100-tab pack = £17.40. Label: 5, 25, counselling, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 15 years, acute attack, 1.5 g daily in 3 divided doses; maintenance, 0.75–1.5 g daily in divided doses

Granules, m/r, grey, e/c, vanilla-flavoured, mesalazine 500 mg/sachet, net price 100-sachet pack = £29.30; 1 g/sachet, 50-sachet pack = £29.30; 1.5 g/sachet, 60-sachet pack = £49.80. Label: 25, counselling, administration, see dose, blood disorder symptoms (see recommendation above)

Suppositories, mesalazine 500 mg. Net price 30-suppos pack = £15.90. Counselling, blood disorder symptoms (see recommendation above)

Dose ADULT and CHILD over 15 years, acute attack, by rectum, 0.5–1 g 2–3 times daily adjusted according to response; CHILD 12–15 years, see BNF for Children

Enema, mesalazine 2 g in 59-mL pack. Net price 7 enemas = £31.20. Counselling, blood disorder symptoms (see recommendation above)

Dose acute attack or maintenance, by rectum, 2 g daily at bedtime; CHILD 12–18 years, see BNF for Children

Rectal foam, mesalazine 1 g/metered application, net price 14-application canister with disposable applicators and plastic bags = £31.10. Counselling, blood disorder symptoms (see recommendation above)

Excipients include cetostearyl alcohol, disodium edetate, polysorbate 60, propylene glycol, sodium metabisulphate

Dose mild ulcerative colitis affecting sigmoid colon and rectum, ADULT and CHILD over 12 years, 2 metered applications (mesalazine 2 g) into the rectum at bedtime increased if necessary to 2 metered applications (mesalazine 2 g) twice daily

Olsalazine Sodium

Indications treatment of mild ulcerative colitis and maintenance of remission

Cautions see notes above; interactions: Appendix 1 (aminosalicylates)

Blood disorders See recommendation above

Contra-indications see notes above

Side-effects see notes above; also watery diarrhoea

Dose
- ADULT and CHILD over 12 years, acute attack, 1 g daily in divided doses after meals increased if necessary over 1 week to max. 3 g daily (max. single dose 1 g); maintenance, 500 mg twice daily after meals
- CHILD under 12 years see BNF for Children

Dipentum® (UCB Pharma) Capsules, brown, olsalazine sodium 250 mg. Net price 112-cap pack = £20.57. Label: 21, counselling, blood disorder symptoms (see recommendation above)

Tablets, yellow, scored, olsalazine sodium 500 mg. Net price 60-tab pack = £22.04. Label: 21, counselling, blood disorder symptoms (see recommendation above)

Sulfasalazine (Sulphasalazine)

Indications treatment of mild to moderate and severe ulcerative colitis and maintenance of remission; active Crohn's disease; rheumatoid arthritis (section 10.1.3)

Cautions see notes above; also history of allergy; hepatic impairment; G6PD deficiency (section 9.1.5); slow acetylator status; risk of haematological and hepatic toxicity (differential white cell, red cell and platelet counts initially and at monthly intervals for first 3 months); liver function tests at monthly intervals for first 3 months); upper gastro-intestinal side-effects common over 4 g daily; acute porphyria (section 9.8.2); interactions: Appendix 1 (aminosalicylates)

Blood disorders See recommendation above

Contra-indications see notes above; also sulphasalazine and olsalazine

Side-effects see notes above; also loss of appetite; fever; blood disorders (including Heinz body anaemia, megaloblastic anaemia); hypersensitivity reactions (including exfoliative dermatitis, epidermal necrolysis, pruritus, photosensitisation, anaphylaxis, serum sickness); ocular complications (including peri-orbital oedema); stomatitis, parotitis; ataxia, aseptic meningitis, vertigo, tinnitus, insomnia, depression, hallucinations; kidney reactions (including proteinur-
ia, crystalluria, haematuria); oligosperma; urine may be coloured orange; some soft contact lenses may be stained

**Dose**

- **By mouth**, acute attack 1–2 g 4 times daily (but see **cautions** until remission occurs (if necessary corticosteroids may also be given), reducing to a maintenance dose of 500 mg 4 times daily; **CHILD** over 2 years, acute attack 40–60 mg/kg daily, maintenance dose 20–30 mg/kg daily
- **By rectum**, in suppositories, alone or in conjunction with oral treatment 0.5–1 g morning and night after a bowel movement

**Sulfasalazine** (Non-proprietary) *(Non-proprietary)*

- **Tablets**, sulfasalazine 500 mg. Net price 112 = £9.21. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
- **Tablets**, e/c, sulfasalazine 500 mg. **NET** price 112-tab pack = £21.52. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**Brands include** Salazine EC

**Salazopyrin** *(Pharmacia)* *(Pharmacia)*

- **Tablets**, yellow, scored, sulfasalazine 500 mg. Net price 112-tab pack = £8.97. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
- **EN-Tabs** *(= tablets e/c)*, yellow, f/c, sulfasalazine 500 mg. **NET** price 112-tab pack = £8.43. Label: 5, 14, 25, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
- **Suspension**, yellow, sulfasalazine 250 mg/5 mL. **NET** price 500 mL = £18.84. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained
- **Suppositories**, yellow, sulfasalazine 500 mg. **NET** price 10 = £3.30. Label: 14, counselling, blood disorder symptoms (see recommendation above), contact lenses may be stained

**BUDESONIDE**

**Indications** see preparations

**Cautions** section 6.3.2; **interactions**: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Side-effects** section 6.3.2

**Dose**

- See preparations

**Budenofalk** *(Dr Falk)* *(Dr Falk)*

- **Capsules**, pink, enclosing e/c pellets, budesonide 3 mg, **NET** price 100-cap pack = £76.70. Label: 5, 10, steroid card, 22, 25
- **Dose** mild to moderate Crohn’s disease affecting ileum or ascending colon, chronic diarrhoea due to collagenous colitis, **ADULT** over 18 years, 3 mg 3 times daily for up to 8 weeks; reduce dose for the last 2 weeks of treatment (see also section 6.3.2), **CHILD** 12–18 years, see **BNF for Children**

**Rectal foam**, budesonide 2 mg/metered application, net price 14-application canister with disposable applicators and plastic bags = £58.22

**Excipients** include cetyl alcohol, disodium edetate, propylene glycol, sorbic acid
- **Dose** ulcerative colitis affecting sigmoid colon and rectum, **by rectum**; **ADULT** over 18 years, 1 metered application (budesonide 2 mg) once daily for up to 8 weeks

**Entocort** *(AstraZeneca)* *(AstraZeneca)*

- **CR Capsules**, grey/pink, enclosing e/c pellets, m/r granules, budesonide 3 mg, **NET** price 100-cap pack = £99.00. Label: 5, 10, steroid card, 25
- **Note** Dispense in original container (contains desiccant)
- **Dose** mild to moderate Crohn’s disease affecting the ileum or ascending colon, 9 mg once daily in the morning for up to 8 weeks; reduce dose for the last 2–4 weeks of treatment (see also section 6.3.2), **CHILD** 12–18 years, see **BNF for Children**

**Enema**, budesonide 2 mg/100 mL when dispersible tablet reconstituted in isotonic saline vehicle, net price pack of 7 dispersible tablets and bottles of vehicle = £33.00
- **Dose** ulcerative colitis involving rectal and recto-sigmoid disease, **by rectum**; 1 enema at bedtime for 4 weeks; **CHILD** 12–18 years, see **BNF for Children**

**HYDROCORTISONE**

**Indications** ulcerative colitis, proctitis, proctosigmoiditis

**Cautions** section 6.3.2; systemic absorption may occur; prolonged use should be avoided

**Contra-indications** intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

**Side-effects** section 6.3.2; also local irritation

**Dose**

- **By rectum** see preparations

**Colifoam** *(Meda)* *(Meda)*

- **Foam** in aerosol pack, hydrocortisone acetate 10%, net price 14-application canister with applicator = £8.21
- **Excipients** include cetyl alcohol, hydroxybenzoates (parabens), propylene glycol
- **Dose** initially 1 metered application (125 mg hydrocortisone acetate) inserted into the rectum once or twice daily for 2–3 weeks, then once on alternate days, **CHILD** 2–18 years, see **BNF for Children**

**1.5.2 Corticosteroids**

For the role of corticosteroids in acute ulcerative colitis and Crohn’s disease, see Inflammatory Bowel Disease, p. 52.

**BECLOMETASONE DIPROPIONATE**

**Indications** adjunct to aminosalicylates in acute mild to moderate ulcerative colitis; asthma (section 3.2); allergic and vasomotor rhinitis (section 12.2.1); oral ulceration [unlicensed indication] (section 12.3.1)

**Cautions** section 6.3.2; **interactions**: Appendix 1 (corticosteroids)

**Contra-indications** section 6.3.2

**Side-effects** section 6.3.2; also nausea, constipation, headache, and drowsiness

**Dose**

- 5 mg in the morning; max. duration of treatment 4 weeks; **CHILD** safety and efficacy not established

**Clipper** *(Trinity-Chiesi)* *(Trinity-Chiesi)*

- **Tablets**, m/r, ivory, beclometasone dipropionate 5 mg, **NET** price 30-tab pack = £60.00. Label: 25
**PREDNISOLONE**

**Indications** ulcerative colitis, and Crohn’s disease; other indications, see section 6.3.2, see also preparations

**Cautions** section 6.3.2; systemic absorption may occur with rectal preparations; prolonged use should be avoided

**Contra-indications** section 6.3.2; intestinal obstruction, bowel perforation, recent intestinal anastomoses, extensive fistulas; untreated infection

**Side-effects** section 6.3.2

**Dose**
- **By mouth**, initially 20–40 mg daily (or up to 1 mg/kg daily) preferably taken in the morning after breakfast; continued until remission occurs, followed by reducing doses
- **By rectum**, see preparations

**Oral preparations** Section 6.3.2

**Rectal preparations**

**Predenema®** (Forest)
- **Retention enema**, prednisolone 20 mg (as sodium metasulphobenzoate) in 100-mL single-dose disposable pack. Net price 1 (standard tube) = £1.21

**Dose** ulcerative colitis, by rectum, **ADULT** and **CHILD** over 12 years, initially 20 mg at bedtime for 2–4 weeks, continued if good response

**Predfoam®** (Forest)
- **Foam** in aerosol pack, prednisolone 20 mg (as metasulphobenzoate sodium)/metered application, net price 14-application canister with disposable applicators = £6.32

**Excipients** include cetostearyl alcohol, disodium edetate, polysorbate 20, sorbic acid

**Dose** proctitis and distal ulcerative colitis, 1 metered application (20 mg prednisolone) inserted into the rectum once or twice daily for 2 weeks, continued for further 2 weeks if good response; **CHILD** not recommended

**Predsol®** (UCB Pharma)
- **Retention enema**, prednisolone 20 mg (as sodium phosphate) in 100-mL single-dose disposable packs fitted with a nozzle. Net price 7 = £7.50

**Dose** rectal and rectosigmoidal ulcerative colitis and Crohn’s disease, **by rectum**, initially 20 mg at bedtime for 2–4 weeks, continued if good response; **CHILD** not recommended

**Suppositories**, prednisolone 5 mg (as sodium phosphate). Net price 10 = £1.40

**Dose** **ADULT** and **CHILD** proctitis and rectal complications of Crohn’s disease, **by rectum**, 5 mg inserted night and morning after a bowel movement

---

**AZATHIOPRINE**

**Indications** see under Inflammatory Bowel Disease, p. 52; autoimmune conditions and prophylaxis of transplant rejection (section 8.2.1); rheumatoid arthritis (section 10.1.3)

**Cautions** section 8.2.1

**Contra-indications** section 8.2.1

**Side-effects** section 8.2.1; also severe diarrhoea

**Dose**
- Severe acute Crohn’s disease, maintenance of remission of Crohn’s disease or ulcerative colitis [unlicensed indications], **ADULT** over 18 years, **by mouth**, 2–2.5 mg/kg daily; some patients may respond to lower doses

**Preparations** Section 8.2.1

---

**CICLOSPORIN** (Cyclosporin)

**Indications** severe acute ulcerative colitis refractory to corticosteroid treatment [unlicensed indication]; transplantation and graft-versus-host disease, nephrotic syndrome (section 8.2.2); rheumatoid arthritis (section 10.1.3); atopic dermatitis and psoriasis (section 13.5.3)

**Cautions** section 8.2.2

**Contra-indications** section 8.2.2

**Side-effects** section 8.2.2

**Dose**
- **By continuous intravenous infusion**, **ADULT** over 18 years, 2 mg/kg daily over 24 hours; dose adjusted according to blood-ciclosporin concentration and response

**Preparations** Section 8.2.2

---

**MERCAPTOPURINE**

**Indications** see under Inflammatory Bowel disease, p. 52; acute leukaemias and chronic myeloid leukaemia (section 8.1.3)

**Cautions** section 8.1.3

**Contra-indications** section 8.1.3

**Side-effects** section 8.1.3

**Dose**
- Severe acute Crohn’s disease, maintenance of remission of Crohn’s disease or ulcerative colitis [unlicensed indications], **ADULT** over 18 years, **by mouth**, 1–1.5 mg/kg daily; some patients may respond to lower doses

**Preparations** Section 8.1.3

---

**METHOTREXATE**

**Indications** see under Inflammatory Bowel Disease, p. 52; malignant disease (section 8.1.3); rheumatoid arthritis (section 10.1.3); psoriasis (section 13.5.3)

**Cautions** section 10.1.3

**Contra-indications** section 10.1.3

**Side-effects** section 10.1.3

---

1.5.3 Drugs affecting the immune response

For the role of azathioprine, ciclosporin, mercaptopurine, and methotrexate in the treatment of inflammatory bowel disease, see p. 52.
Dose

- Severe Crohn's disease [unlicensed indication], ADULT over 18 years, by intramuscular injection, induction of remission, 25 mg once weekly; maintenance, 15 mg once weekly

Important
Note that the above dose is a weekly dose. To avoid error with low-dose methotrexate, it is recommended that:

- the patient is carefully advised of the dose and frequency and the reason for taking methotrexate and any other prescribed medicine (e.g. folic acid);
- the prescription and the dispensing label clearly show the dose and frequency of methotrexate administration;
- the patient is warned to report immediately the onset of any feature of blood disorders (e.g. sore throat, bruising, and mouth ulcers), liver toxicity (e.g. nausea, vomiting, abdominal discomfort, and dark urine), and respiratory effects (e.g. shortness of breath).

Preparations
Section 10.1.3

Cytokine modulators

Infliximab and adalimumab are monoclonal antibodies which inhibit the pro-inflammatory cytokine, tumour necrosis factor alpha. They should be used under specialist supervision. Adequate resuscitation facilities must be available when infliximab is used.

ADALIMUMAB

Indications see under Inflammatory Bowel Disease, p. 52; ankylosing spondylitis, psoriatic arthritis, rheumatoid arthritis, juvenile idiopathic arthritis, (section 10.1.3); psoriasis (section 13.5.3)

Cautions section 10.1.3

Contra-indications section 10.1.3

Side-effects section 10.1.3

Dose

- By subcutaneous injection, severe active Crohn's disease, ADULT over 18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks after initial dose; then if the condition has responded, maintenance either 5 mg/kg 6 weeks after initial dose, then 5 mg/kg every 8 weeks or further dose of 5 mg/kg if signs and symptoms recur; CHILD 6–18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then 5 mg/kg every 8 weeks; interval between maintenance doses adjusted according to response; discontinue if no response within 10 weeks of initial dose

Fistulating Crohn's disease, ADULT over 18 years, initially 5 mg/kg, then 5 mg/kg 2 weeks and 6 weeks after initial dose, then if condition has responded, consult product literature for guidance on further doses; CHILD under 18 years, see BNF for Children

SODIUM CROMOGLICATE (sodium cromoglycate) may be helpful as an adjunct to dietary avoidance.

Preparations
Section 10.1.3

1.5.4 Food allergy

Allergy with classical symptoms of vomiting, colic and diarrhoea caused by specific foods such as shellfish should be managed by strict avoidance. The condition should be distinguished from symptoms of occasional food intolerance in those with irritable bowel syndrome.

Preparations
Section 10.1.3

SODIUM CROMOGLICATE

(Sodium cromoglycate)

Indications food allergy (in conjunction with dietary restriction); asthma (section 3.3); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

Side-effects occasional nausea, rashes, and joint pain

Dose

- 200 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response; CHILD 2–14 years 100 mg 4 times daily before meals; may be increased if necessary after 2–3 weeks to a max. of 40 mg/kg daily and then reduced according to response

Counselling Capsules may be swallowed whole or the contents dissolved in hot water and diluted with cold water before taking

Nalcrom® (Sanofi-Aventis) ™
Capsules, sodium cromoglicate 100 mg. Net price 100-cap pack = £62.17. Label: 22, counselling, see dose above
Before prescribing laxatives it is important to be sure that the patient is constipated and that the constipation is not secondary to an underlying undiagnosed complaint.

It is also important for those who complain of constipation to understand that bowel habit can vary considerably in frequency without doing harm. Some people tend to consider themselves constipated if they do not have a bowel movement each day. A useful definition of constipation is the passage of hard stools less frequently than the patient’s own normal pattern and this can be explained to the patient.

Misconceptions about bowel habits have led to excessive laxative use. Abuse may lead to hypokalaemia. Thus, laxatives should generally be avoided except where straining will exacerbate a condition (such as angina) or increase the risk of rectal bleeding as in haemorrhoids. Laxatives are also of value in drug-induced constipation, for the expulsion of parasites after anthelmintic treatment, and to clear the alimentary tract before surgery and radiological procedures. Prolonged treatment of constipation is sometimes necessary.

Children Laxatives should be prescribed by a healthcare professional experienced in the management of constipation in children. Delays of greater than 3 days between stools may increase the likelihood of pain on passing hard stools leading to anal fissure, anal spasm and eventually to a learned response to avoid defaecation.

If increased fluid and fibre intake is insufficient, an osmotic laxative containing macrogol or lactulose (section 1.6.4) can be used. If there is evidence of minor faecal retention, the addition of a stimulant laxative (section 1.6.2) may overcome withholding but may lead to colic or, in the presence of faecal impaction in the rectum, an increase of faecal overflow.

In children with faecal impaction, an oral preparation containing macrogol is used to clear faecal mass and to establish and maintain soft well-formed stools. Rectal administration of laxatives may be effective but this route is frequently distressing for the child and may lead to persistent withholding. If the impacted mass is not expelled following treatment with macrogol, referral to hospital may be necessary. Enemas may be administered under heavy sedation in hospital or alternatively, a bowel cleansing solution (section 1.6.5) may be tried. In severe cases or where the child is afraid, a manual evacuation under anaesthetic may be appropriate.

Long-term regular use of laxatives is essential to maintain well-formed stools and prevent recurrence of faecal impaction; intermittent use may provoke relapses.

For children with chronic constipation, it may be necessary to exceed the licensed doses of some laxatives. Parents and carers of children should be advised to adjust the dose of laxative in order to establish a regular pattern of bowel movements in which stools are soft, well-formed, and passed without discomfort.

Pregnancy If dietary and lifestyle changes fail to control constipation in pregnancy, moderate doses of poorly absorbed laxatives may be used. A bulk-forming laxative should be tried first. An osmotic laxative, such as lactulose, can also be used. Bisacodyl or senna may be suitable, if a stimulant effect is necessary.

The laxatives that follow have been divided into 5 main groups (sections 1.6.1–1.6.5). This simple classification disguises the fact that some laxatives have a complex action.

### 1.6.1 Bulk-forming laxatives

Bulk-forming laxatives relieve constipation by increasing faecal mass which stimulates peristalsis; patients should be advised that the full effect may take some days to develop.

Bulk-forming laxatives are of particular value in those with small hard stools, but should not be required unless fibre cannot be increased in the diet. A balanced diet, including adequate fluid intake and fibre is of value in preventing constipation.

Bulk-forming laxatives are useful in the management of patients with colostomy, ileostomy, haemorrhoids, anal fissure, chronic diarrhoea associated with diverticular disease, irritable bowel syndrome, and as adjuncts in ulcerative colitis (section 1.5). Adequate fluid intake must be maintained to avoid intestinal obstruction. Unprocessed wheat bran, taken with food or fruit juice, is a most effective bulk-forming preparation. Finely ground bran, though more palatable, has poorer water-retaining properties, but can be taken as bran bread or biscuits in appropriately increased quantities. Oat bran is also used.

Methylcellulose, ispaghula, and ster culia are useful in patients who cannot tolerate bran. Methylcellulose also acts as a faecal softener.

#### ISPAGHULA HUSK

**Indications** see notes above

**Cautions** adequate fluid intake should be maintained to avoid intestinal obstruction—it may be necessary to supervise elderly or debilitated patients or those with intestinal narrowing or decreased motility

**Contra-indications** difficulty in swallowing, intestinal obstruction, colonic atony, faecal impaction

**Side-effects** flatulence, abdominal distension, gastrointestinal obstruction or impaction; hypersensitivity reported

**Dose**

• See preparations below

**Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed
1.6.2 Stimulant laxatives

Stimulant laxatives include bisacodyl and members of the anthraquinone group, senna and dantron (danthon). The indications for dantron are limited (see below) by its potential carcinogenicity (based on rodent carcinogenicity studies) and evidence of genotoxicity. Powerful stimulants such as cascara (an anthraquinone) and castor oil are obsolete. Docusate sodium probably acts both as a stimulant and as a softening agent.

Stimulant laxatives increase intestinal motility and often cause abdominal cramp; they should be avoided in intestinal obstruction. Excessive use of stimulant laxatives can cause diarrhoea and related effects such as hypokalaemia; however, prolonged use may be justifiable in some circumstances (see section 1.6 for the use of stimulant laxatives in children).

Glycerol suppositories act as a rectal stimulant by virtue of the mildly irritant action of glycerol. The parasymphathomimetics bethanechol, distigmine, neostigmine, and pyridostigmine (see section 7.4.1 and section 10.2.1) enhance parasympathetic activity in the gut and increase intestinal motility. They are rarely used for their gastro-intestinal effects. Organic obstruction of the gut must first be excluded and they should not be used shortly after bowel anastomosis.

### METHYCELLULOSE

**Indications** see notes above; adjunct in obesity (but see section 4.5.1)

**Cautions** see under Ispaghula Husk

**Contra-indications** see under Ispaghula Husk; also infective bowel disease

**Side-effects** see under Ispaghula Husk

**Dose**

- See preparations below

  **Counselling** Preparations that swell in contact with liquid should always be carefully swallowed with water and should not be taken immediately before going to bed

---

**BISACODYL**

**Indications** see under Dose

**Cautions** see notes above; pregnancy, see p. 59

**Contra-indications** see notes above, acute surgical abdominal conditions, acute inflammatory bowel disease, severe dehydration

**Side-effects** see notes above; tablets, griping; suppositories, local irritation
### Dose

- **Constipation. by mouth;** 5–10 mg at night; **CHILD** (but see section 1.6) 4–10 years (on medical advice only) 5 mg at night, over 10 years, adult dose

**By rectum** in suppositories, 10 mg in the morning; **CHILD** (but see section 1.6) under 10 years (on medical advice only) 5 mg, over 10 years, adult dose

- Before radiological procedures and surgery, **by mouth,** 10–20 mg the night before procedure and **by rectum** in suppositories, 10 mg the following morning; **CHILD** 4–10 years **by mouth,** 5 mg the night before procedure and **by rectum** in suppositories, 5 mg the following morning; over 10 years, adult dose

**Note** tablets act in 10–12 hours; suppositories act in 20–60 minutes

### Bisacodyl (Non-proprietary)

**Tablets,** e/c, bisacodyl 5 mg. Net price 20 = 65p. Label: 5, 25

**Suppositories,** bisacodyl 10 mg. Net price 12 = 89p

**Paediatric suppositories,** bisacodyl 5 mg. Net price 5 = 94p

**Note** The brand name Dulcolax (Boehringer Ingelheim) is used for bisacodyl tablets. Net price 10-tab pack = 74p; suppositories (10 mg), 10 = £1.57; paediatric suppositories (5 mg), 5 = 94p.

The brand names Dulcolax, Liquid and Dulcolax Perles are used for sodium picosulfate preparations

### DANTRON (Danthron)

**Indications** only for constipation in terminally ill patients of all ages

**Cautions** see notes above; rodent studies indicate potential carcinogenic risk; avoid prolonged contact with skin (as in incontinent patients or infants wearing nappies)—risk of irritation and excoriation; pregnancy (Appendix 4) and breastfeeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above; urine may be coloured red

**Dose**

- See under preparations

**With poloxamer ‘188’ (as co-danthramer)**

**Note** Co-danthramer suspension 5 mL = one co-danthramer capsule, but strong co-danthramer suspension 5 mL = two strong co-danthramer capsules

**Co-danthramer (Non-proprietary)**

**Capsules,** co-danthramer 25/200 (dantron 25 mg, poloxamer ‘188’ 200 mg). Net price 60-cap pack = £12.86. Label: 14, (urine red)

**Dose** 1–2 capsules at bedtime; **CHILD** 1 capsule at bedtime (restricted indications, see notes above)

**Strong capsules,** co-danthramer 37.5/500 (dantron 37.5 mg, poloxamer ‘188’ 500 mg). Net price 60-cap pack = £15.55. Label: 14, (urine red)

**Dose** **ADULT** and **CHILD** over 12 years, 1–2 capsules at bedtime (restricted indications, see notes above)

**Suspension,** co-danthramer 25/200 in 5 mL (dantron 25 mg, poloxamer ‘188’ 200 mg/5 mL). Net price 300 mL = £11.27, 1 litre = £37.57. Label: 14, (urine red)

**Dose** 5–10 mL at night; **CHILD** 2.5–5 mL (restricted indications, see notes above)

**Brands include** Codalax, Danlax

**With docusate sodium (as co-danthrusate)**

**Co-danthrusate (Non-proprietary)**

**Capsules,** co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg). Net price 63-cap pack = £14.50. Label: 14, (urine red)

**Dose** 1–3 capsules at night; **CHILD** 6–12 years 1 capsule at night (restricted indications, see notes above)

**Brands include** Normax

**Suspension,** yellow, co-danthrusate 50/60 (dantron 50 mg, docusate sodium 60 mg/5 mL). Net price 200 mL = £8.75. Label: 14, (urine red)

**Dose** 5–15 mL at night; **CHILD** 6–12 years 5 mL at night (restricted indications, see notes above)

**Brands include** Normax

### Docusate Sodium (Dicetyl sodium sulphosuccinate)

**Indications** constipation, adjunct in abdominal radiological procedures

**Cautions** see notes above; do not give with liquid paraffin; rectal preparations not indicated if haemorrhoids or anal fissure; pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- **By mouth,** chronic constipation, up to 500 mg daily in divided doses; **CHILD** (but see section 1.6) 6 months–2 years 12.5 mg 3 times daily, 2–12 years 12.5–25 mg 3 times daily (use paediatric oral solution only)

**Note** Oral preparations act within 1–2 days

With barium meal, **ADULT** and **CHILD** over 12 years, 400 mg

**Dicolyt** (UCB Pharma)

**Capsules,** yellow/white, docusate sodium 100 mg, net price 30-cap pack = £2.40, 100-cap pack = £8.00

**Docusol** (Typharm)

**Adult oral solution,** sugar-free, docusate sodium 50 mg/5 mL, net price 300 mL = £2.48

**Paediatric oral solution,** sugar-free, docusate sodium 12.5 mg/5 mL, net price 300 mL = £1.63

**Rectal preparations**

**Norgalax Micro-enema** (Norgine)

**Enema,** docusate sodium 120 mg in 10-g single-dose disposable packs. Net price 10-g unit = 60p

**Dose** **ADULT** and **CHILD** (but see section 1.6) over 12 years, 10-g unit

### Glycerol (Glycerin)

**Indications** constipation

**Dose**

- See below
Glycerol Suppositories, BP (Glycerin Suppositories)

Suppositories, gelatin 140 mg, glycerol 700 mg, purified water to 1 g. Net price 12 = £1.07 (infant), £1.03 (child), £1.54 (adult)

Dose 1 suppository moistened with water before use, when required. The usual sizes are for INFANT under 1 year, small (1-g mould), CHILD 1–12 years medium (2-g mould), ADULT and CHILD over 12 years, large (4-g mould)

Indications constipation; bowel evacuation before abdominal radiological and endoscopic procedures on the colon, and surgery (section 1.6.5); acts within 6–12 hours

Cautions see notes above; active inflammatory bowel disease (avoid if fulminant); pregnancy, see p. 59; breastfeeding (Appendix 5)

Side-effects see notes above; severe dehydration

Contra-indications see notes above; pregnancy, see p. 59

Bowel cleansing solutions

Section 1.6.5

Other stimulant laxatives

Unstandardised preparations of cascara, frangula, rhubarb, and senna should be avoided as their laxative action is unpredictable. Aloeis, colocynth, and jalap should be avoided as they have a drastic purgative action.

Sodium Picosulfate (Non-proprietary)

Elixir, sodium picosulfate 5 mg/5 mL, net price 100 mL = £1.85

Note The brand name Dulcolax Liquid (Boehringer Ingelheim) is used for sodium picosulfate elixir 5 mg/5 mL.

Dulcolax® (Boehringer Ingelheim)

Perles® (= capsules), sodium picosulfate 2.5 mg, net price 20-cap pack = £1.93, 50-cap pack = £2.73

Note The brand name Dulcolax is also used for bisacodyl tablets and suppositories

ARACHIS OIL

Enema, arachis (peanut) oil in 130-mL single-dose disposable packs. Net price 130 mL = £7.98

Note The brand name Arachis Oil Enema is also used for bisacodyl tablets and suppositories

LIQUID PARAFFIN

Indications constipation; bowel evacuation after abdominal radiological and endoscopic procedures on the colon, and surgery (section 1.6.5); acts within 6–12 hours

Cautions see notes above; active inflammatory bowel disease (avoid if fulminant); pregnancy, see p. 59; breastfeeding (Appendix 5)

Contra-indications see notes above; severe dehydration

Side-effects anal seepage of paraffin and consequent anal irritation after prolonged use, granulomatous reactions caused by absorption of small quantities of liquid paraffin (especially from the emulsion), lipid pneumonia, and interference with the absorption of fat-soluble vitamins

Dose See under preparation
1.6.4 Osmotic laxatives

Osmotic laxatives increase the amount of water in the large bowel, either by drawing fluid from the body into the bowel or by retaining the fluid they were administered with.

**Lactulose** is a semi-synthetic disaccharide which is not absorbed from the gastro-intestinal tract. It produces an osmotic diarrhoea of low faecal pH, and discourages the proliferation of ammonia-producing organisms. It is therefore useful in the treatment of hepatic encephalopathy.

**Macrogols** are inert polymers of ethylene glycol which sequester fluid in the bowel; giving fluid with macrogols may reduce the dehydrating effect sometimes seen with osmotic laxatives.

Saline purgatives such as magnesium hydroxide are commonly abused but are satisfactory for occasional use; adequate fluid intake should be maintained.

**Magnesium salts** are useful where rapid bowel evacuation is required. **Sodium salts** should be avoided as they may give rise to sodium and water retention in susceptible individuals. **Phosphate enemas** are useful in bowel clearance before radiology, endoscopy, and surgery.

---

**LACTULOSE**

**Indications** constipation (may take up to 48 hours to act), hepatic encephalopathy (portal systemic encephalopathy)

**Cautions** lactose intolerance; interactions: Appendix 1 (lactulose)

**Contra-indications** galactosaemia, intestinal obstruction

**Side-effects** flatulence, cramps, and abdominal discomfort

**Dose**

- See under preparations below

**Lactulose** (Non-proprietary)

**Solution**, lactulose 3.1–3.7 g/5 mL with other ketoses. Net price 300–mL pack = £2.51, 500–mL pack = £2.90

**Dose** constipation, initially 15 mL twice daily, adjusted according to patient’s needs; CHILD (adjusted according to response but see section 1.6) under 1 year 2.5 mL twice daily, 1–5 years 5 mL twice daily, 5–10 years 10 mL twice daily

Hepatic encephalopathy, 30–50 mL 3 times daily, subsequently adjusted to produce 2–3 soft stools daily

**Brands** include Daphlac, Lactugal, Regulose

**MACROGOLS** (Polyethylene glycols)

**Indications** see preparations below

**Cautions** pregnancy (Appendix 4); breast-feeding (Appendix 5); discontinue if symptoms of fluid and electrolyte disturbance; see also preparations below

**Laxido®** (Galen)

**Oral powder**, orange-flavoured, macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g. sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 45.5 g/sachet.

**Dose**

- Faecal impaction, ADULT and CHILD over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days
- After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

**Movicol®** (Norgine)

**Oral powder**, macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g. sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 45.5 g/sachet.

**Dose**

- Faecal impaction, ADULT and CHILD over 12 years, 1–3 sachets daily in divided doses usually for up to 2 weeks; contents of each sachet dissolved in half a glass (approx. 125 mL) of water, maintenance, 1–2 sachets daily
- Faecal impaction, ADULT and CHILD over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days
- After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours

**Movicol®-Half** (Norgine)

**Oral powder**, macrogol ‘3350’ (polyethylene glycol ‘3350’) 6.563 g, sodium bicarbonate 89.3 mg, sodium chloride 175.4 mg, potassium chloride 23.3 mg/sachet, net price 20–sachet pack = £3.56, 30–sachet pack = £5.34. Label: 13

**Note** also available in natural flavour (sugar-free)

**Cautions** patients with cardiovascular impairment should not take more than 2 sachets in any 1 hour

**Movicol®-Half** (Norgine)

**Oral powder**, macrogol ‘3350’ (polyethylene glycol ‘3350’) 13.125 g. sodium bicarbonate 178.5 mg, sodium chloride 350.7 mg, potassium chloride 45.5 g/sachet.

**Dose**

- Faecal impaction, ADULT and CHILD over 12 years, 8 sachets daily dissolved in 1 litre of water and drunk within 6 hours, usually for max. 3 days
- After reconstitution the solution should be kept in a refrigerator and discarded if unused after 6 hours
SGastro-intestinal system  
Acute gastro-intestinal conditions  
Elderly and debilitated;  
Caution  
Indications  
Rectal use in constipation; bowel evacuation.  
See preparations  
Dose  
Acute gastro-intestinal conditions  
Contra-indications  
Cardiovascular impairment; renal impairment  
Dose  
Chronic constipation and recurrence of faecal impaction, Child 2–6 years 1 sachet daily, 7–11 years 2 sachets daily, adjust accordingly to response, max. 4 sachets daily  
Faecal impaction, Child (taken in divided doses over 12 hours each day until impaction resolves or for max. 7 days) 5–11 years 4 sachets on first day then increased in steps of 2 sachets daily to 12 sachets daily, content of each sachet dissolved in quarter of a glass (approx. 60–65 mL) of water  
After reconstitution the solution should be kept in a refrigerator and discarded if unused after 24 hours  
Side-effects  
Local irritation; with enema, electrolyte disturbances  
Dose  
See under preparations  
Carbalax® (Forest)  
Suppositories, sodium acid phosphate (anhydrous)  
1.3 g, sodium bicarbonate 1.08 g, net price 12 = £2.01  
Dose  
Constipation, Adult and Child over 12 years, 1 suppository, inserted 30 minutes before evacuation required; moisten with water before use  
Fleet® Ready-to-use Enema (De Witt)  
Enema, sodium acid phosphate 21.4 g, sodium phosphate 9.4 g/118 mL, net price 133 mL pack (delivers 118 mL dose) with standard tube = £57p  
Dose  
Adult and Child (but see section 1.6) over 12 years, 118 mL. Child 3–12 years, on doctor’s advice only (under 3 years not recommended)  
Phosphates Enema BP Formula B  
Enema, sodium dihydrogen phosphate dihydrate 12.8 g, sodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL. Net price 128 mL with standard tube = £2.98, with long rectal tube = £3.98  
Dose  
128 mL, Child (but see section 1.6) over 3 years, reduced according to body weight  
Sodium Citrate (Rectal)  
Indications  
Rectal use in constipation  
Cautions  
Elderly and debilitated; see also notes above  
Contra-indications  
Acute gastro-intestinal conditions  
Dose  
See under preparations  
Micolette Micro-enema® (Pinewood)  
Enema, sodium citrate 450 mg, sodium lauryl sulphoacetate 45 mg, glycerol 625 mg, together with potassium sorbate and sorbitol in a viscous solution, in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 31p  
Dose  
Adult and Child over 3 years, 5–10 mL (but see section 1.6)  
Micralax Micro-enema® (UCB Pharma)  
Enema, sodium citrate 450 mg, sodium alkylsulphoacetate 45 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 41p  
Dose  
Adult and Child over 3 years, 5 mL (but see section 1.6)  
Relaxit Micro-enema® (Crawford)  
Enema, sodium citrate 450 mg, sodium lauryl sulphate 75 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 32p  
Dose  
Adult and Child (but see section 1.6) 5 mL (insert only half nozzle length in child under 3 years)  
MAGNESIUM SALTS  
Indications  
See under preparations below  
Cautions  
Renal impairment (Appendix 3; risk of magnesium accumulation); hepatic impairment (see Appendix 2); elderly and debilitated; see also notes above  
Contra-indications  
Acute gastro-intestinal conditions  
Side-effects  
Colic  
Dose  
Magnesium hydroxide  
Magnesium Hydroxide Mixture, BP  
Aqueous suspension containing about 8% hydrated magnesium oxide. Do not store in cold place  
Dose  
Constipation, 30–45 mL with water at bedtime when required, Child 3–12 years, 5–10 mL with water at bedtime when required  
Magnesium hydroxide with liquid paraffin  
Liquid Paraffin and Magnesium Hydroxide Oral Emulsion, BP  
Oral emulsion, 25% liquid paraffin in aqueous suspension containing 6% hydrated magnesium oxide  
Dose  
Constipation, 5–20 mL when required  
Note  
Liquid paraffin and magnesium hydroxide preparations on sale to the public include: Milpar  
Magnesium sulphate  
Magnesium Sulphate  
Label: 13, 23  
Dose  
Rapid bowel evacuation (acts in 2–4 hours) 5–10 g in a glass of water preferably before breakfast  
Note  
Magnesium sulphate is on sale to the public as Epsom Salts  
Bowel cleansing solutions  
Section 1.6.5  
PHOSPHATES (RECTAL)  
Indications  
Rectal use in constipation; bowel evacuation before abdominal radiological procedures, endoscopy, and surgery  
Cautions  
Elderly and debilitated; with enema, electrolyte disturbances, renal impairment, congestive heart failure, ascites, uncontrolled hypertension, maintain adequate hydration  
Contra-indications  
Acute gastro-intestinal conditions (including gastro-intestinal obstruction, inflammatory bowel disease, and conditions associated with increased colonic absorption)  
Side-effects  
Local irritation; with enema, electrolyte disturbances  
Dose  
See under preparations  
Carbalax® (Forest)  
Suppositories, sodium acid phosphate (anhydrous)  
1.3 g, sodium bicarbonate 1.08 g, net price 12 = £2.01  
Dose  
Constipation, Adult and Child over 12 years, 1 suppository, inserted 30 minutes before evacuation required; moisten with water before use  
Fleet® Ready-to-use Enema (De Witt)  
Enema, sodium acid phosphate 21.4 g, sodium phosphate 9.4 g/118 mL, net price 133 mL pack (delivers 118 mL dose) with standard tube = £57p  
Dose  
Adult and Child (but see section 1.6) over 12 years, 118 mL. Child 3–12 years, on doctor’s advice only (under 3 years not recommended)  
Phosphates Enema BP Formula B  
Enema, sodium dihydrogen phosphate dihydrate 12.8 g, sodium phosphate dodecahydrate 10.24 g, purified water, freshly boiled and cooled, to 128 mL. Net price 128 mL with standard tube = £2.98, with long rectal tube = £3.98  
Dose  
128 mL, Child (but see section 1.6) over 3 years, reduced according to body weight  
SODIUM CITRATE (RECTAL)  
Indications  
Rectal use in constipation  
Cautions  
Elderly and debilitated; see also notes above  
Contra-indications  
Acute gastro-intestinal conditions  
Dose  
See under preparations  
Micolette Micro-enema® (Pinewood)  
Enema, sodium citrate 450 mg, sodium lauryl sulphoacetate 45 mg, glycerol 625 mg, together with potassium sorbate and sorbitol in a viscous solution, in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 31p  
Dose  
Adult and Child over 3 years, 5–10 mL (but see section 1.6)  
Micralax Micro-enema® (UCB Pharma)  
Enema, sodium citrate 450 mg, sodium alkylsulphoacetate 45 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 41p  
Dose  
Adult and Child over 3 years, 5 mL (but see section 1.6)  
Relaxit Micro-enema® (Crawford)  
Enema, sodium citrate 450 mg, sodium lauryl sulphate 75 mg, sorbic acid 5 mg, together with glycerol and sorbitol in a viscous solution in 5-mL single-dose disposable packs with nozzle. Net price 5 mL = 32p  
Dose  
Adult and Child (but see section 1.6) 5 mL (insert only half nozzle length in child under 3 years)  
Bowel cleansing solutions  
Bowel cleansing solutions are used before colonic surgery, colonoscopy, or radiological examination to ensure the bowel is free of solid contents. They are not treatments for constipation.
Bowel cleansing solutions

CitraFleet

Indications
See under preparations

Cautions
Electrolyte disturbances; maintain adequate hydration; heart disease; ulcerative colitis; diabetes mellitus; reflux oesophagitis; impaired gag reflex; unconscious or semiconscious or possibility of regurgitation or aspiration; renal impairment

Appendix 3; pregnancy

Contra-indications
Gastro-intestinal obstruction, gastro-intestinal ulceration, perforated bowel, congestive cardiac failure; toxic colitis, toxic megacolon or ileus

Side-effects
Nausea, vomiting, abdominal pain

Gastro-intestinal retention, gastro-intestinal ulceration, perforated megacolon or ileus

Dose

See under preparations

CitraFleet® (De Witt)

Oral powder, sugar-free, sodium picosulfate 10 mg/sachet, with magnesium citrate. Contains 86 mmol Mg and 5 mmol K+/sachet. Net price 2-sachet pack (lemon-flavoured) = £3.25. Label: 10, patient information leaflet, 13, counselling, see below

Dose
Bowel evacuation on day before radiological procedure, endoscopy, or surgery. ADULT over 18 years, 1 sachet before 8 a.m. then 1 sachet 6–8 hours later

Acts within 3 hours of first dose

Note
Low residue diet recommended on the day before procedure and copious intake of water or other clear fluids recommended during treatment

Counselling
One sachet should be reconstituted with 150 mL (approx. half a glass) of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be allowed to cool before drinking

Citramag® (Sanochemia)

Oral powder, sugar-free, effervescent, magnesium carbonate 11.57 g, anhydrous citric acid 17.70 g/sachet, net price 10-sachet pack (lemon and lime flavour) = £14.90. Label: 10, patient information leaflet, 13, counselling, see below

Dose
Bowel evacuation for surgery, colonoscopy or radiological examination, on day before procedure, 1 sachet at 8 a.m. and 1 sachet 6–8 hours later

Note
No further oral intake of food or fluids

Counselling
The patient information leaflet advises that hot water (200 mL) is needed to make the solution and provides guidance on the timing and procedure for reconstitution; it also mentions need for high fluid, low residue diet beforehand (according to hospital advice), and explains that only clear fluids can be taken after Citramag until procedure completed

Fleet Phospho-soda® (De Witt)

Oral solution, sugar-free, sodium dihydrogen phosphate dihydrate 24.4 g, disodium phosphate dodecahydrate 10.8 g/45 mL. Contains about 217 mmol Na+ and 45 mL. Net price 2 × 45 mL bottles = £4.79. Label: 10, patient information leaflet, counselling

Dose
ADULT and CHILD over 15 years, 45 mL diluted with half a glass (120 mL) of cold water, followed by one full glass (240 mL) of cold water

Timing of doses is dependent on the time of the procedure

For morning procedure, first dose should be taken at 7 a.m. and second at 7 p.m. on day before the procedure

For afternoon procedure, first dose should be taken at 7 p.m. on day before and second dose at 7 a.m. on day of the procedure

Solid food must not be taken during dosing period; clear liquids or water should be substituted for meals

Acts within half to 6 hours of first dose

Klean-Prep® (Norgine)

Oral powder, sugar-free, macrogol ‘3350’ (polyethylene glycol ‘3350’) 100 g, anhydrous sodium sulphate 7.5 g, sodium chloride 2.691 g, potassium chloride 1.015 g and Sorbitol (containing ascorbic acid 4.7 g, sodium ascorbate 5.9 g), net price 4-sachet pack (2 each of sachet A and B) = £10.27. Label: 10, patient information leaflet, 13, counselling, see below

Counselling
The patient information leaflet advises that heat is generated during reconstitution and that the solution should be kept in a refrigerator and discarded if unused after 24 hours

Note
Allergic reactions reported. 1 sachet when reconstituted with 1 litre of water provides Na 125 mmol, K 10 mmol

Moviprep® (Norgine)

Oral powder, sugar-free, lemon-flavoured, Sachet A (containing macrogol ‘3350’ (polyethylene glycol ‘3350’) 100 g, anhydrous sodium sulphate 7.5 g, sodium chloride 2.691 g, potassium chloride 1.015 g) and Sachet B (containing ascorbic acid 4.7 g, sodium ascorbate 5.9 g), net price 4-sachet pack (2 each of sachet A and B) = £10.27. Label: 10, patient information leaflet, 13, counselling, see below

Counselling
One pair of sachets (A and B) should be reconstituted in 1 litre of water (providing absorbable Na 56.2 mmol, K 14.2 mmol/litre) and taken over 1–2 hours. Solid food should not be taken during treatment. 1 litre of other clear fluid should also be taken during treatment

Picolax® (Ferring)

Oral powder, sugar-free, sodium picosulfate 10 mg/sachet, with magnesium citrate. Contains 87 mmol Mg and 5 mmol K+/sachet. Net price 2-sachet pack = £3.53. Label: 10, patient information leaflet, 13, counselling, see below

Dose
Bowel evacuation on day before radiological procedure, endoscopy, or surgery. ADULT and CHILD over 9 years, 1 sachet before 8 a.m. then 1 sachet 6–8 hours later; CHILD 1–2 years, quarter sachet before 8 a.m. then quarter sachet 6–8 hours later; 2–4 years, half sachet before 8 a.m. then half sachet 6–8 hours later; 4–9 years, 1 sachet before 8 a.m. then half sachet 6–8 hours later

Note
No further oral intake of food or fluids

Counselling
One sachet should be reconstituted with 150 mL of cold water; patients should be warned that heat is generated during reconstitution and that the solution should be kept in a refrigerator and discarded if unused after 24 hours

Note
Allergic reactions reported. 1 sachet when reconstituted with 1 litre of water provides Na 125 mmol, K 10 mmol
1.6.6 Peripheral opioid-receptor antagonists

Methylnaltrexone is a peripherally acting opioid-receptor antagonist that is licensed for the treatment of opioid-induced constipation in patients receiving palliative care, when response to other laxatives is inadequate; it should be used as an adjunct to existing laxative therapy. Methylnaltrexone does not alter the central analgesic effect of opioids. For the prevention of opioid-induced constipation in palliative care, see p. 17.

**METHYLNALTREXONE BROMIDE**

**Indications** opioid-induced constipation in terminally ill patients, when response to other laxatives is inadequate

**Cautions** diverticular disease; faecal impaction; patients with colostomy or peritoneal catheter; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications** gastro-intestinal obstruction; acute surgical abdominal conditions; severe hepatic impairment (Appendix 2)

**Side-effects** abdominal pain, nausea, diarrhoea, flatulence; dizziness; injection site reactions

**Dose**
- By subcutaneous injection, ADULT over 18 years, body-weight under 38 kg, 150 micrograms/kg on alternate days; body-weight 38–62 kg, 8 mg on alternate days; body-weight 62–114 kg, 12 mg on alternate days; body-weight over 114 kg, 150 micrograms/kg on alternate days; may be given less frequently depending on response; 2 consecutive doses may be given 24 hours apart if no response to treatment on the preceding day; rotate sites of injection; max. duration of treatment 4 months

**Note** May act within 30–60 minutes

Relistor® (Wyeth) ▼

**Injection**, methylnaltrexone bromide 20 mg/mL, net price 0.6-mL vial = £21.05, 7-vial pack (with syringes and needles) = £147.35

When necessary topical preparations containing **local anaesthetics** (section 1.7.1) or **corticosteroids** (section 1.7.2) are used provided perianal thrush has been excluded. Perianal thrush is best treated with **nystatin** by mouth and by local application (see section 5.2, section 7.2.2, and section 13.10.2).

For the management of **anal fissures**, see section 1.7.4.

1.7 Local preparations for anal and rectal disorders

1.7.1 Soothing haemorrhoidal preparations

Soothing preparations containing mild astringents such as bismuth subgallate, zinc oxide, and hamamelis may give symptomatic relief in haemorrhoids. Many proprietary preparations also contain lubricants, vasoconstrictors, or mild antiseptics.

**Local anaesthetics** are used to relieve pain associated with haemorrhoids and pruritus ani but good evidence is lacking. Lidocaine (lignocaine) ointment (section 15.2) is used before emptying the bowel to relieve pain associated with **anal fissure**. Alternative local anaesthetics include tetracaine (amethocaine), cinchocaine (dibucaine), and pramocaine (pramoxime), but they are more irritant. Local anaesthetic ointments can be absorbed through the rectal mucosa therefore excessive application should be avoided, particularly in infants and children. Preparations containing local anaesthetics should be used for short periods only (no longer than a few days) since they may cause sensitisation of the anal skin.

1.7.2 Compound haemorrhoidal preparations with corticosteroids

Corticosteroids are often combined with local anaesthetics and soothing agents in preparations for haemorrhoids. They are suitable for occasional short-term use after exclusion of infections, such as herpes simplex; prolonged use can cause atrophy of the anal skin. See section 13.4 for general comments on topical corticosteroids and section 1.7.1 for comment on local anaesthetics.

**Children** Haemorrhoids in children are rare. Treatment is usually symptomatic and the use of a locally applied cream is appropriate for short periods; however, local anaesthetics can cause stinging initially and this may aggravate the child’s fear of defaecation.

Anugesic-HC® (Pfizer) ▼

**Cream**, benzyl benzoate 1.2%, bismuth oxide 0.875%, hydrocortisone acetate 0.5%, Peru balsam 1.85%, pramocaine hydrochloride 1%, zinc oxide 12.35%. Net price 30 g (with rectal nozzle) = £3.71

**Dose** apply night and morning and after a bowel movement; do not use for longer than 7 days; **CHILD** not recommended

**Suppositories**, buff, benzyl benzoate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 5 mg, Peru balsam 49 mg, pramocaine

Anal and perianal pruritus, soreness, and excoriation are best treated by application of bland ointments and suppositories (section 1.7.1). These conditions occur commonly in patients suffering from haemorrhoids, fistulas, and proctitis. Cleansing with attention to any minor faecal soiling, adjustment of the diet to avoid hard stools, the use of bulk-forming materials such as bran (section 1.6.1) and a high residue diet are helpful. In proctitis these measures may supplement treatment with corticosteroids or sulfasalazine (see section 1.5).
1.7.3 Rectal sclerosants

Oily phenol injection is used to inject haemorrhoids particularly when unprolapsed.

**PHENOL**

**Indications** see notes above

**Side-effects** irritation, tissue necrosis

**Oily Phenol Injection, BP**

- phenol 5% in a suitable fixed oil. Net price 5-mL amp = £5.00
- Dose 2–3 mL into the submucosal layer at the base of the pile; several injections may be given at different sites, max. total injected 10 mL at any one time
- Available from UCB Pharma

**Management of anal fissures**

The management of anal fissures requires stool softening by increasing dietary fibre in the form of bran or by using a bulk-forming laxative. Short-term use of local anaesthetic preparations may help (section 1.7.1). If these measures are inadequate, the patient should be referred for specialist treatment in hospital. The use of a topical nitrate (e.g. glyceryl trinitrate 0.4% ointment) may be considered. Before considering surgery, topical diltiazem 2% may be used twice daily [unlicensed indication] in patients with chronic anal fissures unresponsive to topical nitrates.

The **Scottish Medicines Consortium** (p. 3) has advised (January 2008) that glyceryl trinitrate 0.4% ointment (Rectogesic®) is not recommended for use within NHS Scotland for the relief of pain associated with chronic anal fissure.

**Suppositories**, cinchocaine (dibucaine) hydrochloride 1 mg, fluocortolone caproate 630 micrograms, fluocortolone pivalate 610 micrograms, net price 12 = £2.15
- Dose insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily) then 1 suppository every other day for 1 week

**Uniriod-HC**  (Chemidex)  

- Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g (with applicator) = £4.23
- Dose ADULT and CHILD over 12 years, apply twice daily and after a bowel movement, externally or by rectum; do not use for longer than 7 days; CHILD under 12 years on medical advice only

**Suppositories**, cinchocaine (dibucaine) hydrochloride 5 mg, hydrocortisone 5 mg. Net price 12 = £1.91
- Dose ADULT and CHILD over 12 years, insert 1 suppository twice daily and after a bowel movement; do not use for longer than 7 days

**Xyloproct** (AstraZeneca)  

- Ointment (water-miscible), aluminium acetate 3.5%, hydrocortisone acetate 0.275%, lidocaine 5%, zinc oxide 18%, net price 20 g (with applicator) = £2.26
- Dose apply several times daily; short-term use only

**Ultraproct**  (Meadow)  

- Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, fluocortolone caproate 0.095%, fluocortolone pivalate 0.092%, net price 30 g (with rectal nozzle) = £4.57
- Dose apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

**Scheriproct**  (Valeant)  

- Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, prednisolone hexanoate 0.19%. Net price 30 g = £3.00
- Dose apply twice daily for 5–7 days (3–4 times daily on 1st day if necessary), then once daily for a few days after symptoms have cleared

**Suppositories**, cinchocaine (dibucaine) hydrochloride 1 mg, prednisolone hexanoate 1.3 mg. Net price 12 = £1.41
- Dose insert 1 suppository daily after a bowel movement, for 5–7 days (in severe cases initially 2–3 times daily)

**Proctofoam HC**  (Meda)  

- Foam in aerosol pack, hydrocortisone acetate 1%, pramocaine hydrochloride 1%. Net price 21.2-g pack = £6.39
- Dose ADULT and CHILD over 14 years, spray once over the affected area up to 3 times daily; do not use for longer than 7 days without medical advice; CHILD under 14 years on medical advice only

**Anusol-HC**  (McNeil)  

- Ointment, benzylo benzate 1.25%, bismuth oxide 0.875%, bismuth subgallate 2.25%, hydrocortisone acetate 0.25%, Peru balsam 1.875%, zinc oxide 10.75%. Net price 30 g (with rectal nozzle) = £3.50
- Dose apply night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

**Note** A proprietary brand (Anusol Plus HC ointment) is on sale to the public

**Suppositories**, benzylo benzate 33 mg, bismuth oxide 24 mg, bismuth subgallate 59 mg, hydrocortisone acetate 10 mg, Peru balsam 49 mg, zinc oxide 296 mg. Net price 12 = £2.46
- Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

**Note** A proprietary brand (Anusol Plus HC suppositories) is on sale to the public

**Perinal**  (Dermal)  

- Spray application, hydrocortisone 0.2%, lidocaine hydrochloride 1%. Net price 30-mL pack = £6.99
- Dose ADULT and CHILD over 12 years, apply twice daily and after a bowel movement, externally or by rectum; do not use for longer than 7 days; CHILD not recommended

**Proctosediyl**  (Aventis Pharma)  

- Ointment, cinchocaine (dibucaine) hydrochloride 0.5%, hydrocortisone 0.5%. Net price 30 g = £9.40
- Dose haemorrhoids and proctitis, 1 applicatorful (4–6 mg hydrocortisone acetate, 4–6 mg pramocaine hydrochloride) by rectum 2–3 times daily and after each bowel movement (max. 4 times daily), do not use for longer than 7 days; CHILD not recommended

hydrochloride 27 mg, zinc oxide 296 mg, net price 12 = £2.69
- Dose insert 1 suppository night and morning and after a bowel movement; do not use for longer than 7 days; CHILD not recommended

**Note** A proprietary brand (Xyloproct Ointment) is on sale to the public

**Ointment**  (AstraZeneca)  

- Dose ADULT and CHILD over 12 years, insert 1 suppository twice daily and after a bowel movement; do not use for longer than 7 days
1.8 Stoma care

Prescribing for patients with stoma calls for special care. The following is a brief account of some of the main points to be borne in mind.

Enteric-coated and modified-release preparations are unsuitable, particularly in patients with an ileostomy, as there may not be sufficient release of the active ingredient.

Laxatives. Enemas and washouts should not be prescribed for patients with an ileostomy as they may cause rapid and severe loss of water and electrolytes. Colostomy patients may suffer from constipation and whenever possible should be treated by increasing fluid intake or dietary fibre. Bulk-forming drugs (section 1.6.1) should be tried. If they are insufficient, as small a dose as possible of senna (section 1.6.2) should be used.

Antidiarrhoeals. Drugs such as loperamide, codeine phosphate, or co-phenotrope (diphenoxylate with atropine) are effective. Bulk-forming drugs (section 1.6.1) may be tried but it is often difficult to adjust the dose appropriately.

Antibacterials should not be given for an episode of acute diarrhoea.

Antacids. The tendency to diarrhoea from magnesium salts or constipation from aluminium salts may be increased in these patients.

Diuretics should be used with caution in patients with an ileostomy as they may become excessively dehydrated and potassium depletion may easily occur. It is usually advisable to use a potassium-sparing diuretic (see section 2.2.3).

Digoxin. Patients with a stoma are particularly susceptible to hypokalaemia if on digoxin therapy and potassium supplements or a potassium-sparing diuretic may be advisable (for comment see section 9.1.1.2) should be used. Modified-release preparations should be avoided for the reasons given above.

Patients are usually given advice about the use of cleansing agents, protective creams, lotions, deodorants, or sealants whilst in hospital, either by the surgeon or by stoma care nurses. Voluntary organisations offer help and support to patients with stoma.

Iron preparations may cause loose stools and sore skin in these patients. If this is troublesome and if iron is definitely indicated an intramuscular iron preparation (see section 9.1.1.2) should be used. Modified-release preparations should be avoided for the reasons given above.

1.9 Drugs affecting intestinal secretions

1.9.1 Drugs affecting biliary composition and flow

The use of laparoscopic cholecystectomy and of endoscopic biliary techniques has limited the place of the bile acid ursodeoxycholic acid in gallstone disease. Ursodeoxycholic acid is suitable for patients with unimpaired gall bladder function, small or medium-sized radiolucent stones, and whose mild symptoms are not amenable to other treatment; it should be used cautiously in those with liver disease (but see below). Patients should be given dietary advice (including avoidance of excessive cholesterol and calories) and they require radiological monitoring. Long-term prophylaxis may be needed after complete dissolution of the gallstones has been confirmed because they may recur in up to 25% of patients within one year of stopping treatment.

Ursodeoxycholic acid is also used in primary biliary cirrhosis; liver tests improve in most patients but the effect on overall survival is uncertain. Ursodeoxycholic acid has also been tried in primary sclerosing cholangitis [unlicensed indication].

1.9.2 Bile acid sequestrants
1.9.3 Aprotinin
1.9.4 Pancreatin

1.10 Ursodeoxycholic acid

Indications see under Dose and under preparations.

Cautions see notes above; Interactions: Appendix 1 (ursodeoxycholic acid)

Contra-indications: radio-opaque stones, pregnancy (Appendix 4), non-functioning gall bladder, inflammatory diseases and other conditions of the small intestine, colon and liver which interfere with entero-hepatic circulation of bile salts.

Side-effects: nausea, vomiting, diarrhoea; gallstone calcification; pruritus.

Dose

- Dissolution of gallstones, 8–12 mg/kg daily as a single dose at bedtime or in two divided doses, for up to 2 years; treatment is continued for 3–4 months after stones dissolve
- Primary biliary cirrhosis, see under Ursodiol®

GLYCERYL TRINITRATE

Indications anal fissure; angina, left ventricular failure (section 2.6.1); extravasation (section 10.3)

Cautions see section 2.6.1

Contra-indications see section 2.6.1

Side-effects see section 2.6.1; also diarrhoea, burning, itching, and rectal bleeding.

Dose

- See preparations

Rectogesic® (Strakan) ▼ (POM)

Rectal ointment, glyceryl trinitrate 0.4%, net price 30 g = £32.80

Excipients include lanolin, propylene glycol

Dose ADULT over 18 years, apply 2.5 cm of ointment to anal canal every 12 hours until pain stops; max. duration of use 8 weeks

Note 2.5 cm of ointment contains glyceryl trinitrate 1.5 mg; discard tube 8 weeks after first opening.

Notes

GLYCERYL TRINITRATE

Indications anal fissure; angina, left ventricular failure (section 2.6.1); extravasation (section 10.3)

Cautions see section 2.6.1

Contra-indications see section 2.6.1

Side-effects see section 2.6.1; also diarrhoea, burning, itching, and rectal bleeding.

Rectogesic® (Strakan) ▼ (POM)

Rectal ointment, glyceryl trinitrate 0.4%, net price 30 g = £32.80

Excipients include lanolin, propylene glycol

Dose ADULT over 18 years, apply 2.5 cm of ointment to anal canal every 12 hours until pain stops; max. duration of use 8 weeks

Note 2.5 cm of ointment contains glyceryl trinitrate 1.5 mg; discard tube 8 weeks after first opening.

Notes
Colestyramine (cholestyramine) is an anion-exchange resin that is not absorbed from the gastro-intestinal tract. It relieves diarrhoea and pruritus by forming an insoluble complex with bile acids in the intestine. Colestyramine can interfere with the absorption of a number of drugs. Colestyramine is also used in hypercholesterolaemia (section 2.12).

### COLESTYRAMINE

**(Cholestyramine)**

**Indications** pruritus associated with partial biliary obstruction and primary biliary cirrhosis; diarrhoea associated with Crohn’s disease, ileal resection, vagotomy, diabetic vagal neuropathy, and radiation; hypercholesterolaemia (section 2.12)

**Cautions** see section 2.12

**Contra-indications** see section 2.12

**Side-effects** see section 2.12

**Dose**

- Pruritus, 4–8 g daily in a suitable liquid; **CHILD** 6–12 years, consult product literature
- Diarrhoea, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in a suitable liquid in 1–4 divided doses, then adjusted as required; max. 36 g daily; **CHILD** 6–12 years, consult product literature

**Counselling** Other drugs should be taken at least 1 hour before or 4–6 hours after colestyramine to reduce possible interference with absorption

**Note** The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content

#### Preparations

**Section 2.12**

### 1.9.3 Aprotinin

Aprotinin is no longer used for the treatment of acute pancreatitis.

### 1.9.4 Pancreatin

Supplements of pancreatin are given by mouth to compensate for reduced or absent exocrine secretion in cystic fibrosis, and following pancreatectomy, gastrectomy, or chronic pancreatitis. They assist the digestion of starch, fat, and protein. Pancreatin may also be necessary if a tumour (e.g. pancreatic cancer) obstructs outflow from the pancreas.

Pancreatin is inactivated by gastric acid therefore pancreatin preparations are best taken with food (or immediately before or after food). Gastric acid secretion may be reduced by giving cimetidine or ranitidine an hour beforehand (section 1.3). Concurrent use of antacids also reduces gastric acidity. Enteric-coated preparations deliver a higher enzyme concentration in the duodenum (provided the capsule contents are swallowed whole without chewing). Higher-strength preparations are also available (important: see CSM advice below).

Since pancreatin is also inactivated by heat, excessive heat should be avoided if preparations are mixed with liquids or food; the resulting mixtures should not be kept for more than one hour.

Dosage is adjusted according to size, number, and consistency of stools, so that the patient thrives; extra allowance may be needed if snacks are taken between meals.

Pancreatin can irritate the peroral skin and buccal mucosa if retained in the mouth, and excessive doses can cause perianal irritation. The most frequent side-effects are gastro-intestinal, including nausea, vomiting, and abdominal discomfort; hyperuricaemia and hyperuricosuria have been associated with very high doses. Hypersensitivity reactions occur occasionally and may affect those handling the powder.

### Preparations

**Section 2.12**

#### 1.9.2 Bile acid sequestrants

Colestyramine is also used in hypercholesterolaemia (section 2.12).
Creon® 10 000 (Solvay)  
**Capsules**, brown/clear, enclosing buff-coloured e/c granules of pancreatin (pork), providing: protease 600 units, lipase 10 000 units, amylase 8000 units. Net price 100-cap pack = £16.66. Counselling, see dose  
**Dose**  
ADULT and CHILD initially 1–2 capsules with each meal either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Nutrizym 10® (Merck)  
**Capsules**, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 300 units, lipase 10 000 units, amylase 9000 units. Net price 100–200 units = £20.39. Label: 25, counselling, see dose  
**Dose**  
ADULT and CHILD initially 1–2 capsules with each meal either taken whole or contents mixed with water or sprinkled on soft food (then swallowed immediately without chewing); higher doses may be required according to response

Pancrease® (Paines & Byrne)  
**Granules**, pancreatin (pork), providing minimum of: protease 300 units, lipase 5000 units, amylase 4000 units/g. Net price 300 g = £20.39. Label: 25, counselling, see dose  
**Dose**  
ADULT and CHILD 5–10 g just before meals washed down or mixed with a little milk or water

Pancrease® (Paines & Byrne)  
**Capsules**, pancreatin (pork), providing minimum of: protease 430 units, lipase 8000 units, amylase 9000 units. Net price 300-cap pack = £15.80. Counselling, see dose  
**Dose**  
ADULT and CHILD over 1 year 2–6 capsules with each meal, swallowed whole or sprinkled on food, INFANT up to 1 year contents of 1–2 capsules mixed with feeds

Nutrizym 22® (Merck)  
**Capsules**, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 1100 units, lipase 25 000 units, amylase 1700 units. Net price 300-tab pack = £4.51. Label: 5, 25, counselling, see dose  
**Dose**  
ADULT and CHILD 5–15 tablets before each meal

Nutrizym 22® (Merck)  
**Tablets** forte, e/c, pancreatin (pork), providing minimum of: protease 330 units, lipase 5600 units, amylase 5000 units. Net price 300-tab pack = £13.74. Label: 5, 25, counselling, see dose  
**Dose**  
ADULT and CHILD 6–10 tablets before each meal

Nutrizym 22® (Merck)  
**Powder**, pancreatin (pork), providing minimum of: protease 1400 units, lipase 25 000 units, amylase 30 000 units/g. Net price 300 g = £24.28. Counselling, see dose  
**Dose**  
ADULT and CHILD over 1 month, 0.5–2.5 g before each meal, washed down or mixed with liquid, NEONATE 250–500 mg with each feed

Higher-strength preparations  
The CSM has advised of data associating the high-strength pancreatin preparations Nutrizym 22® and Pancrease HL® with the development of large bowel strictures (fibrosing colonopathy) in children with cystic fibrosis aged between 2 and 13 years. No association was found with Creon® 25 000. The following was recommended:

- Pancrease HL®, Nutrizym 22®, Panzytrat® 25 000 [now discontinued] should not be used in children aged 15 years or less with cystic fibrosis;
- the total dose of pancreatic enzyme supplements used in patients with cystic fibrosis should not usually exceed 10 000 units of lipase per kg body-weight daily;
- if a patient on any pancreatin preparation develops new abdominal symptoms (or any change in existing abdominal symptoms) the patient should be reviewed to exclude the possibility of colonic damage.

Possible risk factors are gender (boys at greater risk than girls), more severe cystic fibrosis, and concomitant use of laxatives. The peak age for developing fibrosing colonopathy is between 2 and 8 years.

Counselling  
It is important to ensure adequate hydration at all times in patients receiving higher-strength pancreatin preparations.

Creon® 25 000 (Solvay)  
**Capsules**, orange/clear, enclosing brown-coloured e/c pellets of pancreatin (pork), providing: protease (total) 1000 units, lipase 25 000 units, amylase 18 000 units, net price 100-cap pack = £30.03. Counselling, see above and under dose  
**Dose**  
ADULT and CHILD initially 1 capsule with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Creon® 40 000 (Solvay)  
**Capsules**, brown/clear, enclosing brown-coloured e/c granules of pancreatin (pork), providing: protease (total) 1600 units, lipase 40 000 units, amylase 25 000 units, net price 100-cap pack = £60.00. Counselling, see above and under dose  
**Dose**  
ADULT and CHILD initially 1–2 capsules with meals either taken whole or contents mixed with fluid or soft food (then swallowed immediately without chewing)

Nutrizym 22® (Merck)  
**Capsules**, red/yellow, enclosing e/c minitablets of pancreatin (pork), providing minimum of: protease 1100 units, lipase 22 000 units, amylase 19 800 units. Net price 100–200 units = £33.33. Counselling, see above and under dose  
**Dose**  
ADULT and CHILD over 15 years, 1–2 capsules with meals and 1 capsule with snacks, swallowed whole or contents taken with water or sprinkled on soft food (then swallowed immediately without chewing)

Pancrease HL® (Janssen-Cilag)  
**Capsules**, enclosing light brown e/c minitablets of pancreatin (pork), providing minimum of: protease 1250 units, lipase 25 000 units, amylase 22 500 units. Net price 100 = £33.65. Counselling, see above and under dose  
**Dose**  
ADULT and CHILD over 15 years, 1–2 capsules during each meal and 1 capsule with snacks swallowed whole or contents sprinkled on slightly acidic liquid or soft food (then swallowed immediately without chewing)
2.1 Positive inotropic drugs

2.1.1 Cardiac glycosides
Cardiac glycosides increase the force of myocardial contraction and reduce conductivity within the atrio-ventricular (AV) node. Digoxin is the most commonly used cardiac glycoside. Cardiac glycosides are most useful in the treatment of supraventricular tachycardias, especially for controlling ventricular response in persistent atrial fibrillation (section 2.3.1). For reference to the role of digoxin in heart failure, see section 2.5.5.

2.1.2 Phosphodiesterase inhibitors
Positive inotropic drugs increase the force of contraction of the myocardium; for sympathomimetics with inotropic activity see section 2.7.1.
by the ventricular rate at rest, which should not be allowed to fall below 60 beats per minute except in special circumstances, e.g. with the concomitant administration of a beta-blocker.

Digoxin is now rarely used for rapid control of heart rate (see section 2.3 for the management of supraventricular arrhythmias). Even with intravenous administration, response may take many hours; persistence of tachycardia is therefore not an indication for exceeding the recommended dose. The intramuscular route is not recommended.

In patients with heart failure who are in sinus rhythm a loading dose is not required, and a satisfactory plasma-digoxin concentration can be achieved over a period of about a week.

Digoxin has a long half-life and maintenance doses need to be given only once daily (although higher doses may be divided to avoid nausea). Digitoxin also has a long half-life and maintenance doses need to be given only once daily or on alternate days. Renal function is the most important determinant of digoxin dosage, whereas elimination of digitoxin depends on metabolism by the liver.

Unwanted effects depend both on the concentration of the cardiac glycoside in the plasma and on the sensitivity of the conducting system or of the myocardium, which is often increased in heart disease. It can sometimes be difficult to distinguish between toxic effects and clinical deterioration because symptoms of both are similar. Also, the plasma concentration alone cannot indicate toxicity reliably but the likelihood of toxicity increases progressively through the range 1.5 to 3 micrograms/litre for digoxin. Cardiac glycosides should be used with special care in the elderly who may be particularly susceptible to digitalis toxicity.

Regular monitoring of plasma-digoxin concentration during maintenance treatment is not necessary unless problems are suspected. Hypokalaemia predisposes the patient to digitalis toxicity; it is managed by giving a potassium sparing diuretic or, if necessary, potassium supplementation.

Toxicity can often be managed by discontinuing digoxin; serious manifestations require urgent specialist management. Digoxin-specific antibody fragments are available for reversal of life-threatening overdosage (see below).

### DIGOXIN

**Indications** heart failure (see also section 2.5.5), supraventricular arrhythmias (particularly atrial fibrillation and atrial flutter; see also section 2.3.2)

**Cautions** recent myocardial infarction; sick sinus syndrome; thyroid disease; reduce dose in the elderly; severe respiratory disease; hypokalaemia, hypomagnesaemia, hypercalcaemia, and hypoxia (risk of digitalis toxicity); monitor serum electrolytes and renal function; avoid rapid intravenous administration (risk of hypertension and reduced coronary flow); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (cardiac glycosides)

**Contra-indications** intermittent complete heart block, second degree AV block; supraventricular arrhythmias associated with accessory conducting pathways e.g. Wolff-Parkinson-White syndrome; ventricular tachycardia or fibrillation; hypertrophic cardiomyopathy (unless concomitant atrial fibrillation and heart failure—but use with caution); myocarditis; constrictive pericarditis (unless to control atrial fibrillation or improve systolic dysfunction—but use with caution);

**Side-effects** see notes above; also nausea, vomiting, diarrhoea; arrhythmias, conduction disturbances; dizziness; blurred or yellow vision; rash, eosinophilia; *less commonly* depression; *very rarely* anorexia, intestinal ischaemia and necrosis, psychosis, apathy, confusion, headache, fatigue, weakness, gynaecomastia on long-term use, and thrombocytopenia

**Dose**

- Rapid digitalisation, for atrial fibrillation or flutter, by mouth, 0.75–1.5 mg over 24 hours in divided doses
- Maintenance, for atrial fibrillation or flutter, by mouth, according to renal function and initial loading dose; usual range 125–250 micrograms daily
- Heart failure (for patients in sinus rhythm), by mouth, 62.5–125 micrograms once daily
- Emergency loading dose, for atrial fibrillation or flutter, by intravenous infusion (but rarely necessary), 0.75–1 mg over at least 2 hours (see also Cautions) then maintenance dose by mouth on the following day

**Note** The above doses may need to be reduced if digoxin (or another cardiac glycoside) has been given in the preceding 2 weeks. Digoxin doses in the BNF may differ from those in product literature. For plasma concentration monitoring, blood should ideally be taken at least 6 hours after a dose

**Digoxin (Non-proprietary)**

- **Tablets**, digoxin 62.5 micrograms, net price 28 = £1.66; 125 micrograms, 28 = £1.34; 250 micrograms, 28 = £1.37
- **Injection**, digoxin 250 micrograms/mL, net price 2-ML amp = 70p

**Available from Antigen**

**Paediatric injection**, digoxin 100 micrograms/mL

**Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939**

**Lanoxin® (GSK)**

- **Tablets**, digoxin 125 micrograms, net price 20 = 32p; 250 micrograms (scored), 20 = 32p
- **Injection**, digoxin 250 micrograms/mL, net price 2-ML amp = 66p

**Lanoxin-PG® (GSK)**

- **Tablets**, blue, digoxin 62.5 micrograms, net price 20 = 32p
- **Elixir**, yellow, digoxin 50 micrograms/mL. Do not dilute, measure with pipette. Net price 60 mL = £5.35. Counselling, use of pipette

### DIGITOXIN

**Indications** heart failure, supraventricular arrhythmias (particularly atrial fibrillation)

**Cautions** see under Digoxin

**Contra-indications** see under Digoxin

**Side-effects** see under Digoxin

**Dose**

- Maintenance, 100 micrograms daily or on alternate days; may be increased to 200 micrograms daily if necessary

**Digoxin (Non-proprietary)**

- **Tablets**, digoxin 100 micrograms, net price 28 = £4.11
Digoxin-specific antibody

Digoxin-specific antibody fragments are indicated for the treatment of known or strongly suspected digoxin or digitoxin overdose, in situations where measures beyond the withdrawal of the cardiac glycoside and correction of any electrolyte abnormalities are felt to be necessary (see also notes above).

Digibind® (GSK) Injection, powder for preparation of infusion, digoxin-specific antibody fragments (F(ab)) 38 mg, net price per vial = £93.97 (hosp. and poisons centres only)

Dose consult product literature

2.1.2 Phosphodiesterase inhibitors

Enoximone and milrinone are selective phosphodiesterase inhibitors which exert most of their effect on the myocardium. Sustained haemodynamic benefit has been observed after administration, but there is no evidence of any beneficial effect on survival.

2.2 Diuretics

2.2.1 Thiazides and related diuretics

2.2.2 Loop diuretics

2.2.3 Potassium-sparing diuretics and aldosterone antagonists

2.2.4 Potassium-sparing diuretics with other diuretics

2.2.5 Osmotic diuretics

2.2.6 Mercurial diuretics

2.2.7 Carbonic anhydrase inhibitors

2.2.8 Diuretics with potassium

Thiazides (section 2.2.1) are used to relieve oedema due to chronic heart failure (section 2.5.5) and, in lower doses, to reduce blood pressure.

Loop diuretics (section 2.2.2) are used in pulmonary oedema due to left ventricular failure and in patients with chronic heart failure (section 2.5.5).

Combination diuretic therapy may be effective in patients with oedema resistant to treatment with one diuretic. Vigorous diuresis, particularly with loop diuretics, may induce acute hypotension; rapid reduction of plasma volume should be avoided.

Elderly Lower initial doses of diuretics should be used in the elderly because they are particularly susceptible to the side-effects. The dose should then be adjusted according to renal function. Diuretics should not be used continuously on a long-term basis to treat simple gravitational oedema (which will usually respond to increased movement, raising the legs, and support stockings).

Potassium loss Hypokalaemia may occur with both thiazide and loop diuretics. The risk of hypokalaemia depends on the duration of action as well as the potency and is thus greater with thiazides than with an equipotent dose of a loop diuretic.
Thiazides and related diuretics are moderately potent diuretics; they inhibit sodium reabsorption at the beginning of the distal convoluted tubule. They act within 1 to 2 hours of oral administration and most have a duration of action of 12 to 24 hours; they are usually administered early in the day so that the diuresis does not interfere with sleep.

In the management of hypertension a low dose of a thiazide, e.g. bendroflumethiazide (bendrofluazide) 2.5 mg daily, produces a maximal or near-maximal blood pressure lowering effect, with very little biochemical disturbance. Higher doses cause more marked changes in plasma potassium, sodium, uric acid, glucose, and lipids, with little advantage in blood pressure control. For reference to the use of thiazides in chronic heart failure see section 2.5.5.

Bendroflumethiazide (bendrofluazide) is widely used for mild or moderate heart failure and for hypertension—alone in the treatment of mild hypertension or with other drugs in more severe hypertension.

Chlortalidone (chlorthalidone), a thiazide-related compound, has a longer duration of action than the thiazides and may be given on alternate days to control oedema. It is also useful if acute retention is liable to be precipitated by a more rapid diuresis or if patients dislike a domestic diuresis; it is administered early in the day so that the diuresis does not interfere with sleep.

Metolazone is particularly effective when combined with a loop diuretic (even in renal failure); profound diuresis can occur and the patient should therefore be monitored carefully.

Xipamide and indapamide are chemically related to chlortalidone. Indapamide is claimed to lower blood pressure with less metabolic disturbance, particularly less aggravation of diabetes mellitus.

Contra-indications

Thiazides and related diuretics should be avoided in refractory hypokalaemia, hyponatraemia and hypercalcaemia, symptomatic hyperuricaemia, and Addison's disease.

Side-effects

Side-effects of thiazides and related diuretics include mild gastro-intestinal disturbances, postural hypotension, altered plasma lipid concentrations, metabolic and electrolyte disturbances including hypokalaemia (see also notes above), hypernatraemia, hypomagnesaemia, hypercalcaemia, hyperglycaemia, hyperchloremic alkalosis, hyperuricaemia, and gout. Less common side-effects include blood disorders such as agranulocytosis, leucopenia, and thrombocytopenia, and impotence. Pancreatitis, intrahepatic cholestasis, cardiac arrhythmias, headache, dizziness, paraesthesia, visual disturbances, and hypersensitivity reactions (including pneumonitis, pulmonary oedema, photosensitivity, and severe skin reactions) have also been reported.

BENEDROFLUMETHIAZIDE

(Bendrofluazide)

Indications

Oedema, hypertension (see also notes above)

Cautions

see notes above

Contra-indications

see notes above

Side-effects

see notes above

Dose

- Oedema, initially 5–10 mg daily in the morning or on alternate days; maintenance 5–10 mg 1–3 times weekly
- Hypertension, 2.5 mg daily in the morning; higher doses rarely necessary (see notes above)

Bendroflumethiazide (Non-proprietary)

Tablets, bendroflumethiazide 2.5 mg. net price 28 = 83p; 5 mg, 28 = 86p

Brands include Aprinox, Neo-NaClex

CHLORTALIDONE

(Chlorthalidone)

Indications

ascites due to cirrhosis in stable patients (under close supervision), oedema due to nephrotic syndrome, hypertension (see also notes above), mild to moderate chronic heart failure; diabetes insipidus (see section 6.5.2)

Cautions

see notes above

Contra-indications

see notes above

Side-effects

see notes above; also rarely jaundice and allergic interstitial nephritis

Dose

- Oedema, up to 50 mg daily
- Hypertension, 25 mg daily in the morning, increased to 50 mg daily if necessary (but see notes above)
- Heart failure, 25–50 mg daily in the morning, increased if necessary to 100–200 mg daily (reduce to lowest effective dose for maintenance)
**Cyclophantiazide**

**Indications**
Oedema, hypertension (see also notes above); heart failure

**Cautions**
see notes above

**Side-effects**
see notes above; also rarely depression

**Dose**
- Heart failure, 250–500 micrograms daily in the morning increased if necessary to 1 mg daily (reduce to lowest effective dose for maintenance)
- Hypertension, initially 250 micrograms daily in the morning, increased if necessary to 500 micrograms daily (but see notes above)
- Oedema, up to 500 micrograms daily for a short period

**Navidrex**

- Tablets, yellow, scored, chlortalidone 50 micrograms, net price 28-tab pack = £1.27
- Excipients include gluten

**Indapamide**

**Indications**
essential hypertension

**Cautions**
see notes above; also acute porphyria (section 9.8.2)

**Contra-indications**
see notes above

**Side-effects**
see notes above; also palpitation, diuresis with doses above 2.5 mg daily

**Dose**
- 2.5 mg daily in the morning

**Indapamide (Non-proprietary)**

- Tablets, s/c, indapamide 2.5 mg, net price 28-tab pack = £1.36, 56-tab pack = £2.24

**Natrilix**

- Tablets, f/c, indapamide 2.5 mg, Net price 30-tab pack = £4.50, 60-tab pack = £9.00

**Modified release**

**Ethibide XL**

- Tablets, m/r, indapamide 1.5 mg, net price 30-tab pack = £4.05. Label: 25
- Dose: hypertension, 1 tablet daily, preferably in the morning

**Natrilix SR**

- Tablets, m/r, indapamide 1.5 mg, net price 30-tab pack = £4.50. Label: 25
- Dose: hypertension, 1 tablet daily, preferably in the morning

**Metenix 5**

- Tablets, blue, metolazone 5 mg, net price 100-tab pack = £18.94

**Xipamide**

**Indications**
Oedema, hypertension (see also notes above)

**Cautions**
see notes above; also acute porphyria (section 9.8.2)

**Contra-indications**
see notes above

**Side-effects**
see notes above

**Dose**
- Oedema, initially 40 mg daily in the morning, increased to 80 mg in resistant cases; maintenance 20 mg in the morning
- Hypertension, 20 mg daily in the morning

**Diurexan**

- Tablets, scored, xipamide 20 mg, net price 140-tab pack = £19.46

---

**Loop diuretics**

Loop diuretics are used in pulmonary oedema due to left ventricular failure; intravenous administration produces relief of breathlessness and reduces pre-load sooner than would be expected from the time of onset of diuresis. Loop diuretics are also used in patients with chronic heart failure. Diuretic-resistant oedema (except lymphoedema and oedema due to peripheral venous stasis or calcium-channel blockers) can be treated with a loop diuretic combined with a thiazide or related diuretic (e.g., bendroflumethiazide 5–10 mg daily or metolazone 5–20 mg daily).

If necessary, a loop diuretic can be added to antihypertensive treatment to achieve better control of blood pressure in those with resistant hypertension, or in patients with impaired renal function or heart failure. Loop diuretics inhibit reabsorption from the ascending limb of the loop of Henle in the renal tubule and are powerful diuretics. Hypokalaemia may develop, and care is needed to avoid hypotension. If there is an enlarged prostate, urinary retention may occur; this is less likely if small doses and less potent diuretics are used initially.

**Furosemide** (frusemide) and **bumetanide** are similar in activity; both act within 1 hour of oral administration and diuresis is complete within 6 hours so that, if necessary, they can be given twice in one day without interfering with sleep. Following intravenous administration they have a peak effect within 30 minutes. The diuresis associated with these drugs is dose related. In patients with impaired renal function very large doses may occasionally be needed; in such doses both drugs may cause deafness and bumetanide can cause myalgia.

**Torasemide** has properties similar to those of furosemide and bumetanide, and is indicated for oedema and for hypertension.

---

**Hygroton**

- Tablets, yellow, scored, chlortalidone 50 mg, net price 28-tab pack = £1.64

**Ethibide XL**

- Tablets, m/r, metolazone 5 mg, net price 30-tab pack = £19.46

**Alliance**

- Tablets, blue, metolazone 5 mg, 60-tab pack = £6.00, 120-tab pack = £12.00

**Genus**

- Tablets, blue, xipamide 20 mg, net price 140-tab pack = £19.46
Furosemide (frusemide)

**Indications** oedema (see notes above); resistant hypertension (see notes above)

**Cautions** section 2.2; also monitor electrolytes; hypotension; prostatic enlargement; impaired micturition; gout; diabetes; intravenous administration rate should not usually exceed 4 mg/minute, however single doses of up to 80 mg may be administered more rapidly; a lower infusion rate may be considered in those with renal impairment; hepatorenal syndrome; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications** see under Furosemide

**Side-effects** mild gastro-intestinal disturbances; hypotension; hyperglycaemia (less common than with thiazides); hyperuricaemia and gout; electrolyte disturbances including hypernatraemia, hypokalaemia (see also section 2.2), hypocalcaemia, and hypomagnesaemia, metabolic alkalosis; rarely paraesthesia, blood disorders (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia, haemolytic anaemia), bone marrow depression (withdrawal treatment), tinnitus and deafness (usually with large parenteral doses and rapid administration, in renal impairment, or in hypoproteinaemia), and hypersensitivity reactions (including rashes, photosensitivity, eosinophilia, exfoliative dermatitis, purpura, and anaphylaxis), pancreatitis, intrabpetic cholesterol; temporary increase in plasma cholesterol and triglyceride concentration also reported

**Dose**

- **By mouth**, oedema, initially 40 mg in the morning; maintenance 20–40 mg daily; CHILD 1–3 mg/kg daily, max. 40 mg daily
- **By intramuscular injection** or slow intravenous injection (rate of administration, see Cautions above), initially 20–50 mg, increased if necessary in steps of 20 mg not less than every 2 hours; doses greater than 50 mg by intravenous infusion only; max. 1.5 g daily; CHILD 0.5–1.5 mg/kg daily, max. 20 mg daily

**Furosemide** (Non-proprietary) Tablets, furosemide 20 mg, net price 28 = £1.22; 5 mg, 28-tab pack = £2.53

**Oral solution**, sugar-free, furosemide, net price 20 mg/5 mL, 150 mL = £12.68; 40 mg/5 mL, 150 mL = £16.31; 50 mg/5 mL, 150 mL = £17.68

**Injection**, furosemide 10 mg/mL, net price 2-mL amp = 55p, 5-mL amp = 66p, 25-mL amp = £2.50

**Lasix** (Sanofi-Aventis) Injection, furosemide 10 mg/mL, net price 2-mL amp = 78p

**Note** Large-volume furosemide injections also available; brands include Minijet

---

Bumetanide

**Indications** oedema (see notes above)

**Cautions** see under Furosemide; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications** see under Furosemide

**Side-effects** see under Furosemide; also headache, dizziness, fatigue, gynaecomastia, myalgia

**Dose**

- **By mouth**, 1 mg in the morning, repeated after 6–8 hours if necessary; severe cases, 5 mg daily increased by 5 mg every 12–24 hours according to response; ELDERLY, 500 micrograms daily may be sufficient
- **By intravenous injection**, 1–2 mg, repeated after 20 minutes if necessary; ELDERLY, 500 micrograms daily may be sufficient
- **By intravenous infusion**, 2–5 mg over 30–60 minutes; ELDERLY, 500 micrograms daily may be sufficient
- **By intramuscular injection**, 1 mg initially then adjusted according to response; ELDERLY, 500 micrograms daily may be sufficient

**Bumetanide** (Non-proprietary) Tablets, bumetanide 1 mg, net price 28-tab pack = £1.22; 5 mg, 28-tab pack = £2.53

**Oral solution**, bumetanide 1 mg/5 mL, net price 150 mL = £128.00

**Injection**, bumetanide 500 micrograms/mL, net price 4-mL amp = £1.79

**Burinex** (LEO) Tablets, scored, bumetanide 1 mg, net price 28-tab pack = £1.52; 5 mg, 28 = £9.67

---

Torasemide

**Indications** oedema (see notes above), hypertension

**Cautions** see under Furosemide; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

**Contra-indications** see under Furosemide

**Side-effects** see under Furosemide; also dry mouth; rarely limb paraesthesia

**Dose**

- **Oedema**, 5 mg once daily, preferably in the morning, increased if required to 20 mg once daily; usual max. 40 mg daily
- **Hypertension**, 2.5 mg daily, increased if necessary to 5 mg once daily

**Torasemide** (Non-proprietary) Tablets, torasemide 5 mg, net price 28-tab pack = £5.62; 10 mg, 28-tab pack = £8.09

**Torem** (Roche) Tablets, torasemide 2.5 mg, net price 28-tab pack = £3.78; 5 mg (scored), 28-tab pack = £5.53; 10 mg (scored), 28-tab pack = £8.14
2.2.3 Potassium-sparing diuretics and aldosterone antagonists

Amiloride and triamterene on their own are weak diuretics. They cause retention of potassium and are therefore given with thiazide or loop diuretics as a more effective alternative to potassium supplements. See section 2.2.4 for compound preparations with thiazides or loop diuretics.

Potassium supplements must not be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

Potassium supplements must be given with potassium-sparing diuretics. Administration of a potassium-sparing diuretic to a patient receiving an ACE inhibitor or an angiotensin-II receptor antagonist can also cause severe hyperkalaemia.

AMILORIDE HYDROCHLORIDE

**Indications**  oedema; potassium conservation when used as an adjunct to thiazide or loop diuretics for hypertension, congestive heart failure, or hepatic cirrhosis with ascites

**Cautions**  monitor electrolytes; diabetes mellitus; elderly; renal impairment (manufacturers advise avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

**Contra-indications**  hyperkalaemia; anuria; Addison’s disease

**Side-effects**  include gastro-intestinal disturbances, dry mouth, rashes, confusion, postural hypotension, hyperkalaemia, hyponatraemia

**Dose**
- Used alone, initially 10 mg daily or 5 mg twice daily, adjusted according to response; max. 20 mg daily
- With other diuretics, congestive heart failure and hypertension, initially 5–10 mg daily; cirrhosis with ascites, initially 5 mg daily

**Amiloride** (Non-proprietary)

**Tablets**, amiloride hydrochloride 5 mg, net price 28-tab pack = £1.03

**Oral solution**, sugar-free, amiloride hydrochloride 5 mg/5 mL, net price 150 mL = £39.73

**Brands include Amilamont** (Excipients include propylene glycol, see Excipients, p. 2)

**Diuretics and aldosterone antagonists**

**Indications**  oedema, potassium conservation with thiazide and loop diuretics

**Cautions**  see under Amiloride Hydrochloride; may cause blue fluorescence of urine

**Contra-indications**  see under Amiloride Hydrochloride

**Side-effects**  include gastro-intestinal disturbances, dry mouth, rashes; slight decrease in blood pressure, hyperkalaemia, hyponatraemia; photosensitivity and blood disorders also reported; triamterene found in kidney stones

**Disease**  include gastro-intestinal disturbances, dry mouth, rashes; slight decrease in blood pressure, hyperkalaemia, hyponatraemia

**Dose**
- Initially 150–250 mg daily, reducing to alternate days after 1 week; taken in divided doses after breakfast and lunch; lower initial dose when given with other diuretics

**Counselling**  Urine may look slightly blue in some lights

**Dyta(®) (Goldshield)**

**Capsules**, maroon, triamterene 50 mg, net price 30-cap pack = £17.35 Label: 14, (see above), 21

**Compound preparations with thiazides or loop diuretics**

Section 2.2.4

**Aldosterone antagonists**

Spironolactone potentiates thiazide or loop diuretics by antagonising aldosterone; it is a potassium-sparing diuretic. Spironolactone is of value in the treatment of oedema and ascites caused by cirrhosis of the liver; furosemide (section 2.2.2) can be used as an adjunct. Low doses of spironolactone are beneficial in severe heart failure, see section 2.5.5.

Spironolactone is also used in primary hyperaldosteronism (Conn’s syndrome). It is given before surgery or if surgery is not appropriate, in the lowest effective dose for maintenance.

**Eplerenone** is licensed for use as an adjunct in left ventricular dysfunction with evidence of heart failure after a myocardial infarction (see also section 2.5.5 and section 2.10.1).

Potassium supplements must not be given with aldosterone antagonists.

**Eplerenone**

**Indications**  adjunct in stable patients with left ventricular dysfunction with evidence of heart failure, following myocardial infarction (start therapy within 3–14 days of event)

**Cautions**  measure plasma-potassium concentration before treatment, during initiation, and when dose changed; elderly; hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 50 mL/minute; Appendix 3); pregnancy; breast-feeding (Appendix 5); **interactions:** Appendix 1 (diuretics)

**Contra-indications**  hyperkalaemia; concomitant use of potassium-sparing diuretics or potassium supplements

**Side-effects**  diarrhoea, nausea; hypotension; dizziness; hyperkalaemia; rash; less commonly flatulence, vomiting, atrial fibrillation, postural hypotension, arterial thrombosis, dyslipidaemia, pharyngitis, headache, insomnia, gynaeacomastia, pycnephritis, hyponatraemia, dehydration, eosinophilia, asthenia, malaise, back pain, leg cramps, impaired renal function, azotaemia, sweating and pruritus

**Dose**
- Initially 25 mg once daily, increased within 4 weeks to 50 mg once daily; **CHILD** not recommended

**Inspra(®) (Pfizer)**

**Tablets**, yellow, 1/2, eplerenone 25 mg, net price 28-tab pack = £42.72; 50 mg, 28-tab pack = £42.72
SIRONOLACTONE

Indications  oedema and ascites in cirrhosis of the liver, malignant ascites, nephrotic syndrome, congestive heart failure (section 2.5.5); primary hyperaldosteronism

Cautions  potential metabolic products carcinogenic in rodents; elderly; monitor electrolytes (discontinue if hyperkalaemia); acute porphyria (section 9.2.2); hepatic impairment; renal impairment (manufacturers advise avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (diuretics)

Contra-indications  hyperkalaemia, hyponatraemia; Addison’s disease

Side-effects  gastro-intestinal disturbances; impotence, gynaecomastia; menstrual irregularities; lethargy, headache, confusion; rash; hyperkalaemia (discontinue); hyponatraemia; hepatotoxicity, osteomalacia, and blood disorders reported

Dose  • 100–200 mg daily, increased to 400 mg if required; CHILD initially 3 mg/kg daily in divided doses

• Heart failure, see section 2.5.5

Spironolactone (Non-proprietary) [H]

Tablets, spironolactone 25 mg, net price 28 = £1.76; 50 mg, 28 = £2.53; 100 mg, 28 = £3.55. Label: 21

Oral suspensions, spironolactone 5 mg/5 mL, 10 mg/5 mL, 25 mg/5 mL, 50 mg/5 mL, and 100 mg/5 mL. Label: 21

Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

Aldactone® (Pharmacia) [H]

Tablets, f/c, spironolactone 25 mg (buff), net price 100-tab pack = £8.89; 50 mg (off-white), 100-tab pack = £17.78; 100 mg (buff), 28-tab pack = £9.96. Label: 21

With thiazides or loop diuretics  Section 2.2.4

2.2.4 Potassium-sparing diuretics with other diuretics

Although it is preferable to prescribe thiazides (section 2.2.1) and potassium-sparing diuretics (section 2.2.3) separately, the use of fixed combinations may be justified if compliance is a problem. Potassium-sparing diuretics are not usually necessary in the routine treatment of hypertension, unless hypokalaemia develops. For interactions, see Appendix 1 (diuretics).

Amiloride with thiazides

Co-amilozide (Non-proprietary) [H]

Tablets, co-amilozide 2.5/25 (amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-tab pack = £2.57

Brands include Moduretic 25

Dose  hypertension, initially 1 tablet daily, increased if necessary to max. 2 tablets daily

Congestive heart failure, initially 1 tablet daily, increased if necessary to max. 4 tablets daily

Oedema and ascites in cirrhosis of the liver, initially 2 tablets daily, increased if necessary to max. 4 tablets daily; reduce for maintenance if possible

Amiloride with loop diuretics

Co-amilofruse (Non-proprietary) [H]

Tablets, co-amilofruse 2.5/20 (amiloride hydrochloride 2.5 mg, furosemide 20 mg), net price 28-tab pack = £1.19, 56-tab pack = £1.63

Brands include Frumil LS

Dose  oedema, 1 tablet in the morning

Tablets, co-amilofruse 5/40 (amiloride hydrochloride 5 mg, furosemide 40 mg), net price 28-tab pack = £1.24, 56-tab pack = £1.61

Brands include Frumil-C O, Frumil

Dose  oedema, 1–2 tablets in the morning

Tablets, co-amilofruse 10/80 (amiloride hydrochloride 10 mg, furosemide 80 mg), net price 28-tab pack = £9.33, 56-tab pack = £14.86

Brands include Andi

Dose  oedema, 1 tablet in the morning

Burinex A® (Chemidex) [H]

Tablets, ivory, scored, amiloride hydrochloride 5 mg, bumetanide 1 mg, net price 28-tab pack = £2.63

Dose  oedema, 1–2 tablets daily

Triameterene with thiazides

Counselling  Urine may look slightly blue in some lights

Co-triamterzide (Non-proprietary) [H]

Tablets, co-triamterzide 50/25 (triameterene 50 mg, hydrochlorothiazide 25 mg), net price 30-tab pack = 95p. Label: 14, (see above), 21

Dose  hypertension, 1 tablet daily after breakfast, increased if necessary, max. 4 daily

Oedema, 2 tablets daily (1 after breakfast and 1 after midday meal) increased to 3 daily if necessary (2 after breakfast and 1 after midday meal), usual maintenance in oedema, 1 daily or 2 on alternate days; max. 4 daily

Brands include Triam-Co

Dyazide® (Goldshield) [H]

Tablets, peach, scored, co-triamteride 50/25 (triameterene 50 mg, hydrochlorothiazide 25 mg), net price 30-tab pack = 95p. Label: 14, (see above), 21

Dose  hypertension, 1 tablet daily after breakfast, increased if necessary, max. 4 daily

Oedema, 2 tablets daily (1 after breakfast and 1 after midday meal) increased to 3 daily if necessary (2 after breakfast and 1 after midday meal), usual maintenance in oedema, 1 daily or 2 on alternate days; max. 4 daily

Brands include Triam-Co

Dytide® (Goldshield) [H]

Capsules, clear/maroon, triameterene 50 mg, benz-thiazide 25 mg, net price 30-cap pack = £17.35.

Label: 14, (see above), 21

Dose  oedema, initially 3 capsules daily (2 after breakfast and 1 after midday meal) for 1 week then 1 or 2 on alternate days
2.2.5 Osmotic diuretics

Mannitol is an osmotic diuretic that can be used to treat cerebral oedema and raised intra-ocular pressure.

MANNITOL

Indications  see notes above; glaucoma (section 11.6)

Cautions  extravasation causes inflammation and thrombophlebitis

Contra-indications  congestive cardiac failure, pulmonary oedema

Side-effects  chills, fever

Dose

- Cerebral oedema and raised intra-ocular pressure, by intravenous infusion over 30–60 minutes, 0.25–2 g/kg repeated if necessary 1–2 times after 4–8 hours

Mannitol (Baxter)  [UK]

Intravenous infusion, mannnitol 10% and 20%

2.2.6 Mercurial diuretics

Mercurial diuretics are effective but are now almost never used because of their nephrotoxicity.

2.2.7 Carbonic anhydrase inhibitors

The carbonic anhydrase inhibitor acetazolamide is a weak diuretic and is little used for its diuretic effect. It is used for prophylaxis against mountain sickness [unlicensed indication] but is not a substitute for acclimatisation. Acetazolamide and eye drops of dorzolamide and brinzolamide inhibit the formation of aqueous humour and are used in glaucoma (section 11.6).

2.2.8 Diuretics with potassium

Many patients on diuretics do not need potassium supplements (section 9.2.1.1). For many of those who do, the amount of potassium in combined preparations may not be enough, and for this reason their use is to be discouraged.

Diuretics with potassium and potassium-sparing diuretics should not usually be given together.

Counselling  Modified-release potassium tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

Centyl K® (LEO)  [UK]

Tablets, green, f/c, bendroflumethiazide 2.5 mg, potassium 7.7 mmol for modified release, net price 56-tab pack = £7.50. Label: 25, 27, counselling, see above

Diuride-K Continus® (Teofarma)  [UK]

Tablets, white/orange, f/c, furosemide 40 mg, potassium 8 mmol for modified release, net price 30-tab pack = £3.00. Label: 25, 27, counselling, see above

Neo-NaClex-K® (Goldshield)  [UK]

Tablets, pink/white, f/c, bendroflumethiazide 2.5 mg, potassium 8.4 mmol for modified release, net price 100 tab-pack = £8.99. Label: 25, 27, counselling, see above

2.3 Anti-arrhythmic drugs

2.3.1 Management of arrhythmias

2.3.2 Drugs for arrhythmias
Atrial fibrillation  Atrial fibrillation can be managed by either controlling the ventricular rate or by attempting to restore and maintain sinus rhythm. All patients with atrial fibrillation should be assessed for their risk of stroke and thromboembolism, and thromboprophylaxis given if necessary (see below).

Ventricular rate can be controlled with a beta-blocker (section 2.4), or diltiazem [unlicensed indication], or verapamil. If rate control is inadequate during normal activities, digoxin can be added; in those who require additional rate control during exercise, a combination of diltiazem or verapamil with digoxin should be used, but care is required if ventricular function is diminished. Digoxin is usually only effective for controlling ventricular rate at rest, therefore digoxin monotherapy should only be used in predominantly sedentary patients; digoxin is also used if atrial fibrillation is accompanied by congestive heart failure.

Sinus rhythm can be restored by electrical cardioversion, or pharmacological cardioversion with an intravenous anti-arrhythmic drug e.g. flecainide or amiodarone. If necessary, sotalol or amiodarone can be started 4 weeks before electrical cardioversion to increase success of the procedure. If drug treatment is required to maintain sinus rhythm, a beta-blocker is used. If a standard beta-blocker is not appropriate or is ineffective, an oral anti-arrhythmic drug such as sotalol (section 2.4), flecainide, propafenone, or amiodarone, is required.

In symptomatic paroxysmal atrial fibrillation, ventricular rhythm is controlled with a beta-blocker. Alternatively, if symptoms persist or a beta-blocker is not appropriate, an oral anti-arrhythmic drug such as sotalol, flecainide, propafenone, or amiodarone can be given (see also Paroxysmal Supraventricular Tachycardia below, and Supraventricular Arrhythmias).

All haemodynamically unstable patients with acute-onset atrial fibrillation should undergo electrical cardioversion. Intravenous amiodarone, or alternatively flecainide, can be used in non-life-threatening cases where electrical cardioversion is delayed. If urgent ventricular rate control is required, a beta-blocker, verapamil, or amiodarone can be given intravenously.

All patients with atrial fibrillation should be assessed for their risk of stroke and the need for thromboprophylaxis. Anticoagulants (section 2.8) are indicated for those with a history of ischaemic stroke, transient ischaemic attacks, or thromboembolic events, and those with valve disease, heart failure, or impaired left ventricular function; anticoagulants should be considered for those with cardiovascular disease, diabetes, hypertension, or thyrotoxicosis, and in the elderly. Anticoagulants are also indicated during cardioversion procedures. Aspirin (section 2.9) is less effective than warfarin at preventing emboli, but may be appropriate if there are no other risk factors for stroke, or if warfarin is contra-indicated.

Paroxysmal supraventricular tachycardia  In most patients this remits spontaneously or can be returned to sinus rhythm by reflex vagal stimulation with respiratory manoeuvres, prompt squatting, or pressure over one carotid sinus (important: pressure over carotid sinus should be restricted to monitored patients—it can be dangerous in recent ischaemia, digitalis toxicity, or the elderly).

If vagal stimulation fails, intravenous administration of adenosine is usually the treatment of choice. Intravenous administration of verapamil is useful for patients without myocardial or valvular disease (important: never in patients recently treated with beta-blockers, see p. 118). For arrhythmias that are poorly tolerated, synchronised d.c. shock usually provides rapid relief.

In cases of paroxysmal supraventricular tachycardia with block, digitalis toxicity should be suspected. In addition to stopping administration of the cardiac glycoside and giving potassium supplements, intravenous administration of a beta-blocker may be useful. Specific digoxin antibody is available if the toxicity is considered life-threatening (section 2.1.1).

Arrhythmias after myocardial infarction  In patients with a paroxysmal tachycardia or rapid irregularity of the pulse it is best not to administer an anti-arrhythmic until an ECG record has been obtained. Bradycardia, particularly if complicated by hypotension, should be treated with 500 micrograms of atropine sulphate given intravenously; the dose may be repeated every 3–5 minutes if necessary up to a maximum total dose of 3 mg. If there is a risk of asystole, or if the patient is unstable and has failed to respond to atropine, adrenaline should be given by intravenous infusion in a dose of 2–10 micrograms/minute, adjusted according to response.

For further advice, refer to the most recent recommendations of the Resuscitation Council (UK) available at www.resus.org.uk.

Ventricular tachycardia  Drug treatment is used both for the treatment of ventricular tachycardia and for prophylaxis of recurrent attacks that merit suppression. Ventricular tachycardia requires treatment most commonly in the acute stage of myocardial infarction, but the likelihood of this and other life-threatening arrhythmias diminishes sharply over the first 24 hours after the attack, especially in patients without heart failure or shock. Lidocaine (lignocaine) is the preferred drug for emergency use. Other drugs are best administered under specialist supervision. Very rapid ventricular tachycardia causes profound circulatory collapse and should be treated urgently with d.c. shock.

Torsade de pointes is a form of ventricular tachycardia associated with a long QT syndrome (usually drug-induced, but other factors including hypokalaemia, severe bradycardia, and genetic predisposition are also implicated). Episodes are usually self-limiting, but are frequently recurrent and can cause impairment or loss of consciousness. If not controlled, the arrhythmia can progress to ventricular fibrillation and sometimes death. Intravenous infusion of magnesium sulphate (section 9.5.1.3) is usually effective. A beta-blocker (but not sotalol) and atrial (or ventricular) pacing can be considered. Anti-arrhythmics can further prolong the QT interval, thus worsening the condition.
2.3.2 Drugs for arrhythmias

Anti-arrhythmic drugs can be classified clinically into those that act on supraventricular arrhythmias (e.g. verapamil), those that act on both supraventricular and ventricular arrhythmias (e.g. disopyramide), and those that act on ventricular arrhythmias (e.g. lidocaine (lignocaine)).

They can also be classified according to their effects on the electrical behaviour of myocardial cells during activity:

- Class I: membrane stabilising drugs (e.g. lidocaine, flecaïnine)
- Class II: beta-blockers
- Class III: amiodarone and sotalol (also Class II)
- Class IV: calcium-channel blockers (includes verapamil but not dihydroprydines)

This latter classification (the Vaughan Williams classification) is of less clinical significance.

Cautions The negative inotropic effects of anti-arrhythmic drugs tend to be additive. Therefore special care should be taken if two or more are used, especially if myocardial function is impaired. Most or all drugs that are effective in countering arrhythmias can also provoke them in some circumstances; moreover, hypokalaemia enhances the arrhythmogenic (pro-arrhythmic) effect of many drugs.

Supraventricular arrhythmias

Adenosine is usually the treatment of choice for terminating paroxysmal supraventricular tachycardia. As it has a very short duration of action (half-life only about 8 to 10 seconds, but prolonged in those taking dipyridamole), most side-effects are short lived. Unlike verapamil, adenosine can be used after a beta-blocker. Verapamil may be preferable to adenosine in asthma.

Oral administration of a cardiac glycoside (such as digoxin, section 2.1.1) slows the ventricular response in cases of atrial fibrillation and atrial flutter. However, intravenous infusion of digoxin is rarely effective for rapid control of ventricular rate. Cardiac glycosides are contra-indicated in supraventricular arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome).

Verapamil (section 2.6.2) is usually effective for supraventricular tachycardias. An initial intravenous dose (important: serious beta-blocker interaction hazard, see p. 118) may be followed by oral treatment; hypotension may occur with large doses. It should not be used for tachyarrhythmias where the QRS complex is wide (i.e. broad complex) unless a supraventricular origin has been established beyond reasonable doubt. It is also contra-indicated in atrial fibrillation with pre-excitation (e.g. Wolff-Parkinson-White syndrome). It should not be used in children with arrhythmias without specialist advice; some supraventricular arrhythmias in childhood can be accelerated by verapamil with dangerous consequences.

Intravenous administration of a beta-blocker (section 2.4) such as esmolol or propranolol, can achieve rapid control of the ventricular rate.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone, beta-blockers (see p. 86), disopyramide, flecaïnine, procainamide (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939), and propafenone, see below under Supraventricular and Ventricular Arrhythmias.

Adenosine

Indications rapid reversion to sinus rhythm of paroxysmal supraventricular tachycardias, including those associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); aid to diagnosis of broad or narrow complex supraventricular tachycardias

Cautions atrial fibrillation or flutter with accessory pathway (conduction down anomalous pathway may increase); heart transplant (see below); interactions: Appendix 1 (adenosine)

Contra-indications second- or third-degree AV block and sick sinus syndrome (unless pacemaker fitted); asthma

Side-effects include transient facial flush, chest pain, dyspnoea, bronchospasm, choking sensation, nausea, light-headedness; severe bradycardia reported (requiring temporary pacing); ECG may show transient rhythm disturbances

Dose

- By rapid intravenous injection into central or large peripheral vein, 6 mg over 2 seconds with cardiac monitoring; if necessary followed by 12 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes; increments should not be given if high level AV block develops at any particular dose

Important Patients with a heart transplant are very sensitive to effects of adenosine and should receive initial dose of 3 mg over 2 seconds, followed if necessary by 6 mg after 1–2 minutes, and then by 12 mg after a further 1–2 minutes. Also, if essential to give with dipyridamole reduce initial dose to 0.5–1 mg

Note Adenosine doses in the BNF may differ from those in product literature

Adenocor® (Sanofi-Synthelabo) [oral]

Injection, Adenosine 3 mg/mL in physiological saline, net price 2-mL vial = £4.45 (hosp. only)

Note Intravenous infusion of adenosine (Adenocan, Sanofi Winthrop) may be used in conjunction with radionuclide myocardial perfusion imaging in patients who cannot exercise adequately or for whom exercise is inappropriate—consult product literature

Supraventricular and ventricular arrhythmias

Amiodarone is used in the treatment of arrhythmias particularly when other drugs are ineffective or contra-indicated. It may be used for paroxysmal supraventricular, nodal and ventricular tachycardias, atrial fibrillation and flutter, and ventricular fibrillation. It may also be used for tachyarrhythmias associated with Wolff-Parkinson-White syndrome. It should be initiated only under hospital or specialist supervision. Amiodarone may be given by intravenous infusion as well as by mouth, and has the advantage of causing little or no myocardial depression. Unlike oral amiodarone, intravenous amiodarone may act relatively rapidly.

Intravenous injection of amiodarone may be used in cardiopulmonary resuscitation for ventricular fibrilla-
tion or pulseless tachycardia unresponsive to other interventions (section 2.7.3).

Amiodarone has a very long half-life (extending to several weeks) and only needs to be given once daily (but high doses may cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely (see also Appendix 1).

Most patients taking amiodarone develop corneal microdeposits (reversible on withdrawal of treatment); these rarely interfere with vision, but drivers may be dazzled by headlights at night. However, if vision is impaired or if optic neuritis or optic neuropathy occur, amiodarone must be stopped to prevent blindness and expert advice sought. Because of the possibility of phototoxic reactions, patients should be advised to shield the skin from light during treatment and for several months after discontinuing amiodarone; a wide-spectrum sunscreen (section 13.8.1) to protect against both long-wave ultraviolet and visible light should be used.

Amiodarone contains iodine and can cause disorders of thyroid function; both hypothyroidism and hyperthyroidism may occur. Clinical assessment alone is unreliable, and laboratory tests should be performed before treatment and every 6 months. Thyroxine (T4) may be raised in the absence of hyperthyroidism; therefore tri-iodothyronine (T3), T4, and thyroid-stimulating hormone (thyrotrophin, TSH) should all be measured. A raised T3 and T4 with a very low or undetectable TSH concentration suggests the development of thyrotoxicosis. The thyrotoxicosis may be very refractory, and amiodarone should usually be withdrawn at least temporarily to help achieve control; treatment with carbimazole may be required. Hypothyroidism can be treated with replacement therapy without withdrawing amiodarone if it is essential; careful supervision is required. Pneumonitis should always be suspected if new or worsening respiratory symptoms occur (but high doses may cause nausea unless divided). Many weeks or months may be required to achieve steady-state plasma-amiodarone concentration; this is particularly important when drug interactions are likely (see also Appendix 1).

Propafenone is used for the prophylaxis and treatment of ventricular arrhythmias and also for some supraventricular arrhythmias. It has complex mechanisms of action, including weak beta-blocking activity (therefore caution is needed in obstructive airways disease—contra-indicated if severe).

Drugs for supraventricular arrhythmias include adenosine, cardiac glycosides, and verapamil; see above under Supraventricular Arrhythmias. Drugs for ventricular arrhythmias include lidocaine; see under Ventricular Arrhythmias, p. 84.

Mexiletine and procainamide are both available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939. Mexiletine can be used for life-threatening ventricular arrhythmias; procainamide is given by intravenous injection to control ventricular arrhythmias.

**AMIODARONE HYDROCHLORIDE**

**Indications** see notes above (should be initiated in hospital or under specialist supervision)

**Cautions** liver-function and thyroid-function tests required before treatment and then every 6 months (see notes above for tests of thyroid function); hypokalaemia (measure serum-potassium concentration before treatment); chest x-ray required before treatment; heart failure; elderly; severe bradycardia and conduction disturbances in excessive dosage; intravenous use may cause moderate and transient fall in blood pressure (circulatory collapse precipitated by rapid administration or overdosage) or severe hepatocellular toxicity (monitor transaminases closely); give by central venous catheter only; infusion via peripheral veins may cause pain and inflammation; ECG monitoring and resuscitation facilities must be available during intravenous use; acute porphyria (section 9.8.2); interactions: Appendix 1 (amiodarone)

**Contra-indications** (except in cardiac arrest) sinus bradycardia, sino-atrial heart block; unless pacemaker fitted avoid in severe conduction disturbances or sinus node disease; thyroid dysfunction; iodine sensitivity; avoid intravenous use in severe respiratory failure, circulatory collapse, or severe arterial hypotension; avoid bolus injection in congestive heart failure or cardiomyopathy; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, taste disturbances, raised serum transaminases (may require dose reduction or withdrawal if accompanied by acute liver disorders); jaundice; bradycardia (see Cautions); pulmonary toxicity (including pneumonitis and fibrosis); tremor, sleep disorders; hypothyroïdism, hyperthyroïdism; reversible corneal microdeposits (sometimes with night glare); phototoxicity, persistent slate-grey skin discolouration (see also notes above), injection-site reactions; less commonly onset or worsening of arrhythmia, conduction disturbances (see Cautions), peripheral neuropathy and myopathy (usually reversible on withdrawal); very rarely chronic liver disease including cirrhosis, sinus arrest, bronchospasm (in patients with severe respiratory failure), ataxia, benign intracranial hypertension, headache, vertigo, epididymo-orchitis, impotence, haemolytic or aplastic anaemia, thrombocytopenia, rash (including exfoliative dermatitis), hypersensitivity including vasculitis, alopecia, impaired vision due to optic...
neuritis or optic neuropathy (including blindness), anaphylaxis on rapid injection, also hypotension, respiratory distress syndrome, sweating, and hot flushes

**Dose**

- **By mouth**, 200 mg 3 times daily for 1 week reduced to 200 mg twice daily for a further week; maintenance, usually 200 mg daily or the minimum required to control the arrhythmia
- **By intravenous infusion** via central venous catheter, initially 5 mg/kg over 20–120 minutes with ECG monitoring; subsequent infusion given if necessary according to response up to max. 1.2 g in 24 hours
- Ventricular fibrillation or pulseless ventricular tachycardia refractory to defibrillation, section 2.7.3

**Amiodarone (Non-proprietary)** *(Amynex)*

**Tablets**, amiodarone hydrochloride 100 mg, net price 28-tab pack = £1.39; 200 mg, 28-tab pack = £1.42.

**Injection**, amiodarone hydrochloride 30 mg/mL, net price 10-mL prefilled syringe = £10.25

**Excipients** may include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Sterile concentrate**, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33, 6-mL amp = £2.86. For dilution and use as an infusion

**Excipients** may include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

**Cordarone X** *(Sanofi-Aventis)* *(Amyben)*

**Tablets**, scored, amiodarone hydrochloride 100 mg, net price 28-tab pack = £4.45; 200 mg, 28-tab pack = £7.27.

**Label**: 11

**Stere concentrate**, amiodarone hydrochloride 50 mg/mL, net price 3-mL amp = £1.33. For dilution and use as an infusion

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

### DISOPYRAMIDE

**Indications** ventricular arrhythmias, especially after myocardial infarction; supraventricular arrhythmias

**Cautions** monitor for hypotension, hypoglycaemia, ventricular tachycardia, ventricular fibrillation or torsade de points (discontinue if occur); atrial flutter or atrial tachycardia with partial block, bundle branch block, heart failure (avoid if severe); prostatic enlargement; susceptibility to angle-closure glaucoma; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (disopyramide)

**Contra-indications** second- and third-degree heart block and sinus node dysfunction (unless pacemaker fitted); cardiogenic shock; severe uncompensated heart failure

**Side-effects** ventricular tachycardia, ventricular fibrillation or torsade de points (usually associated with prolongation of QRS complex or QT interval—see Cautions above), myocardial depression, hypotension, AV block; antimuscarnic effects include dry mouth, blurred vision, urinary retention, and very rarely angle-closure glaucoma; gastro-intestinal irritation; psychosis, cholestatic jaundice, hypoglycaemia also reported (see Cautions above)

**Dose**

- **By mouth**, 300–800 mg daily in divided doses
- **By slow intravenous injection**, 2 mg/kg over at least 5 minutes to a max. of 150 mg, with ECG monitoring, followed immediately either by 200 mg **by mouth**, then 200 mg every 8 hours for 24 hours or 400 micrograms/kg/hour **by intravenous infusion**; max. 300 mg in first hour and 800 mg daily

**Disopyramide (Non-proprietary)** *(Amyben)*

**Capsules**, disopyramide (as phosphate) 100 mg, net price 84 = £21.37; 150 mg, 84 = £26.72

**Injection**, disopyramide (as phosphate) 10 mg/mL, net price 5-mL amp = £2.72

### FLECAINIDE ACETATE

**Indications** Capsules, tablets, and injection: AV nodal reciprocating tachycardia, arrhythmias associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome), disabling symptoms of paroxysmal atrial fibrillation in patients without left ventricular dysfunction (arrhythmias of recent onset will respond more readily)

**Immediate-release tablets only**: symptomatic sustained ventricular tachycardia, disabling symptoms of premature ventricular contractions or non-sustained ventricular tachycardia in patients resistant to or intolerant of other therapy

**Injection only**: ventricular tachyarrhythmias resistant to other treatment

**Cautions** patients with pacemakers (especially those who may be pacemaker dependent because stimulation threshold may rise appreciably); atrial fibrillation following heart surgery; elderly (accumulation may occur); ECG monitoring and resuscitation facilities must be available during intravenous use; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (flecainide)

**Contra-indications** heart failure; abnormal left ventricular function; history of myocardial infarction and either asymptomatic ventricular ectopics or asymptomatic non-sustained ventricular tachycardia; long-standing atrial fibrillation where conversion to sinus rhythm not attempted: haemodynamically significant valvular heart disease; avoid in sinus node dysfunction, atrial conduction defects, second-degree or greater AV block, bundle branch block or distal block unless pacing rescue available

**Side-effects** oedema, pro-arrhythmic effects; dyspnoea, dizziness, asthenia, fatigue, fever, visual disturbances; rarely pneumonitis, hallucinations, depression, confusion, anaemia, dyskinesia, convulsions, peripheral neuropathy; also reported gastro-intestinal disturbances, anorexia, hepatic dysfunction, flushing, syncope, drowsiness, tremor, vertigo, headache, anxiety, insomnia, ataxia, paraesthesia, anaemia, leucopenia, thrombocytopenia, corneal deposits, tis-
2 Cardiovascular system

2.3.2 Drugs for arrhythmias

Tambocor

Flecainide (Non-proprietary)

By mouth.

Dose

- By mouth (initiated under direction of hospital consultant), ventricular arrhythmias, initially 100 mg twice daily (max. 400 mg daily usually reserved for rapid control or in heavily built patients), reduced after 3–5 days to the lowest dose which controls arrhythmia

Supraventricular arrhythmias, 50 mg twice daily, increased if required to max. 300 mg daily

- By slow intravenous injection (in hospital), 2 mg/kg over 10–30 minutes, max. 150 mg, with ECG monitoring; followed if required by infusion at a rate of 1.5 mg/kg/hour for 1 hour, subsequently reduced to 100–250 micrograms/kg/hour for up to 24 hours; max. cumulative dose in first 24 hours, 600 mg; transfer to oral treatment, as above

Flecainide acetate 50 mg, net price 60-tab pack = £9.81; 100 mg, 60-tab pack = £15.04

Tambocor® (3M)

Tablets, flecainide acetate 50 mg, net price 60-tab pack = £14.46; 100 mg (scored), 60-tab pack = £20.66

Injection, flecainide acetate 10 mg/mL, net price 15-mL amp = £4.40

Modified release

Tambocor® XL (Meda)

Capsules, m/r, grey/pink, flecainide acetate 200 mg, net price 30-cap pack = £14.77. Label: 25

Dose

- supraventricular arrhythmias, 200 mg once daily

- supraventricular atrial dysrhythmias, 100 mg twice daily and, if necessary, to max. 300 mg 3 times daily after food under direct hospital supervision with ECG monitoring and blood pressure control (if QRS interval prolonged by more than 20%, reduce dose or discontinue if necessary). Max. 1000 mg daily

Dose

- Body-weight 70 kg and over, initially 150 mg 3 times daily after food under direct hospital supervision with ECG monitoring and blood pressure control (if QRS interval prolonged by more than 20%, reduce dose or discontinue until ECG returns to normal limits); may be increased at intervals of at least 3 days to 300 mg twice daily and, if necessary, to max. 300 mg 3 times daily; body-weight under 70 kg, reduce dose; ELDERLY may respond to lower doses

Verapamil® (Abbott) Tablets, 12.5 mg, propafenone hydrochloride 150 mg, net price 90-tab pack = £7.37; 300 mg, 60-tab pack = £9.34. Label: 21, 25

Ventricular arrhythmias

Lidocaine (lidocaine) is relatively safe when used by slow intravenous injection and should be considered first for emergency use. Though effective in suppressing ventricular tachycardia and reducing the risk of ventricular fibrillation following myocardial infarction, it has not been shown to reduce mortality when used prophylactically in this condition. In patients with cardiac or hepatic failure doses may need to be reduced to avoid convulsions, depression of the central nervous system, or depression of the cardiovascular system.

Moracizine (Ethmazine®, Shire) is available from ‘special-order’ manufacturers or specialist-importing companies (see p. 939) for the prophylaxis and treatment of serious and life-threatening ventricular arrhythmias for patients already stabilised on moracizine.

Drugs for both supraventricular and ventricular arrhythmias include amiodarone, beta-blockers, disopyramide, flecainide, procarinamide (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939), and propafenone, see above under Supraventricular and Ventricular Arrhythmias.

Mexiletine is available from ‘special-order’ manufacturers or specialist-importing companies (see p. 939) for treatment of life-threatening ventricular arrhythmias.

Lidocaine hydrochloride

Indications ventricular arrhythmias, especially after myocardial infarction

Cautions lower doses in congestive cardiac failure and following cardiac surgery; monitor ECG and have resuscitation facilities available; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (lidocaine)

Contra-indications sino-atrial disorders, all grades of atrioventricular block, severe myocardial depression; acute porphyria (section 9.8.2)

Side-effects dizziness, paraesthesia, or drowsiness (particularly if injection too rapid); other CNS effects include confusion, respiratory depression and convulsions; hypotension and bradycardia (may lead to cardiac arrest); rarely hypersensitivity reactions including anaphylaxis
2.4 Beta-adrenoceptor blocking drugs

Beta-adrenoceptor blocking drugs (beta-blockers) block the beta-adrenoceptors in the heart, peripheral vasculature, bronchi, pancreas, and liver. Many beta-blockers are now available and in general they are all equally effective. There are, however, differences between them which may affect choice in treating particular diseases or individual patients. Intrinsic sympathomimetic activity (ISA, partial agonist activity) represents the capacity of beta-blockers to stimulate as well as to block adrenergic receptors.

Oxprenolol, pindolol, acebutolol, and celiprolol have intrinsic sympathomimetic activity; they tend to cause less bradycardia than the other beta-blockers and may also cause less coldness of the extremities. Some beta-blockers are lipid soluble and some are water soluble. Atenolol, celiprolol, nadolol, and sotalol are the most water-soluble; they are less likely to enter the brain, and may therefore cause less sleep disturbance and nightmares. Water-soluble beta-blockers are excreted by the kidneys and dosage reduction is often necessary in renal impairment.

Beta-blockers with a relatively short duration of action have to be given two or three times daily. Many of these are, however, available in modified-release formulations so that administration once daily is adequate for hypertension. For angina twice-daily treatment may sometimes be needed even with a modified-release formulation. Some beta-blockers such as atenolol, bisoprolol, carvedilol, celiprolol, and nadolol have an intrinsically longer duration of action and need to be given only once daily.

Beta-blockers slow the heart and can depress the myocardium; they are contra-indicated in patients with second- or third-degree heart block. Beta-blockers should also be avoided in patients with worsening unstable heart failure; care is required when initiating a beta-blocker in those with stable heart failure (see also section 2.5.5). Sotalol may prolong the QT interval, and it occasionally causes life-threatening ventricular arrhythmias (important: particular care is required to avoid hypokalaemia in patients taking sotalol).

Labetalol, celiprolol, carvedilol, and nebivolol are beta-blockers that have, in addition, an arteriolar vasodilating action, by diverse mechanisms, and thus lower peripheral resistance. There is no evidence that these drugs have important advantages over other beta-blockers in the treatment of hypertension.

Beta-blockers can precipitate asthma and this effect can be dangerous. Beta-blockers should be avoided in patients with a history of asthma or bronchospasm; if there is no alternative, a cardioselective beta-blocker can be used with extreme caution under specialist supervision. Atenolol, bisoprolol, metoprolol, nebivolol, and (to a lesser extent) acebutolol, have less effect on the beta (bronchial) receptors and are, therefore, relatively cardioselective, but they are not cardiospecific. They have a lesser effect on airways resistance but are not free of this side-effect.

Beta-blockers are also associated with fatigue, coldness of the extremities (may be less common with those with ISA, see above), and sleep disturbances with nightmares (may be less common with the water-soluble beta-blockers, see above).

Beta-blockers are not contra-indicated in diabetes; however, they can lead to a small deterioration of glucose tolerance and interfere with metabolic and autonomic responses to hypoglycaemia. Cardioselective beta-blockers (see above) may be preferable and beta-blockers should be avoided altogether in those with frequent episodes of hypoglycaemia. Beta blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes.

Hypertension The mode of action of beta-blockers in hypertension is not understood, but they reduce cardiac output, alter baroceptor reflex sensitivity, and block peripheral adrenoceptors. Some beta-blockers depress plasma renin secretion. It is possible that a central effect may also partly explain their mode of action.

Beta-blockers are effective for reducing blood pressure but other antihypertensives (section 2.5) are usually more effective for reducing the incidence of stroke, myocardial infarction, and cardiovascular mortality, especially in the elderly. Other antihypertensives are therefore preferred for routine initial treatment of uncomplicated hypertension.

In general, the dose of a beta-blocker does not have to be high; for example, atenolol is given in a dose of 25–50 mg daily and it is rarely necessary to increase the dose to 100 mg.

Beta-blockers can be used to control the pulse rate in patients with phaeochromocytoma (section 2.5.4). However, they should never be used alone as beta-blockade without concurrent alpha-blockade may lead to a hypertensive crisis. For this reason phenoxybenzamine should always be used together with the beta-blocker.
Angina  By reducing cardiac work beta-blockers improve exercise tolerance and relieve symptoms in patients with angina (for further details on the management of stable and unstable angina see section 2.6). As with hypertension there is no good evidence of the superiority of any one drug, although occasionally a patient will respond better to one beta-blocker than to another. There is some evidence that sudden withdrawal may cause an exacerbation of angina and therefore gradual reduction of dose is preferable when beta-blockers are to be stopped. There is a risk of precipitating heart failure when beta-blockers and verapamil are used together in established ischaemic heart disease (important: see p. 118).

Myocardial infarction  For advice on the management of ST-segment-elevation myocardial infarction see section 2.10.1; for advice on the management of non-ST-segment-elevation myocardial infarction see section 2.6. Several studies have shown that some beta-blockers can reduce the recurrence rate of myocardial infarction. However, uncontrolled heart failure, hypotension, bradycardias, and obstructive airways disease render beta-blockers unsuitable in some patients following a myocardial infarction. Atenolol and metoprolol may reduce early mortality after intravenous and subsequent oral administration in the acute phase, while acebutolol, metoprolol, propranolol, and timolol have protective value when started in the early convalescent phase. The evidence relating to other beta-blockers is less convincing; some have not been tested in trials of secondary prevention. Sudden cessation of a beta-blocker can cause a rebound worsening of myocardial ischaemia.

Arrhythmias  Beta-blockers act as antiarrhythmic drugs principally by attenuating the effects of the sympathetic system on automaticity and conductivity within the heart. They can be used in conjunction with digoxin to control the ventricular response in atrial fibrillation, especially in patients with thyrotoxicosis. Beta-blockers are also useful in the management of supraventricular tachycardias, and are used to control those following myocardial infarction (see above).

Esmolol is a relatively cardioselective beta-blocker with a very short duration of action, used intravenously for the short-term treatment of supraventricular arrhythmias, sinus tachycardia, or hypertension, particularly in the peri-operative period. It may also be used in other situations, such as acute myocardial infarction, where sustained beta blockade might be hazardous.

Sotalol, a non-cardioselective beta-blocker with additional class III anti-arrhythmic activity, is used for prophylaxis in paroxysmal supraventricular arrhythmias. It also suppresses ventricular ectopic beats and non-sustained ventricular tachycardia. It has been shown to be more effective than lidocaine (lignocaine) in the termination of spontaneous sustained ventricular tachycardia due to coronary disease or cardiomyopathy. However, it may induce torsade de pointes in susceptible patients.

Heart failure  Beta-blockers may produce benefit in heart failure by blocking sympathetic activity. Bisoprolol and carvedilol reduce mortality in any grade of stable heart failure; nebivolol is licensed for stable mild to moderate heart failure in patients over 70 years. Treatment should be initiated by those experienced in the management of heart failure (section 2.5.5).

Thyrotoxicosis  Beta-blockers are used in pre-operative preparation for thyroidectomy. Administration of propranolol can reverse clinical symptoms of thyrotoxicosis within 4 days. Routine tests of increased thyroid function remain unaltered. The thyroid gland is rendered less vascular thus making surgery easier (section 6.2.2).

Other uses  Beta-blockers have been used to alleviate some symptoms of anxiety; probably patients with palpitation, tremor, and tachycardia respond best (see also section 4.1.2 and section 4.9.3). Beta-blockers are also used in the prophylaxis of migraine (section 4.7.4.2). Betaxolol, carteolol, levobunolol, metipranolol and timolol are used topically in glaucoma (section 11.6).

**PROPRANOLOL HYDROCHLORIDE**

**Indications** see under Dose

**Cautions** see notes above; also avoid abrupt withdrawal especially in ischaemic heart disease; first-degree AV block; portal hypertension (risk of deterioration in liver function); diabetes; history of obstructive airways disease (introduce cautiously and monitor lung function—see also Bronchospasm below); myasthenia gravis; symptoms of hypoglycaemia and thyrotoxicosis may be masked (also see notes above); psoriasis; history of hypersensitivity—may increase sensitivity to allergens and result in more serious hypersensitivity response, also may reduce response to adrenaline (epinephrine) (see also section 3.4.3); reduce dose of oral propranolol in hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (beta-blockers), important: verapamil interaction, see also p. 118

**Contra-indications** asthma (important: see Bronchospasm below), uncontrolled heart failure, Prinzmetal’s angina, marked bradycardia, hypotension, sick sinus syndrome, second- or third-degree AV block, cardiogenic shock, metabolic acidosis, severe peripheral arterial disease; phaeochromocytoma (apart from specific use with alpha-blockers, see also notes above)

**Bronchospasm** The CSM has advised that beta-blockers, including those considered to be cardioselective, should not be given to patients with a history of asthma or bronchospasm. However, in rare situations where there is no alternative a cardioselective beta-blocker is given to these patients with extreme caution and under specialist supervision.

**Side-effects** see notes above; also gastro-intestinal disturbances; bradycardia, heart failure, hypotension, conduction disorders, peripheral vasoconstriction (including exacerbation of intermittent claudication and Raynaud’s phenomenon); bronchospasm (see above); dyspnoea; headache, fatigue, sleep disturbances, paraesthesia, dizziness, vertigo, psychoses; sexual dysfunction; purpura, thrombocytopenia; visual disturbances; exacerbation of psoriasis, alopecia; rarely rashes and dry eyes (reversible on withdrawal); **overdose**: see Emergency Treatment of Poisoning, p. 32

**Dose**

- **By mouth**, hypertension, initially 80 mg twice daily, increased at weekly intervals as required; maintenance 160–320 mg daily
- Prophylaxis of variceal bleeding in portal hypertension, initially 40 mg twice daily, increased to 80 mg twice daily according to heart rate; max. 160 mg twice daily
Phaeochromocytoma (only with an alpha-blocker),
60 mg daily for 3 days before surgery or 30 mg daily in patients unsuitable for surgery
Angina, initially 40 mg 2–3 times daily; maintenance 120–240 mg daily
Arrhythmias, hypertrophic cardiomyopathy, anxiety tachycardia, and thyrotoxicosis (adjunct), 10–40 mg 3–4 times daily
Anxiety with symptoms such as palpitation, sweating, tremor, 40 mg once daily, increased to 40 mg 3 times daily if necessary
Prophylaxis after myocardial infarction, 40 mg 4 times daily for 2–3 days, then 80 mg twice daily, beginning 5 to 21 days after infarction
Migraine prophylaxis and essential tremor, initially 40 mg 2–3 times daily; maintenance 80–160 mg daily

- **By intravenous injection**, arrhythmias and thyrotoxic crisis, 1 mg over 1 minute; if necessary repeat at 2-minute intervals; max. total dose 10 mg (5 mg in anaesthesia)
  
  **Note** Excessive bradycardia can be countered with **intravenous injection** of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32

**Propranolol** (Non-proprietary) (**A**)

- **Tablets**, propranolol hydrochloride 10 mg, net price 28 = 91p; 40 mg, 28 = 97p; 80 mg, 56 = £1.68; 160 mg, 56 = £3.29. Label: 8  
  **Brands include** Angiol

- **Oral solution**, propranolol hydrochloride 5 mg/5 mL, net price 150 mL = £12.50; 10 mg/5 mL, 150 mL = £16.45; 50 mg/5 mL, 150 mL = £19.98. Label: 8  
  **Brands include** Syprol

**Inderal** (**A**)

- **Injection**, propranolol hydrochloride 1 mg/mL, net price 1-mL amp = 21p

**Modified release**

**Note** Modified-release preparations can be used for once daily administration

**Half-Inderal LA** (**A**)

- **Capsules**, m/r, lavender/pink, propranolol hydrochloride 80 mg, net price 28-cap pack = £5.40. Label: 8, 25  
  **Note** Modified-release capsules containing propranolol hydrochloride 80 mg also available; brands include Bedranol SR, Half Beta Prograne

**Inderal-LA** (**A**)

- **Capsules**, m/r, lavender/pink, propranolol hydrochloride 160 mg, net price 28-cap pack = £6.67. Label: 8, 25  
  **Note** Modified-release capsules containing propranolol hydrochloride 160 mg also available; brands include Bedranol SR, Beta Prograne, Slo-Pro

**ACEBUTOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride; renal impairment (Appendix 3)

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** see under Propranolol Hydrochloride

**Dose**

- Hypertension, initially 400 mg once daily or 200 mg twice daily, increased after 2 weeks to 400 mg twice daily if necessary
- Angina, initially 400 mg once daily or 200 mg twice daily; 300 mg 3 times daily in severe angina; up to 1.2 g daily has been used
- Arrhythmias, 0.4–1.2 g daily in 2–3 divided doses

**Sectral** (**Sanofi-Aventis**) (**FM**)

- **Capsules**, acebutolol (as hydrochloride) 100 mg (buff/white), net price 84-cap pack = £14.97; 200 mg (buff/pink), 56-cap pack = £19.18. Label: 8  
  **Tablets**, f/c, acebutolol 400 mg (as hydrochloride), net price 28-tab pack = £18.62. Label: 8

**ATENOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride; renal impairment (Appendix 3)

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** see under Propranolol Hydrochloride

**Dose**

- **By mouth**, hypertension, 25–50 mg daily (higher doses rarely necessary)
- Angina, 100 mg daily in 1 or 2 doses
- Arrhythmias, 50–100 mg daily

- **By intravenous injection**, arrhythmias, 2.5 mg at a rate of 1 mg/minute, repeated at 5-minute intervals to a max. of 10 mg

  **Note** Excessive bradycardia can be countered with **intravenous injection** of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for **overdosage** see Emergency Treatment of Poisoning, p. 32

- **By intravenous infusion**, arrhythmias, 150 micrograms/kg over 20 minutes, repeated every 12 hours if required

  Early intervention within 12 hours of myocardial infarction (section 2.10.1), by **intravenous injection** over 5 minutes, 5 mg, then by mouth, 50 mg after 15 minutes, 50 mg after 12 hours, then 100 mg daily

**Atenolol** (Non-proprietary) (**FM**)

- **Tablets**, atenolol 25 mg, net price 28-tab pack = 81p; 50 mg, 28-tab pack = 85p; 100 mg, 28-tab pack = 86p. Label: 8  
  **Brands include** Atenex

**Tenormin** (**AstraZeneca**) (**FM**)

- **‘25’ tablets**, f/c, atenolol 25 mg, net price 28-tab pack = £4.41. Label: 8  
  **LS tablets**, orange, f/c, scored, atenolol 50 mg, net price 28-tab pack = £5.11. Label: 8  
  **Tablets**, orange, f/c, scored, atenolol 100 mg, net price 28-tab pack = £6.50. Label: 8  
  **Syrup**, sugar-free, atenolol 25 mg/5mL, net price 500 mL = £8.55. Label: 8  
  **Injection**, atenolol 500 micrograms/mL, net price 10-mL amp = 96p (hosp. only)

**With diuretic**

**Co-tenidone** (Non-proprietary) (**FM**)

- **Tablets**, co-tenidone 50/12.5 (atenolol 50 mg, chlortalidone 12.5 mg), net price 28-tab pack = £1.15; co-
Bisoprolol Fumarate

**Adjunct in stable moderate to severe heart failure**
Hypertension and angina, usually 10 mg once daily.

**Dose**
- Hypertension, 1 tablet daily (but see also under Dose above).

**Kalten** *(BPC 100)*
Capsules, red/ivory, atenolol 50 mg, co-amiloizide 2.5/25 (anhydrous amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-cap pack = £10.01. Label: 8
- Hypertension, 1 capsule daily

**Tenoret 50** *(AstraZeneca)*
Tablets, brown, f/c, co-tenidone 50/12.5 (atenolol 50 mg, chlortalidone 12.5 mg), net price 28-tab pack = £5.70. Label: 8
- Hypertension, 1 tablet daily

**Tenoretic** *(AstraZeneca)*
Tablets, brown, f/c, co-tenidone 100/25 (atenolol 100 mg, chlortalidone 25 mg), net price 28-tab pack = £8.12. Label: 8
- Hypertension, 1 tablet daily (but see also under Dose above)

**With calcium-channel blocker**

**Betad-Adalat** *(Bayer)*
Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.41. Label: 8, 25
- Hypertension, 1 capsule daily, increased if necessary to twice daily; elderly, 1 daily
- Angina, 1 capsule twice daily

**Tenif** *(AstraZeneca)*
Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.63. Label: 8, 25
- Hypertension, 1 capsule daily, increased if necessary to twice daily; elderly, 1 daily
- Angina, 1 capsule twice daily

**BISOPROLOL FUMARATE**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride; ensure heart failure not worsening before increasing dose; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** see under Propranolol Hydrochloride; severe chronic heart failure; acute or decompensated heart failure requiring intravenous inotropes; hepatic impairment

**Side-effects** postural hypotension, dizziness, headache, fatigue, gastro-intestinal disturbances, bradycardia; occasionally diminished peripheral circulation, peripheral oedema and painful extremities, dry mouth, eye irritation or disturbed vision, impotence, disturbances of micturition, influenza-like symptoms; rarely angina, AV block, exacerbation of intermittent claudication or Raynaud's phenomenon; allergic skin reactions, exacerbation of psoriasis, nasal stuffiness, wheezing, depressed mood, sleep disturbances, paraesthesia, heart failure, changes in liver enzymes, thrombocytopenia, leucopenia also reported

**Dose**
- Hypertension, initially 12.5 mg once daily, increased after 2 days to usual dose of 25 mg once daily; if necessary may be further increased at intervals of at least 2 weeks to max. 50 mg daily in single or divided doses; ELDERS initial dose of 12.5 mg daily may provide satisfactory control
- Angina, initially 12.5 mg twice daily, increased after 2 days to 25 mg twice daily
- Adjunct in heart failure (section 2.5.5) initially 3.125 mg twice daily (with food), dose increased at intervals of at least 2 weeks to 6.25 mg twice daily, then to 12.5 mg twice daily, then to 25 mg twice daily; increase to highest dose tolerated, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg and 50 mg twice daily in patients over 85 kg

**Carvedilol** *(Non-proprietary)*
Tablets, carvedilol 3.125 mg, net price 28-tab pack = £5.73; 6.25 mg, 28-tab pack = £6.09; 12.5 mg, 28-tab pack = £6.14; 25 mg, 28-tab pack = £7.24. Label: 8

**Eucardic** *(Roche)*
Tablets, scored, carvedilol 3.125 mg (pink), net price 28-tab pack = £7.60; 6.25 mg (yellow), 28-tab pack = £7.84; 12.5 mg (peach), 28-tab pack = £9.35; 25 mg, 28-tab pack = £11.68. Label: 8

**CARDIOVASCULAR SYSTEM**

**Bisoprolol Fumarate**

**Indications** hypertension, 1 tablet daily (but see also under Dose above).

**Kalten** *(BPC 100)*
Capsules, red/ivory, atenolol 50 mg, co-amiloizide 2.5/25 (anhydrous amiloride hydrochloride 2.5 mg, hydrochlorothiazide 25 mg), net price 28-cap pack = £10.01. Label: 8
- Hypertension, 1 capsule daily

**Tenoret 50** *(AstraZeneca)*
Tablets, brown, f/c, co-tenidone 50/12.5 (atenolol 50 mg, chlortalidone 12.5 mg), net price 28-tab pack = £5.70. Label: 8
- Hypertension, 1 tablet daily

**Tenoretic** *(AstraZeneca)*
Tablets, brown, f/c, co-tenidone 100/25 (atenolol 100 mg, chlortalidone 25 mg), net price 28-tab pack = £8.12. Label: 8
- Hypertension, 1 tablet daily (but see also under Dose above)

**With calcium-channel blocker**

**Betad-Adalat** *(Bayer)*
Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.41. Label: 8, 25
- Hypertension, 1 capsule daily, increased if necessary to twice daily; elderly, 1 daily
- Angina, 1 capsule twice daily

**Tenif** *(AstraZeneca)*
Capsules, reddish-brown, atenolol 50 mg, nifedipine 20 mg (m/r), net price 28-cap pack = £10.63. Label: 8, 25
- Hypertension, 1 capsule daily, increased if necessary to twice daily; elderly, 1 daily
- Angina, 1 capsule twice daily

**BISOPROLOL FUMARATE**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride; ensure heart failure not worsening before increasing dose; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** see under Propranolol Hydrochloride; severe chronic heart failure; acute or decompensated heart failure requiring intravenous inotropes; hepatic impairment

**Side-effects** postural hypotension, dizziness, headache, fatigue, gastro-intestinal disturbances, bradycardia; occasionally diminished peripheral circulation, peripheral oedema and painful extremities, dry mouth, eye irritation or disturbed vision, impotence, disturbances of micturition, influenza-like symptoms; rarely angina, AV block, exacerbation of intermittent claudication or Raynaud's phenomenon; allergic skin reactions, exacerbation of psoriasis, nasal stuffiness, wheezing, depressed mood, sleep disturbances, paraesthesia, heart failure, changes in liver enzymes, thrombocytopenia, leucopenia also reported

**Dose**
- Hypertension, initially 12.5 mg once daily, increased after 2 days to usual dose of 25 mg once daily; if necessary may be further increased at intervals of at least 2 weeks to max. 50 mg daily in single or divided doses; ELDERS initial dose of 12.5 mg daily may provide satisfactory control
- Angina, initially 12.5 mg twice daily, increased after 2 days to 25 mg twice daily
- Adjunct in heart failure (section 2.5.5) initially 3.125 mg twice daily (with food), dose increased at intervals of at least 2 weeks to 6.25 mg twice daily, then to 12.5 mg twice daily, then to 25 mg twice daily; increase to highest dose tolerated, max. 25 mg twice daily in patients with severe heart failure or body-weight less than 85 kg and 50 mg twice daily in patients over 85 kg

**Carvedilol** *(Non-proprietary)*
Tablets, carvedilol 3.125 mg, net price 28-tab pack = £5.73; 6.25 mg, 28-tab pack = £6.09; 12.5 mg, 28-tab pack = £6.14; 25 mg, 28-tab pack = £7.24. Label: 8

**Eucardic** *(Roche)*
Tablets, scored, carvedilol 3.125 mg (pink), net price 28-tab pack = £7.60; 6.25 mg (yellow), 28-tab pack = £7.84; 12.5 mg (peach), 28-tab pack = £9.35; 25 mg, 28-tab pack = £11.68. Label: 8
**CELPROLOL HYDROCHLORIDE**

**Indications** mild to moderate hypertension

**Cautions** see under Propranolol Hydrochloride; renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3)

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** headache, dizziness, fatigue, nausea and somnolence; also bradycardia, bronchospasm; depression and pneumonitis reported rarely

**Dose**
- 200 mg once daily in the morning, increased to 400 mg once daily if necessary

**Celprolol (Non-proprietary)**

**Tablets**, celprolol hydrochloride 200 mg, net price 28-tab pack = £6.41; 400 mg, 28-tab pack = £37.89. Label: 8, 22

**Celectol®** (Winthrop)

**Tablets**, f/c, scored, celprolol hydrochloride 200 mg (yellow), net price 28-tab pack = £20.63; 400 mg, 28-tab pack = £41.26. Label: 8, 22

**ESMOLOL HYDROCHLORIDE**

**Indications** short-term treatment of supraventricular arrhythmias (including atrial fibrillation, atrial flutter, sinus tachycardia); tachycardia and hypertension in peri-operative period

**Cautions** see under Propranolol Hydrochloride; renal impairment

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** see under Propranolol Hydrochloride; also on infusion venous irritation and thrombophlebitis

**Dose**
- By iv inf, usually within range 50–200 micrograms/kg/minute (consult product literature for details of dose titration and doses during peri-operative period)

**Brevibloc®** (Baxter)

**Injection**, esmolol hydrochloride 10 mg/mL, net price 10-mL vial = £7.79, 250-mL infusion bag = £89.69

**METOPROLOL TARTRATE**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride; hepatic impairment (Appendix 2)

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** see under Propranolol Hydrochloride

**Dose**
- By mouth, initially 100 mg (50 mg in elderly) twice daily with food, increased at intervals of 14 days to usual dose of 200 mg twice daily; up to 800 mg daily in 2 divided doses (3–4 divided doses if higher); max. 2.4 g daily

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 32

**By intravenous injection**, 50 mg over at least 1 minute, repeated after 5 minutes if necessary; max. total dose 200 mg

Hypertension of pregnancy, 20 mg/hour, doubled every 30 minutes; usual max. 160 mg/hour

Hypertension following myocardial infarction, 15 mg/hour, gradually increased to max. 120 mg/hour

**Labetalol Hydrochloride** (Non-proprietary)

**Tablets**, f/c, labetalol hydrochloride 100 mg, net price, 56 = £7.80; 200 mg, 56 = £11.83; 400 mg, 56 = £17.73. Label: 8, 21

**Trandate®** (UCB Pharma)

**Tablets**, all orange, f/c, labetalol hydrochloride 50 mg, net price 56-tab pack = £3.79; 100 mg, 56-tab pack = £4.17; 200 mg, 56-tab pack = £6.77; 400 mg, 56-tab pack = £9.42. Label: 8, 21

**Injection**, labetalol hydrochloride 5 mg/mL, net price 20-mL amp = £2.12

**LABETALOL HYDROCHLORIDE**

**Indications** hypertension (including hypertension in pregnancy, hypertension with angina, and hypertension following acute myocardial infarction); hypertensive crisis (but see section 2.5); controlled hypotension in anaesthesia

**Cautions** see under Propranolol Hydrochloride; interferes with laboratory tests for catecholamines; liver damage (see below); renal impairment (Appendix 3)

**Liver damage** Severe hepato cellular damage reported after both short-term and long-term treatment. Appropriate laboratory testing needed at first symptom of liver dysfunction and if laboratory evidence of damage (or if jaundice) labetalol should be stopped and not restarted

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** postural hypotension (avoid upright position during and for 3 hours after intravenous administration), tiredness, weakness, headache, rashes, scalp tingling, difficulty in micturition, episodic gastric pain, nausea, vomiting; liver damage (see above); rarely lichenoid rash

**Dose**
- By mouth, initially 100 mg (50 mg in elderly) twice daily with food, increased at intervals of 14 days to usual dose of 200 mg twice daily; up to 800 mg daily in 2 divided doses (3–4 divided doses if higher); max. 2.4 g daily

**By intravenous injection**, 50 mg over at least 1 minute, repeated after 5 minutes if necessary; max. total dose 200 mg

**Note** Excessive bradycardia can be countered with intravenous injection of atropine sulphate 0.6–2.4 mg in divided doses of 600 micrograms; for overdosage see Emergency Treatment of Poisoning, p. 32

In surgery, by slow intravenous injection 2–4 mg at induction or to control arrhythmias developing during anaesthesia; 2-mg doses may be repeated to a max. of 10 mg
Early intervention within 12 hours of infarction, **by intravenous injection** 5 mg every 2 minutes to a max. of 15 mg, followed after 15 minutes by 50 mg **by mouth** every 6 hours for 48 hours; maintenance 200 mg daily in divided doses

Metoprolol Tartrate (Non-proprietary) *(BNF)*

**Tablets**, metoprolol tartrate 50 mg, net price 28 = £1.39, 56 = £1.54; 100 mg, 28 = £1.88, 56 = £2.24. Label: 8

**Betaloc** *(AstraZeneca) (BNF)*

**Injection**, metoprolol tartrate 1 mg/mL, net price 5-ml amp. = 42p

Lopresor *(Novartis) (BNF)*

**Tablets**, I/c, scored, metoprolol tartrate 50 mg (pink), net price 56-tab pack = £2.57; 100 mg (blue), 56-tab pack = £6.88. Label: 8

**NADOLOL** *(Menarini)* *(BNF)*

**Tablets**, red, s/c, co-prenozide 160/0.25 (oxprenolol chloride 160 mg, cyclopenthiazide 250 micrograms), net price 28-tab pack = £10.66. Label: 8

**OXPRENOLOL HYDROCHLORIDE** *(BNF)*

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride; reduce dose in hepatic impairment

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** see under Propranolol Hydrochloride; oedema, headache, dizziness, depression, visual disturbances, paraesthesia, impotence

**Dose**

- Hypertension, 5 mg daily. **ELDERLY** initially 2.5 mg daily, increased if necessary to 5 mg daily
- Adjunct in heart failure (section 2.5.5), initially 1.25 mg once daily, then if tolerated increased at intervals of 1–2 weeks to 2.5 mg once daily, then to 5 mg once daily, then to max. 10 mg once daily

**Nebilet** *(Menarini)* *(BNF)*

**Tablets**, scored, nebivolol (as hydrochloride) 5 mg, net price 28-tab pack = £9.23. Label: 8

**NEBIVOLOL** *(Menarini)* *(BNF)*

**Tablets**, red, s/c, co-prenozide 160/0.25 (oxprenolol hydrochloride 160 mg, co-prenozide 250 micrograms), net price 28-tab pack = £10.66. Label: 8

**With diuretic**

**Trasidrex** *(Goldshield)* *(BNF)*

**Tablets**, red, s/c, co-prenozide 160/0.25 (oxprenolol hydrochloride 160 mg (m/r), cyclopenthiazide 250 micrograms), net price 28-tab pack = £10.66. Label: 8
**PINDOLOL**

**Indications** see under Dose

**Cautions** see under Propranolol Hydrochloride

**Contra-indications** see under Propranolol Hydrochloride; severe renal impairment (Appendix 3)

**Side-effects** see under Propranolol Hydrochloride

**Dose**
- Hypertension, initially 5 mg 2–3 times daily or 15 mg once daily, increased as required at weekly intervals; usual maintenance 15–30 mg daily; max. 45 mg daily
- Angina, 2.5–5 mg up to 3 times daily

**Pindolol (Non-proprietary)**

**Tablets**, pindolol 5 mg, net price 100-tab pack = £7.81. Label: 8

**Visken®** (Amidpharm)

**Tablets**, scored, pindolol 5 mg, net price 56-tab pack = £5.85; 15 mg, 28-tab pack = £8.79. Label: 8

**With diuretic**

**Viskaldix®** (Amidpharm)

**Tablets**, scored, pindolol 10 mg, clopamide 5 mg, net price 28-tab pack = £6.70. Label: 8

**Dose** hypertension, 1 tablet daily in the morning, increased if necessary to 2 daily; max. 3 daily

---

**SOTALOL HYDROCHLORIDE**

**Indications** Tablets and injection: life-threatening arrhythmias including ventricular tachyarrhythmias, symptomatic non-sustained ventricular tachyarrhythmias

**Tablets only**: prophylaxis of paroxysmal atrial tachycardia or fibrillation, paroxysmal AV re-entrant tachycardias (both nodal and involving accessory pathways), paroxysmal supraventricular tachycardia after cardiac surgery; maintenance of sinus rhythm following cardioversion of atrial fibrillation or flutter

**Injection only**: electrophysiological study of inducible ventricular and supraventricular arrhythmias; temporary substitution for tablets

**CSM advice.** The use of sotalol should be limited to the treatment of ventricular arrhythmias or prophylaxis of supraventricular arrhythmias (see above). It should no longer be used for angina, hypertension, thyrotoxicosis or for secondary prevention after myocardial infarction; when stopping sotalol for these indications, the dose should be reduced gradually

**Cautions** see under Propranolol Hydrochloride; reduce dose in renal impairment (avoid if creatinine clearance less than 10 ml/minute; Appendix 3); correct hypokalaemia, hypomagnesaemia, or other electrolyte disturbances; severe or prolonged diarrhoea; interactions: Appendix 1 (beta-blockers), important: verapamil interaction see also p. 118

**Contra-indications** see under Propranolol Hydrochloride; congenital or acquired long QT syndrome; torsade de pointes; renal failure

**Side-effects** see under Propranolol Hydrochloride; arrhythmicogenic (pro-arrhythmic) effect (torsade de pointes—increased risk in women)

**Dose**
- **By mouth** with ECG monitoring and measurement of corrected QT interval, arrhythmias, initially 80 mg daily in 1–2 divided doses increased gradually at intervals of 2–3 days to usual dose of 160–320 mg daily in 2 divided doses; higher doses of 480–640 mg daily for life-threatening ventricular arrhythmias under specialist supervision
- **By intravenous injection** over 10 minutes, acute arrhythmias, 20–120 mg with ECG monitoring, repeated if necessary with 6-hour intervals between injections

**Sotalol (Non-proprietary)**

**Tablets**, sotalol hydrochloride 40 mg, net price 56 = £1.34; 80 mg, 56 = £1.99; 160 mg, 28 = £2.21. Label: 8

**Beta-Cardone®** (UCB Pharma)

**Tablets**, scored, sotalol hydrochloride 40 mg (green), net price 56-tab pack = £1.34; 80 mg (pink), 56-tab pack = £1.99; 200 mg, 28-tab pack = £2.50. Label: 8

**Sotacor®** (Bristol-Myers Squibb)

**Tablets**, scored, sotalol hydrochloride 80 mg, net price 28-tab pack = £3.25; 160 mg, 28-tab pack = £6.41. Label: 8

**Injection**, sotalol hydrochloride 10 mg/mL, net price 4-mL amp = £1.76

---

**TIMOLOL MALEATE**

**Indications** see under Dose: glaucoma (section 11.6)

**Cautions** see under Propranolol Hydrochloride; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

**Contra-indications** see under Propranolol Hydrochloride

**Side-effects** see under Propranolol Hydrochloride

**Dose**
- Hypertension, initially 10 mg daily in 1–2 divided doses; gradually increased if necessary to max. 60 mg daily, usual maintenance dose 10–30 mg daily (doses above 30 mg daily given in divided doses)
- Angina, initially 5 mg twice daily increased if necessary by 10 mg daily every 3–4 days; max. 30 mg twice daily
- Prophylaxis after myocardial infarction, initially 5 mg twice daily, increased after 2 days to 10 mg twice daily if tolerated
- Migraine prophylaxis, 10–20 mg daily in 1–2 divided doses

**Betim®** (Valeant)

**Tablets**, scored, timolol maleate 10 mg, net price 30-tab pack = £2.08. Label: 8

**With diuretic**

**Prestim®** (Valeant)

**Tablets**, scored, timolol maleate 10 mg, bendroflumethiazide 2.5 mg, net price 30-tab pack = £3.49. Label: 8

**Dose** hypertension, 1–2 tablets daily; max. 4 daily
2 Cardiovascular system

2.5 Hypertension and heart failure

2.5.1 Vasodilator antihypertensive drugs
2.5.2 Centrally acting antihypertensive drugs
2.5.3 Adrenergic neurone blocking drugs
2.5.4 Alpha-adrenoceptor blocking drugs
2.5.5 Drugs affecting the renin-angiotensin system

Lowering raised blood pressure decreases the risk of stroke, coronary events, heart failure, and renal impairment. Advice on antihypertensive therapy in this section takes into account the recommendations of the Joint British Societies (JBS2: British Societies' guidelines on prevention of cardiovascular disease in clinical practice. Heart 2005; 91 (Suppl V): v1–v52).

Possible causes of hypertension (e.g. renal disease, endocrine causes), contributory factors, risk factors, and the presence of any complications of hypertension, such as left ventricular hypertrophy, should be established. Patients should be given advice on lifestyle changes to reduce blood pressure or cardiovascular risk; these include smoking cessation, weight reduction, reduction of excessive intake of alcohol, reduction of dietary salt, reduction of total and saturated fat, increasing exercise, and increasing fruit and vegetable intake.

Thresholds and targets for treatment1 The following thresholds for treatment are recommended:

- Accelerated (malignant) hypertension (with papilloedema or fundal haemorrhages and exudates) or acute cardiovascular complications, admit for immediate treatment;
- Where the initial blood pressure is systolic \( \geq 160 \text{ mmHg} \) or diastolic \( \geq 100 \text{ mmHg} \), treat immediately;
- Where the initial blood pressure is systolic \( 160–219 \text{ mmHg} \) or diastolic \( 110–119 \text{ mmHg} \), confirm over 1–2 weeks then treat if these values are sustained;
- Where the initial blood pressure is systolic \( 160–179 \text{ mmHg} \) or diastolic \( 100–109 \text{ mmHg} \), and the patient has cardiovascular complications, target-organ damage (e.g. left ventricular hypertrophy, renal impairment) or diabetes mellitus (type 1 or 2), confirm over 3–4 weeks then treat if these values are sustained;
- Where the initial blood pressure is systolic \( 160–179 \text{ mmHg} \) or diastolic \( 100–109 \text{ mmHg} \), but the patient has no cardiovascular complications, no target-organ damage, or no diabetes, advise lifestyle changes, reassess weekly initially and treat if these values are sustained on repeat measurements over 4–12 weeks;
- Where the initial blood pressure is systolic \( 140–159 \text{ mmHg} \) or diastolic \( 90–99 \text{ mmHg} \) and the patient has cardiovascular complications, target-

1. Thresholds and targets for treatment based on blood pressure measured in clinic may not apply to ambulatory or home blood-pressure monitoring, which usually give lower values.

A target systolic blood pressure < 140 mmHg and diastolic blood pressure < 90 mmHg is suggested. A lower target systolic blood pressure < 130 mmHg and diastolic blood pressure < 80 mmHg should be considered for those with established atherosclerotic cardiovascular disease, diabetes, or chronic renal failure. In some individuals it may not be possible to reduce blood pressure below the suggested targets despite the use of appropriate therapy.

Drug treatment of hypertension Response to drug treatment for hypertension may be affected by the patient’s age and ethnic background. An ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) may be the most appropriate initial drug in younger Caucasians; however a beta-blocker may be considered if an ACE inhibitor or an angiotensin-II receptor antagonist is not tolerated or is contra-indicated (see also Hypertension in Pregnancy, p. 93). Afro-Caribbean patients and those aged over 55 years respond less well to ACE inhibitors and angiotensin-II receptor antagonists, therefore a thiazide (section 2.2.1) or a calcium-channel blocker (section 2.6.2) may be chosen for initial treatment.

Beta-blockers, especially when combined with a thiazide diuretic, should be avoided for the routine treatment of uncomplicated hypertension in patients with diabetes or in those at high risk of developing diabetes. A single antihypertensive drug is often not adequate and other antihypertensive drugs are usually added in a step-wise manner until control is achieved. Unless it is necessary to lower the blood pressure urgently, an interval of at least 4 weeks should be allowed to determine response.

Where two antihypertensive drugs are needed, an ACE inhibitor or an angiotensin-II receptor antagonist may be combined with either a thiazide or a calcium-channel blocker.

If control is inadequate with 2 drugs, a thiazide and a calcium-channel blocker may be added. The addition of an alpha-blocker (section 2.5.4), spironolactone, another diuretic, or a beta-blocker should be considered in resistant hypertension. In patients with primary hyperaldosteronism, spironolactone (section 2.2.3) is effective.

Other measures to reduce cardiovascular risk Aspirin (section 2.9) in a dose of 75 mg daily reduces the risk of cardiovascular events and myocardial infarction. Unduly high blood pressure must be controlled before aspirin is given. Unless contra-indicated, aspirin is recommended for all patients with established cardiovascular disease or those with a 10-year cardiovascular risk.

2. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (Heart 2005; 91 (Suppl V): v1–v52)—see inside back cover. The Joint British Societies’ ‘Cardiac Risk Assessor’ computer programme may also be used to determine cardiovascular disease risk.
Hypertension in the elderly

Benefit from antihypertensive therapy is evident up to at least 80 years of age, but it is probably inappropriate to apply a strict age limit when deciding on drug therapy. Patients who reach 80 years of age while taking antihypertensive drugs should continue treatment, provided that it continues to be of benefit and does not cause significant side-effects. The thresholds for treatment are diastolic pressure averaging \( \geq 90 \text{ mmHg} \) or systolic pressure averaging \( \geq 160 \text{ mmHg} \) over 3 to 6 months’ observation (despite appropriate lifestyle interventions). Treatment with a low dose of a thiazide or a dihydropyridine calcium-channel blocker is effective. An ACE inhibitor (or an angiotensin-II receptor antagonist) (section 2.5.5) can be added if necessary.

Isolated systolic hypertension

Isolated systolic hypertension (systolic pressure \( \geq 160 \text{ mmHg} \), diastolic pressure \(< 90 \text{ mmHg}\)) is associated with an increased cardiovascular disease risk, particularly in those aged over 60 years. Systolic blood pressure averaging 160 mmHg or higher over 3 to 6 months (despite appropriate lifestyle interventions) should be lowered in those over 80 years, even if diastolic hypertension is absent. Treatment with a low dose of a thiazide or a dihydropyridine calcium-channel blocker is effective. An ACE inhibitor (or an angiotensin-II receptor antagonist) (section 2.5.5) can be added if necessary. Patients with severe postural hypotension should not receive blood pressure lowering drugs.

Isolated systolic hypertension in younger patients is uncommon but treatment may be indicated in those with a threshold systolic pressure of 160 mmHg (or less if at increased risk of cardiovascular disease, see above).

Hypertension in diabetes

For patients with diabetes, the aim should be to maintain systolic pressure \(< 130 \text{ mmHg}\) and diastolic pressure \( < 80 \text{ mmHg}\). However, in some individuals, it may not be possible to achieve this level of control despite appropriate therapy. Most patients require a combination of antihypertensive drugs.

Hypertension in renal disease

The threshold for antihypertensive treatment in patients with renal impairment or persistent proteinuria is a systolic blood pressure \( \geq 140 \text{ mmHg} \) or a diastolic blood pressure \( \geq 90 \text{ mmHg} \). Optimal blood pressure is a systolic blood pressure \(< 130 \text{ mmHg}\) and a diastolic pressure \( < 80 \text{ mmHg}\), or lower if proteinuria exceeds 1 g in 24 hours. An ACE inhibitor (or an angiotensin-II receptor antagonist) should be considered for patients with proteinuria; however, ACE inhibitors should be used with caution in renal impairment, see section 2.5.5.1. Thiazide diuretics may be ineffective and high doses of loop diuretics may be required. A dihydropyridine calcium channel blocker can be added.

Hypertension in pregnancy

High blood pressure in pregnancy may usually be due to pre-existing essential hypertension or to pre-eclampsia. Methylodopa (section 2.5.2) is safe in pregnancy. Beta-blockers are effective and safe in the third trimester. Modified-release preparations of nifedipine (unlicensed) are also used for hypertension in pregnancy. Intravenous administration of labetalol (section 2.4) can be used to control hypertensive crises; alternatively, hydralazine (section 2.5.1) may be used by the intravenous route. For use of magnesium sulphate in pre-eclampsia and eclampsia, see section 9.5.1.3.

Accelerated or very severe hypertension

Accelerated (or malignant) hypertension or very severe hypertension (e.g. diastolic blood pressure \( > 140 \text{ mmHg}\)) requires urgent treatment in hospital, but it is not an indication for parenteral antihypertensive therapy. Normally treatment should be by mouth with a beta-blocker (atenolol or labetalol) or a long-acting calcium-channel blocker (e.g. amlodipine or modified-release nifedipine). Within the first 24 hours the diastolic blood pressure should be reduced to 100–110 mmHg. Over the next 2 or 3 days blood pressure should be further reduced using a calcium-channel blocker, diuretic, ACE inhibitor, beta-blocker, or vasodilator, alone or in combination. Rapid reduction in blood pressure can reduce organ perfusion leading to cerebral infarction and blindness, deterioration in renal function, and myocardial ischaemia. Sodium nitroprusside (unlicensed) by infusion is the drug of choice on the rare occasions when parenteral treatment is necessary.

For advice on short-term management of hypertensive episodes in pheochromocytoma, see under Phaeochromocytoma, section 2.5.4.

Vasodilator antihypertensive drugs

Vasodilators have a potent hypotensive effect, especially when used in combination with a beta-blocker and a thiazide. Important: for a warning on the hazards of a very rapid fall in blood pressure, see Accelerated or Very Severe Hypertension, above.

Diazoxide has been used by intravenous injection in hypertensive emergencies. Hydralazine is given by mouth as an adjunct to other antihypertensives for the treatment of resistant hypertension but is rarely used; when used alone it causes tachycardia and fluid retention. The incidence of side-effects is lower if the dose is kept below 100 mg daily, but systemic lupus erythematosus should be suspected.
if there is unexplained weight loss, arthritis, or any other unexplained ill health.

**Sodium nitroprusside** [unlicensed] is given by intravenous infusion to control severe hypertensive crises on the rare occasions when parenteral treatment is necessary.

**Minoxidil** should be reserved for the treatment of severe hypertension resistant to other drugs. Vasodilation is accompanied by increased cardiac output and tachycardia and the patients develop fluid retention. For this reason the addition of a beta-blocker and a diuretic (usually furosemide, in high dosage) are mandatory. Hypertrichosis is troublesome and renders this drug unsuitable for women.

Prazosin, doxazosin, and terazosin (section 2.5.4) have alpha-blocking and vasodilator properties.

**Ambrisentan, bosentan, epoprostenol (section 2.8.1), iloprost, sildenafil, and sitaxentan** are licensed for the treatment of some types of pulmonary hypertension and should be used under specialist supervision. Bosentan is also licensed to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease.

The **Scottish Medicines Consortium** (p. 3) has advised (November 2005) that iloprost (Ventavis®) is accepted for restricted use within NHS Scotland in patients in whom bosentan is ineffective or not tolerated.

The **Scottish Medicines Consortium** (p. 3) has advised (May 2008) that bosentan (Tracleer®) is not recommended for use within NHS Scotland to reduce the number of new digital ulcers in patients with systemic sclerosis and ongoing digital ulcer disease.

The **Scottish Medicines Consortium** (p. 3) has advised (October 2008) that ambrisentan (Volibris®) should be prescribed only by specialists in the Scottish Pulmonary Vascular Unit or other similar specialists.

## AMBRISENTAN

**Indications** pulmonary arterial hypertension

**Cautions** not to be initiated in significant anaemia; monitor haemoglobin or haematocrit concentration after 1 month and 3 months of starting treatment, and periodically thereafter (reduce dose or discontinue treatment if significant decrease in haemoglobin or haematocrit concentration observed); monitor liver function before treatment, and monthly thereafter—discontinue if liver enzymes raised significantly or if symptoms of liver impairment develop; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3)

**Contra-indications** pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** abdominal pain, constipation; palpitation, flushing, peripheral oedema; upper respiratory-tract disorders; headache; anaemia; *less commonly* hypersensitivity reactions (including angioedema and rash)

**Dose**
- **ADULT** over 18 years, 5 mg once daily, increased if necessary to 10 mg once daily

**Volibris®** (GSK) Tablets, 1, c, orange, ambrisentan 5 mg (pale pink), net price 30-tab pack = £1651.07; 10 mg (dark pink), 30-tab pack = £1651.07

## BOSENTAN

**Indications** pulmonary arterial hypertension; systemic sclerosis with ongoing digital ulcer disease (to reduce number of new digital ulcers)

**Cautions** not to be initiated if systemic systolic blood pressure is below 85 mmHg; monitor haemoglobin before and during treatment (monthly for first 4 months, then 3-monthly); avoid abrupt withdrawal; monitor liver function before treatment, at monthly intervals during treatment, and 2 weeks after dose increase (reduce dose or suspend treatment if liver enzymes raised significantly)—discontinue if symptoms of liver impairment; hepatic impairment (Appendix 2); interactions: Appendix 1 (bosentan)

**Contra-indications** acute porphyria (section 9.8.2) pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances, dry mouth, rectal haemorrhage, hepatic impairment (see Cautions, above); flushing; hypotension, palpitation, oedema, chest pain; dyspnoea; headache, dizziness, fatigue; back pain and pain in extremities; anaemia; hypersensitivity reactions (including rash, pruritus, and anaphylaxis)

**Dose**
- Pulmonary arterial hypertension, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily; max. 250 mg twice daily; **CHILD** under 12 years see **BNF for Children**
- Systemic sclerosis with ongoing digital ulcer disease, initially 62.5 mg twice daily increased after 4 weeks to 125 mg twice daily

**Tracleer®** (Actelion) Tablets, 1, c, orange, bosentan (as monohydrate) 62.5 mg, net price 56-tab pack = £1541.00; 125 mg, 56-tab pack = £1541.00

## DIAZOXIDE

**Indications** hypertensive emergency including severe hypertension associated with renal disease (but see section 2.5); hypoglycaemia (section 6.1.4)

**Cautions** ischaemic heart disease; renal impairment (Appendix 3); pregnancy and labour (Appendix 4); interactions: Appendix 1 (diazoxide)

**Side-effects** tachycardia, hypotension, hyperglycaemia, sodium and water retention; rarely cardiomegaly, hyperosmolar non-ketotic coma, leucopenia, thrombocytopenia, and hirsuitism

**Dose**
- By rapid intravenous injection (less than 30 seconds), 1–3 mg/kg to max. single dose of 150 mg (see below); may be repeated after 5–15 minutes if required
- **Note** Single doses of 300 mg have been associated with angina and with myocardial and cerebral infarction

**Eudemine®** (Goldshield) **Injection** diazoxide 15 mg/mL, net price 20-mL amp = £30.00

**Tablets**, see section 6.1.4

## HYDRAZINE HYDROCHLORIDE

**Indications** moderate to severe hypertension (adjunct); heart failure (with long-acting nitrate, but see section 2.5.5); hypertensive crisis (including during pregnancy) (but see section 2.5)
Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); coronary artery disease (may provoke angina, avoid after myocardial infarction until stabilised), cerebrovascular disease; occasionally blood pressure reduction too rapid even with low parenteral doses; pregnancy (Appendix 4); breastfeeding (Appendix 5); manufacturer advises test for antinuclear factor and for proteinuria every 6 months and check acetylator status before increasing dose above 100 mg daily; but evidence of clinical value unsatisfactory; interactions: Appendix 1 (hydralazine)

Contra-indications idiopathic systemic lupus erythematosus, severe tachycardia, high output heart failure, myocardial insufficiency due to mechanical obstruction, coronary pulmonary, dissecting aortic aneurysm; acute porphyria (section 9.8.2)

Side-effects tachycardia, palpitation, flushing, hypotension, fluid retention, gastro-intestinal disturbances; headache, dizziness; systemic lupus erythematosus-like syndrome after long-term therapy with over 100 mg daily (or less in women and in slow acetylator individuals) (see also notes above); rarely rashes, fever, peripheral neuritis, polyneuritis, paraesthesia, arthralgia, myalgia, increased lacrimation, nasal congestion, dyspnoea, agitation, anxiety, anorexia; blood disorders (including leucopenia, thrombocytopenia, haemolytic anaemia), abnormal liver function, jaundice, increased to usual max. 50 mg twice daily (see notes above)

Dose
- By mouth, hypertension, 25 mg twice daily, increased to usual max. 50 mg twice daily (see notes above)
- Heart failure (initiated in hospital) 25 mg 3–4 times daily, increased every 2 days if necessary; usual maintenance dose 50–75 mg 4 times daily
- By slow intravenous injection, hypertension with renal complications and hypertensive crisis, 5–10 mg diluted with 10 ml sodium chloride 0.9%; may be repeated after 20–30 minutes (see Cautions)
- By intravenous infusion, hypertension with renal complications and hypertensive crisis, initially 200–300 micrograms/minute; maintenance usually 50–150 micrograms/minute

Hydralazine (Non-proprietary) Tablets, hydralazine hydrochloride 25 mg, net price 56 = £11.79; 50 mg, 56 = £18.54

Apresoline® (Amdipharm) Tablets, yellow, s/c, hydralazine hydrochloride 25 mg, net price 84-tab pack = £2.82

Injection, powder for reconstitution, hydralazine hydrochloride, net price 20-mg amp = £1.84

Contra-indications unstable angina; within 6 months of myocardial infarction; decompensated cardiac failure (unless under close medical supervision); severe arrhythmias; congenital or acquired heart-valve defects; within 3 months of cerebrovascular events; pulmonary veno-occlusive disease; conditions which increase risk of bleeding; pregnancy (Appendix 4); breastfeeding (Appendix 5)

Side-effects vasodilation, hypotension, syncope, cough, headache, throat or jaw pain; nausea, vomiting, diarrhoea, chest pain, dyspnoea, bronchospasm, and wheezing also reported

Dose
- By inhalation of nebulised solution, initial dose 2.5 micrograms increased to 5 micrograms for second dose, if tolerated maintain at 5 micrograms 6–9 times daily according to response; reduce to 2.5 micrograms 6–9 times daily if higher dose not tolerated; CHILD 8–18 years see BNF for Children

Ventavis® (Schering Health) Nebuliser solution, iloprost (as trentalometal) 10 micrograms/mL, net price 30 × 1-mL (10 microgram) unit-dose vials = £425.00, 168 × 1-mL = £2377.20. For use with Prodose® or Venta-Neb® nebuliser

MINOXIDIL

Indications severe hypertension, in addition to a diuretic and a beta-blocker

Cautions see notes above; angina; after myocardial infarction (until stabilised); lower doses in dialysis patients; acute porphyria (section 9.8.2); pregnancy (Appendix 4); interactions: Appendix 1 (vasodilator antihypertensives)

Contra-indications phaeochromocytoma

Side-effects sodium and water retention; weight gain, peripheral oedema, tachycardia, hypertrichosis; reversible rise in creatinine and blood urea nitrogen; occasionally, gastro-intestinal disturbances, breast tenderness, rashes

Dose
- Initially 5 mg (ELDERLY, 2.5 mg) daily, in 1–2 divided doses, increased in steps of 5–10 mg at intervals of at least 3 days; max. 100 mg daily (seldom necessary to exceed 50 mg daily)

Loniten® (Pharmacon) Tablets, scored, minoxidil 2.5 mg, net price 60-tab pack = £8.88; 5 mg, 60-tab pack = £15.83; 10 mg, 60-tab pack = £30.68

SILDENAFIL

Indications pulmonary arterial hypertension; erectile dysfunction (section 7.4.5)

Cautions hypotension (avoid if systolic blood pressure below 90 mmHg); intravascular volume depletion; left ventricular outflow obstruction; cardiovascular disease; autonomic dysfunction; pulmonary veno-occlusive disease; anatomical deformation of the penis, predisposition to priapism; bleeding disorders or active peptic ulceration; consider gradual withdrawal; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 ( sildenafil)
### Cardiovascular system

**Contra-indications** recent history of stroke or myocardial infarction, history of non-arteritic anterior ischaemic optic neuropathy; hereditary degenerative retinal disorders; avoid concomitant use of nitrates

**Side-effects** gastro-intestinal disturbances, dry mouth; flushing, oedema; bronchitis, cough; headache, migraine, night sweats, paraesthesia, insomnia, anxiety, tremor, vertigo; fever, influenza-like symptoms; anaemia; back and limb pain, myalgia; visual disturbances, retinal haemorrhage, photophobia, painful red eyes; nasal congestion, epistaxis; cellulitis, alopecia, less commonly nausea, constipation, impotence, Raynaud's phenomenon, acute transient plebitis

**Cautions** hypothyroidism, hyponatraemia, ischaemic hypertensive crisis (but see section 2.5); Thelin ADULT

**Dose**

- 20 mg 3 times daily; CHILD under 18 years see BNF for Children

**Revatio® (Pfizer)**

**Tablets, f/c, sildenafil (as citrate), 20 mg, net price 90-tab pack = £373.50**

**Viagra® (Pfizer)**

**Tablets 20 mg, net price 28-tab pack = £1540.00**

Section 7.4.5 (erectile dysfunction)

### SITAXENTAN SODIUM

**Indications** pulmonary arterial hypertension

**Cautions** test liver function before treatment and monitor monthly during treatment (discontinue treatment if liver enzymes significantly raised); measure haemoglobin concentration before treatment, after 1–3 months, then every 3 months; pregnancy (Appendix 4); interactions. Appendix 1 (sitaxentan)

**Contra-indications** hepatic impairment; breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances; peripheral oedema, flushing; headache, insomnia, fatigue, diziness; decreased haemoglobin, prolonged prothrombin time, increased INR; muscle cramp; nasal congestion, epistaxis

**Dose**

- ADULT over 18 years 100 mg once daily

**Thelin® (Encysive)**

**Tablets, f/c, yellow-orange, sitaxentan sodium 100 mg, net price 28-tab pack = £1540.00**

### SODIUM NITROPRUSSIDE

**Indications** hypertensive crisis (but see section 2.5); controlled hypotension in anaesthesia; acute or chronic heart failure

**Cautions** hypothyroidism, hyponatraemia, ischaemic heart disease, impaired cerebral circulation, elderly; hypothermia; monitor blood pressure and blood-cyanide concentration and if treatment exceeds 3 days, also blood-thiocyanate concentration; avoid sudden withdrawal—terminate infusion over 15–30 minutes; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding; interactions: Appendix 1 (sodium nitroprusside)

**Contra-indications** severe vitamin B deficiency; Leber's optic atrophy; compensatory hypertension

**Side-effects** associated with over rapid reduction in blood pressure (reduce infusion rate): headache, dizziness, nausea, retching, abdominal pain, perspiration, palpitation, anxiety, retrosternal discomfort; occasionally reduced platelet count, acute transient plebitis

**Cyanide** Side-effects caused by excessive plasma concentration of the cyanide metabolite include tachycardia, sweating, hyperventilation, arrhythmias, marked metabolic acidosis (discontinue and give antidote, see p. 34)

**Dose**

- Hypertensive crisis, by intravenous infusion, initially 0.5–1.5 micrograms/kg/minute, then increased in steps of 500 nanograms/kg/minute every 5 minutes within range 0.5–8 micrograms/kg/minute (lower doses if already receiving other anti-hypertensives); stop if response unsatisfactory with max. dose in 10 minutes

**Note** Lower initial dose of 300 nanograms/kg/minute has been used

- Maintenance of blood pressure at 30–40% lower than pretreatment diastolic blood pressure, 20–400 micrograms/minute (lower doses for patients being treated with other anti-hypertensives)

- Controlled hypotension in surgery, by intravenous infusion, max. 1.5 micrograms/kg/minute

- Heart failure, by intravenous infusion, initially 10–15 micrograms/minute, increased every 5–10 minutes as necessary; usual range 10–200 micrograms/minute normally for max. 3 days

**Sodium Nitroprusside (Non-proprietary)** Intravenous infusion, powder for reconstitution, sodium nitroprusside 10 mg/mL Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

2.5.2 Centrally acting antihypertensive drugs

Methyldopa is a centrally acting antihypertensive; it may be used for the management of hypertension in pregnancy. Side-effects are minimised if the daily dose is kept below 1 g.

Clonidine has the disadvantage that sudden withdrawal may cause a hypertensive crisis.

Moxonidine, a centrally acting drug, is licensed for mild to moderate essential hypertension. It may have a role when thiazides, calcium-channel blockers, ACE inhibitors, and beta-blockers are not appropriate or have failed to control blood pressure.

### CLONIDINE HYDROCHLORIDE

**Indications** hypertension; migraine (section 4.7.4.2); menopausal flushing (section 6.4.1.1)

**Cautions** must be withdrawn gradually to avoid hypertensive crisis; Raynaud's syndrome or other occlusive peripheral vascular disease; history of depression; avoid in acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (clonidine)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Side-effects** dry mouth, sedation, depression, fluid retention, bradycardia, Raynaud's phenomenon, headache, dizziness, euphoria, nocturnal unrest, rash, nausea, constipation, rarely impotence
Dose
- **By mouth**, 50–100 micrograms 3 times daily, increased every second or third day; usual max. dose 1.2 mg daily
- By slow intravenous injection, 150–300 micrograms; max. 750 micrograms in 24 hours

Catapres® (Boehringer Ingelheim) Tablets, scored, clonidine hydrochloride 100 micrograms, net price 100-tab pack = £5.60; 300 micrograms, 100-tab pack = £13.04. Label: 3, 8

Injection, clonidine hydrochloride 150 micrograms/mL, net price 1-mL amp = 29p

**Dixarit®**

Section 4.7.4.2

---

**METHYLDOPA**

**Indications** hypertension

**Cautions** monitor blood counts and liver-function before treatment and at intervals during first 6–12 weeks or if unexplained fever occurs; history of depression; positive direct Coombs’ test in up to 20% of patients (may affect blood cross-matching); interference with laboratory tests; hepatic impairment (avoid in active liver disease; Appendix 2); renal impairment (Appendix 3); **interactions**: Appendix 1 (methyl dopa)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications** depression, active liver disease, phaeochromocytoma, acute porphyria (section 9.8.2)

**Side-effects** gastro-intestinal disturbances, dry mouth, stomatitis, sialadenitis; bradycardia, exacerbation of angina, postural hypotension, oedema; sedation, headache, dizziness, asthenia, myalgia, arthralgia, paraesthesia, nightmares, mild psychosis, depression, impaired mental acuity, parkinsonism, Bell’s palsy; abnormal liver function tests, hepatitis, jaundice; pancreatitis; haemolytic anaemia; bone marrow depression, leucopenia, thrombocytopenia, eosinophilia; hypersensitivity reactions including lupus erythematosus-like syndrome, drug fever, myocarditis, pericarditis; rashes (including toxic epidermal necrolysis); nasal congestion, failure of ejaculation, impotence, decreased libido, gynaecomastia, hyperprolactinaemia, amenorrhoea

**Dose**
- Initially 250 mg 2–3 times daily, increased gradually at intervals of at least 2 days, max. 3 g daily; **ELDERLY** initially 125 mg twice daily, increased gradually, max. 2 g daily

**Methyl dopa** (Non-proprietary) Tablets, coated, methyl dopa (anhydrous) 125 mg, net price 56-tab pack = £13.60; 250 mg, 56-tab pack = £8.36; 300 mg, 56-tab pack = £12.78. Label: 3, 8

**Aldomet®** (MSD) Tablets, all yellow, f/c, methyl dopa (anhydrous) 250 mg, net price 60 = £1.88; 500 mg, 30 = £1.90. Label: 3, 8

---

**MOXONIDINE**

**Indications** mild to moderate essential hypertension

**Cautions** avoid abrupt withdrawal (if concomitant treatment with beta-blocker has to be stopped, discontinue beta-blocker first, then moxonidine after a few days); susceptibility to angle-closure glaucoma; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); **interactions**: see Appendix 1 (moxonidine)

**Contra-indications** history of angioedema; conduction disorders (sick sinus syndrome, sino-atrial block, second- or third-degree AV block); bradycardia; life-threatening arrhythmia; severe heart failure; severe coronary artery disease, unstable angina; severe liver disease; also on theoretical grounds: Raynaud’s syndrome, intermittent claudication, epilepsy, depression, Parkinson’s disease; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** dry mouth; headache, fatigue, dizziness, nausea, sleep disturbance (rarely sedation), asthenia, vasodilatation; rarely skin reactions; very rarely angle-closure glaucoma

**Dose**
- 200 micrograms once daily in the morning, increased if necessary after 3 weeks to 400 micrograms daily in 1–2 divided doses; max. 600 micrograms daily in 2 divided doses (max. single dose 400 micrograms)

**Moxonidine** (Non-proprietary) Tablets, f/c, moxonidine 200 micrograms, net price 28-tab pack = £5.50; 300 micrograms, net price 28-tab pack = £8.10; 400 micrograms, net price 28-tab pack = £6.25. Label: 3

**Physiosters®** (Solvay) Tablets, f/c, moxonidine 200 micrograms (pink), net price 28-tab pack = £9.72; 300 micrograms (red), 28-tab pack = £11.49; 400 micrograms (red), 28-tab pack = £13.26. Label: 3

---

**2.5.3 Adrenergic neurone blocking drugs**

Adrenergic neurone blocking drugs prevent the release of noradrenaline from postganglionic adrenergic neurones. These drugs do not control supine blood pressure and may cause postural hypotension. For this reason they have largely fallen from use, but may be necessary with other therapy in resistant hypertension.

**Guamethidine**, which also depletes the nerve endings of noradrenaline, is licensed for rapid control of blood pressure.

---

**GUANETHIDINE MONOSULPHATE**

**Indications** hypertensive crisis (but see section 2.5)

**Cautions** coronary or cerebral arteriosclerosis, asthma, history of peptic ulceration; renal impairment (avoid if creatinine clearance less than 40 mL/minute; Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (adrenergic neurone blockers)

**Contra-indications** phaeochromocytoma, heart failure

**Side-effects** postural hypotension, failure of ejaculation, fluid retention, nasal congestion, headache, diarrhoea, drowsiness

**Dose**
- By intramuscular injection, 10–20 mg, repeated after 3 hours if required

---
2.5.4 Alpha-adrenoceptor blocking drugs

Prazosin has post-synaptic alpha-blocking and vasodilator properties and rarely causes tachycardia. It may, however, reduce blood pressure rapidly after the first dose and should be introduced with caution. **Doxazosin**, **indoramin**, and **terazosin** have properties similar to those of prazosin.

Alpha-blockers can be used with other antihypertensive drugs in the treatment of resistant hypertension (section 2.5).

### Prostatic hyperplasia

Alfuzosin, doxazosin, indoramin, prazosin, tamsulosin, and terazosin are indicated for benign prostatic hyperplasia (section 7.4.1).

---

### DOXAZOSIN

#### Indications

Hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1).

#### Caution

Care with initial dose (postural hypotension); cataract surgery (risk of intra-operative floppy iris syndrome); susceptibility to heart failure; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (alpha-blockers).

#### Side-effects

Gastro-intestinal disturbances; oedema, hypotension, postural hypotension; dyspnoea, rhinitis, coughing; asthenia, fatigue, vertigo, dizziness, headache, paraesthesia, sleep disturbance, anxiety, depression; respiratory-tract infection, urinary-tract infection, influenza-like symptoms; back pain, myalgia; less commonly weight changes, flushing, syncope, tremor, agitation, micturition disturbance, impotence, epistaxis, arthralgia, tinnitus, hypersensitivity reactions (including pruritus, purpura, rash); alopecia; very rarely cholestatics, hepatits, jaundice, bronchospasms, gynaecomastia, priapism, abnormal ejaculation, leucopenia, thrombocytopenia, blurred vision.

#### Dose

- Hypertension, 1 mg daily, increased after 1–2 weeks to 2 mg once daily, and thereafter to 4 mg once daily if necessary; max. 16 mg daily.

**Doxazosin** (Non-proprietary) Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £9.39; 2 mg, 28-tab pack = £9.47; 4 mg, 28-tab pack = £14.42. Counselling, driving.

**Cardura** (Pfizer) Tablets, doxazosin (as mesilate) 1 mg, net price 28-tab pack = £10.56; 2 mg, 28-tab pack = £14.08. Counselling, driving.

---

### INDORAMIN

#### Indications

Hypertension (see notes above); benign prostatic hyperplasia (section 7.4.1).

#### Caution

Avoid alcohol (enhances rate and extent of absorption); control incipient heart failure before initiating indoramin; elderly; Parkinson's disease; epilepsy (convulsions in animal studies); history of depression; cataract surgery (risk of floppy iris syndrome); hepatic impairment; renal impairment; interactions: Appendix 1 (alpha-blockers).

#### Driving

Drowsiness may affect performance of skilled tasks e.g. driving; effects of alcohol may be enhanced.

#### Contra-indications

Established heart failure.

#### Side-effects

See section 7.4.1; drowsiness, sedation; less commonly dry mouth, hypotension, syncope, nasal congestion, dizziness, depression, fatigue, headache, weight gain, failure of ejaculation; rarely hypersensitivity reactions (including rash and puritus); diarrhoea, nausea, palpitation, urinary frequency and incontinence, and priapism also reported.

#### Dose

- Hypertension, initially 25 mg twice daily, increased by 25–50 mg daily at intervals of 2 weeks; max. daily dose 200 mg in 2–3 divided doses.

**Baratol** (Amdipharm) Tablets, blue, f/c, indoramin (as hydrochloride) 25 mg, net price 84-tab pack = £9.00. Label: 2

**Doralese** (Pfizer) Tablets, indoramin (as mesilate) 25, counselling, driving.

#### Section 7.4.1 (prostatic hyperplasia)

---

### PRAZOSIN

#### Indications

Hypertension (see notes above); congestive heart failure (but see section 2.5.5); Raynald's syndrome (see also section 2.6.4); benign prostatic hyperplasia (section 7.4.1).

#### Caution

First dose may cause collapse due to hypotension (therefore should be taken on retiring to bed); elderly; cataract surgery (risk of intra-operative floppy iris syndrome); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (alpha-blockers).

#### Contra-indications

Not recommended for congestive heart failure due to mechanical obstruction (e.g. aortic stenosis).

#### Side-effects

See section 7.4.1; also gastro-intestinal disturbances; postural hypotension, oedema, palpitation; dyspnoea, nasal congestion; drowsiness, headache, depression, nervousness, vertigo; urinary frequency; weakness; blurred vision; less commonly tachycardia, insomnia, paraesthesia, sweating, impo-
tence, arthralgia, eye disorders, tinnitus, epistaxis, allergic reactions including rash, pruritus, and urticaria; rarely pancreatitis, flushing, vasculitis, bradycardia, hallucinations, worsening of narcolepsy, gynaecomastia, priapism, urinary incontinence, and alopecia.

**Dose**

- Hypertension (see notes above), 500 micrograms 2–3 times daily for 3–7 days, the initial dose on retiring to bed at night (to avoid collapse, see Cautions); increased to 1 mg 2–3 times daily for a further 3–7 days; further increased if necessary to max. 20 mg daily in divided doses.
- Congestive heart failure (but see section 2.5.5), 500 micrograms 2–4 times daily (initial dose at bedtime, see above), increasing to 4 mg daily in divided doses; maintenance 4–20 mg daily in divided doses (but rarely used).
- Raynaud’s syndrome (but efficacy not established, see section 2.6.4), initially 500 micrograms twice daily (initial dose at bedtime, see above) increased, if necessary, after 3–7 days to usual maintenance 1–2 mg twice daily.

**Prazosin**

**Indications**

- Mild to moderate hypertension (see notes above);
- Benign prostatic hyperplasia (section 7.4.1).

**Cautions**

- First dose may cause collapse due to hypotension (within 30–90 minutes, therefore should be taken on retiring to bed) (may also occur with rapid dose increase); pregnancy (Appendix 4).

**Side-effects**

- See section 7.4.1; also drowsiness, dizziness, lack of energy, peripheral oedema; urinary frequency and priapism reported.

**Dose**

- Hypertension, 1 mg at bedtime (compliance with bedtime dose important, see Cautions); dose doubled after 7 days if necessary; usual maintenance dose 2–10 mg once daily; more than 20 mg daily rarely improves efficacy.

**Phaeochromocytoma**

Long-term management of phaeochromocytoma involves surgery. Alpha-blockers are used in the short-term management of hypertensive episodes in phaeochromocytoma. Once alpha blockade is established, tachycardia can be controlled by the cautious addition of a beta-blocker (section 2.4); a cardioselective beta-blocker is preferred.

**Phenoxybenzamine**, a powerful alpha-blocker, is effective in the management of phaeochromocytoma but it has many side-effects. *Phentolamine* is a short-acting alpha-blocker used mainly during surgery of phaeochromocytoma; its use for the diagnosis of phaeochromocytoma has been superseded by measurement of catecholamines in blood and urine.

**Metirosine** (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) inhibits the enzyme tyrosine hydroxylase, and hence the synthesis of catecholamines. It is rarely used in the pre-operative management of phaeochromocytoma, and long term in patients unsuitable for surgery; an alpha-adrenoceptor blocking drug may also be required. Metirosine should not be used to treat essential hypertension.

**PHENOXYBENZAMINE HYDROCHLORIDE**

**Indications**

- Hypertensive episodes in phaeochromocytoma.

**Cautions**

- Elderly; congestive heart failure; severe heart disease (see also Contra-indications); cerebrovascular disease (avoid if history of cerebrovascular accident); renal impairment; carcinogenic in animals; avoid in acute porphyria (section 9.8.2); avoid infusion in hypovolaemia; avoid extravasation (irritant to tissues); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications**

- History of cerebrovascular accident; during recovery period after myocardial infarction (usually 3–4 weeks).

**Side-effects**

- Postural hypotension with dizziness and marked compensatory tachycardia, lassitude, nasal congestion, miosis, inhibition of ejaculation; rarely gastrointestinal disturbances; decreased sweating and dry mouth after intravenous infusion; idiosyncratic profound hypotension within few minutes of starting infusion.

**Dose**

- See under preparations.

**Phenoxybenzamine**

**Indication**

- Hypertensive episodes in phaeochromocytoma.

**Dose**

- Oral route: 2 mg 2–4 times daily for 3–7 days, then increased, if necessary, to max. 20 mg daily in divided doses.

**Phenoxybenzamine hydrochloride**

**Indications**

- Hypertensive episodes in phaeochromocytoma.

**Cautions**

- Elderly; congestive heart failure; severe heart disease (see also Contra-indications); cerebrovascular disease (avoid if history of cerebrovascular accident); renal impairment; carcinogenic in animals; avoid in acute porphyria (section 9.8.2); avoid infusion in hypovolaemia; avoid extravasation (irritant to tissues); pregnancy (Appendix 4); breast-feeding (Appendix 5).

**Contra-indications**

- History of cerebrovascular accident; during recovery period after myocardial infarction (usually 3–4 weeks).

**Side-effects**

- Postural hypotension with dizziness and marked compensatory tachycardia, lassitude, nasal congestion, miosis, inhibition of ejaculation; rarely gastrointestinal disturbances; decreased sweating and dry mouth after intravenous infusion; idiosyncratic profound hypotension within few minutes of starting infusion.

**Dose**

- See under preparations.

**Phenoxybenzamine**

**Dose**

- Oral route: 2 mg 2–4 times daily for 3–7 days, then increased, if necessary, to max. 20 mg daily in divided doses.

**Phenoxybenzamine hydrochloride**

**Indication**

- Hypertensive episodes in phaeochromocytoma.

**Dose**

- Oral route: 2 mg 2–4 times daily for 3–7 days, then increased, if necessary, to max. 20 mg daily in divided doses.
2 Cardiovascular system

2.5.5 Drugs affecting the renin-angiotensin system

2.5.5.1 Angiotensin-converting enzyme inhibitors

2.5.5.2 Angiotensin-II receptor antagonists

2.5.5.3 Renin inhibitors

Heart failure

Drug treatment of heart failure due to left ventricular systolic dysfunction is covered below; optimal management of heart failure with preserved left ventricular function is not established.

The treatment of chronic heart failure aims to relieve symptoms, improve exercise tolerance, reduce the incidence of acute exacerbations, and reduce mortality. An ACE inhibitor, titrated to a 'target dose' (or the maximum tolerated dose if lower), and a beta-blocker is recommended to achieve these aims. A diuretic is also necessary in most patients to reduce symptoms of fluid overload.

An ACE inhibitor (section 2.5.5.1) is generally advised for patients with asymptomatic left ventricular dysfunction or symptomatic heart failure. An angiotensin-II receptor antagonist (section 2.5.5.2) may be a useful alternative for patients who, because of side-effects such as cough, cannot tolerate ACE inhibitors; a relatively high dose of the angiotensin-II receptor antagonist may be required to produce benefit.

The beta-blockers bisoprolol and carvedilol (section 2.4) are of value in any grade of stable heart failure and left-ventricular systolic dysfunction; nebivolol (section 2.4) is licensed for stable mild to moderate heart failure in patients over 70 years. Beta-blocker treatment should be started by those experienced in the management of heart failure, at a very low dose and titrated very slowly over a period of weeks or months. Symptoms may deteriorate initially, calling for adjustment of concomitant therapy.

Patients with fluid overload should also receive either a loop or a thiazide diuretic (with salt or fluid restriction where appropriate). A thiazide diuretic (section 2.2.1) may be of benefit in patients with mild heart failure and good renal function; however, thiazide diuretics are ineffective in patients with poor renal function (estimated creatinine clearance less than 30 mL/minute, see Appendix 3) and a loop diuretic (section 2.2.2) is preferred. If diuresis with a single diuretic is insufficient, a combination of a loop diuretic and a thiazide diuretic may be tried; addition of metolazone (section 2.2.1) may also be considered but the resulting diuresis may be profound and care is needed to avoid potentially dangerous electrolyte disturbances.

The aldosterone antagonist spironolactone (section 2.2.3) can be considered for patients with moderate to severe heart failure who are already taking an ACE inhibitor and a beta-blocker; low doses of spironolactone (usually 25 mg daily) reduce symptoms and mortality in these patients. If spironolactone cannot be used, eplerenone (section 2.2.3) may be considered for the management of heart failure after an acute myocardial infarction with evidence of left ventricular dysfunction. Close monitoring of serum creatinine and potassium is necessary with any change in treatment or in the patient's condition.

Digoxin (section 2.1.1) improves symptoms of heart failure and exercise tolerance and reduces hospitalisation due to acute exacerbations but it does not reduce mortality. Digoxin is reserved for patients with atrial fibrillation and also for selected patients in sinus rhythm who remain symptomatic despite treatment with an ACE inhibitor, a beta-blocker, and a diuretic.

Patients who cannot tolerate an ACE inhibitor or an angiotensin-II receptor antagonist, or in whom they are contra-indicated, may be given isosorbide dinitrate (section 2.6.1) with hydralazine (section 2.5.1), but this combination may be poorly tolerated. In African-American patients, the combination of isosorbide dinitrate and hydralazine may be considered in addition to standard therapy if necessary.

Angiotensin-converting enzyme inhibitors

Angiotensin-converting enzyme inhibitors (ACE inhibitors) inhibit the conversion of angiotensin I to angiotensin II. They have many uses and are generally well tolerated. The main indications of ACE inhibitors are shown below.

Heart failure

ACE inhibitors are used in all grades of heart failure, usually combined with a beta-blocker (section 2.5.5). Potassium supplements and potassium-sparing diuretics should be discontinued before introducing an ACE inhibitor because of the risk of hyperkalaemia. However, a low dose of spironolactone may be beneficial in severe heart failure (section 2.5.5) and can be used with an ACE inhibitor provided serum potassium is monitored carefully. Profound first-dose hypo-
tension may occur when ACE inhibitors are introduced to patients with heart failure who are already taking a high dose of a loop diuretic (e.g. furosemide 80 mg daily or more). Temporary withdrawal of the loop diuretic reduces the risk, but may cause severe rebound pulmonary oedema. Therefore, for patients on high doses of loop diuretics, the ACE inhibitor may need to be initiated under specialist supervision, see below. An ACE inhibitor can be initiated in the community in patients who are receiving a low dose of a diuretic or who are not otherwise at risk of serious hypotension; nevertheless, care is required and a very low dose of the ACE inhibitor is given initially.

**Hypertension** An ACE inhibitor may be the most appropriate initial drug for hypertension in younger Caucasian patients; Afro-Caribbean patients, those aged over 55 years, and those with primary aldosteronism respond less well (see section 2.5). ACE inhibitors are particularly indicated for hypertension in patients with type 1 diabetics with nephropathy (see also section 6.1.5). They may reduce blood pressure very rapidly in some patients particularly in those receiving diuretic therapy (see Cautions, below); the first dose should preferably be given at bedtime.

**Diabetic nephropathy** For comment on the role of ACE inhibitors in the management of diabetic nephropathy, see section 6.1.5.

**Prophylaxis of cardiovascular events** ACE inhibitors are used in the early and long-term management of patients who have had a myocardial infarction, see section 2.10.1. ACE inhibitors may also have a role in preventing cardiovascular events.

**Initiation under specialist supervision** ACE inhibitors should be initiated under specialist supervision and with careful clinical monitoring in those with severe heart failure or in those:
- receiving multiple or high-dose diuretic therapy (e.g. more than 80 mg of furosemide daily or its equivalent);
- with hypovolaemia;
- with hyponaatraemia (plasma-sodium concentration below 130 mmol/litre);
- with hypotension (systolic blood pressure below 90 mmHg);
- with unstable heart failure;
- receiving high-dose vasodilator therapy;
- known renovascular disease.

**Renal effects** Renal function and electrolytes should be checked before starting ACE inhibitors (or increasing the dose) and monitored during treatment (more frequently if features mentioned below present); hyperkalaemia and other side-effects of ACE inhibitors are more common in those with impaired renal function and the dose may need to be reduced (Appendix 3). Although ACE inhibitors now have a specialised role in some forms of renal disease, including chronic kidney disease, they also occasionally cause impairment of renal function which may progress and become severe in other circumstances (at particular risk are the elderly). A specialist should be involved if renal function is significantly reduced as a result of treatment with an ACE inhibitor.

Concomitant treatment with NSAIDs increases the risk of renal damage, and potassium-sparing diuretics (or potassium-containing salt substitutes) increase the risk of hyperkalaemia.

In patients with severe bilateral renal artery stenosis (or severe stenosis of the artery supplying a single functioning kidney), ACE inhibitors reduce or abolish glomerular filtration and are likely to cause severe and progressive renal failure. They are therefore not recommended in patients known to have these forms of critical renovascular disease.

ACE inhibitor treatment is unlikely to have an adverse effect on overall renal function in patients with severe unilateral renal artery stenosis and a normal contralateral kidney, but glomerular filtration is likely to be reduced (or even abolished) in the affected kidney and the long-term consequences are unknown.

ACE inhibitors are therefore best avoided in patients with known or suspected renovascular disease, unless the blood pressure cannot be controlled by other drugs. If ACE inhibitors are used, they should be initiated only under specialist supervision and renal function should be monitored regularly.

ACE inhibitors should also be used with particular caution in patients who may have undiagnosed and clinically silent renovascular disease. This includes patients with peripheral vascular disease or those with severe generalised atherosclerosis.

**Cautions** ACE inhibitors need to be initiated with care in patients receiving diuretics (important: see Concomitant diuretics, below); first doses can cause hypotension especially in patients taking high doses of diuretics, on a low-sodium diet, on dialysis, dehydrated or with heart failure (see above). They should also be used with caution in peripheral vascular disease or generalised atherosclerosis owing to risk of clinically silent renovascular disease; for use in known renovascular disease, see Renal Effects above. The risk of agranulocytosis is possibly increased in collagen vascular disease (blood counts recommended). ACE inhibitors should be used with care in patients with severe or symptomatic aortic stenosis (risk of hypotension) and in hypertrophic cardiomyopathy. They should also be used with care (or avoided) in those with a history of idiopathic or hereditary angioedema. ACE inhibitors should be used with caution in breast-feeding (Appendix 5). Interactions: Appendix 1 (ACE inhibitors).

**Anaphylactoid reactions** To prevent anaphylactoid reactions, ACE inhibitors should be avoided during dialysis with high-flux polycrylonitrile membranes and during low-density lipoprotein apheresis with dextran sulphate; they should also be withheld before desensitisation with wasp or bee venom.

**Concomitant diuretics** ACE inhibitors can cause a very rapid fall in blood pressure in volume-depleted patients; treatment should therefore be initiated with very low doses. If the dose of diuretic is greater than 80 mg furosemide or equivalent, the ACE inhibitor should be initiated under close supervision and in some patients the diuretic dose may need to be reduced or the diuretic discontinued at least 24 hours beforehand (may not be possible in heart failure—risk of pulmonary oedema). If high-dose diuretic therapy cannot be stopped, close observation is recommended after administration of the first dose of ACE inhibitor, for at least 2 hours or until the blood pressure has stabilised.
Contra-indications  ACE inhibitors are contra-indicated in patients with hypersensitivity to ACE inhibitors (including angioedema). ACE inhibitors should not be used in pregnancy (Appendix 4).

Side-effects  ACE inhibitors can cause profound hypotension (see Cautions) and renal impairment (see Renal effects above), and a persistent dry cough. They can also cause angioedema (onset may be delayed; higher incidence reported in Afro-Caribbean patients), rash (which may be associated with pruritus and urticaria), pancreatitis, and upper respiratory-tract symptoms such as sinusitis, rhinitis, and sore throat. Gastro-intestinal effects reported with ACE inhibitors include nausea, vomiting, dyspepsia, diarrhoea, constipation, and abdominal pain. Altered liver function tests, cholestasis jaundice, and hepatitis have been reported. Hyperkalaemia, hypoglycaemia, and blood disorders including thrombocytopenia, leucopenia, neutropenia, and haemolytic anaemia have also been reported. Other reported side-effects include headache, dizziness, fatigue, malaise, taste disturbance, paraesthesia, bronchospasm, fever, soroitis, vasculitis, myalgia, arthralgia, positive antinuclear antibody, raised erythrocyte sedimentation rate, eosinophilia, leucocytosis, and photosensitivity.

Combination products  Products incorporating an ACE inhibitor with a thiazide diuretic or a calcium-channel blocker are available for the management of hypertension. Use of these combination products should be reserved for patients whose blood pressure has not responded adequately to a single antihypertensive drug and who have been stabilised on the individual components of the combination in the same proportions.

CAPTOPRIL

Indications  mild to moderate essential hypertension alone or with thiazide therapy and severe hypertension resistant to other treatment; congestive heart failure with left ventricular dysfunction (adjunct—see section 2.5.5); following myocardial infarction, see dose; diabetic nephropathy (microalbuminuria greater than 30 mg/day) in type 1 diabetes

Cautions  see notes above

Contra-indications  see notes above

Side-effects  see notes above; tachycardia, serum sickness, weight loss, stomatitis, maculopapular rash, photosensitivity, flushing and acidosis

Dose  • Hypertension, used alone, initially 12.5 mg twice daily; if used in addition to diuretic (see notes above), or in elderly, initially 6.25 mg twice daily (first dose at bedtime); usual maintenance dose 25 mg twice daily; max. 50 mg twice daily (rarely 3 times daily in severe hypertension)

• Heart failure (adjunct), initially 6.25–12.5 mg 2–3 times daily under close medical supervision (see notes above), increased gradually at intervals of at least 2 weeks up to max. 150 mg daily in divided doses if tolerated

• Prophylaxis after infarction in clinically stable patients with asymptomatic or symptomatic left ventricular dysfunction (radionuclide ventriculography or echocardiography undertaken before initiation), initially 6.25 mg, starting as early as 3 days after infarction, then increased over several weeks to 150 mg daily (if tolerated) in divided doses

• Diabetic nephropathy, 75–100 mg daily in divided doses; if further blood pressure reduction required, other antihypertensives may be used in conjunction with captopril; in severe renal impairment, initially 12.5 mg twice daily (if concomitant diuretic therapy required, loop diuretic rather than thiazide should be chosen)

Captopril (Non-proprietary)  £14.10

Tablets, captopril 12.5 mg, net price 56-tab pack = £1.59; 25 mg, 56-tab pack = £1.70; 50 mg, 56-tab pack = £2.22

Brands include Ecopace, Kaplon, Tenospril

Capoten® (Squibb)  £14.00

Tablets, captopril 12.5 mg (scored), net price 56-tab pack = £9.82; 25 mg, 56-tab pack = £11.19; 50 mg (scored), 56-tab pack = £19.07 (also available as Acepr®)

With diuretic  Note  For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Co-zidocapt (Non-proprietary)  £14.00

Tablets, co-zidocapt 12.5/25 (hydrochlorothiazide 12.5 mg, captopril 25 mg), net price 28-tab pack = £14.10

Brands include Capto-co

Tablets, co-zidocapt 25/50 (hydrochlorothiazide 25 mg, captopril 50 mg), net price 28-tab pack = £14.00

Brands include Capto-co

Capozide® (Squibb)  £7.45 (also available as Acezide®)

Indications  essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

Cautions  see notes above; severe hepatic impairment (Appendix 2)

Contra-indications  see notes above; ascites

Side-effects  see notes above; dyspnoea and bronchitis

Dose  • Hypertension, initially 1 mg once daily (reduced to 500 micrograms daily if used in addition to diuretic (see notes above), in the elderly, and in renal impairment), then adjusted according to response; usual maintenance dose 2.5–5 mg once daily; max. 5 mg daily

• Heart failure (adjunct), initially 500 micrograms once daily under close medical supervision (see notes above), increased gradually to 1–2.5 mg once daily if tolerated; max. 5 mg once daily

Vascace® (Roche)  £7.65

Tablets, f/c, cilazapril 500 micrograms (white), net price 28-tab pack = £3.65; 1 mg (yellow), 28-tab pack = £6.01; 2.5 mg (pink), 28-tab pack = £7.64; 5 mg (brown), 28-tab pack = £13.28
ENALAPRIL MALEATE

**Indications** hypertension; symptomatic heart failure (adjunct—see section 2.5.5); prevention of symptomatic heart failure in patients with asymptomatic left ventricular dysfunction

**Cautions** see notes above; hepatic impairment

**Side-effects** see notes above; also dyspnoea; depression, asthenia; blurred vision; less commonly dry mouth, peptic ulcer, anorexia, ileus; arrhythmias, palpitation, flushing; confusion, nervousness, drowsiness, insomnia, vertigo; impotence; muscle cramps; tinnitus; alopecia, sweating; hyponatraemia; rarely stomatitis, glossitis, hepatic failure, Raynaud’s syndrome, pulmonary infiltrates, allergic alveolitis, dream abnormalities, gynaecomastia, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative dermatitis, pemphigus; very rarely gastro-intestinal angiooedema

**Dose**
- Hypertension, used alone, initially 5 mg once daily; if used in addition to diuretic (see notes above), or in renal impairment, lower initial doses may be required; usual maintenance dose 20 mg once daily; max. 40 mg once daily
- Heart failure (adjunct), asymptomatic left ventricular dysfunction, initially 2.5 mg once daily under close medical supervision (see notes above), increased gradually over 2–4 weeks to 10–20 mg twice daily if tolerated

Enalapril Maleate (Non-proprietary) Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £1.12; 10 mg, 28-tab pack = £1.22

Brands include Edney

Innovace® (MSD) Tablets, enalapril maleate 2.5 mg, net price 28-tab pack = £5.35; 5 mg (scored), 28-tab pack = £7.51; 10 mg (red), 28-tab pack = £10.53; 20 mg (peach), 28-tab pack = £12.51

With diuretic

**Note** For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Imidapril hydrochloride

**Indications** essential hypertension

**Cautions** see notes above; hepatic impairment

**Side-effects** see notes above; dry mouth, glossitis, ileus; bronchitis, dyspnoea; sleep disturbances, depression, confusion, blurred vision, tinnitus, impotence

**Dose**
- Initially 5 mg daily before food; if used in addition to diuretic (see notes above), in elderly, in patients with heart failure, angina or cerebrovascular disease, or in renal or hepatic impairment, initially 2.5 mg daily; if necessary increase dose at intervals of at least 3 weeks; usual maintenance dose 10 mg once daily; max. 20 mg daily (elderly, 10 mg daily)

Tanatril® (Trinity) Tablets, scored, imidapril hydrochloride 5 mg, net price 28-tab pack = £6.78; 10 mg, 28-tab pack = £7.66; 20 mg, 28-tab pack = £9.20

**Lisinopril**

**Indications** hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); short-term treatment following myocardial infarction in haemodynamically stable patients; renal complications of diabetes mellitus

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; also less commonly tachycardia, palpitation, cerebrovascular accident, myocardial infarction, Raynaud’s syndrome, confusion, mood changes, vertigo, sleep disturbances, asthenia, impotence; rarely dry mouth, gynaecomastia, alopecia, psoriasis; very rarely allergic alveolitis, pulmonary infiltrates, profuse sweating, pemphigus, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**
- Hypertension, initially 10 mg once daily; if used in addition to diuretic (see notes above) or in cardiac decompensation or in volume depletion, initially 2.5–5 mg once daily; usual maintenance dose 20 mg once daily; max. 80 mg once daily
- Heart failure (adjunct), initially 2.5 mg once daily under close medical supervision (see notes above); increased in steps no greater than 10 mg at intervals of at least 2 weeks up to max. 35 mg once daily if tolerated
- Prophylaxis after myocardial infarction, systolic blood pressure over 120 mmHg, 5 mg within 24 hours, fol-
lowed by further 5 mg 24 hours later, then 10 mg after a further 24 hours, and continuing with 10 mg once daily for 6 weeks (or continued if heart failure); systolic blood pressure 100–120 mmHg, initially 2.5 mg once daily, increased to maintenance dose of 5 mg once daily

Note Should not be started after myocardial infarction if systolic blood pressure less than 100 mmHg; temporarily reduce maintenance dose to 5 mg and if necessary 2.5 mg daily if systolic blood pressure 100 mmHg or less during treatment; withdraw if prolonged hypotension occurs (systolic blood pressure less than 90 mmHg for more than 1 hour)

- Renal complications of diabetes mellitus, initially 2.5–5 mg once daily adjusted according to response; usual dose range 10–20 mg once daily

Lisinopril (Non-proprietary) (HM)

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £1.02; 10 mg, 28-tab pack = £1.10; 20 mg, 28-tab pack = £1.37

Carace® (Bristol-Myers Squibb) (HM)

Tablets, scored, lisinopril 5 mg, net price 28-tab pack = £8.51; 10 mg (yellow), 28-tab pack = £10.51; 20 mg (orange), 28-tab pack = £11.89

Zestril® (AstraZeneca) (HM)

Tablets, lisinopril (as dihydrate) 2.5 mg, net price 28-tab pack = £6.26; 5 mg (pink), 28-tab pack = £7.86; 10 mg (pink), 28-tab pack = £9.70; 20 mg (pink), 28-tab pack = £10.97

With diuretic

Note For mild to moderate hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Carace Plus® (Bristol-Myers Squibb) (HM)

Carace 10 Plus tablets, blue, lisinopril 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.88

Carace 20 Plus tablets, yellow, scored, lisinopril 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.44

Lisicostad® (Genus) (HM)

Lisicostad 10/12.5 mg tablets, scored, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £10.99

Lisicostad 20/12.5 mg tablets, scored, lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £11.99

Zestoretic® (AstraZeneca) (HM)

Zestoretic 10 tablets, peach, lisinopril (as dihydrate) 10 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £13.01

Zestoretic 20 tablets, lisinopril (as dihydrate) 20 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £14.72

MOEXIPRIL HYDROCHLORIDE

Indications essential hypertension

Cautions see notes above; hepatic impairment (Appendix 2)

Contra-indications see notes above

Side-effects see notes above; arrhythmias, angina, chest pain, syncope, cerebrovascular accident, myocardial infarction; appetite and weight changes; dry mouth, photosensitivity, flushing, nervousness, mood changes, anxiety, drowsiness, sleep disturbance, tinnitus, influenza-like syndrome, sweating and dyspnoea

Dose

- Used alone, initially 7.5 mg once daily; if used in addition to diuretic (see notes above), with nifedipine, in elderly, in renal or hepatic impairment, initially 3.75 mg once daily; usual range 15–30 mg once daily; doses above 30 mg daily not shown to increase efficacy

Perdix® (UBC Pharma) (HM)

Tablets, f/c, pink, scored, moexipril hydrochloride 7.5 mg, net price 28-tab pack = £7.55; 15 mg, 28-tab pack = £8.70

PERINDOPRIL ERBUMINE

Indications hypertension (but see notes above); symptomatic heart failure (adjunct—see section 2.5.5); prophylaxis of cardiac events following myocardial infarction or revascularisation in stable coronary artery disease

Cautions see notes above; hepatic impairment (Appendix 2)

Contra-indications see notes above

Side-effects see notes above; asthenia, mood and sleep disturbances

Dose

- Hypertension, initially 4 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2 mg once daily; max. 8 mg daily

- Heart failure (adjunct), initially 2 mg once daily in the morning under close medical supervision (see notes above), increased after at least 2 weeks to max. 4 mg once daily if tolerated

- Following myocardial infarction or revascularisation, initially 4 mg once daily in the morning increased after 2 weeks to 8 mg once daily if tolerated; ELDERLY 2 mg once daily for 1 week, then 4 mg once daily for 1 week, thereafter increased to 8 mg once daily if tolerated

Perindopril (Non-proprietary) (HM)

Tablets, perindopril erbumine (= tert-butylamine) 2 mg, net price 30-tab pack = £4.45; 4 mg, 30-tab pack = £4.21; 8 mg, 30-tab pack = £4.60. Label: 22

Perindopril arginine

Coverys® Arginine (Servier) (HM)

Tablets, f/c, perindopril arginine 2.5 mg (white), net price 30-tab pack = £11.36; 5 mg (light green, scored), 30-tab pack = £11.36; 10 mg (green), 30-tab pack = £11.36. Label: 22

Dose Hypertension, initially 5 mg once daily in the morning for 1 month, subsequently adjusted according to response; if used in addition to diuretic (see notes above), in elderly, in renal impairment, in cardiac decompensation, or in volume depletion, initially 2.5 mg once daily; max. 10 mg daily

Heart failure (adjunct), initially 2.5 mg once daily in the morning under close medical supervision (see notes above), increased after 2 weeks to max. 5 mg once daily if tolerated

Following myocardial infarction or revascularisation, initially 5 mg once daily in the morning increased after 2 weeks to 10 mg once daily if tolerated; ELDERLY 2.5 mg once daily for 1 week, then 5 mg once daily for 1 week, thereafter increased to 10 mg once daily if tolerated
indapamide, see section 2.2.1

Coversyl® Arginine Plus (Servier) (W)
Tablets, f/c, perindopril arginine 5 mg, indapamide 1.25 mg, net price 30-tab pack = £14.49. Label: 22

INDICATIONS
- Essential hypertension; congestive heart failure (adjunct—see section 2.5.5)

CAUTIONS
- See notes above; hepatic impairment (Appendix 2)

CONTRA-INDICATIONS
- See notes above

SIDE-EFFECTS
- See notes above; asthenia, chest pain, oedema, flatulence, nervousness, depression, insomnia, blurred vision, impotence, and back pain

DOSE
- Hypertension, initially 10 mg once daily; with a diuretic (see notes above), in elderly, or in renal impairment initially 2.5 mg daily; usual maintenance dose 20–40 mg daily in single or 2 divided doses; up to 80 mg daily has been given
- Heart failure (adjunct), initial dose 2.5 mg daily under close medical supervision (see notes above), increased gradually to 10–20 mg daily in 1–2 divided doses if tolerated; max. 40 mg daily

Quinapril

Tablets, quinapril (as hydrochloride) 5 mg, net price 28-tab pack = £17.8; 10 mg, 28-tab pack = £2.16; 20 mg, 28-tab pack = £2.56; 40 mg, 28-tab pack = £3.26. Brands include Quinil

With diuretic

Note: For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

Accuretic® (Pfizer) (W)
Tablets, f/c, quinapril (as hydrochloride) 5 mg (brown), net price 28-tab pack = £8.60; 10 mg (brown), 28-tab pack = £8.80; 20 mg (brown), 28-tab pack = £18.79; 40 mg (red-brown), 28-tab pack = £9.75

RAMIPRIL

INDICATIONS
- Mild to moderate hypertension; congestive heart failure (adjunct—see section 2.5.5); following myocardial infarction in patients with clinical evidence of heart failure; susceptible patients over 55 years, prevention of myocardial infarction, stroke, cardiovascular death or need of revascularisation procedures (consult product literature)

CAUTIONS
- See notes above; hepatic impairment (Appendix 2)

CONTRA-INDICATIONS
- See notes above

SIDE-EFFECTS
- See notes above; arrhythmias, angina, chest pain, syncope, cerebrovascular accident, myocardial infarction, loss of appetite, stomatitis, dry mouth, skin reactions including erythema multiforme and pemphigoid exanthema; precipitation or exacerbation of Raynaud’s syndrome; conjunctivitis, onyx-cholyasis, confusion, nervousness, depression, anxiety, impotence, decreased libido, alopecia, bronchitis and muscle cramps

DOSE
- Hypertension, initially 1.25 mg once daily, increased at intervals of 1–2 weeks; usual range 2.5–5 mg once daily; max. 10 mg once daily; if used in addition to diuretic see notes above
- Heart failure (adjunct), initially 1.25 mg once daily under close medical supervision (see notes above), increased gradually at intervals of 1–2 weeks to max. 10 mg daily if tolerated (daily doses of 2.5 mg or more may be taken in 1–2 divided doses)
- Prophylaxis after myocardial infarction (started in hospital 3 to 10 days after infarction), initially 2.5 mg twice daily, increased after 2 days to 5 mg twice daily; maintenance 2.5–5 mg twice daily

Note
- If initial 2.5-mg dose not tolerated, give 1.25 mg twice daily for 2 days before increasing to 2.5 mg twice daily, then 5 mg twice daily
- Prophylaxis of cardiovascular events or stroke, initially 2.5 mg once daily, increased after 1 week to 5 mg once daily, then increased after a further 3 weeks to 10 mg once daily

Ramipril (Non-proprietary) (W)
Capsules, ramipril 1.25 mg, net price 28-cap pack = £1.07; 2.5 mg, 28-cap pack = £1.15; 5 mg, 28-cap pack = £1.29; 10 mg, 28-cap pack = £1.54. Brands include Lopace

Tablets, ramipril 1.25 mg, net price 28-tab pack = £1.42; 2.5 mg, 28-tab pack = £1.58; 5 mg, 28-tab pack = £1.93; 10 mg, 28-tab pack = £2.44

Triatrace (Aventis Pharma) (W)
Tablets, scored, ramipril 1.25 mg (white), net price 28-tab pack = £5.30; 2.5 mg (yellow), 28-tab pack = £7.51; 5 mg (red), 28-tab pack = £10.46; 10 mg (white), 28-tab pack = £14.24

Tiratrace pack, tablets, 35-day starter pack of ramipril 7 × 2.5 mg with 21 × 5 mg and 7 × 10 mg, net price = £13.00

With calcium-channel blocker

Note
- For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of felodipine, see section 2.6.2

Triapin® (Aventis Pharma) (W)
Triapin tablets, f/c, brown, ramipril 5 mg, felodipine 5 mg (m/r), net price 28-tab pack = £26.25. Label: 25

Triapin mite® tablets, f/c, orange, ramipril 2.5 mg, felodipine 2.5 mg (m/r), net price 28-tab pack = £28.55. Label: 25

TRANDOLAPRIL

INDICATIONS
- Mild to moderate hypertension; following myocardial infarction in patients with left ventricular dysfunction

CAUTIONS
- See notes above; hepatic impairment (Appendix 2)

CONTRA-INDICATIONS
- See notes above

SIDE-EFFECTS
- See notes above; also ileus, dry mouth; tachycardia, palpitation, arrhythmias, angina, transient ischaemic attacks, cerebral haemorrhage, myocardial infarction, syncope; dyspnoea, bronchitis; asthenia, nervousness, sleep disturbances; hot flushes; alopecia, sweating, skin reactions including
2 Cardiovascular system

2.5.5 Drugs affecting the renin-angiotensin system

Stevens-Johnson syndrome, toxic epidermal necrolysis, and psoriasis-like efflorescence

Dose

- Hypertension, initially 500 micrograms once daily, increased at intervals of 2–4 weeks; usual range 1–2 mg once daily; max. 4 mg daily; if used in addition to diuretic see notes above
- Prophylaxis after myocardial infarction (starting as early as 3 days after infarction), initially 500 micrograms once daily, gradually increased to max. 4 mg once daily
- Note If symptomatic hypotension develops during titration, do not increase dose further; if possible, reduce dose of any adjunctive treatment and if this is not effective or feasible, reduce dose of trandolapril

Trandolapril (Non-proprietary) 

Capsules, trandolapril 500 micrograms, net price 14-cap pack = £1.41; 1 mg, 28-cap pack = £6.86; 2 mg, 28-cap pack = £6.86; 4 mg, 28-cap pack = £11.61

Gopten (Abbott) 

Capsules, trandolapril 500 micrograms (red/yellow), net price 14-cap pack = £1.40; 1 mg (red/orange), 28-cap pack = £12.28; 2 mg (red/red), 28-cap pack = £6.86; 4 mg (red/maroon), 28-cap pack = £11.64

With calcium-channel blocker

Note For hypertension in patients stabilised on the individual components in the same proportions. For cautions, contra-indications, and side-effects of verapamil, see section 2.6.2

Tarka (Abbott) 

Capsules, pink, trandolapril 2 mg, verapamil hydrochloride 180 mg (m/r), net price 28 cap-pack = £17.85. Label: 25

2.5.5.2 Angiotensin-II receptor antagonists

Candesartan, eprosartan, irbesartan, losartan, olmesartan, telmisartan, and valsartan are angiotensin-II receptor antagonists with many properties similar to those of the ACE inhibitors. However, unlike ACE inhibitors, they do not inhibit the breakdown of bradykinin and other kinins, and thus are unlikely to cause the persistent dry cough which commonly complicates ACE inhibitor therapy. They are therefore a useful alternative for patients who have to discontinue an ACE inhibitor because of persistent cough.

An angiotensin-II receptor antagonist may be used as an alternative to an ACE inhibitor in the management of heart failure (section 2.5.5) or diabetic nephropathy (section 6.1.5).

Cautions Angiotensin-II receptor antagonists should be used with caution in renal artery stenosis (see also Renal Effects under ACE Inhibitors, section 2.5.5.1). Monitoring of plasma-potassium concentration is advised, particularly in the elderly and in patients with renal impairment; lower initial doses may be appropriate in these patients. Angiotensin-II receptor antagonists should be used with caution in aortic or mitral valve stenosis and in hypertrophic cardiomyopathy. Those with primary aldosteronism, and Afro-Caribbean patients (particularly those with left ventricular hypertrophy), may not benefit from an angiotensin-II receptor antagonist. Interactions: Appendix 1 (angiotensin-II receptor antagonists).

Contra-indications Angiotensin-II receptor antagonists, like the ACE inhibitors, should also be avoided in pregnancy (Appendix 4) and breast-feeding (Appendix 5).

Side-effects Side-effects are usually mild. Symptomatic hypotension including dizziness may occur, particularly in patients with intravascular volume depletion (e.g. those taking high-dose diuretics). Hyperkalaemia occurs occasionally; angioedema has also been reported with some angiotensin-II receptor antagonists.

Candesartan Cilexetil

Indications hypertension; heart failure with impaired left ventricular systolic function in conjunction with an ACE inhibitor, or when ACE inhibitors are not tolerated (see also section 2.5.5)

Cautions see notes above; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications see notes above; also cholestasis

Side-effects see notes above; also vertigo, headache; very rarely nausea, hepatitis, blood disorders, hypotension, back pain, arthralgia, myalgia, rash, urticaria, pruritus

Dose

- Hypertension, initially 8 mg (hepatic impairment 2 mg, renal impairment or intravascular volume depletion 4 mg) once daily, increased if necessary at intervals of 4 weeks to max. 32 mg once daily; usual maintenance dose 8 mg once daily
- Heart failure, initially 4 mg once daily, increased at intervals of at least 2 weeks to 'target' dose of 32 mg once daily or to max. tolerated dose

Amias (Takeda) 

Tablets, candesartan cilexetil 2 mg (white), net price 7-tab pack = £2.99; 4 mg (white, scored), 7-tab pack = £3.24, 28-tab pack = £8.15; 8 mg (pink, scored), 28-tab pack = £9.89; 16 mg (pink, scored), 28-tab pack = £12.72; 32 mg (pink, scored), 28-tab pack = £16.13

Eprosartan

Indications hypertension (see also notes above)

Cautions see notes above; also hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Contra-indications see notes above

Side-effects see notes above; also flatulence, hypertriglyceridaemia, arthralgia, rhinitis; rarely headache, asthma, anaemia, hypersensitivity reactions (including rash, pruritus, urticaria); very rarely nausea

Dose

- 600 mg once daily (elderly over 75 years, mild to moderate hepatic impairment, renal impairment, initially 300 mg once daily); if necessary increased after 2–3 weeks to 800 mg once daily

Teveten (Solvay) 

Tablets, 1.25 mg, eprosartan (as mesilate) 300 mg (white), net price 28-tab pack = £11.63; 400 mg (pink), 56-tab pack = £15.77; 600 mg (white), 28-tab pack = £14.31. Label: 21
IRBESARTAN

**Indications** hypertension; renal disease in hypertensive type 2 diabetes mellitus (see also notes above)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; also nausea, vomiting; fatigue; musculoskeletal pain; less commonly diarrhoea, dyspepsia, flushing, tachycardia, chest pain, cough, and sexual dysfunction; rarely rash, urticaria; very rarely headache, myalgia, arthralgia, tinnitus, taste disturbance, hepatitis, renal dysfunction, and cutaneous vasculitis

**Dose**

- Hypertension, initially 150 mg once daily, increased if necessary to 300 mg once daily (in haemodialysis or in ELDERLY over 75 years, initial dose of 75 mg once daily may be used); CHILD not recommended
- Renal disease in hypertensive type 2 diabetes mellitus, initially 150 mg once daily, increased to 300 mg once daily if tolerated (in haemodialysis or in ELDERLY over 75 years, consider initial dose of 75 mg once daily); CHILD not recommended

**CoAprovel** (Bristol-Myers Squibb, Sanofi-Synthelabo) (A)

Tablets, f/c, irbesartan 75 mg, net price 28-tab pack = £10.29; 150 mg, 28-tab pack = £12.57; 300 mg, 28-tab pack = £16.91

**With diuretic**

**Note** For hypertension not adequately controlled with irbesartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

**OLMESARTAN MEDOXOMIL**

**Indications** hypertension (see also notes above)

**Cautions** see notes above; hepatic impairment (avoid in severe impairment; Appendix 2); renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3)

**Contra-indications** see notes above; biliary obstruction

**Side-effects** see notes above; also gastro-intestinal disturbances; chest pain, peripheral oedema, hypertriglyceridaemia; fatigue; influenza-like symptoms, cough, pharyngitis, rhinitis; urinary-tract infection; haematuria, hyperuricaemia; arthritis, musculoskeletal pain; less commonly angina, vertigo, rash; very rarely headache, thrombocytopenia, myalgia, pruritus, urticaria

**Dose**

- Initially 10 mg once daily; if necessary increased to 20 mg once daily; max. 40 mg daily

**Olmetec** (Sankyo) (A)

Tablets, f/c, olmesartan medoxomil 10 mg, net price 28-tab pack = £10.95; 20 mg, 28-tab pack = £12.95, 40 mg, 28-tab pack = £17.50

**With diuretic**

**Note** For hypertension not adequately controlled with olmesartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1

**TELMSARTAN**

**Indications** hypertension (see also notes above)

**Cautions** see notes above; hepatic impairment (Appendix 2); avoid in severe impairment; renal impairment (Appendix 3)

**Contra-indications** see notes above; biliary obstruction

**Side-effects** see notes above; also gastro-intestinal disturbances; chest pain; influenza-like symptoms including pharyngitis and sinusitis; urinary-tract infection; arthralgia, myalgia, back pain, leg cramps; eczema; less commonly dry mouth, flatulence, anxiety, vertigo, tendinitis-like symptoms, abnormal vision,
increased sweating; rarely bradycardia, tachycardia, dyspnoea, insomnia, depression, blood disorders, increase in uric acid, eosinophilia, rash, and pruritis; syncope and asthma also reported.

Dose

- Usually 40 mg once daily (but 20 mg may be sufficient), increased if necessary after at least 4 weeks, to max. 80 mg once daily.

Micardis® (Boehringer Ingelheim)  Tablets, telmisartan 20 mg, net price 28-tab pack = £9.25; 40 mg, 28-tab pack = £11.34; 80 mg, 28-tab pack = £14.18.

- For hypertension, usually 80 mg once daily (initially 40 mg once daily; see notes above; With diuretic.

Note For patients with hypertension not adequately controlled by telmisartan alone. For cautions, contra-indications, and side-effects of thiazides, see section 2.2.1.

Co-Diovan® (Novartis) Tablets 80/12.5, orange, f/c, valsartan 80 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £16.44.

- Tablets 160/12.5, red, f/c, valsartan 160 mg, hydrochlorothiazide 12.5 mg, net price 28-tab pack = £21.66.

2.5.5.3 Renin inhibitors

Renin inhibitors inhibit renin directly; renin converts angiotensinogen to angiotensin I. Aliskiren is licensed for the treatment of hypertension, either alone or in combination with other antihypertensives.

The Scottish Medicines Consortium (p. 3) has advised (December 2008) that aliskiren (Rasilez®) is not recommended for use within NHS Scotland for the treatment of essential hypertension.

ALISKIREN

Indications essential hypertension.

Cautions patients taking concomitant diuretics, on a low-sodium diet, or who are dehydrated (first doses may cause hypotension—initiate with care); renal artery stenosis; renal impairment (Appendix 3); monitor plasma-potassium concentration and renal function in renal impairment, diabetes mellitus, and heart failure; interactions: Appendix 1 (aliskiren).

Contra-indications pregnancy (Appendix 4); breastfeeding (Appendix 5).

Side-effects diarrhea; less commonly rash; rarely angioedema; anaemia and hyperkalaemia also reported.

Dose

- ADULT over 18 years, 150 mg once daily, increased if necessary to 300 mg once daily.

Rasilez® (Novartis) Tablets, f/c, aliskiren (as hemifumarate) 150 mg (pink), net price 28-tab pack = £19.80; 300 mg (red), net price 28-tab pack = £23.80. Label: 21.

2.6 Nitrates, calcium-channel blockers, and other antianginal drugs

2.6.1 Nitrates

2.6.2 Calcium-channel blockers

2.6.3 Other antianginal drugs

2.6.4 Peripheral vasodilators and related drugs

Nitrates, calcium-channel blockers, and potassium-channel activators have vasodilating effects. Vaso-
Angina

It is important to distinguish unstable angina from stable angina. Stable angina usually results from atherosclerotic plaques in the coronary arteries and is often precipitated by exertion and relieved by rest. Unstable angina is usually due to plaque rupture and is often characterised by new onset severe angina or sudden worsening of previously stable angina. Treatment of stable and unstable angina involves management of acute anginal pain, and long-term management to prevent angina attacks and to reduce the risk of cardiovascular events.

Stable angina

Acute attacks of stable angina should be managed with sublingual glyceryl trinitrate; sublingual glyceryl trinitrate can also be taken before performing activities that are known to bring on an attack. If attacks occur more than twice a week, regular drug therapy is required and should be introduced in a stepwise manner according to response.

Patients with mild or moderate stable angina should be given a beta-blocker (section 2.4). In those with left-ventricular dysfunction, beta-blocker treatment should be started at a very low dose and titrated very slowly over a period of weeks or months (section 2.5.5).

For those patients in whom beta-blockers are not tolerated or are contra-indicated, a long-acting nitrate (section 2.6.1) or a rate-limiting calcium-channel blocker (diltiazem or verapamil, section 2.6.2) can be used; in patients with left-ventricular dysfunction, diltiazem and verapamil are contra-indicated because heart failure may be precipitated (important: see p. 113); however, a long-acting dihyd rolepine calcium-channel blocker, such as amiodipine or felodipine, is suitable. Nicorandil or ivabradine (section 2.6.3) are alternatives.

When a single drug fails to control symptoms, combination treatment can be used. A calcium-channel blocker can be added to a beta-blocker, although combining verapamil with a beta-blocker should be avoided (see p. 118); combinations including diltiazem and a beta-blocker should be used with caution. Long-acting nitrates can also be used with a beta-blocker or a calcium-channel blocker, if appropriate. Combinations that include nicorandil can also be considered.

Patients should be referred to a specialist if a combination of two drugs fails to control symptoms. Revascularisation procedures may be appropriate.

Unstable angina

Unstable angina and non-ST-segment elevation myocardial infarction are managed similarly. The aims of management are to provide supportive care and pain relief during the acute attack and to prevent further cardiac events and death. For advice on the management of patients with ST-segment elevation acute myocardial infarction, see section 2.10.1.

Initial management Oxygen (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hyperoxia should be avoided and particular care is required in patients with chronic obstructive Airways disease.

Nitrates (section 2.6.1) are used to relieve ischaemic pain. If sublingual glyceryl trinitrate is not effective, intravenous or buccal glyceryl trinitrate or intravenous isosorbide dinitrate is given. If pain continues, diamorphine (section 4.7.2) can be given by slow intravenous injection; an antiemetic such as metoclopramide should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect in a dose of 300 mg (section 2.9). If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel in a dose of 300 mg (section 2.9) and a low molecular weight heparin or fondaparinux (section 2.8.1), should also be given.

Patients without contra-indications should receive beta-blockers (section 2.4) which should be continued indefinitely. In patients without left ventricular dysfunction and in whom beta-blockers are inappropriate, diltiazem or verapamil can be given (section 2.6.2).

The glycoprotein IIb/IIIa inhibitors eptifibatide and tirofiban (section 2.9) are recommended (with aspirin and heparin) for unstable angina or for non-ST-segment elevation myocardial infarction in patients at a high risk of either myocardial infarction or death. Abciximab, eptifibatide, or tirofiban can also be used with aspirin and heparin in patients undergoing percutaneous coronary intervention, to reduce the immediate risk of vascular occlusion.

Revascularisation procedures are often appropriate for patients with unstable angina.

Long-term management

The need for long-term angina treatment or for coronary angiography should be assessed. Most patients will require standard angina treatment (see Stable angina) to prevent recurrence of symptoms.

Prevention of cardiovascular events

Patients with stable and unstable angina should be given advice and treatments to reduce their cardiovascular risk. The importance of life-style changes, especially stopping smoking, should be emphasised. Patients should take aspirin indefinitely in a dose of 75 mg daily. A combination of aspirin and clopidogrel is given for up to 12 months in patients with non-ST-segment elevation acute coronary syndromes (section 2.9). An ACE inhibitor (section 2.5.5.1) and a statin (section 2.12) should also be given.

2.6.1 Nitrates

Nitrates have a useful role in angina (for details on the management of stable angina, see section 2.6). Although they are potent coronary vasodilators, their principal benefit follows from a reduction in venous return which reduces left ventricular work. Unwanted effects such as flushing, headache, and postural hypotension may limit therapy, especially when angina is severe or when patients are unusually sensitive to the effects of nitrates. Sublingual glyceryl trinitrate is one of the most effective drugs for providing rapid symptomatic relief of
angina, but its effect lasts only for 20 to 30 minutes; the 300-microgram tablet is often appropriate when glyceryl trinitrate is first used. The aerosol spray provides an alternative method of rapid relief of symptoms for those who find difficulty in dissolving sublingual preparations. Duration of action may be prolonged by modified-release and transdermal preparations (but tolerance may develop, see below).

Isosorbide dinitrate is active sublingually and is a more stable preparation for those who only require nitrates infrequently. It is also effective by mouth for prophylaxis; although the effect is slower in onset, it may persist for several hours. Duration of action of up to 12 hours is claimed for modified-release preparations. The activity of isosorbide dinitrate may depend on the production of active metabolites, the most important of which is isosorbide mononitrate. Isosorbide mononitrate itself is also licensed for angina prophylaxis; modified-release formulations (for once daily administration) are available. Glyceryl trinitrate or isosorbide dinitrate may be tried by intravenous injection when the sublingual form is ineffective in patients with chest pain due to myocardial infarction or severe ischaemia. Intravenous injections are also useful in the treatment of acute left ventricular failure.

Tolerance Many patients on long-acting or transdermal nitrates rapidly develop tolerance (with reduced therapeutic effects). Reduction of blood-nitrate concentrations to low levels for 4 to 8 hours each day usually maintains effectiveness in such patients. If tolerance is suspected during the use of transdermal patches they should be left off for several consecutive hours in each 24 hours; in the case of modified-release tablets of isosorbide dinitrate (and conventional formulations of isosorbide mononitrate), the second of the two daily doses should be given after about 8 hours rather than after 12 hours. Conventional formulations of isosorbide mononitrate should not usually be given more than twice daily unless small doses are used; modified-release formulations of isosorbide mononitrate should only be given once daily, and used in this way do not produce tolerance.

GLYCERYL TRINITRATE

Indications prophylaxis and treatment of angina; left ventricular failure; anal fissure (section 1.7.4); extra-sascular (section 10.3)

Cautions hypothyroidism, malnutrition, hypothermia; head trauma, cerebral haemorrhage; recent history of myocardial infarction; hypoxaemia or other ventilation and perfusion abnormalities; susceptibility to angle-closure glaucoma; metal-containing transdermal systems should be removed before cardioversion or diathermy; avoid abrupt withdrawal; tolerance (see notes above); severe hepatic impairment; severe renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (nitrates)

Contra-indications hypersensitivity to nitrates; hypotensive conditions and hypovolaemia; hypertrophic cardiomyopathy, aortic stenosis, cardiac tamponade, constrictive pericarditis, mitral stenosis; marked anaemia

Side-effects postural hypotension, tachycardia (but paradoxical bradycardia also reported); throbbing headache, dizziness; less commonly nausea, vomiting, heartburn; flushing; temporary hypoxaemia; rash; application site reactions with transdermal patches; very rarely angle-closure glaucoma

Injection Specific side-effects following injection (particularly if given too rapidly) include severe hypotension, dia phoresis, apprehension, restlessness, muscle twitching, retrosternal discomfort, palpitation, abdominal pain, syncope; prolonged administration has been associated with methaemoglobinemia

Dose • Sublingually, 0.3–1 mg, repeated as required • By intravenous infusion, 10–200 micrograms/minute • By transdermal application, see under preparations

Short-acting tablets and sprays

Glyceryl Trinitrate (Non-proprietary)

Sublingual tablets, glyceryl trinitrate 300 micro- grammes, net price 100 = £2.71; 500 micrograms, 100 = £2.84; 600 micrograms, 100 = £3.13. Label: 16

Note Glyceryl trinitrate tablets should be supplied in glass containers of not more than 100 tablets, closed with a foil-lined cap, and containing no cotton wool wadding; they should be discarded after 8 weeks in use

Aerosol spray, glyceryl trinitrate 400 micrograms/ metered dose, net price 200-dose unit = £3.13

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Coro-Nitro Pump Spray® (Ayrton Saunders)

Aerosol spray, glyceryl trinitrate 400 micrograms/ metered dose, net price 200-dose unit = £3.13

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Glytrin Spray® (Sanofi-Synthelabo)

Aerosol spray, glyceryl trinitrate 400 micrograms/ metered dose, net price 200-dose unit = £3.49

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Cautions flammable

GTN 300 mcg (Martindale)

Sublingual tablets, glyceryl trinitrate 300 micro- grammes, net price 100 = £2.71. Label: 16

Nitrolingual Pumpspray® (Merck)

Aerosol spray, glyceryl trinitrate 400 micrograms/ metered dose, net price 200-dose unit = £3.65

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Nitromin® (Egis)

Aerosol spray, glyceryl trinitrate 400 micrograms/ metered dose, net price 180-dose unit = £2.63, 200- dose unit = £2.82

Dose treatment or prophylaxis of angina, spray 1–2 doses under tongue and then close mouth

Longer-acting tablets

Suscard® (Forest)

Buccal tablets, m/r, glyceryl trinitrate 2 mg, net price 100-tab pack = £12.70; 3 mg, 100-tab pack = £18.33; 5 mg, 100-tab pack = £24.96. Counselling, see below

Dose treatment of angina, 2 mg as required, increased to 3 mg if necessary; prophylaxis 2–3 mg 3 times daily, 5 mg in severe angina

Unstable angina (adjunct), up to 5 mg with ECG monitoring

Congestive heart failure, 5 mg 3 times daily, increased to 10 mg 3 times daily in severe cases

Acute heart failure, 5 mg repeated until symptoms abate

Counselling Tablets have rapid onset of effect; they are placed between upper lip and gum, and left to dissolve; vary site to reduce risk of dental caries
Parenteral preparations

**Note** Glass or polyethylene apparatus is preferable; loss of potency will occur if PVC is used.

**Glyceryl Trinitrate** (Non-proprietary) (\(\text{\textregistered}\))

Injection, glyceryl trinitrate 5 mg/mL. To be diluted before use. Net price 5-mL amp = £6.49; 10-mL amp = £12.98

Excipients may include ethanol, propylene glycol (see Excipients, p. 2)

**Nitroine** (UCB Pharma) (\(\text{\textregistered}\))

Injection, glyceryl trinitrate 1 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 10-mL amp = £7.34; 50-mL bottle = £17.21

Excipients include propylene glycol (see Excipients, p. 2)

**Nitronal** (Merck) (\(\text{\textregistered}\))

Injection, glyceryl trinitrate 5 mg/mL. To be diluted before use or given undiluted with syringe pump. Net price 5-mL vial = £1.92; 50-mL vial = £15.67

Transdermal preparations

**Deponit** (UCB Pharma)

Patches, self-adhesive, transparent, glyceryl trinitrate, ‘5’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £15.96; ‘10’ patch (releasing approx. 10 mg/24 hours), 28 = £17.57

Dose prophylaxis of angina, apply one ‘5’ or one ‘10’ patch to lateral chest wall, upper arm, thigh, abdomen, or shoulder; increase to two ‘10’ patches every 24 hours if necessary; replace every 24 hours, siting replacement patch on different area; see also notes above (Tolerance)

**Minitran** (3M)

Patches, self-adhesive, transparent, glyceryl trinitrate, ‘5’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 30 = £11.62; ‘10’ patch (releasing approx. 10 mg/24 hours), 30 = £12.87; ‘15’ patch (releasing approx. 15 mg/24 hours), 30 = £14.19

Dose prophylaxis of angina, apply one ‘5’ patch to chest or upper arm, replace every 24 hours, siting replacement patch on different area; adjust dose according to response; see also notes above (Tolerance)

Maintenance of venous potency (‘5’ patch only), consult product literature

**Nitro-Dur** (Schering-Plough)

Patches, self-adhesive, buff, glyceryl trinitrate, ‘0.2 mg/h’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £11.01; ‘0.4 mg/h’ patch (releasing approx. 10 mg/24 hours), 28 = £12.18; ‘0.6 mg/h’ patch (releasing approx. 15 mg/24 hours), 28 = £13.41

Dose prophylaxis of angina, apply one ‘0.2 mg/h’ patch to chest or outer upper arm, replace every 24 hours, siting replacement patch on different area; adjust dose according to response; see also notes above (Tolerance)

**Carmicin** (Novartis)

Ointment, glyceryl trinitrate 2%, net price 60 g = £9.55. Counselling, see administration below

Excipients include w/o fat

Dose prophylaxis of angina, usual dose 1–2 inches of ointment measured on to Applicule, and applied (usually to chest, arm, or thigh) without rubbing in and secured with surgical tape, every 3–4 hours as required; to determine dose, ½ inch on first day then increased by ½ inch/day until headache occurs, then reduced by ½ inch

Note Approx. 800 micrograms/hour absorbed from 1 inch of ointment

Transderm-Nitro (Novartis)

Patches, self-adhesive, pink, glyceryl trinitrate, ‘5’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 28 = £21.31; ‘10’ patch (releasing approx. 10 mg/24 hours), 28 = £23.43

**Trintek** (Goldshield)

Patches, self-adhesive, glyceryl trinitrate, ‘5’ patch (releasing approx. 5 mg/24 hours when in contact with skin), net price 30 = £11.84; ‘10’ patch (releasing approx. 10 mg/24 hours), net price 30 = £13.10; ‘15’ patch (releasing approx. 15 mg/24 hours), net price 30 = £14.42

Dose prophylaxis of angina, apply one ‘5’ patch to lateral chest wall; replace every 24 hours, siting replacement patch on different area; adjust dose according to response, max one ‘15’ patch daily; see also notes above (Tolerance)

ISOSORBIDE DINITRATE

**Indications** prophylaxis and treatment of angina; left ventricular failure

**Cautions** see under Glyceryl Trinitrate

**Contra-indications** see under Glyceryl Trinitrate

**Side-effects** see under Glyceryl Trinitrate

**Dose**

- **By mouth**, daily in divided doses, angina 30–120 mg, left ventricular failure 40–160 mg, up to 240 mg if required
- **By intravenous infusion**, 2–10 mg/hour; higher doses up to 20 mg/hour may be required

**Short-acting tablets and sprays**

**Isosorbide Dinitrate** (Non-proprietary)

Tablets, isosorbide dinitrate 10 mg, net price 56-tab pack = £9.30; 20 mg, net price 56-tab pack = £11.49

**Angitak** (LPC)

Aerosol spray, isosorbide dinitrate 1.25 mg/metered dose, net price 200-dose unit = £3.95

**Dose** treatment or prophylaxis of angina, spray 1–3 doses under tongue whilst holding breath; allow 30 second interval between each dose

**Modified-release preparations**

**Cedocard Retard** (Pharmacia)

Retard-20 tablets, m/r, yellow, scored, isosorbide dinitrate 20 mg, net price 60-tab pack = £6.85. Label: 25

Dose prophylaxis of angina, 1 tablet every 12 hours

**Retard-40 tablets, m/r, scored, isosorbide dinitrate 40 mg, net price 60-tab pack = £13.31. Label: 25

Dose prophylaxis of angina, 1–2 tablets every 12 hours

**Isoket Retard** (UCB Pharma)

Retard-20 tablets, m/r, scored, isosorbide dinitrate 20 mg, net price 56-tab pack = £3.23. Label: 25

Dose prophylaxis of angina, 30–120 mg daily

**Retard-40 tablets, m/r, scored, isosorbide dinitrate 40 mg, net price 56-tab pack = £7.95. Label: 25

Dose prophylaxis of angina, 40 mg daily in 1–2 divided doses, increased if necessary to 60–80 mg daily in 2–3 divided doses

**Parenteral preparations**

**Isoket** (UCB Pharma) (\(\text{\textregistered}\))

Injection 0.05%, isosorbide dinitrate 500 micrograms/mL. To be diluted before use or given undi-
luted with syringe pump. Net price 50-mL bottle = £8.94

Injection 0.1%, isosorbide dinitrate 1 mg/mL. To be diluted before use. Net price 10-mL amp = £3.37; 50-mL bottle = £16.70; 100-mL bottle = £25.98

Note Glass or polyethylene infusion apparatus is preferable. Loss of potency if PVC used

ISOSORBIDE MONONITRATE

Indications prophylaxis of angina; adjunct in congestive heart failure

Cautions see under Glyceryl Trinitrate

Contra-indications see under Glyceryl Trinitrate

Side-effects see under Glyceryl Trinitrate

Dose

• Initially 20 mg 2–3 times daily or 40 mg twice daily (10 mg twice daily in those who have not previously received nitrates); up to 120 mg daily in divided doses if required

Isosorbide Mononitrate (Non-proprietary)

Tablets, isosorbide mononitrate 10 mg, net price = £1.02; 20 mg, 56 = £1.05; 40 mg, 56 = £1.51. Label: 25

Brands include Angeze

Elantan® (UCB Pharma)

Elantan 10 tablets, scored, isosorbide mononitrate 10 mg, net price 56-tab pack = £3.31; 84-tab pack = £4.97. Label: 25

Elantan 20 tablets, scored, isosorbide mononitrate 20 mg, net price 56-tab pack = £4.32; 84-tab pack = £6.13. Label: 25

Elantan 40 tablets, scored, isosorbide mononitrate 40 mg, net price 56-tab pack = £7.03; 84-tab pack = £10.56. Label: 25

Ismo® (Riemser)

Ismo 10 tablets, isosorbide mononitrate 10 mg, net price 60-tab pack = £3.31. Label: 25

Ismo 20 tablets, scored, isosorbide mononitrate 20 mg, net price 60-tab pack = £4.85. Label: 25

Chemydur® 60XL (Sovereign)

Tablets, m/r, scored, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £5.99. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet for 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Elantan LA® (UCB Pharma)

Elantan LA 25 capsules, m/r, brown/white, enclosing white micropellets, isosorbide mononitrate 25 mg, net price 28-cap pack = £6.59. Label: 25

Dose prophylaxis of angina, 1 capsule in the morning, increased if necessary to 2 capsules

Elantan LA 50 capsules, m/r, brown/pink, enclosing white micropellets, isosorbide mononitrate 50 mg, net price 28-cap pack = £10.54. Label: 25

Dose prophylaxis of angina, 1 capsule daily in the morning, increased if necessary to 2 capsules

Imdur® (AstraZeneca)

Duana® (= tablets m/r), yellow, f/c, scored, isosorbide mononitrate 60 mg, net price 28-tab pack = £11.14. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet if headache occurs), increased to 2 tablets in the morning if required

Isib 60XL® (Ranbaxy)

Tablets, m/r, scored, yellow, isosorbide mononitrate 60 mg, net price 28-tab pack = £8.15. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet for 2–4 days if headache occurs), increased if necessary to 2 tablets

Ismo Retard® (Riemser)

Tablets, m/r, s/c, isosorbide mononitrate 40 mg, net price 30-tab pack = £10.71. Label: 25

Dose prophylaxis of angina, 1 tablet daily in morning

Isodur® (Galen)

Isodur 25XL capsules, m/r, brown/white, isosorbide mononitrate 25 mg, net price 28-cap pack = £5.63. Label: 25

Isodur 50XL capsules, m/r, brown/pink, isosorbide mononitrate 50 mg, net price 28-cap pack = £9.07. Label: 25

Dose prophylaxis of angina, 25–50 mg daily in the morning, increased if necessary to 50–100 mg once daily

Isodur® (ProStrakan)

Isodur 25XL tablets, m/r, ivory, isosorbide mononitrate 25 mg, net price 28-tab pack = £6.95. Label: 25

Isodur 40XL tablets, m/r, ivory, isosorbide mononitrate 40 mg, net price 28-tab pack = £6.78. Label: 25

Isodur 50XL tablets, m/r, ivory, isosorbide mononitrate 50 mg, net price 28-tab pack = £6.78. Label: 25

Isodur 60XL tablets, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £6.78. Label: 25

Dose prophylaxis of angina, 25–60 mg daily in the morning (if headache occurs with 60-mg tablet, half a 60-mg tablet may be given for 2–4 days), increased if necessary to 50–120 mg daily

Modisal LA® (UCB Pharma)

Modisal LA25 capsules, m/r, brown/white, isosorbide mononitrate 25 mg, net price 28-cap pack = £6.22. Label: 25

Modisal LA50 capsules, m/r, brown/peach, isosorbide mononitrate 50 mg, net price 28-cap pack = £10.03. Label: 25

Dose prophylaxis of angina, 25–50 mg daily in the morning, increased if necessary to 100 mg once daily

Modisal XL® (Sanofi)

Tablets, m/r, ivory, isosorbide mononitrate 60 mg, net price 28-tab pack = £10.36. Label: 25

Dose prophylaxis of angina, 1 tablet daily in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily

Monomax® (Trinity-Chiesi)

Monomax® SR, capsules, m/r, isosorbide mononitrate 40 mg, net price 28-cap pack = £8.31; 60 mg, 28-cap pack = £9.03. Label: 25

Dose prophylaxis of angina, 40–60 mg daily in the morning, increased if necessary to 120 mg daily

Note Also available as Angeze SR

Monomax® XL tablets, m/r, isosorbide mononitrate 60 mg, net price 28-tab pack = £6.75. Label: 25

Dose prophylaxis of angina, 1 tablet in the morning (half a tablet for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets

Monomil XL® (IVAX)

Tablets, m/r, isosorbide mononitrate 60 mg, net price 28-tab pack = £4.50. Label: 25

Dose prophylaxis of angina, 1 tablet daily in the morning (half a tablet daily for first 2–4 days to minimise possibility of headache), increased if necessary to 2 tablets once daily
Monogen XL 60 © (Neolab)  
Zemon 60XL tablets, m/r, t/c, isosorbide mononitrate 60 mg, net price 28-tab pack = £11.14. Label: 25
Zemon 40XL tablets, m/r, t/c, isosorbide mononitrate 40 mg, net price 28-tab pack = £14.25. Label: 25

2.6.2 Calcium-channel blockers

Calcium-channel blockers (less correctly called ‘calcium-antagonists’) interfere with the inward displacement of calcium ions through the slow channels of active cell membranes. They influence the myocardial cells, the cells within the specialised conducting system of the heart, and the cells of vascular smooth muscle. Thus, myocardial contractility may be reduced, the formation and propagation of electrical impulses within the heart may be depressed, and coronary or systemic vascular tone may be diminished.

Calcium-channel blockers differ in their predilection for the various possible sites of action and, therefore, their therapeutic effects are disparate, with much greater variation than those of beta-blockers. There are important differences between verapamil, diltiazem, and the dihydropyridine calcium-channel blockers (amlodipine, felodipine, isradipine, lacidipine, nicardipine, nifedipine, and nimodipine). Verapamil and diltiazem should usually be avoided in heart failure because they may further depress cardiac function and cause clinically significant deterioration.

Verapamil is used for the treatment of angina (section 2.6), hypertension (section 2.5), and arrhythmias (section 2.3.2). It is a highly negatively inotropic calcium channel-blocker and it reduces cardiac output, slows the heart rate, and may impair atrioventricular conduction. It may precipitate heart failure, exacerbate conduction disorders, and cause hypotension at high doses and should not be used with beta-blockers (see p. 118). Constipation is the most common side-effect.

Nifedipine relaxes vascular smooth muscle and dilates coronary and peripheral arteries. It has more influence on vessels and less on the myocardium than does verapamil, and unlike verapamil has no anti-arrhythmic activity. It rarely precipitates heart failure because any negative inotropic effect is offset by a reduction in left ventricular work. Short-acting formulations of nifedipine are not recommended for angina or long-term management of hypertension; their use may be associated with large variations in blood pressure and reflex tachycardia. Nicardipine has similar effects to those of nifedipine and may produce less reduction of myocardial contractility. Amlodipine and felodipine also resemble nifedipine and nicardipine in their effects and do not reduce myocardial contractility and they do not produce clinical deterioration in heart failure. They have a longer duration of action and can be given once daily. Nifedipine, nicardipine, amlodipine, and felodipine are used for the treatment of angina (section 2.6) or hypertension. All are valuable in forms of angina associated with coronary vasospasm. Side-effects associated with vasodilatation such as flushing and headache (which become less obtrusive after a few days), and ankle swelling (which may respond only partially to diuretics) are common.

Isradipine, lacidipine, and lercanidipine have similar effects to those of nifedipine and nicardipidine; they are indicated for hypertension only.

Nimodipine is related to nifedipine but the smooth muscle relaxant effect preferentially acts on cerebral arteries. Its use is confined to prevention and treatment of vascular spasm following aneurysmal subarachnoid haemorrhage.

Diltiazem is effective in most forms of angina (section 2.6); the longer-acting formulation is also used for hypertension. It may be used in patients for whom beta-blockers are contra-indicated or ineffective. It has a less negative inotropic effect than verapamil and significant myocardial depression occurs rarely. Nevertheless because of the risk of bradycardia it should be used with caution in association with beta-blockers.

Unstable angina Calcium-channel blockers do not reduce the risk of myocardial infarction in unstable angina. The use of diltiazem or verapamil should be reserved for patients resistant to treatment with beta-blockers.

Withdrawal There is some evidence that sudden withdrawal of calcium-channel blockers may be associated with an exacerbation of angina.

AMLODIPINE

Indications hypertension, prophylaxis of angina
Cautions hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (calcium-channel blockers)

Contra-indications cardiogenic shock, unstable angina, significant aortic stenosis: acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects abdominal pain, nausea; palpitation, flushing, oedema; headache, dizziness, sleep disturbances, fatigue; less commonly gastrointestinal disturbances, dry mouth, taste disturbances, hypotension, syncope, chest pain, dyspnoea, rhinitis, mood changes, asthenia, tremor, paraesthesia, urinary disturbances, impotence, gynaecomastia, weight changes, myalgia, muscle cramps, back pain, arthralgia, visual disturbances, tinnitus, purpura, and skin discoloration; very rarely gastritis, pancreatitis, hepatitis, jaundice, cholestasis, gingival hyperplasia, myocardial infarction, arrhythmias, tachycardia, vasculitis, coughing, peripheral neuropathy, hyperglycaemia, thrombocytopenia, angioedema, and urticaria
Diltiazem hydrochloride

**Indications**
Prophylaxis and treatment of angina; hypertension

**Cautions**
Reduce dose in hepatic and renal impairment; heart failure or significantly impaired left ventricular function, bradycardia (avoid if severe), first degree AV block, or prolonged PR interval, interactions: Appendix 1 (calcium-channel blockers)

**Contra-indications**
Severe bradycardia, left ventricular failure with pulmonary congestion, third-degree AV block (unless pacemaker fitted), sick sinus syndrome; acute porphyria (but see section 9.8.2); pregnancy; breast-feeding (Appendix 5)

**Side-effects**
Bradycardia, sino-atrial block, AV block, palpitation, dizziness, hypotension, malaise, asthenia, headache, hot flushes, gastro-intestinal disturbances, oedema (notably of ankles); rarely rashes (including erythema multiforme and exfoliative dermatitis), photosensitivity; hepatitis, gynaecomastia, gum hyperplasia, extrapyramidal symptoms, depression reported

**Dose**
- Angina, 60 mg 3 times daily (elderly initially twice daily); increased if necessary to 360 mg daily
- Longer-acting formulations, see under preparations below

**Standard formulations**
- Tablets, m/r (see note above), diltiazem hydrochloride 60 mg, net price 84 = £3.34. Label: 25
- Brains include: Optil

**Diltiazem**

**Indications**
- Angina, initially 90 mg twice daily (elderly, dose form not appropriate for initial dose titration); increased to 120 mg or 180 mg twice daily (dose form not appropriate for initial dose titration), increased if necessary to 300 mg once daily in elderly and in hepatic or renal impairment, initially 120 mg daily
- Angina, initially 90 mg twice daily; increased if necessary to 240 mg once daily
- Angina, initially 90 mg twice daily (elderly, dose form not appropriate for initial dose titration), increased if necessary to 180 mg twice daily if required

**Longer-acting formulations**
- Note Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of diltiazem, prescribers should specify the brand to be dispensed

**Adizem®**

**Capsules**
- Capsules, m/r, diltiazem hydrochloride 90 mg (white), net price 56-cap pack = £7.86; 120 mg (brown), 56-cap pack = £8.73; 180 mg (brown), 56-cap pack = £9.66. Label: 25

**Calcicard®**

**Tablets**
- Tablets, m/r, diltiazem hydrochloride 90 mg, net price 56-tab pack = £6.33; 120 mg, 56-tab pack = £7.04. Label: 25

**Dicardia®**

**Capsules**
- Capsules, m/r, diltiazem hydrochloride 60 mg (pink/white), net price 56-cap pack = £8.31; 90 mg (pink/yellow), 56-cap pack = £10.33; 120 mg (pink/orange), 56-cap pack = £11.49. Label: 25

**Diltiazem SR®**

**Capsules**
- Capsules, m/r, diltiazem hydrochloride 120 mg (pink/blue), net price 28-cap pack = £9.66; 180 mg (dark pink/blue), 28-cap pack = £10.96; 200 mg (brown), 28-cap pack = £6.66; 240 mg (red/blue), 28-cap pack = £12.17; 300 mg (maroon/blue), 28-cap pack = £9.66. Label: 25
Dilzem SR® (Cephalon) *(NH)*  
**Capsules**, m/r, all beige, diltiazem hydrochloride 60 mg, net price 56-cap pack = £6.40; 90 mg, 56-cap pack = £9.59; 120 mg, 56-cap pack = £10.95. Label: 25  
**Dose** angina and mild to moderate hypertension, initially 90 mg twice daily (elderly 60 mg twice daily); up to 180 mg twice daily may be required

Dilzem XL® (Cephalon) *(NH)*  
**Capsules**, m/r, diltiazem hydrochloride 120 mg, net price 28-cap pack = £6.61; 180 mg, 28-cap pack = £9.81; 240 mg, 28-cap pack = £11.70. Label: 25  
**Dose** angina and mild to moderate hypertension, initially 180 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily); if necessary may be increased to 360 mg once daily

Sllozem® (Merck) *(NH)*  
**Capsules**, m/r, diltiazem hydrochloride 120 mg (pink/clear), net price 28-cap pack = £7.00; 180 mg (pink/clear), 28-cap pack = £7.80; 240 mg (red/clear), 28-cap pack = £8.20; 300 mg (red/white), 28-cap pack = £8.50. Label: 25  
**Dose** angina and mild to moderate hypertension, initially 240 mg once daily (elderly and in hepatic and renal impairment, 120 mg once daily); if necessary may be increased to 360 mg once daily

Tildiem LA® (Sanofi-Synthelabo) *(NH)*  
**Capsules**, m/r, diltiazem hydrochloride 200 mg (pink/grey, containing white pellets), net price 28-cap pack = £6.66; 300 mg (white/yellow, containing white pellets), 28-cap pack = £7.51. Label: 25  
**Dose** angina and mild to moderate hypertension, initially 200 mg once daily before or with food, increased if necessary to 300–400 mg daily, max. 500 mg daily; **ELDERLY** and in hepatic or renal impairment, initially 200 mg daily, increased if necessary to 300 mg daily

Tildiem Retard® (Sanofi-Synthelabo) *(NH)*  
**Tablets**, m/r, diltiazem hydrochloride 90 mg, net price 56-tab pack = £8.55; 120 mg, 56-tab pack = £9.53. Label: 25  
**Counselling** Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy  
**Dose** mild to moderate hypertension, initially 90 mg or 120 mg twice daily; increased if necessary to 360 mg daily in divided doses; **ELDERLY** in hepatic or renal impairment, initially 120 mg once daily; increased if necessary to 10 mg once daily

Viazem XL® (Genus) *(NH)*  
**Capsules**, m/r, diltiazem hydrochloride 120 mg (lavender), net price 28-cap pack = £6.60; 180 mg (white/blue-green), 28-cap pack = £7.36; 240 mg (blue-green/lavender), 28-cap pack = £7.74; 300 mg (white/lavender), 28-cap pack = £8.03; 360 mg (blue-green), 28-cap pack = £14.70. Label: 25  
**Dose** angina and mild to moderate hypertension, initially 180 mg once daily; adjusted according to response to 240 mg once daily; max. 360 mg once daily; **ELDERLY** in hepatic or renal impairment, initially 120 mg once daily, adjusted according to response

Zemtard® (Galen) *(NH)*  
**Zemtard 300XL capsules**, m/r, white/blue, diltiazem hydrochloride 300 mg, net price 28-cap pack = £7.45. Label: 25  
**Dose** angina and mild to moderate hypertension, 180–300 mg once daily, increased if necessary to 360 mg once daily in hypertension and to 480 mg once daily in angina; **ELDERLY** and in hepatic or renal impairment, initially 120 mg once daily

### FELODIPINE

**Indications** hypertension, prophylaxis of angina  
**Cautions** withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment or if cardiogenic shock develops; severe left ventricular dysfunction; avoid grapefruit juice (may affect metabolism); reduce dose in hepatic impairment; breast-feeding (Appendix 5); **interactions**: Appendix 1 (calcium-channel blockers)  
**Contra-indications** unstable angina, uncontrolled heart failure; significant aortic stenosis; within 1 month of myocardial infarction; acute porphyria (section 9.8.2); pregnancy (Appendix 4)  
**Side-effects** flushing, headache, palpitation, dizziness, fatigue, gravitational oedema; rarely rash, pruritus, cutaneous vasculitis, gum hyperplasia, urinary frequency, impotence, fever  
**Dose**  
- Hypertension, initially 5 mg (elderly 2.5 mg) daily in the morning; usual maintenance 5–10 mg once daily; doses above 20 mg daily rarely needed  
- Angina, initially 5 mg daily in the morning, increased if necessary to 10 mg once daily

**Felodipine** (Non-proprietary) *(NH)*  
**Tablets**, m/r, felodipine 2.5 mg, net price 28-tab pack = £6.70; 5 mg, 28-tab pack = £8.93; 10 mg, 28-tab pack = £12.01, 30-tab pack = £12.87. Label: 25  
**Brands include** Cardioplén XL, Feloten XL, Keloc SR, Neofel XL, Parmid XL, Vasalupa  
**Plendil®** (AstraZeneca) *(NH)*  
**Tablets**, m/r, f/c, felodipine 2.5 mg (yellow), net price 28-tab pack = £6.70; 5 mg (pink), 28-tab pack = £4.47; 10 mg (brown), 28-tab pack = £6.01. Label: 25

### ISRADIPINE

**Indications** hypertension  
**Cautions** sick sinus syndrome (if pacemaker not fitted); avoid grapefruit juice (may affect metabolism); poor cardiac reserve; reduce dose in hepatic or renal impairment; pregnancy (Appendix 4); **interactions**: Appendix 1 (calcium-channel blockers)  
**Contra-indications** cardiogenic shock; symptoms of or mild left ventricular dysfunction; avoid grapefruit juice (may affect metabolism); reduce dose in hepatic impairment; breast-feeding (Appendix 5)  
**Side-effects** abdominal discomfort; tachycardia, palpitation, flushing, peripheral oedema; dyspnoea; headache, fatigue, dizziness; polyuria; rash; less commonly, hypotension, weight gain; very rarely vomiting, nausea, gum hyperplasia, anorexia, drowsiness, arthralgia, bradycardia, heart failure, cough, depression, paraesthesia, anxiety, erectile dysfunction, blood disorders (such as thrombocytopenia, leucopenia, anaemia), arthralgia, visual disturbance, hypersensitivity reactions; hepatitis and gynaecomastia also reported
Dose
- 2.5 mg twice daily, increased if necessary after 3–4 weeks to 5 mg twice daily (exceptionally up to 10 mg twice daily); **ELDERLY** (or in hepatic or renal impairment) 1.25 mg twice daily, increased if necessary after 3–4 weeks according to response, maintenance dose of 2.5 mg or 5 mg once daily may be sufficient

Prescal® (Novartis) [FAM]  
Tablets, yellow, scored, isradipine 2.5 mg, net price 56-tab pack = £16.54

**LACIDIPINE**

**Indications**  hypertension

**Cautions**  cardiac conduction abnormalities; poor cardiac reserve; avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications**  cardiacogenic shock, unstable angina, aortic stenosis; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**  flushing, palpitation, oedema; headache, dizziness; rarely gastro-intestinal disturbances, gum hyperplasia, aggravation of angina, mood disturbances, asthenia, polyuria, muscle cramps, skin rash (including pruritus and erythema)

**Dose**  
- Initially 2 mg as a single daily dose, preferably in the morning; increased after 3–4 weeks to 4 mg daily, then if necessary to 6 mg daily

Motens® (Boehringer Ingelheim) [FAM]  
Tablets, both f/c, lacidipine 2 mg, net price 28-tab pack = £9.92; 4 mg (scored), 28-tab pack = £13.48

**LERCANIDIPINE HYDROCHLORIDE**

**Indications**  mild to moderate hypertension

**Cautions**  left ventricular dysfunction; sick sinus syndrome (if pacemaker not fitted); avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications**  aortic stenosis; unstable angina, uncontrolled heart failure; within 1 month of myocardial infarction; renal impairment; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**  flushing, peripheral oedema, palpitation, tachycardia, headache, dizziness, asthenia, also gastro-intestinal disturbances, hypotension, drowsiness, myalgia, polyuria, rash

**Dose**  
- Initially 10 mg once daily; increased, if necessary, after at least 2 weeks to 20 mg daily

Zanidip® (Recordati) [FAM]  
Tablets, f/c, lercanidipine hydrochloride 10 mg (yellow), net price 28-tab pack = £5.80; 20 mg (pink), 28-tab pack = £11.00. Label: 22

**NICARDIPINE HYDROCHLORIDE**

**Indications**  prophylaxis of angina; mild to moderate hypertension

**Cautions**  withdraw if ischaemic pain occurs or existing pain worsens within 30 minutes of initiating treatment or increasing dose; congestive heart failure or significantly impaired left ventricular function; elderly; avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications**  cardiogenic shock; advanced aortic stenosis; unstable or acute attacks of angina; avoid within 1 month of myocardial infarction; acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

**Side-effects**  dizziness, headache, peripheral oedema, flushing, palpitation, nausea; also gastro-intestinal disturbances, drowsiness, insomnia, tinnitus, hypertension, rash, dyspnoea, paraesthesia, frequency of micturition; thrombocytopenia, depression and impotence reported

**Dose**  
- Initially 20 mg 3 times daily, increased, after at least three days, to 30 mg 3 times daily (usual range 60–120 mg daily)

Nicardipine (Non-proprietary) [FAM]  
Capsules, nicardipine hydrochloride 20 mg, net price 56-cap pack = £3.09; 30 mg, 56-cap pack = £4.93

Cardene® (Astellas) [FAM]  
Capsules, nicardipine hydrochloride 20 mg (blue/white), net price 56-cap pack = £8.57; 30 mg (blue/pale blue), 56-cap pack = £9.95

**Modified release**

Cardene SR® (Astellas) [FAM]  
Capsules, m/r, nicardipine hydrochloride 30 mg, net price 56-cap pack = £10.21; 45 mg (blue), 56-cap pack = £14.86. Label: 25  
**Dose**  mild to moderate hypertension, initially 30 mg twice daily; usual effective dose 45 mg twice daily (range 30–60 mg twice daily)

**NIFEDIPINE**

**Indications**  prophylaxis of angina; hypertension; Raynaud’s phenomenon

**Cautions**  see notes above; also withdraw if ischaemic pain occurs or existing pain worsens shortly after initiating treatment; poor cardiac reserve; heart failure or significantly impaired left ventricular function (heart failure deterioration observed); severe hypotension; elderly; diabetes mellitus; hepatic impairment (Appendix 2); may inhibit labour; pregnancy (Appendix 4); breast-feeding (Appendix 5); avoid grapefruit juice (may affect metabolism); **interactions:** Appendix 1 (calcium-channel blockers)

**Contra-indications**  cardiogenic shock; advanced aortic stenosis; within 1 month of myocardial infarction; unstable or acute attacks of angina; acute porphyria (section 9.8.2)

**Side-effects**  gastro-intestinal disturbance; hypotension, oedema, vasodilatation, palpitation; headache, dizziness, lethargy, asthenia; rare anorexia, gum hyperplasia, mood disturbances, hyperglycaemia, male infertility, purpura, and photosensitivity reactions; also reported

**Dose**  
- Initially 30 mg twice daily; increased to 60 mg, then further increased if necessary

Cardene SR® (Astellas) [FAM]  
Capsules, nicardipine hydrochloride 30 mg, net price 56-cap pack = £3.09; 30 mg, 56-cap pack = £4.93
dysphagia, intestinal obstruction, intestinal ulcer, bezoar formation (with some modified-release preparations), gynaecomastia, agranulocytosis, and anaphylaxis

**Dose**

- See preparations below

**Nifedipine** (Non-proprietary)  
**Capsules**, nifedipine 5 mg, net price 84-cap pack = £2.84; 10 mg, 84-cap pack = £3.94  
**Dose** angina prophylaxis (but not recommended, see notes above) and Raynaud's phenomenon, initially 5 mg 3 times daily, adjusted according to response to 20 mg 3 times daily  
**Hypertension**, not recommended therefore no dose stated

**Adalat** (Bayer)  
**Capsules**, orange, nifedipine 5 mg, net price 90-cap pack = £6.08; 10 mg, 90-cap pack = £7.74  
**Dose** angina prophylaxis (but not recommended, see notes above) and Raynaud's phenomenon, initially 5 mg 3 times daily, adjusted according to response to max. 20 mg 3 times daily  
**Hypertension**, not recommended therefore no dose stated

**Modified release**

**Note** Different versions of modified-release preparations may not have the same clinical effect. To avoid confusion between these different formulations of nifedipine, prescribers should specify the brand to be dispensed. Modified-release formulations may not be suitable for dose titration in hepatic disease

**Adalat Retard** (Bayer)  
**LA 20 tablets**, m/r, t/c, pink, nifedipine 20 mg, net price 28-tab pack = £5.27. Label: 25  
**LA 30 tablets**, m/r, t/c, pink, nifedipine 30 mg, net price 28-tab pack = £7.59. Label: 25  
**LA 60 tablets**, m/r, t/c, pink, nifedipine 60 mg, net price 28-tab pack = £9.69. Label: 25  
**Counselling** Tablet membrane may pass through gastro-intestinal tract unchanged, but being porous has no effect on efficacy  
**Dose** hypertension, 20–30 mg once daily, increased if necessary to max. 90 mg once daily  
**Angina** prophylaxis, 30 mg once daily, increased if necessary to max. 90 mg once daily  
**Cautions** dose form not appropriate for use in hepatic impairment or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease (including Crohn’s disease)

**Adalat Retard 10 tablets**  
**Retard 20 tablets**, m/r, t/c, pink-grey, nifedipine 20 mg, net price 56-tab pack = £8.50. Label: 25  
**Dose** hypertension and angina prophylaxis, 10 mg twice daily, adjusted according to response to 40 mg twice daily

**Adipine MR** (Trinity-Chiesi)  
**Tablets**, m/r, nifedipine 10 mg (apricot), net price 56-tab pack = £5.96; 20 mg (pink), 56-tab pack = £7.43. Label: 21, 25  
**Dose** hypertension and angina prophylaxis, 10 mg twice daily, after food (initial titration 10 mg twice daily), max. 40 mg twice daily

**Adipine XL** (Trinity-Chiesi)  
**Tablets**, m/r, red, nifedipine 30 mg, net price 28-tab pack = £5.89; 60 mg, 28-tab pack = £8.84. Label: 25  
**Dose** hypertension and angina prophylaxis, 30 mg once daily, increased if necessary, max. 90 mg once daily

**Coracten SR** (UCB Pharma)  
**Capsules**, m/r, nifedipine 10 mg (grey/pink, enclosing yellow pellets), net price 60-cap pack = £4.70;  
20 mg (pink/brown, enclosing yellow pellets), 60-cap pack = £6.52. Label: 25  
**Dose** hypertension and angina prophylaxis, initially 10 mg twice daily, increased if necessary to max. 40 mg twice daily

**Coracten XL** (UCB Pharma)  
**Capsules**, m/r, nifedipine 30 mg (brown), net price 28-cap pack = £5.89; 60 mg (orange), 28-cap pack = £8.84. Label: 25  
**Dose** hypertension and angina prophylaxis, 30 mg once daily, increased if necessary; max. 90 mg once daily

**Fortipine LA 40** (Goldshield)  
**Tablets**, m/r, red, nifedipine 40 mg, net price 30-tab pack = £9.60. Label: 21, 25  
**Dose** hypertension and angina prophylaxis, 40 mg once daily, increased if necessary to 80 mg daily in 1–2 divided doses

**Hypolar Retard 20** (Sandoz)  
**Tablets**, m/r, red, t/c, nifedipine 20 mg, net price 56-tab pack = £5.75. Label: 25  
**Dose** hypertension and angina prophylaxis, 20 mg twice daily, increased if necessary to 40 mg twice daily

**Nifedipress MR** (Dexcel)  
**Tablets**, m/r, pink, nifedipine 10 mg, net price 56-tab pack = £9.23; 20 mg, 56-tab pack = £10.06. Label: 25  
**Dose** hypertension and angina prophylaxis, initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

**Tensipine MR** (Genus)  
**Tablets**, m/r, pink-grey, nifedipine 10 mg, net price 56-tab pack = £4.30; 20 mg, 56-tab pack = £5.49. Label: 21, 25  
**Dose** hypertension and angina prophylaxis, initially 10 mg twice daily, adjusted according to response to 40 mg twice daily

**Valni XL** (Winthrop)  
**Tablets**, m/r, red, nifedipine 30 mg, net price 28-tab pack = £9.89; 60 mg, 28-tab pack = £14.71. Label: 25  
**Dose** severe hypertension and prophylaxis of angina, 30 mg once daily, increased if necessary to max. 90 mg once daily  
**Cautions** dose form not appropriate for use in hepatic impairment, or where there is a history of oesophageal or gastro-intestinal obstruction, decreased lumen diameter of the gastro-intestinal tract, or inflammatory bowel disease, or ileostomy after proctocolectomy

**With atenolol**  
Section 2.4

**NIMODIPINE**

**Indications** prevention and treatment of ischaemic neurological deficits following aneurysmal subarachnoid haemorrhage

**Cautions** cerebral oedema or severely raised intracranial pressure; hypotension; avoid concomitant administration of nimodipine tablets and infusion, other calcium-channel blockers, or beta-blockers; concomitant nephrotoxic drugs; avoid grapefruit juice (may affect metabolism); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (calcium-channel blockers, alcohol (infusion only))

**Contra-indications** within 1 month of myocardial infarction; unstable angina; acute porphyria (section 9.8.2)

**Side-effects** hypotension, variation in heart-rate, flushing, headache, gastro-intestinal disorders, nausea, sweating and feeling of warmth; thrombocyto-penia and ileus reported
Dose

- Prevention, by mouth, 60 mg every 4 hours, starting within 4 days of aneurysmal subarachnoid haemorrhage and continued for 21 days
- Treatment, by intravenous infusion via central catheter, initially 1 mg/hour (up to 500 micrograms/hour if body-weight less than 70 kg or if blood pressure unstable), increased after 2 hours to 2 mg/hour if no severe fall in blood pressure; continue for at least 5 days (max. 14 days); if surgical intervention during treatment, continue for at least 5 days after surgery; max. total duration of nimodipine use 21 days

Nimotop® (Bayer) Tablets, yellow, f/c, nimodipine 30 mg, net price 100-tab pack = £38.85
Intravenous injection, nimodipine 200 micrograms/mL; also contains ethanol 20% and macrogol ‘400’ 17%, net price 50-mL vial (with polyethylene infusion catheter) = £13.24
Note Polyethylene, propylene, or glass apparatus should be used. PVC should be avoided

VERAPAMIL HYDROCHLORIDE

Indications see under Dose and preparations

Cautions first-degree AV block; acute phase of myocardial infarction (avoid if bradycardia, hypertension, left ventricular failure); patients taking beta-blockers (important: see below); hepatic impairment (Appendix 2); children, specialist advice only (section 3.2.2); pregnancy (Appendix 4) and breast-feeding (Appendix 5); avoid grapefruit juice (may affect metabolism); interactions: Appendix 1 (calcium-channel blockers)

Verapamil and beta-blockers Verapamil injection should not be given to patients recently treated with beta-blockers because of the risk of hypotension and asystole. The suggestion that when verapamil injection has been given first, an interval of 30 minutes before giving a beta-blocker is sufficient has not been confirmed.

It may also be hazardous to give verapamil and a beta-blocker together by mouth (should only be contemplated if myocardial function well preserved).

Contra-indications hypotension, bradycardia, second- and third-degree AV block, sick sinus syndrome, cardiogenic shock, sino-atrial block; history of heart failure or significantly impaired left ventricular function, even if controlled by therapy; atrial flutter or fibrillation complicating syndromes associated with accessory conducting pathways (e.g. Wolff-Parkinson-White syndrome); acute porphyria (section 9.8.2)

Side-effects constipation; less commonly nausea, vomiting, flushing, headache, dizziness, fatigue, ankle oedema; rarely allergic reactions (erythema, pruritus, urticaria, angioedema, Stevens-Johnson syndrome); malagia, arthralgia, paraesthesia, erythromelalgia; increased prolactin concentration; rarely gynaecomastia and gingival hyperplasia after long-term treatment; after intravenous administration or high doses, hypotension, heart failure, bradycardia, heart block, and asystole

Dose

- By mouth, supraventricular arrhythmias (but see also Contra-indications), 40–120 mg 3 times daily
- By slow intravenous injection over 2 minutes (3 minutes in elderly), supraventricular arrhythmias (but see also Contra-indications), 5–10 mg (preferably with ECG monitoring); in paroxysmal tachyarrhythmias a further 5 mg after 5–10 minutes if required

Verapamil (Non-proprietary) Tablets, coated, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.54; 80 mg, 84-tab pack = £1.68; 120 mg, 28-tab pack = £1.41; 160 mg, 56-tab pack = £20.23
Oral solution, verapamil hydrochloride 40 mg/5 mL, net price 150 mL = £36.90
Brands include Zolivera

Cordilox® (Dexcel) Tablets, yellow, f/c, verapamil hydrochloride 40 mg, net price 84-tab pack = £1.50; 80 mg, 84-tab pack = £2.05; 120 mg, 28-tab pack = £1.15; 160 mg, 56-tab pack = £2.80
Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.11

Securon® (Abbott) Injection, verapamil hydrochloride 2.5 mg/mL, net price 2-mL amp = £1.08

Modified release

Half Securon MR® (Abbott) Tablets, m/r, f/c, verapamil hydrochloride 120 mg, net price 28-tab pack = £7.50. Label: 25
Dose see Securon SR

Securon SR® (Abbott) Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £6.29. Label: 25
Dose hypertension, 240 mg daily (new patients initially 120 mg), increased if necessary to max. 480 mg daily (doses above 240 mg daily as 2 divided doses)
Angina, 240 mg twice daily (may sometimes be reduced to once daily)
Prophyaxis after myocardial infarction where beta-blockers not appropriate (started at least 1 week after infarction), 360 mg daily in divided doses, given as 240 mg in the morning and 120 mg in the evening or 120 mg 3 times daily

Univer® (Cephalon) Capsules, m/r, verapamil hydrochloride 120 mg (yellow/dark blue), net price 28-cap pack = £7.51; 180 mg (yellow), 56-cap pack = £18.15; 240 mg (yellow/dark blue), 28-cap pack = £12.24. Label: 25
Dose hypertension, 240 mg daily, max. 480 mg daily (new patients, initial dose 120 mg), angina, 360 mg daily, max. 480 mg daily

Verapress MR® (Dexcel) Tablets, m/r, pale green, f/c, verapamil hydrochloride 240 mg, net price 28-tab pack = £9.90. Label: 25
Dose hypertension, 1 tablet daily, increased to twice daily if necessary; angina, 1 tablet twice daily (may sometimes be reduced to once daily)
Note Also available as Cordilox® MR

Vertab® SR 240 (Trinity-Chiesi) Tablets, m/r, pale green, f/c, scored, verapamil hydrochloride 240 mg, net price 28-tab pack = £8.63. Label: 25
Dose mild to moderate hypertension, 240 mg daily, increased to twice daily if necessary, angina, 240 mg twice daily (may sometimes be reduced to once daily)
### 2.6.3 Other antianginal drugs

**Nicorandil**, a potassium-channel activator with a nitrate component, has both arterial and venous vasodilating properties and is licensed for the prevention and long-term treatment of angina (section 2.6). Nicorandil has similar efficacy to other antianginal drugs in controlling symptoms; it may produce additional symptomatic benefit in combination with other antianginal drugs [unlicensed indication].

Ivabradine lowers the heart rate by its action on the sinus node. It is licensed for the treatment of angina in patients in normal sinus rhythm when beta-blockers are contra-indicated or not tolerated.

### IVABRADINE

**Indications** treatment of angina in patients in normal sinus rhythm (see notes above)

**Cautions** mild heart failure including asymptomatic left ventricular dysfunction; monitor for atrial fibrillation or other arrhythmias (treatment ineffective); hypotension (avoid if severe); retinitis pigmentosa; elderly; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (ivabradine)

**Contra-indications** severe bradycardia (not to be initiated if heart rate below 60 beats per minute); cardiogenic shock; acute myocardial infarction; immediately after cerebrovascular accident; sick-sinus syndrome; sino-atrial block; moderate to severe left ventricular dysfunction; monitor for atrial fibrillation (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** bradycardia, first-degree heart block, ventricular extrasystoles; headache, dizziness; visual disturbances includingophthalmis and blurred vision; less commonly nausea, constipation, diarrhoea, palpitations, supraventricular extrasystoles, dyspnoea, vertigo, muscle cramps, eosinophilia, hyperuricaemia, and raised plasma-creatinine concentration

**Dose**
- Initially 5 mg twice daily, increased if necessary after 3–4 weeks to 7.5 mg twice daily (if not tolerated reduce dose to 2.5–5 mg twice daily); **ELDERLY** initially 2.5 mg twice daily
- Note Ventricular rate at rest should not be allowed to fall below 50 beats per minute

**Procoralan®** (Servier) Tablets, pink, 1/2, 1, 2 mg, ivabradine (as hydrochloride) 5 mg (scored), net price 56-tab pack = £39.00; 7.5 mg, 56-tab pack = £39.00

### NICORANDIL

**Indications** prophylaxis and treatment of angina

**Cautions** hypovolaemia; low systolic blood pressure; acute pulmonary oedema; acute myocardial infarction with acute left ventricular failure and low filling pressures; pregnancy (Appendix 4); interactions: Appendix 1 (nicorandil)

**Driving** Patients should be warned not to drive or operate machinery until it is established that their performance is unimpaired

**Contra-indications** cardiogenic shock; left ventricular failure with low filling pressures; hypotension; breast-feeding

**Side-effects** headache (especially on initiation, usually transitory); cutaneous vasodilatation with flushing; nausea, vomiting, dizziness, weakness also reported; rarely oral ulceration, myalgia, and rash; at high dosage, reduction in blood pressure and/or increase in heart rate; angioedema, hepatic dysfunction, and anal ulceration also reported

**Dose**
- Initially 10 mg twice daily (if susceptible to headache 5 mg twice daily); usual dose 10–20 mg twice daily; up to 30 mg twice daily may be used

**Ikorel®** (Rhône-Poulenc Rorer) Tablets, scored, nicorandil 10 mg, net price 60-tab pack = £8.18; 20 mg, 60-tab pack = £15.54

### 2.6.4 Peripheral vasodilators and related drugs

Peripheral vascular disease can be either occlusive (e.g. intermittent claudication) where occlusion of the peripheral arteries is caused by atherosclerosis, or vasospastic (e.g. Raynaud’s syndrome).

Peripheral arterial occlusive disease is associated with an increased risk of cardiovascular events; this risk is reduced by measures such as smoking cessation (section 4.10), effective control of blood pressure (section 2.5), regulating blood lipids (section 2.12), optimising glycaemic control in diabetes (section 6.1), taking aspirin in a dose of 75 mg daily (section 2.9), and possibly weight reduction in obesity (section 4.5). Exercise training, treatment with cilostazol or naftidrofuryl (see below), and possibly statin therapy can improve symptoms of intermittent claudication.

Cilostazol is licensed for use in intermittent claudication to improve walking distance in patients without peripheral tissue necrosis who do not have pain at rest. Patients receiving cilostazol should be assessed for improvement after 3 months. The **Scottish Medicines Consortium** has advised (October 2005) that cilostazol is not recommended for the treatment of intermittent claudication.

Naftidrofuryl can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl should be assessed for improvement after 3–6 months.

Inositol nicotinate, pentoxifylline (oxpentifylline), and cinnarizine are not established as being effective for the treatment of intermittent claudication.

**Naftidrofuryl** can alleviate symptoms of intermittent claudication and improve pain-free walking distance in moderate disease. Patients taking naftidrofuryl should be assessed for improvement after 3–6 months.

Inositol nicotinate, pentoxifylline (oxpentifylline), and cinnarizine are not established as being effective for the treatment of intermittent claudication.

**Management of Raynaud’s syndrome** includes avoidance of exposure to cold and stopping smoking. More severe symptoms may require vasodilator treatment, which is most often successful in primary Raynaud’s syndrome.

Nifedipine (section 2.6.2) is useful for reducing the frequency and severity of vasospastic attacks. Alternatively, naftidrofuryl may produce symptomatic improvement; inositol nicotinate (a nicotinic acid derivative) may also be considered. Cinnarizine, pentoxifylline, prazosin, and moxisylyte (thymoxamine) are not established as being effective for the treatment of Raynaud’s syndrome.

Vasodilator therapy is not established as being effective for chilblains (section 13.13).
## Cardiovascular system

### CILOSTAZOL

**Indications** intermittent claudication in patients without rest pain and no peripheral tissue necrosis

**Cautions** atrial or ventricular ectopy, atrial fibrillation, atrial flutter, diabetes mellitus (higher risk of intravascular bleeding); concomitant drugs that increase risk of bleeding; hepatic impairment (Appendix 2); **interactions**: Appendix 1 (cilostazol)

**Contra-indications** predisposition to bleeding (e.g. active peptic ulcer, haemorrhagic stroke in previous 6 months, surgery in previous 3 months, proliferative diabetic retinopathy, poorly controlled hypertension); history of ventricular tachycardia, of ventricular fibrillation and of multifocal ventricular ectopics, prolongation of QT interval, congestive heart failure; renal impairment (avoid if creatinine clearance less than 25 mL/minute); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances; tachycardia, palpitation, angina, arrhythmia, chest pain, oedema; rhinitis; dizziness; headache; rash, pruritus, ecchymosis; less commonly gastro-intestinal disturbances. Effects include headache, flushing, rashes, mild gastro-intestinal disturbances, dizziness, headache, pruritus, ecchymosis; side-effects include rash, pruritus, flushing, rashes, mild gastrointestinal disturbances.

**Dose**
- 100 mg twice daily (30 minutes before or 2 hours after food)

**Pletal** (Otsuka) Tablets, cilostazol 50 mg, net price 56-tab pack = £35.31; 100 mg, 56-tab pack = £35.31

### INOSITOL NICOTINATE

**Indications** peripheral vascular disease; hyperlipidemia (section 2.12)

**Cautions** cerebrovascular insufficiency, unstable angina

**Contra-indications** recent myocardial infarction, acute phase of a cerebrovascular accident; pregnancy (Appendix 4)

**Side-effects** nausea, vomiting, hypotension, flushing, syncpe, oedema, headache, dizziness, paraesthesia, rash

**Dose**
- 3 g daily in 2–3 divided doses; max. 4 g daily

**Hexoplal** (Genus) Tablets, scored, inositol nicotinate 500 mg, net price 20 = £4.10

**Tablets forte** scored, inositol nicotinate 750 mg, net price 112-tab pack = £34.02

### MOXISYLYTE

(Thymoxamine)

**Indications** primary Raynaud’s syndrome (short-term treatment)

**Cautions** diabetes mellitus

**Contra-indications** active liver disease; pregnancy (Appendix 4)

**Side-effects** nausea, diarrhoea, flushing, headache, dizziness; hepatic reactions including cholestatic jaundice and hepatitis reported to CSM

**Dose**
- Initially 40 mg 4 times daily, increased to 80 mg 4 times daily if poor initial response; discontinue after 2 weeks if no response

**Opilon** (Concord) Tablets, yellow, t/c, moxisylyte 40 mg (as hydrochloride), net price 112-tab pack = £79.98. Label: 21

### NAFTIDROFURYL OXALATE

**Indications** see under Dose

**Side-effects** nausea, epigastric pain, rash, hepatitis, hepatic failure

**Dose**
- Peripheral vascular disease (see notes above), 100–200 mg 3 times daily
- Cerebral vascular disease, 100 mg 3 times daily

**Naftidrofuryl** (Non-proprietary)

**Capsules** naftidrofuryl oxalate 100 mg, net price 84-cap pack = £5.57. Label: 25, 27

**Praxilene** (Merck) Capsules, pink, naftidrofuryl oxalate 100 mg, net price 84-cap pack = £8.60. Label: 25, 27

### PENTOXIFYLLINE

(Oxpentifylline)

**Indications** peripheral vascular disease; venous leg ulcers [unlicensed indication] (Appendix A8.2.5)

**Cautions** hypotension, coronary artery disease; renal impairment (Appendix 3), severe hepatic impairment; avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (pentoxifylline)

**Contra-indications** cerebral haemorrhage, extensive retinal haemorrhage, acute myocardial infarction; pregnancy and breast-feeding

**Side-effects** gastro-intestinal disturbances, dizziness, agitation, sleep disturbances, headache; rarely flushing, tachycardia, angina, hypotension, thrombocytopenia, intrahepatic cholestasis, hypersensitivity reactions including rash, pruritus and bronchospasm

**Dose**
- 400 mg 2–3 times daily

**Trental** (Aventis Pharma) Tablets, m/r, pink, s/c, pentoxifylline 400 mg, net price 90-tab pack = £20.48. Label: 21, 25

### Other preparations used in peripheral vascular disease

Rutosides (oxerutins, Paroven®) are not vasodilators and are not generally regarded as effective preparations as capillary sealants or for the treatment of cramps; side-effects include headache, flushing, rashes, mild gastrointestinal disturbances.
Shock

Shock is a medical emergency associated with a profound hypotension of shock must be corrected. The underlying causes of shock such as haemorrhage, sepsis, or myocardial insufficiency should be corrected. The profound hypotension of shock must be treated promptly to prevent tissue hypoxia and organ failure. Volume replacement is essential to correct the hypovolaemia associated with haemorrhage and sepsis but may be detrimental in cardiogenic shock. Depending on haemodynamic status, cardiac output may be improved by the use of sympathomimetic inotropes such as adrenaline (epinephrine), dobutamine or dopamine (see notes above). In septic shock, when fluid replacement and inotropic support fail to maintain blood pressure, the vasoconstrictor noradrenaline (norepinephrine) (section 2.7.2) may be considered. In cardiogenic shock peripheral resistance is frequently high and to raise it further may worsen myocardial performance and exacerbate tissue ischaemia.

The use of sympathomimetic inotropes and vasoconstrictors should preferably be confined to the intensive care setting and undertaken with invasive haemodynamic monitoring.

For advice on the management of anaphylactic shock, see section 3.4.3.

2.7 Sympathomimetics

2.7.1 Inotropic sympathomimetics

The cardiac stimulants dobutamine and dopamine act on beta receptors in cardiac muscle, and increase contractility with little effect on rate.

Dopamine (epinephrine) (section 2.7.1) acts on both alpha and beta receptors and increases both heart rate and contractility (beta effects); it can cause peripheral vasodilation (a beta effect) or vasoconstriction (an alpha effect).

Dopexamine (non-proprietary) (Novartis Consumer Health) Strong sterile solution, dopamine hydrochloride 12.5 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL amp = £5.20

Indications cardionic shock in infarction or cardiac surgery

Cautions correct hypovolaemia; low dose in shock due to acute myocardial infarction—see notes above; hyperthyroidism; pregnancy (Appendix 4); interactions: Appendix 1 (sympathomimetics)

Contra-indications tachyarrhythmia, phaeochromocytoma

Side-effects nausea and vomiting, peripheral vasoconstriction, hypotension, hypertension, tachycardia

Dose

- By intravenous infusion, 2.5–10 micrograms/kg/minute, adjusted according to response

Dobutamine (non-proprietary) (Novartis Consumer Health) Strong sterile solution, dobutamine (as hydrochloride) 12.5 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL amp = £5.20

Indications inotropic support in infarction, cardiac surgery, cardiomyopathies, septic shock, and cardiogenic shock

Cautions pregnancy; interactions: Appendix 1 (sympathomimetics)

Side-effects tachycardia and marked increase in systolic blood pressure indicate overdosage; phlebitis; rarely thrombocytopenia

Dose

- By intravenous infusion, 2.5–10 micrograms/kg/minute, adjusted according to response

Dopamine hydrochloride

Indications cardionic shock in infarction or cardiac surgery

Cautions correct hypovolaemia; low dose in shock due to acute myocardial infarction—see notes above; hyperthyroidism; pregnancy (Appendix 4); interactions: Appendix 1 (sympathomimetics)

Contra-indications tachyarrhythmia, phaeochromocytoma

Side-effects nausea and vomiting, peripheral vasoconstriction, hypotension, hypertension, tachycardia

Dose

- By intravenous infusion, 2–5 micrograms/kg/minute initially (see notes above)

Dopamine (non-proprietary) (Novartis Consumer Health) Strong sterile solution, dopamine hydrochloride 40 mg/mL. Net price 5-mL amp = £3.88; 160 mg/mL, 5-mL amp = £14.75. For dilution and use as an intravenous infusion

Intravenous infusion, dopamine hydrochloride 1.6 mg/mL in glucose 5% intravenous infusion, net price 250-mL container (400 mg) = £11.69; 3.2 mg/mL, 250-mL container (800 mg) = £22.93 (both hosp. only)

Select-A-Jet® Dopamine (UCB Pharma) Strong sterile solution, dopamine hydrochloride 40 mg/mL. Net price 5-mL vial = £5.01; 10-mL vial = £8.05. For dilution and use as an intravenous infusion

Dopamine hydrochloride

Indications inotropic support and vasodilator in exacerbations of chronic heart failure and in heart failure associated with cardiac surgery

Cautions myocardial infarction, recent angina, hypokalaemia, hyperglycaemia; correct hypovolaemia before starting and during treatment, monitor blood pressure, pulse, plasma potassium, and blood glucose; avoid abrupt withdrawal; pregnancy; interactions: Appendix 1 (sympathomimetics)

Contra-indications left ventricular outlet obstruction such as hypertrophic cardiomyopathy or aortic stenosis; phaeochromocytoma, thrombocytopenia

Side-effects nausea, vomiting; tachycardia, bradycardia, arrhythmias, angina, myocardial infarction; tremor, headache; dyspnoea; reversible thrombocytopenia; sweating
2.7.2 Vasoconstrictor sympathomimetics

Vasoconstrictor sympathomimetics raise blood pressure transiently by acting on alpha-adrenergic receptors to constrict peripheral vessels. They are sometimes used as an emergency method of elevating blood pressure where other measures have failed (see also section 2.7.1).

The danger of vasoconstrictors is that although they raise blood pressure they also reduce perfusion of vital organs such as the kidney. Spinal and epidural anaesthesia may result in sympathetic block with resultant hypotension. Management may include intravenous fluids (which are usually given prophylactically), oxygen (section 3.6), elevation of the legs, and injection of a pressor drug such as ephedrine. As well as constricting peripheral vessels ephedrine also accelerates the heart rate (by acting on beta receptors). Use is made of this dual action of ephedrine to manage associated bradycardia (although intravenous injection of atropine sulphate 400 to 600 micrograms may also be required if bradycardia persists).

### Ephedrine Hydrochloride

**Indications** see under Dose

**Cautions** hyperthyroidism, diabetes mellitus, ischaemic heart disease, hypertension, susceptibility to angle-closure glaucoma, elderly, pregnancy (Appendix 4); may cause acute urine retention in Laennec’s cirrhosis

**Contra-indications** hypertensive response

**Dose**
- By intravenous infusion, 15–100 mg, adjusted according to response
- In emergency, by intravenous injection, 0.5–5 mg then by intravenous infusion, 15–100 mg, adjusted according to response

**Note** Contact with metal in infusion apparatus should be minimised

**Metaraminol**

**Indications** acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

**Cautions** see under Noradrenaline Acid Tartrate; longer duration of action than noradrenaline (norepinephrine), see below; cirrhosis; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Hypertensive response** Metaraminol has a longer duration of action than noradrenaline, and an excessive vasopressor response may cause a prolonged rise in blood pressure

**Contra-indications** see under Noradrenaline Acid Tartrate

**Side-effects** see under Noradrenaline Acid Tartrate; tachycardia; fatal ventricular arrhythmia reported in Laennec’s cirrhosis

**Dose**
- By intravenous infusion, 1–100 mg, adjusted according to response
- In emergency, by intravenous injection, 0.5–5 mg then by intravenous infusion, 12–120 mg, adjusted according to response

**Note** Strong sterile solution

**Contact with metal in infusion apparatus should be minimised

**Norepinephrine Bitartrate**

**Indications** see under dose

**Cautions** coronary, mesenteric, or peripheral vascular thrombosis; following myocardial infarction, Prinzmetal’s variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypervolaemia; elderly; extravasation at injection site may cause necrosis; interactions: Appendix 1 (sympathomimetics)

**Contra-indications** hypertension (monitor blood pressure and rate of flow frequently); pregnancy (Appendix 4)

**Side-effects** hypertension, headache, bradycardia, arrhythmias, peripheral ischaemia

**Dose**
- Acute hypotension, by intravenous infusion, via central venous catheter, of a solution containing noradrenaline acid tartrate 80 micrograms/mL (equivalent to noradrenaline base 40 micrograms/mL) at an initial rate of 0.16–0.33 mL/minute, adjusted according to response
- Cardiac arrest, by rapid intravenous or intracardiac injection, 0.5–0.75 mL of a solution containing noradrenaline acid tartrate 200 micrograms/mL (equivalent to noradrenaline base 100 micrograms/mL)

**Noradrenaline/Norepinephrine**

**Indications** see under dose

**Cautions** coronary, mesenteric, or peripheral vascular thrombosis; following myocardial infarction, Prinzmetal’s variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypervolaemia; elderly; extravasation at injection site may cause necrosis; interactions: Appendix 1 (sympathomimetics)

**Contra-indications** hypertension (monitor blood pressure and rate of flow frequently); pregnancy (Appendix 4)

**Side-effects** hypertension, headache, bradycardia, arrhythmias, peripheral ischaemia

**Dose**
- Acute hypotension, by intravenous infusion, via central venous catheter, of a solution containing noradrenaline acid tartrate 80 micrograms/mL (equivalent to noradrenaline base 40 micrograms/mL) at an initial rate of 0.16–0.33 mL/minute, adjusted according to response
- Cardiac arrest, by rapid intravenous or intracardiac injection, 0.5–0.75 mL of a solution containing noradrenaline acid tartrate 200 micrograms/mL (equivalent to noradrenaline base 100 micrograms/mL)

**Noradrenaline/Norepinephrine**

**Indications** see under dose

**Cautions** coronary, mesenteric, or peripheral vascular thrombosis; following myocardial infarction, Prinzmetal’s variant angina, hyperthyroidism, diabetes mellitus; hypoxia or hypercapnia; uncorrected hypervolaemia; elderly; extravasation at injection site may cause necrosis; interactions: Appendix 1 (sympathomimetics)

**Contra-indications** hypertension (monitor blood pressure and rate of flow frequently); pregnancy (Appendix 4)

**Side-effects** hypertension, headache, bradycardia, arrhythmias, peripheral ischaemia

**Dose**
- Acute hypotension, by intravenous infusion, via central venous catheter, of a solution containing noradrenaline acid tartrate 80 micrograms/mL (equivalent to noradrenaline base 40 micrograms/mL) at an initial rate of 0.16–0.33 mL/minute, adjusted according to response
- Cardiac arrest, by rapid intravenous or intracardiac injection, 0.5–0.75 mL of a solution containing noradrenaline acid tartrate 200 micrograms/mL (equivalent to noradrenaline base 100 micrograms/mL)
**Phenylephrine Hydrochloride**

**Indications** acute hypotension (see notes above); priapism (section 7.4.5) [unlicensed indication]

**Cautions** see under Noradrenaline Acid Tartrate; longer duration of action than noradrenaline (norepinephrine), see below; coronary disease

**Side-effects** see under Noradrenaline Acid Tartrate; tachycardia or reflex bradycardia

**Dose**
- By subcutaneous or intramuscular injection, 2–5 mg, followed if necessary by further doses of 1–10 mg
- By slow intravenous injection of a 1 mg/mL solution, 100–500 micrograms repeated as necessary after at least 15 minutes
- By intravenous infusion, initial rate up to 180 micrograms/minute reduced to 30–60 micrograms/minute according to response

**Phenylephrine** (Sovereign) Injection, phenylephrine hydrochloride 10 mg/mL (1%), net price 1-mL amp = £5.50

---

**Cardiopulmonary resuscitation**

The algorithm for cardiopulmonary resuscitation (see inside back cover) reflects the most recent recommendations of the Resuscitation Council (UK). These guidelines are available at www.resus.org.uk. Cardiac arrest can be associated with ventricular fibrillation, pulseless ventricular tachycardia, asystole, and electromechanical dissociation (pulseless electrical activity). **Adrenaline** (epinephrine) in 10 000 (100 micrograms/mL) is recommended in a dose of 1 mg (10 mL) by intravenous injection repeated every 3–5 minutes if necessary. Administration through a central line is preferred, however if adrenaline is injected through a peripheral line, it must be flushed with at least 20 mL Sodium Chloride 0.9% injection to aid entry into the central circulation. Intravenous injection of amiodarone 300 mg or 5 mg/kg (from a prefilled syringe or diluted in 20 mL Glucose 5%) should be considered after adrenaline to treat ventricular fibrillation or pulseless ventricular tachycardia in cardiac arrest refractory to defibrillation. An additional dose of amiodarone 150 mg (or 2.5 mg/kg) can be given by intravenous injection if necessary, followed by an intravenous infusion of amiodarone 900 mg over 24 hours.

**Lidocaine**, in a dose of 1 mg/kg, is an alternative if amiodarone is not available; a total dose of 3 mg/kg should not be exceeded during the first hour. **Atropine** 3 mg by intravenous injection (section 15.1.3) as a single dose is also used in non-shockable cardiopulmonary resuscitation to block vagal activity. During cardiopulmonary arrest if intravenous access cannot be obtained, the intraosseous route can be considered; if circulatory access cannot be obtained at all, the endotracheal route can be considered for some drugs.

**Heparin** initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or ‘unfractionated heparin’ to distinguish it from the low molecular weight heparins (see p. 125), which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.

---

**Adrenaline/Epinephrine** 1 in 10 000, Dilute (Non-proprietary) Injection, adrenaline (as acid tartrate) 100 micrograms/mL. 10-mL amp. Brands include Minijet Adrenaline

---

**2.8 Anticoagulants and protamine**

**2.8.1 Parenteral anticoagulants**

**2.8.2 Oral anticoagulants**

**2.8.3 Protamine sulphate**

The main use of anticoagulants is to prevent thrombus formation or extension of an existing thrombus in the slower-moving venous side of the circulation, where the thrombus consists of a fibrin web enmeshed with platelets and red cells. They are therefore widely used in the prevention and treatment of deep-vein thrombosis in the legs.

Anticoagulants are of less use in preventing thrombus formation in arteries, for in faster-flowing vessels thrombi are composed mainly of platelets with little fibrin. They are used to prevent thrombi forming on prosthetic heart valves.

---

**Heparin**

Heparin initiates anticoagulation rapidly but has a short duration of action. It is often referred to as ‘standard’ or ‘unfractionated heparin’ to distinguish it from the low molecular weight heparins (see p. 125), which have a longer duration of action. Although a low molecular weight heparin is generally preferred for routine use, heparin can be used in those at high risk of bleeding because its effect can be terminated rapidly by stopping the infusion.
Treatment
For the initial treatment of deep-vein thrombosis and pulmonary embolism a low molecular weight heparin is used; alternatively, heparin is given as an intravenous loading dose, followed by continuous intravenous infusion (using an infusion pump) or by intermittent subcutaneous injection. Intermittent intravenous injection of heparin is no longer recommended. An oral anticoagulant (usually warfarin, section 2.8.2) is started at the same time as the heparin (the heparin needs to be continued for at least 5 days and until the INR has been in the therapeutic range for 2 consecutive days). Laboratory monitoring, preferably on a daily basis, is essential; determination of the activated partial thromboplastin time (APTT) is the most widely used measure. A low molecular weight heparin or, in some circumstances, heparin is also used in regimens for the management of myocardial infarction (section 2.10.1) and unstable angina (section 2.6).

Thrombosis and pulmonary embolism
Thrombosis and pulmonary embolism (section 2.6.2) is the most widely used measure. A low molecular weight heparin or, in some circumstances, heparin is also used in regimens for the management of myocardial infarction (section 2.10.1) and unstable angina (section 2.6).

Prophylaxis
In patients undergoing general surgery, a low molecular weight heparin is effective for the prevention of postoperative deep-vein thrombosis and pulmonary embolism in 'high-risk' patients (i.e. those with obesity, malignant disease, history of deep-vein thrombosis or pulmonary embolism, patients over 40 years, or those with an established thrombophilic disorder or who are undergoing major or complicated surgery). Subcutaneous injection of low-dose heparin is an alternative; this regimen does not require laboratory monitoring.

To combat the increased risk in major orthopaedic surgery an adjusted dose regimen of heparin (with monitoring), low molecular weight heparin (p. 125) or fondaparinux (p. 128) can be used—a low molecular weight heparin is probably more effective.

Pregnancy
Heparins are used for the management of venous thromboembolism in pregnancy because they do not cross the placenta. Low molecular weight heparins are preferred because they have a lower risk of osteoporosis and of heparin-induced thrombocytopenia. Low molecular weight heparins are eliminated more rapidly in pregnancy, requiring alteration of the dosage regimen for drugs such as dalteparin, enoxaparin, and tinzaparin. Treatment should be stopped at the onset of labour and advice sought from a specialist on continuing therapy after birth.

Extracorporeal circuits
Heparin is also used in the maintenance of extracorporeal circuits in cardiopulmonary bypass and haemodialysis.

Haemorrhage
If haemorrhage occurs it is usually sufficient to withdraw heparin, but if rapid reversal of the effects of heparin is required, protamine sulphate (section 2.8.3) is a specific antidote (but only partially reverses the effects of low molecular weight heparins).

HEPARIN
Indications see under Dose
Cautions see notes above; also elderly; concomitant use of drugs that increase risk of bleeding; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); Interactions: Appendix 1 (heparin).

Heparin-induced thrombocytopenia
Clinically important heparin-induced thrombocytopenia is immune-mediated and does not usually develop until after 5–10 days; it can be complicated by thrombosis. Platelet counts should be measured just before treatment with heparin or low molecular weight heparins, and regular monitoring of platelet counts is recommended if given for longer than 4 days. Signs of heparin-induced thrombocytopenia include a 50% reduction of platelet count, thrombosis, or skin allergy. If heparin-induced thrombocytopenia is strongly suspected or confirmed, heparin should be stopped and an alternative anticoagulant, such as lepirudin or danaparoid, should be given. Ensure platelet counts return to normal range in those who require warfarin.

Contra-indications
Haemorrhagic disorders, thrombocytopenia (including history of heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension; severe liver disease (including oesophageal varices), peptic ulcer; after major trauma or recent surgery to eye or nervous system; acute bacterial endocarditis; spinal or epidural anaesthesia with treatment doses of heparin; hypersensitivity to heparin or to low molecular weight heparins.

Side-effects
Haemorrhage (see notes above), thrombocytopenia (see Cautions), rarely rebound hyperlipidaemia following heparin withdrawal, priapism, hyperkalaemia (see Cautions), osteoporosis (risk lower with low molecular weight heparins), alopecia on prolonged use, injection-site reactions, skin necrosis, and hypersensitivity reactions (including urticaria, angioedema, and anaphylaxis).

Dose
- Treatment of deep-vein thrombosis, pulmonary embolism, unstable angina, and acute peripheral arterial occlusion, by intravenous injection, loading dose 5000–10 000 units, followed by 10 000 units in severe pulmonary embolism), followed by continuous intravenous infusion of 18 units/kg/hour or treatment of deep-vein thrombosis, by subcutaneous injection of 15 000 units every 12 hours (laboratory monitoring essential—preferably on a daily basis, and dose adjusted accordingly): CHILD under 18 years see BNF for Children.
- Prophylaxis in orthopaedic surgery, see notes above.
- Prophylaxis in general and gynaecological surgery (see notes above), by subcutaneous injection, 5000 units 2 hours before surgery, then every 8–12 hours for 7–10 days or until patient is ambulant (monitoring not needed); during pregnancy (with monitoring), 5000–10 000 units every 12 hours (important: prevention of prosthetic heart-valve thrombosis in pregnancy calls for specialist management).
- Haemodialysis by intravenous injection initially 1000–5000 units, followed by continuous intravenous infusion of 250–1000 units/hour.
- Myocardial infarction, see notes above.
- Prevention of clotting in extracorporeal circuits, consult product literature.

Doses above reflect the guidelines of the British Society for Haematology, for doses of the low molecular weight heparins, see p. 125.
**Heparin** (Non-proprietary) *(Ph)*

**Injection**, heparin sodium 1000 units/mL, net price 1-mL amp = £37p, 5-mL amp = £93p, 5-mL vial = £92p, 10-mL amp = £1.60, 20-mL amp = £2.63; 5000 units/mL, 1-mL amp = £72p, 5-mL amp = £1.87, 5-mL vial = £2.09; 25 000 units/mL, 1-mL amp = £1.90, 5-mL vial = £3.68

*Excipients* include benzyl alcohol (avoid in neonates, see *Excipients*, p 2)

---

**Low molecular weight heparins**

Low molecular weight heparins (bemiparin, dalteparin, enoxaparin, and tinzaparin) are usually preferred over unfractionated heparin in the *prevention* of venous thromboembolism because they are as effective and they have a lower risk of heparin-induced thrombocytopenia. Also, the standard prophylactic regimen does not require monitoring. In orthopaedic practice low molecular weight heparins are probably more effective than unfractionated heparin; fondaparinux (p. 128) can also be used. The duration of action of low molecular weight heparins is longer than that of unfractionated heparin; *once-daily subcutaneous* dosage means that they are convenient to use.

Low molecular weight heparins are also used in the *treatment* of deep-vein thrombosis, pulmonary embolism, myocardial infarction (section 2.10.1), unstable coronary artery disease (section 2.6) and for the prevention of clotting in extracorporeal circuits.

Routine monitoring of anti-Factor Xa activity is not usually required during treatment with low molecular weight heparins, but may be necessary in patients at increased risk of bleeding (e.g. in renal impairment and those who are underweight or overweight).

**Injection** *(single-dose syringe)*, dalteparin sodium 12 500 units/mL, net price 2500-unit (0.2-mL) syringe = £1.86; 25 000 units/mL, 5000-unit (0.2-mL) syringe = £2.82, 7500-unit (0.3-mL) syringe = £4.23, 10 000-unit (0.4-mL) syringe = £5.65, 12 500-unit (0.5-mL) syringe = £7.06, 15 000-unit (0.6-mL) syringe = £8.47, 18 000-unit (0.72-mL) syringe = £10.16

**Dose** prophylaxis of deep-vein thrombosis, in surgical patients, *by subcutaneous injection*, moderate risk, 2500 units 1–2 hours before surgery then 2500 units every 24 hours for 5–7 days or longer; high risk, 2500 units 1–2 hours before surgery, then 2500 units 8–12 hours later (or 5000 units on the evening before surgery, then 5000 units on the following evening), then 5000 units every 24 hours for 5–7 days or longer (3 weeks in hip replacement)

**Dose** prophylaxis of deep-vein thrombosis in medical patients, *by subcutaneous injection*, 5000 units every 24 hours

**Dose** Treatment of deep-vein thrombosis and of pulmonary embolism, *by subcutaneous injection*, as a single daily dose, ADULT body-weight under 46 kg, 7500 units daily; body-weight 46–56 kg, 10000 units daily; body-weight 57–68 kg, 12 500 units daily; body-weight 69–82 kg, 15 000 units daily; body-weight 83 kg and over, 18 000 units daily, with oral anticoagulant treatment until prothrombin complex concentration in therapeutic range (usually for at least 5 days); monitoring of anti-Factor Xa not usually required; for patients at increased risk of haemorrhage, see below

**Dose** Treatment of venous thromboembolism in pregnancy [unlicensed indication], *by subcutaneous injection*, early pregnancy body-weight under 50 kg, 5000 units twice daily; body-weight 50–70 kg, 6000 units twice daily; body-weight 70–90 kg, 8000 units twice daily; body-weight over 90 kg, 10 000 units twice daily

**Injection**, dalteparin sodium 2500 units/mL *(for subcutaneous or intravenous use)*, net price 4-mL *(10 000-unit)* amp = £5.12; 10 000 units/mL *(for subcutaneous or intravenous use)*, 1-mL *(10 000-unit)* amp = £5.12; 25 000 units/mL *(for subcutaneous use only)*, 4-mL *(100 000-unit)* vial = £48.66

**Dose** treatment of deep-vein thrombosis and of pulmonary embolism, *by subcutaneous injection*, 200 units/kg (max. 18 000 units) as a single daily dose (or 100 units/kg twice daily if increased risk of haemorrhage) with oral anticoagulant treatment until prothrombin complex concentration in therapeutic range (usually for at least 5 days)

**Note** For monitoring, blood should be taken 3–4 hours after a dose (recommended plasma concentration of anti-Factor Xa 0.5–
ENOXAPARIN SODIUM

Indications see notes above and under preparations

Caution see under Heparin and notes above; low body-weight (increased risk of bleeding)

Contra-indications see under Heparin; breast-feeding

(Appendix 5)

Side-effects see under Heparin

Dose

See under preparation below

Clexane® (Rhoˆne-Poulenc Rorer) [R]

Injection, enoxaparin sodium 100 mg/mL, net price 20-mg (0.2-mL, 2000-units) syringe = £3.15, 40-mg (0.4-mL, 4000-units) syringe = £4.20, 60-mg (0.6-mL, 6000-units) syringe = £4.75, 80-mg (0.8-mL, 8000-units) syringe = £5.40, 100-mg (1-mL, 10 000-units) syringe = £6.69; 300 mg (3-mL, 30 000-units) vial (Clexane® Multidose) = £22.20; 150 mg/mL (Clexane® Forte), 120-mg (0.8-mL, 12 000-units) syringe = £9.77, 150-mg (1-mL, 15 000-units) syringe = £11.10

Dose prophylaxis of deep-vein thrombosis especially in surgical patients, by subcutaneous injection, moderate risk, 20 mg (2000 units) approx 2 hours before surgery then 20 mg (2000 units) every 24 hours for 7–10 days, high risk (e.g. orthopaedic surgery), 40 mg (4000 units) 12 hours before surgery then 40 mg (4000 units) every 24 hours for 7–10 days

Prophylaxis of deep-vein thrombosis in medical patients, by subcutaneous injection, 40 mg (4000 units) every 24 hours for at least 6 days and continued until patient ambulant (max. 14 days)

Treatment of deep-vein thrombosis or pulmonary embolism, by subcutaneous injection, 1.5 mg/kg (150 units/kg) every 24 hours, usually for at least 5 days (and until adequate oral anticoagulation established)

Unstable angina and non-ST-segment-elevation myocardial infarction, by subcutaneous injection, 1 mg/kg (100 units/kg) every 12 hours usually for 2–8 days (minimum 2 days)

Prevention of clotting in extracorporeal circuits, consult product literature

Treatment of venous thromboembolism in pregnancy (unlicensed indication), by subcutaneous injection, early pregnancy body-weight under 30 kg, 40 mg (4000 units) twice daily; body-weight 50–70 kg, 60 mg (6000 units) twice daily; body-weight 70–90 kg, 80 mg (8000 units) twice daily; body-weight over 90 kg, 100 mg (10 000 units) twice daily

Heparinoids

Danaparoid is a heparinoid used for prophylaxis of deep-vein thrombosis in patients undergoing general or orthopaedic surgery. Providing there is no evidence of cross-reactivity, it also has a role in patients who develop thrombocytopenia in association with heparin.

DANAPAROID SODIUM

Indications prevention of deep-vein thrombosis in general or orthopaedic surgery; thromboembolic disease in patients with history of heparin-induced thrombocytopenia

Caution recent bleeding or risk of bleeding; concomitant use of drugs that increase risk of bleeding; antibodies to heparins (risk of antibody-induced thrombocytopenia); body-weight over 90 kg (monitor anti factor Xa activity); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications haemophilia and other haemorrhagic disorders, thrombocytopenia (unless patient has heparin-induced thrombocytopenia), recent cerebral haemorrhage, severe hypertension, active peptic ulcer (unless this is the reason for operation), diabetic retinopathy, acute bacterial endocarditis, spinal or epidural anaesthesia with treatment doses of danaparoid

Side-effects bleeding; hypersensitivity reactions (including rash)

Dose

See under preparations below

Innohep® (LEO) [R]

Injection, tinzaparin sodium 10 000 units/mL, net price 2500-unit (0.25-mL) syringe = £1.98, 3500-unit (0.35-mL) syringe = £2.77, 4500-unit (0.45-mL) syringe = £3.56, 20 000-unit (2-mL) vial = £10.56

Dose prophylaxis of deep-vein thrombosis, by subcutaneous injection, general surgery, 3500 units 2 hours before surgery, then 3500 units every 24 hours for 7–10 days; orthopaedic surgery, 50 units/kg 2 hours before surgery, then 50 units/kg every 24 hours for 7–10 days or 4500 units 12 hours before surgery, then 4500 units every 24 hours for 7–10 days

Prevention of clotting in extracorporeal circuits, consult product literature

Injection, tinzaparin sodium 20 000 units/mL, net price 0.5-mL (10 000-unit) syringe = £8.98, 0.7-mL (14 000-unit) syringe = £12.57, 0.9-mL (18 000-unit) syringe = £16.16, 2-mL (40 000-unit) vial = £34.20

Dose treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, 175 units/kg once daily for at least 6 days (and until adequate oral anticoagulation established)

Treatment of venous thromboembolism in pregnancy (unlicensed indication), by subcutaneous injection, 175 units/kg once daily

Note Treatment regimens do not require anticoagulation monitoring

Asthma Presence of sulphites in formulation may (especially in patients with asthma) lead to hypersensitivity (with broncho-spasm and shock)
injection, 2500 units (1250 units if body-weight under 55 kg, 3750 units if over 90 kg), followed by intravenous infusion of 400 units/hour for 2 hours, then 300 units/hour for 2 hours, then 200 units/hour for 5 days

Orgaran® (Organon) \[\text{INN}\]
Injection, danaparoid sodium 1250 units/mL, net price 0.6-mL amp (750 units) = £29.80

Hirudins

Lepirudin, a recombinant hirudin, is licensed for anticoagulation in patients with Type II (immune) heparin-induced thrombocytopenia who require parenteral anti-thrombotic treatment. The dose of lepirudin is adjusted according to activated partial thromboplastin time (APTT). Bivalirudin, a hirudin analogue, is a thrombin inhibitor which is licensed as an anticoagulant for patients undergoing percutaneous coronary intervention. The Scottish Medicines Consortium has advised (November 2008) that bivalirudin is accepted for restricted use for patients with acute coronary syndromes planned for urgent or early intervention who would have been considered for treatment with unfractionated heparin combined with a glycoprotein IIb/IIIa inhibitor; it should not be used alone.

BIVALIRUDIN

Indications anticoagulation for patients undergoing percutaneous coronary intervention

Cautions exposure to lepirudin (theoretical risk from lepirudin antibodies); brachytherapy procedures; concomitant use of drugs that increase risk of bleeding; renal impairment (avoid if creatinine clearance less than 30 mL/minute); Appendix 3); pregnancy and breast-feeding (Appendix 5)

Contra-indications severe hypertension; subacute thrombocytopenia, anaemia, back and chest pain, and injection-site reactions; very rarely thrombosis

Side-effects bleeding (discontinue); less commonly nausea, vomiting, tachycardia, bradycardia, hypotension, angina, dyspnoea, allergic reactions (including isolated reports of anaphylaxis), headache, thrombocytopenia, anaemia, back and chest pain, and injection-site reactions; very rarely thrombosis

Dose
- Initially by slow intravenous injection, 750 micrograms/kg body-weight or with heparin; haemorrhagic diathesis; dose titration for pulmonary hypertension should be increased by at least once daily thereafter

Contra-indications pregnancy and breast-feeding

Side-effects bleeding; reduced haemoglobin concentration without obvious source of bleeding; fever; hypersensitivity reactions (including rash); injection-site reactions

Heparin flushes

The use of heparin flushes should be kept to a minimum. For maintaining patency of peripheral venous catheters, sodium chloride injection 0.9% is as effective as heparin flushes. The role of heparin flushes in maintaining patency of arterial and central venous catheters is unclear.

Heparin Sodium (Non-proprietary) \[\text{INN}\]
Solution, heparin sodium 10 units/mL, net price 5-mL amp = 25p; 100 units/mL, 2-mL amp = 28p

Dose to maintain patency of catheters, cannulas, etc. 10–200 units flushed through every 4–8 hours. Not for therapeutic use

Excipients may include benzyl alcohol (avoid in neonates, see Excipients, p. 2)

Canusal® (CP) \[\text{INN}\]
Solution, heparin sodium 100 units/mL. Net price 2-mL amp = 57p

Dose to maintain patency of catheters, cannulas, etc., 200 units flushed through every 4 hours or as required. Not for therapeutic use

Hepsal® (CP) \[\text{INN}\]
Solution, heparin sodium 10 units/mL. Net price 5-mL amp = 54p

Dose to maintain patency of catheters, cannulas, etc., 50 units flushed through every 4 hours or as required. Not for therapeutic use

Epoprostenol

Epoprostenol (prostacyclin) can be given to inhibit platelet aggregation during renal dialysis either alone or with heparin. It is also licensed for the treatment of primary pulmonary hypertension resistant to other treatment, usually with oral anticoagulation. Since its half-life is only about 3 minutes it must be given by continuous intravenous infusion. It is a potent vasodilator and therefore its side-effects include flushing, headache, and hypotension.

LEPIRUDIN

Indications thromboembolic disease requiring parenteral anticoagulation in patients with heparin-induced thrombocytopenia type II

Caution hepatic impairment (Appendix 2); renal impairment (Appendix 3); recent bleeding or risk of bleeding including recent puncture of large vessels, organ biopsy, recent major surgery, stroke, bleeding disorders, severe hypertension, bacterial endocarditis; concomitant use of drugs that increase risk of bleeding; determine activated partial thromboplastin time 4 hours after start of treatment (or after infusion rate altered) and at least once daily thereafter

Side-effects bleeding; reduced haemoglobin concentration without obvious source of bleeding; fever; hypersensitivity reactions (including rash); injection-site reactions

Dose
- Initially by slow intravenous injection (of 5 mg/mL solution), 400 micrograms/kg followed by continuous intravenous infusion of 150 micrograms/kg/hour (max. 16.5 mg/hour), adjusted according to activated partial thromboplastin time, for 2–10 days (longer if necessary)

Refudan® (Cellgene) \[\text{INN}\]
Injection, powder for reconstitution, lepirudin, net price 50-mg vial = £57.00

EPROPROSTENOL

Indications see notes above

Cautions anticoagulant monitoring required when given with heparin; haemorrhagic diathesis; dose titration for pulmonary hypertension should be in hospital (risk of pulmonary oedema); concomitant use of drugs that increase risk of bleeding; pregnancy (Appendix 4)
Contra-indications severe left ventricular dysfunction
Side-effects see notes above; also bradycardia, tachycardia, pallor, sweating with higher doses; gastrointestinal disturbances; lassitude, anxiety, agitation; dry mouth, jaw pain, chest pain; also reported, hyperglycaemia and injection-site reactions

Dose
• See product literature

Fionaparin
Fondaparinux sodium is a synthetic pentasaccharide that inhibits activated factor X.

FONDAPARINUX SODIUM

Indications prophylaxis of venous thromboembolism in medical patients immobilised because of acute illness, and patients undergoing major orthopaedic surgery of the legs or abdominal surgery; treatment of deep-vein thrombosis and of pulmonary embolism; treatment of unstable angina or non-ST-segment elevation myocardial infarction; treatment of ST-segment elevation myocardial infarction

Cautions bleeding disorders, active gastrointestinal ulcer disease; recent intracranial haemorrhage; brain, spinal, or ophthalmic surgery; spinal or epidural anaesthesia (risk of spinal haematoma—avoid if using treatment doses); risk of catheter thrombus during percutaneous coronary intervention; low body weight; elderly patients; concomitant use of drugs that increase risk of bleeding; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications active bleeding; bacterial endocarditis

Side-effects bleeding, purpura, anaemia; less commonly gastro-intestinal disturbances, oedema, hepatic impairment, chest pain, dyspnoea, thrombocytopenia, thrombocytopenia, rash, pruritus; rarely hypotension, flushing, cough, vertigo, dizziness, anxiety, drowsiness, confusion, headache, hypokalaemia, hyperbilirubinaemia, injection-site reactions; also reported atrial fibrillation, tachycardia, and pyrexia

Dose
• See under preparation below

Arixtra® (GSK) ↓ FM
Injection, fondaparinux sodium 5 mg/mL, net price 0.3-mL (1.5-mg) prefilled syringe = £6.67
Dose prophylaxis of venous thromboembolism after surgery, by subcutaneous injection, 2.5 mg once daily after surgery then 2.5 mg once daily for 5–9 days (longer after hip surgery), CHILD under 17 years not recommended
Prophylaxis of venous thromboembolism in medical patients, by subcutaneous injection, 2.5 mg once daily for 8 days (or until hospital discharge if sooner), CHILD under 17 years not recommended
ST-segment elevation myocardial infarction, initially by intravenous injection or infusion, 2.5 mg for first day, thereafter by subcutaneous injection 2.5 mg once daily for up to 8 days (or until hospital discharge if sooner), CHILD under 17 years not recommended
Injection, fondaparinux sodium 12.5 mg/mL, net price 0.4-mL (5-mg) prefilled syringe = £12.37, 0.6-mL (7.5-mg) prefilled syringe = £12.37, 0.8-mL (10-mg) prefilled syringe = £12.37
Dose treatment of deep-vein thrombosis and of pulmonary embolism, by subcutaneous injection, ADULT body-weight under 50 kg, 5 mg every 24 hours; body-weight 50–100 kg, 7.5 mg every 24 hours; body-weight over 100 kg, 10 mg every 24 hours; usually for at least 5 days (and until adequate oral anticoagulation established), CHILD under 17 years not recommended

2.8.2 Oral anticoagulants

Coumarins and phenindione

The oral anticoagulants, warfarin, acenocoumarol (nicoumalone) and phenindione, antagonise the effects of vitamin K, and take at least 48 to 72 hours for the anticoagulant effect to develop fully; if an immediate effect is required, heparin must be given concomitantly.

Uses The main indication for these oral anticoagulants is deep-vein thrombosis. Patients with pulmonary embolism should also be treated, as should those with atrial fibrillation who are at risk of embolisation (see also section 2.3.1), and those with mechanical prosthetic heart valves (to prevent emboli developing on the valves); an anti-platelet drug may also be useful in these patients but this combination increases the risk of bleeding.

Warfarin is the drug of choice; acenocoumarol (nicoumalone) and phenindione are seldom required.

These oral anticoagulants should not be used in cerebral artery thrombosis or peripheral artery occlusion as first-line therapy; aspirin (section 2.9) is more appropriate for reduction of risk in transient ischaemic attacks. Heparin or a low molecular weight heparin (section 2.8.1) is usually preferred for the prophylaxis of venous thromboembolism in patients undergoing surgery; alternatively, warfarin can be continued in selected patients currently taking long-term warfarin and who are at high risk of thromboembolism (seek expert advice).

Dose Whenever possible, the base-line prothrombin time should be determined but the initial dose should not be delayed whilst awaiting the result.

For patients who require rapid anticoagulation the usual adult induction dose of warfarin is 10 mg1 on the first day; subsequent doses depend upon the prothrombin time, reported as INR (international normalised ratio).

1. First dose reduced if base-line prothrombin time prolonged, if liver-function tests abnormal, or if patient in cardiac failure, on parenteral feeding, less than average body weight, elderly, or receiving other drugs known to potentiate oral anticoagulants.
For patients who do not require rapid anticoagulation, a lower loading dose can be used over 3–4 weeks. The daily maintenance dose of warfarin is usually 3–9 mg (taken at the same time each day). The following indications and target INRs\(^1\) take into account recommendations of the British Society for Haematology\(^2\):

- **INR 2.5** for treatment of deep-vein thrombosis and pulmonary embolism (including those associated with antiphospholipid syndrome or for recurrence in patients no longer receiving warfarin), for atrial fibrillation, cardioversion (higher target values, such as an INR of 3, can be used for up to 4 weeks before the procedure to avoid cancellations due to low INR), dilated cardiomyopathy, mural thrombus, symptomatic inherited thrombophilia, coronary artery thrombosis (if anticoagulated), and paroxysmal nocturnal haemoglobinuria;

- **INR 3.5** for recurrent deep-vein thrombosis and pulmonary embolism (in patients currently receiving warfarin with INR above 3);

- For mechanical prosthetic heart valves, the recommended target INR depends on the type and location of the valve. Generally, a target INR of 3 is recommended for mechanical aortic valves, and 3.5 for mechanical mitral valves.

**Monitoring** It is essential that the INR be determined daily or on alternate days in early days of treatment, then at longer intervals (depending on response\(^3\)) then up to every 12 weeks.

**Haemorrhage** The main adverse effect of all oral anticoagulants is haemorrhage. Checking the INR and omitting doses when appropriate is essential; if the anticoagulant is stopped but not reversed, the INR should be measured 2–3 days later to ensure that it is falling. The following recommendations (which take into account the recommendations of the British Society for Haematology\(^2\)) are based on the result of the INR and whether there is major or minor bleeding; the recommendations apply to patients taking warfarin:

- Major bleeding—stop warfarin; give phytonadione (vitamin K) 5–10 mg by slow intravenous injection; give dried prothrombin complex (factors II, VII, IX, and X—section 2.11), 30–50 units/kg or fresh frozen plasma 15 mL/kg (if dried prothrombin complex not available);

- **INR > 8.0**, no bleeding or minor bleeding—stop warfarin, restart when INR < 5.0; if there are other risk factors for bleeding give phytonadione (vitamin K) 500 micrograms by slow intravenous injection or 5 mg by mouth (for partial reversal of anticoagulation give smaller oral doses of phytonadione e.g. 0.5–2.5 mg using the intravenous preparation orally); repeat dose of phytonadione if INR still too high after 24 hours

**Unexplained bleeding at therapeutic levels**—always investigate possibility of underlying cause e.g. unsuspected renal or gastro-intestinal tract pathology.

**Pregnancy** Warfarin, acenocoumarol, and phenindione are teratogenic and should not be given in the first trimester of pregnancy. Women of child-bearing age should be warned of this danger since stopping warfarin before the sixth week of gestation may largely avoid the risk of fetal abnormality. These oral anticoagulants cross the placenta with risk of placental or fetal haemorrhage, especially during the last few weeks of pregnancy and at delivery. Therefore, if at all possible, they should be avoided in pregnancy, especially in the first and third trimesters. Difficult decisions may have to be made, particularly in women with prosthetic heart valves, atrial fibrillation, or with a history of recurrent venous thrombosis or pulmonary embolism.

**Treatment booklets** Anticoagulant treatment booklets should be issued to patients, and are available for distribution to local healthcare professionals from Health Authorities and from:

3M Security Printing and Systems Limited
Gorse Street
Chadderton
Oldham
OL9 9QH
0845 610 1112
nhsforms@spsl.uk.com

These booklets include advice for patients on anticoagulant treatment, an alert card to be carried by the patient at all times, and a section for recording of INR results and dosage information. Electronic copies and further advice are also available at www.npsa.nhs.uk/health/alerts.

**WARFARIN SODIUM**

### Indications

- prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophylaxis after insertion of prosthetic heart valve; prophylaxis and treatment of venous thrombosis and pulmonary embolism; transient ischaemic attacks

### Cautions

- see notes above; also recent surgery; concomitant use of drugs that increase risk of bleeding; bacterial endocarditis (increased risk of bleeding; use only if warfarin otherwise indicated); hepatic impairment (Appendix 2); breast-feeding (Appendix 5); avoid cranberry juice; **interactions**: Appendix 1 (coumarins)

### Contra-indications

- peptic ulcer, severe hypertension; renal impairment (avoid if creatinine clearance less than 10 mL/minute); pregnancy (see notes above and Appendix 4)

### Side-effects

- haemorrhage—see notes above; other side-effects reported include hypersensitivity, rash, alopecia, diarrhoea, unexplained drop in haemocrit, ‘purple toes’, skin necrosis, jaundice, hepatic dysfunction; also nausea, vomiting, and pancreatitis

---

1. An INR which is within 0.5 units of the target value is generally satisfactory; larger deviations require dosage adjustment. Target values (rather than ranges) are now recommended.
3. Change in patient’s clinical condition, particularly associated with liver disease, intercurrent illness, or drug administration, necessitates more frequent testing. See also **interactions**, Appendix 1 (warfarin). Major changes in diet (especially involving salads and vegetables) and in alcohol consumption may also affect warfarin control.
2 Cardiovascular system

Dose

- See notes above

Warfarin (Non-proprietary)

Tablets, warfarin sodium 500 micrograms (white), net price 28-tab pack = £93p; 1 mg (brown), 28 = £1.03; 3 mg (blue), 28 = £1.14; 5 mg (pink), 28 = £1.24. Label: 10, anticoagulant card

Acenocoumarol

(Nicoumalone)

Indications see under Warfarin Sodium

Cautions see under Warfarin Sodium

Contra-indications see under Warfarin Sodium

Side-effects see under Warfarin Sodium

Dose

- 4 mg on first day; 4–8 mg on second day; maintenance dose usually 1–8 mg daily adjusted according to response

Sinthrome® (Alliance)

Tablets, acenocoumarol 1 mg, net price 20 = 92p. Label: 10, anticoagulant card

Phenindione

Indications prophylaxis of embolisation in rheumatic heart disease and atrial fibrillation; prophylaxis after insertion of prosthetic heart valve; prophylaxis and treatment of venous thrombosis and pulmonary embolism

Cautions see under Warfarin Sodium; interactions: Appendix 1 (phenindione)

Contra-indications see under Warfarin Sodium; breast-feeding (Appendix 5)

Side-effects see under Warfarin Sodium; also hyper-sensitivity reactions including rashes, exfoliative dermatitis, exanthema, fever, leucopenia, agranulocytosis, eosinophilia, diarrhoea, renal and hepatic damage; urine coloured pink or orange

Dose

- 200 mg on day 1; 100 mg on day 2; maintenance dose usually 50–150 mg daily

Phenindione (Non-proprietary)

Tablets, phenindione 10 mg, net price 28-tab pack = £11.93; 25 mg, 28-tab pack = £15.61; 50 mg, 28-tab pack = £18.45. Label: 10, anticoagulant card

Dabigatran etexilate

Dabigatran etexilate, a direct thrombin inhibitor, is given orally for prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery. Dabigatran etexilate has a rapid onset of action and does not require therapeutic monitoring. The most common side-effect is haemorrhage and patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

NICE guidance

Dabigatran etexilate for the prevention of venous thromboembolism after hip or knee replacement surgery in adults (September 2008)

Dabigatran etexilate is an option for the prophylaxis of venous thromboembolism in adults after total hip replacement or total knee replacement surgery.

Rivaroxaban

Rivaroxaban, a direct inhibitor of activated factor X, is given orally for prophylaxis of venous thromboembolism in adults after hip or knee replacement surgery. Rivaroxaban does not require therapeutic monitoring. The common side-effects are nausea and haemorrhage and patients should be monitored for signs of bleeding or anaemia; treatment should be stopped if severe bleeding occurs.

Pradaxa® (Boehringer Ingelheim)

Capsules, blue/ivory, dabigatran etexilate (as mesilate) 75 mg, net price 10-cap pack = £21.00, 60-cap pack = £126.00; 110 mg 10-cap pack = £21.00, 60-cap pack = £126.00 (all hosp. only). Label: 25

Rivaroxaban

Indications see notes above

Cautions see notes above; also bleeding disorders; concomitant use of drugs that increase risk of bleeding; severe hypertension; active or recent gastrointestinal ulceration; vascular retinopathy; anaesthesia with postoperative indwelling epidural catheter (risk of paralysis—monitor neurological signs and
wait at least 18 hours after rivaroxaban dose before removing catheter and do not give next dose until at least 6 hours after catheter removal; recent surgery; hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3); interactions: (Appendix 1)

Contra-indications active bleeding; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects nausea; haemorrhage (see notes above); less common constipation, diarrhoea, dyspepsia, dry mouth, vomiting, hypotension, oedema, tachycardia, thrombocytopenia, syncope, dizziness, headache, renal impairment, pain in extremities, pruritus, and rash; jaundice also reported

Dose

- Prophylaxis of venous thromboembolism following knee replacement surgery, ADULT over 18 years, 10 mg once daily for 2 weeks starting 6–10 hours after surgery
- Prophylaxis of venous thromboembolism following hip replacement surgery, ADULT over 18 years, 10 mg once daily for 5 weeks starting 6–10 hours after surgery

Xarelto® (Bayer) Tablets, red, f/c, rivaroxaban 10 mg, net price 10-tab pack = £45.00, 30-tab pack = £135.00, 100-tab pack = £450.00

2.8.3 Protamine sulphate

Protamine sulphate is used to treat overdosage of heparin, and low molecular weight heparins. The long half-life of low molecular weight heparins should be taken into consideration when determining the dose of protamine sulphate; the effects of low molecular weight heparins can persist for up to 24 hours after administration. Excessive doses of protamine sulphate can have an anticoagulant effect.

PROTAMINE SULPHATE (Protamine Sulfate)

Indications see above
Caution see above; also monitor activated partial thromboplastin time or other appropriate blood clotting parameters; increased risk of allergic reaction to protamine (including previous treatment with protamine or protamine insulin, allergy to fish, men who are infertile or who have had a vasectomy)

Side-effects nausea, vomiting, lassitude, flushing, hypotension, hypertension, Bradycardia, dyspnoea, rebound bleeding, back pain; hypersensitivity reactions (including angioedema, anaphylaxis) and pulmonary oedema reported

Dose

- Overdosage with subcutaneous injection of heparin, by intravenous injection (rate not exceeding 5 mg/minute), 1 mg neutralises 100 units heparin; give 25–50 mg by intravenous injection (rate not exceeding 5 mg/minute) then any remaining dose given by intravenous infusion over 8–16 hours; max. total dose 50 mg
- Overdosage with subcutaneous injection of low molecular weight heparin, by intermittent intravenous injection (rate not exceeding 5 mg/minute) or by continuous intravenous infusion, 1 mg neutralises approx. 100 units low molecular weight heparin (consult product literature of low molecular weight heparin for details); max. 50 mg

Protamine Sulphate (Non-proprietary)

Injection, protamine sulphate 10 mg /mL, net price 5-mL amp = £1.14, 10-mL amp = £4.15

Prosul® (CP)

Injection, protamine sulphate 10 mg/mL, net price 5-mL amp = 96p (glass), £1.20 (polypropylene)

2.9 Antiplatelet drugs

Antiplatelet drugs decrease platelet aggregation and may inhibit thrombus formation in the arterial circulation, where anticoagulants have little effect.

A single dose of aspirin 300 mg is given as soon as possible after an ischaemic event, preferably dispersed in water or chewed. The initial dose is followed by long-term treatment of aspirin 75 mg daily in order to prevent further cardiovascular disease events.

Long-term use of aspirin, in a dose of 75 mg daily, is also of benefit for all patients with established cardiovascular disease, for patients with a 10-year cardiovascular disease risk of 20% or more and aged over 50 years, for patients with diabetes aged over 50 years or who have had diabetes for more than 10 years, and for patients with diabetes who are receiving antihyperglycaemic treatment. Unduly high blood pressure must be controlled before aspirin is given.

Aspirin in a dose of 75 mg daily is also given following coronary bypass surgery. For details on the use of aspirin in atrial fibrillation see section 2.3.1, for stable angina see section 2.6 and for intermittent claudication see section 2.6.4.

If the patient is at a high risk of gastro-intestinal bleeding, a proton pump inhibitor (section 1.3.5) can be added.

Clopidogrel is licensed for the prevention of ischaemic events in patients with a history of symptomatic ischaemic disease. Clopidogrel, in combination with low-dose aspirin, is also licensed for acute coronary syndrome without ST-segment elevation (section 2.6); in these circumstances the combination is usually given for 12 months (there is no evidence of benefit beyond 12 months). Clopidogrel, in combination with low-dose aspirin, is also licensed for acute myocardial infarction with ST-segment elevation (section 2.10.1); the combi-

---

1. Cardiovascular disease risk may be determined from the chart issued by the Joint British Societies (Heart 2005; 91 (Suppl V): v1–v52)—see inside back cover. The Joint British Societies’ ‘Cardiac Risk Assessor’ computer programme may also be used to determine cardiovascular disease risk.
nation should be continued for at least 4 weeks. Use of clopidogrel with aspirin increases the risk of bleeding. Clopidogrel monotherapy is an alternative when aspirin is contra-indicated, for example in those with aspirin hypersensitivity, or when aspirin is not tolerated despite the addition of a proton pump inhibitor.

The Scottish Medicines Consortium has advised (February 2004) that clopidogrel be accepted for restricted use for the treatment of confirmed acute coronary syndrome (without ST-segment elevation), in combination with aspirin. The Scottish Medicines Consortium has also advised (July 2007) that clopidogrel be accepted for restricted use for patients with ST-segment elevation acute myocardial infarction in combination with aspirin; treatment with clopidogrel is restricted to 4 weeks only. Clopidogrel should be initiated in hospital inpatients only.

**NICE guidance**

**Clopidogrel in the treatment of non-ST-segment elevation acute coronary syndrome** (July 2004)

Clopidogrel in combination with low-dose aspirin is recommended for the management of non-ST-segment elevation acute coronary syndrome in those at moderate to high risk of myocardial infarction or of death. Clopidogrel in combination with low-dose aspirin may be used for up to 12 months after the last event of non-ST-segment elevation acute coronary syndrome.

Dipyridamole is used by mouth as an adjunct to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves. Modified-release preparations are licensed for secondary prevention of ischaemic stroke and transient ischaemic attacks.

A combination of modified-release dipyridamole and low-dose aspirin is used after an ischaemic stroke or transient ischaemic attack, and may reduce the risk of recurrent stroke and other cardiovascular events compared to aspirin alone (see also NICE guidance below).

**NICE guidance**

**Clopidogrel and modified-release dipyridamole in the prevention of occlusive vascular events** (May 2005)

The combination of modified-release dipyridamole and aspirin is recommended to prevent occlusive vascular events in those who have had a transient ischaemic attack or an ischaemic stroke; this combination should be used for 2 years after the last event. Long-term treatment with low-dose aspirin is continued after this period. Clopidogrel monotherapy may be used for those who cannot tolerate low-dose aspirin and have had an occlusive vascular event or have symptomatic peripheral arterial disease.

**Glycoprotein IIb/IIIa inhibitors**

Glycoprotein IIb/IIIa inhibitors prevent platelet aggregation by blocking the binding of fibrinogen to receptors on platelets. Abciximab is a monoclonal antibody which binds to glycoprotein IIb/IIIa receptors and to other related sites; it is licensed as an adjunct to heparin and aspirin for the prevention of ischaemic complications in high-risk patients undergoing percutaneous transluminal coronary intervention. Abciximab should be used once only (to avoid additional risk of thrombocytopenia). Eptifibatide and tirofiban also inhibit glycoprotein IIb/IIIa receptors; they are licensed for use with heparin and aspirin to prevent early myocardial infarction in patients with unstable angina (section 2.6) or non-ST-segment-elevation myocardial infarction. Abciximab, eptifibatide and tirofiban should be used by specialists only.

For use of epoprostenol, see section 2.8.1.

**ABCIXIMAB**

**Indications** prevention of ischaemic cardiac complications in patients undergoing percutaneous coronary intervention; short-term prevention of myocardial infarction in patients with unstable angina not responding to conventional treatment and who are scheduled for percutaneous coronary intervention (use under specialist supervision)

**Cautions** measure baseline prothrombin time, activated clotting time, activated partial thromboplastin time, platelet count, haemoglobin and haematocrit; monitor haemoglobin and haematocrit 12 hours and 24 hours after start of treatment and platelet count 2–4 hours and 24 hours after start of treatment; concomitant use of drugs that increase risk of bleeding; discontinue if uncontrollable serious bleeding occurs or emergency cardiac surgery needed; consult product literature for details of procedures to minimise bleeding; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

**Contra-indications** active internal bleeding; major surgery, intracranial or intraspinal surgery or trauma within last 2 months; stroke within last 2 years; intracranial neoplasm, arteriovenous malformation or aneurysm, severe hypertension, haemorrhagic diathesis, thrombocytopenia, vasculitis, hypertensive retinopathy; breast-feeding (Appendix 5)

**Side-effects** bleeding manifestations; nausea, vomiting, hypotension, bradycardia, chest pain, back pain, headache, fever, puncture site pain, thrombocytopenia.
1. Aspirin tablets 75 mg may be sold to the public in packs of up to 100 tablets; for details relating to other strengths see section 4.7.1 and Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available).

### Dose

- **ADULT** initially by intravenous injection over 1 minute, 250 micrograms/kg, then by intravenous infusion, 125 nanograms/kg/minute (max. 10 micrograms/minute); for prevention of ischaemic complications start 10–60 minutes before percutaneous coronary intervention and continue infusion for 12 hours; for unstable angina start up to 24 hours before possible percutaneous coronary intervention and continue infusion for 12 hours after intervention.

**ReoPro** (Lilly) injection, abciximab 2 mg/mL, net price 5-mL vial = £260.40

### ASPIRIN (antiplatelet)

**Acetylsalicylic Acid**

**Indications** prophylaxis of cerebrovascular disease or myocardial infarction (see section 2.10.1 and notes above)

**Cautions** asthma; uncontrolled hypertension; previous peptic ulceration (but manufacturers may advise avoidance of low-dose aspirin in history of peptic ulceration); concomitant use of drugs that increase risk of bleeding; G6PD deficiency (section 9.1.5); hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (aspirin)

**Contra-indications** use other than as an antiplatelet in asthma; angioedema, urticaria, or rhinitis have been precipitated by aspirin or any other NSAID

**Side-effects** bronchospasm; gastro-intestinal haemorrhage (occasionally major), also other haemorrhage (e.g. subconjunctival)

**Dose**

- See notes above

1. **Aspirin** (Non-proprietary) Dispersible tablets, aspirin 75 mg, net price 28 = 83p; 300 mg, see section 4.7.1. Label: 13, 21, 32

2. **Tablets**, e/c, aspirin 75 mg, net price 28-tab pack = 95p; 56-tab pack = £1.08; 300 mg, see section 4.7.1. Label: 5, 25, 32

**Brands include** Micropirin

3. **Angettes 75** (Bristol-Myers Squibb) Tablets, aspirin 75 mg, net price 28-tab pack = 94p. Label: 32

4. **Caprin** (Pinewood) Tablets, e/c, pink, aspirin 75 mg, net price 28-tab pack = £1.55, 56-tab pack = £3.08, 100-tab pack = £5.24; 300 mg, see section 4.7.1. Label: 5, 25, 32

### Nu-Seals® Aspirin (Alliance) Tablets, e/c, aspirin 75 mg, net price 56-tab pack = £2.60; 300 mg, see section 4.7.1. Label: 5, 25, 32

**Note** Tablets may be chewed at diagnosis for rapid absorption

### CLOPIDOGREL

**Indications** prevention of atherosclerotic events in peripheral arterial disease, or within 35 days of myocardial infarction, or within 6 months of ischaemic stroke; prevention of atherosclerotic events in acute coronary syndrome without ST-segment elevation (given with aspirin—see notes above) and in acute myocardial infarction with ST-segment elevation (given with aspirin—see notes above)

**Cautions** patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; discontinue 7 days before elective surgery if antiplatelet effect not desirable; liver impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (clopidogrel)

**Contra-indications** active bleeding, breast-feeding (Appendix 5)

**Side-effects** dyspepsia, abdominal pain, diarrhoea; bleeding disorders (including gastro-intestinal and intracranial); less commonly nausea, vomiting, gastritis, flatulence, constipation, gastric and duodenal ulcers, headache, dizziness, paraesthesias, leucopenia, decreased platelets (very rarely severe thrombocytopenia), eosinophilia, rash, and pruritus; rarely vertigo; very rarely colitis, pancreatitis, hepatitis, acute liver failure, vasculitis, confusion, hallucinations, taste disturbance, stomatitis, bronchospasm, interstitial pneumonitis, blood disorders (including thrombocytopenic purpura, agranulocytosis and pancytopenia), and hypersensitivity-like reactions (including fever, glomerulonephritis, arthralgia, Stevens-Johnson syndrome, toxic epidermal necrolysis, lichen planus)

**Dose**

- Prevention of atherosclerotic events in peripheral arterial disease or after myocardial infarction or ischaemic stroke, 75 mg once daily

- Acute coronary syndrome (without ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above)

- Acute myocardial infarction (with ST-segment elevation), initially 300 mg then 75 mg daily (with aspirin—see notes above); initial dose omitted if patient over 75 years

5. **Plavix** (Bristol-Myers Squibb, Sanofi-Synthelabo) Tablets, pink, 1/6 clopidogrel (as hydrogen sulphate) 75 mg, net price 30-tab pack = £37.83; 300 mg, 30-tab pack = £151.32

### DIPYRIDAMOLE

**Indications** see notes above and under **Dose**

**Cautions** rapidly worsening angina, aortic stenosis, recent myocardial infarction, left ventricular outflow obstruction, heart failure; may exacerbate migraine; hypotension; myasthenia gravis (risk of exacerbation); coagulation disorders; concomitant use of drugs that increase risk of bleeding; breast-feeding (Appendix 5); **interactions**: Appendix 1 (dipyridamole)
Side-effects  gastro-intestinal effects, dizziness, myalgia, throbbing headache, hypotension, hot flushes and tachycardia; worsening symptoms of coronary heart disease; hypersensitivity reactions such as rash, urticaria, severe bronchospasm and angioedema; increased bleeding during or after surgery; thrombocytopenia reported

Dose
- By mouth, 300–600 mg daily in 3–4 divided doses. Modified-release preparations, see under preparation below.
- By intravenous injection, diagnostic only, consult product literature.

Dipyridamole (Non-proprietary)
- Tablets, coated, dipyridamole 25 mg, net price 84 = £4.28; 100 mg, 84 = £3.19. Label: 22
- Oral suspension, dipyridamole 50 mg/5 mL, net price 150 mL = £37.00
- Persantin® (Boehringer Ingelheim) Tablets, s/c, dipyridamole 25 mg (orange), net price 84-tab pack = £1.57; 100 mg, 84-tab pack = £4.38. Label: 22
- Injection, dipyridamole 5 mg/mL, net price 2-mL amp = 11p

Modified release
- Persantin® Retard (Boehringer Ingelheim) Capsules, m/r, red/orange containing yellow pellets, dipyridamole 200 mg, net price 60-cap pack = £8.38. Label: 21, 25
- Dose secondary prevention of ischaemic stroke and transient ischaemic attacks (used alone or with aspirin), adjacent to oral anticoagulation for prophylaxis of thromboembolism associated with prosthetic heart valves, 200 mg twice daily preferably with food.
- Note Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening.

With aspirin
- For cautious, contra-indications and side-effects of aspirin, see under Aspirin, above.

Asasantin® Retard (Boehringer Ingelheim)
- Capsules, red/ivory, aspirin 25 mg, dipyridamole 200 mg (m/r), net price 60-cap pack = £8.20. Label: 21, 25
- Dose secondary prevention of ischaemic stroke and transient ischaemic attacks, 1 capsule twice daily.
- Note Dispense in original container (pack contains a desiccant) and discard any capsules remaining 6 weeks after opening.

Eptifibatide

Indications prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 12 hours (use under specialist supervision)

Cautions risk of bleeding, concomitant drugs that increase risk of bleeding—discontinue immediately if uncontrolled serious bleeding; measure baseline prothrombin time, activated partial thromboplastin time, platelet count, haemoglobin, haematocrit and serum creatinine; monitor haemoglobin, haematocrit and platelets within 6 hours after start of treatment then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary; hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications abnormal bleeding within 30 days, major surgery or severe trauma within 6 weeks, stroke within last 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia, significant hepatic impairment; breast-feeding.

Side-effects bleeding manifestations; very rarely anaphylaxis and rash

Dose
- Initially by intravenous infusion, 180 micrograms/kg, then by intravenous infusion, 2 micrograms/kg/minute for up to 72 hours (up to 96 hours if percutaneous coronary intervention during treatment).

Integrilin® (GSK) Injection, eptifibatide 2 mg/mL, net price 10-mL (20-mg) vial = £14.45
- Infusion, eptifibatide 750 micrograms/mL, net price 100-mL (75-mg) vial = £45.42

TIROFIBAN

Indications prevention of early myocardial infarction in patients with unstable angina or non-ST-segment-elevation myocardial infarction and with last episode of chest pain within 12 hours (use under specialist supervision)

Cautions major surgery or severe trauma within 3 months (avoid if within 6 weeks); traumatic or protracted cardiopulmonary resuscitation, organ biopsy or lithotripsy within last 2 weeks; risk of bleeding including active peptic ulcer within 3 months; acute pericarditis, aortic dissection, haemorrhagic retinopathy, vasculitis, haematuria, faecal occult blood; severe heart failure, cardiogenic shock, anaemia; puncture of non-compressible vessel within 24 hours; concomitant drugs that increase risk of bleeding (including within 48 hours of thrombolytic administration); monitor platelet count, haemoglobin and haematocrit before treatment, 2–6 hours after start of treatment and then at least once daily; discontinue if thrombolytic therapy, intra-aortic balloon pump or emergency cardiac surgery necessary; discontinue immediately if serious bleeding uncontrolled by pressure occurs; hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (tirofiban)

Contra-indications abnormal bleeding within 30 days, stroke within 30 days or any history of haemorrhagic stroke, intracranial disease (aneurysm, neoplasm or arteriovenous malformation), severe hypertension, haemorrhagic diathesis, increased prothrombin time or INR, thrombocytopenia; breast-feeding (Appendix 5)

Side-effects bleeding manifestations; reversible thrombocytopenia

Dose
- By intravenous infusion, initially 400 nanograms/kg/minute for 30 minutes, then 100 nanograms/kg/minute for at least 48 hours (continue during and for 12–24 hours after percutaneous coronary intervention); max. duration of treatment 108 hours.
Myocardial infarction is part of the spectrum of acute coronary syndromes which includes unstable angina, and myocardial infarction with or without ST-segment elevation.

These notes give an overview of the initial and long-term management of myocardial infarction with ST-segment elevation. For advice on the management of non-ST-segment elevation myocardial infarction and unstable angina, see section 2.6. The aims of management of ST-segment elevation myocardial infarction are to provide supportive care and pain relief, to promote reperfusion and to reduce mortality. Oxygen, diamorphine and nitrates can provide initial support and pain relief; aspirin and percutaneous coronary intervention or thrombolytics promote reperfusion; long-term use of aspirin, beta-blockers, ACE inhibitors, and statins help to reduce mortality further.

Initial management Oxygen (section 3.6) should be administered if there is evidence of hypoxia, pulmonary oedema, or continuing myocardial ischaemia; hypoxia should be avoided and particular care is required in patients with chronic obstructive airways disease. The pain (and anxiety) of myocardial infarction is managed with slow intravenous injection of diamorphine (section 4.7.2); an antiemetic such as metoclopramide (or, if left ventricular function is not compromised, cyclizine) by intravenous injection should also be given (section 4.6).

Aspirin (chewed or dispersed in water) is given for its antiplatelet effect (section 2.9); a dose of 300 mg is suitable. If aspirin is given before arrival at hospital, a note saying that it has been given should be sent with the patient. Clopidogrel, in a dose of 300 mg, should also be given (section 2.9).

Patency of the occluded artery can be restored by percutaneous coronary intervention or by giving a thrombolytic drug (section 2.10.2), unless contra-indicated. Percutaneous coronary intervention is the preferred method and patients should receive a glycopro-
used, an angiotensin-II receptor antagonist may be used for patients with heart failure. A relatively high dose of either the ACE inhibitor or angiotensin-II receptor antagonist may be required to produce benefit.

Nitrates (section 2.6.1) are used for patients with angina.

Eplerenone (section 2.2.3) is licensed for use following a myocardial infarction in those with left ventricular dysfunction and evidence of heart failure. For the role of statins in preventing recurrent cardiovascular events, see section 2.12.

2.10.2 Fibrinolytic drugs

Fibrinolytic drugs act as thrombolytics by activating plasminogen to form plasmin, which degrades fibrin and so breaks up thrombi.

The value of thrombolytic drugs for the treatment of myocardial infarction has been established (section 2.10.1). Streptokinase and alteplase have been shown to reduce mortality. Reteplase and tenecteplase are also licensed for acute myocardial infarction. Thrombolytic drugs are indicated for any patient with acute myocardial infarction for whom the benefit is likely to outweigh the risk of treatment. Trials have shown that the benefit is greatest in those with ECG changes that include ST segment elevation (especially in those with anterior infarction) and in patients with bundle branch block. Patients should not be denied thrombolytic treatment on account of age alone because mortality in the elderly is high and the reduction in mortality is the same as in younger patients.

Alteplase, reteplase and streptokinase need to be given within 12 hours of symptom onset, ideally within 1 hour; use after 12 hours requires specialist advice. Tenecteplase should be given as early as possible and usually within 6 hours of symptom onset.

Alteplase, streptokinase, and urokinase can be used for other thromboembolic disorders such as deep-vein thrombosis and pulmonary embolism. Alteplase is also used for acute ischaemic stroke. Treatment must be started promptly.

Urokinase is also licensed to restore the patency of occluded intravenous catheters and cannulas blocked with fibrin clots.

Contra-indications Thrombolytic drugs are contra-indicated in recent haemorrhage, trauma, or surgery (including dental extraction), coagulation defects, bleeding diatheses, aortic dissection, aneurysm, coma, history of cerebrovascular disease especially recent events or with any residual disability, recent symptoms of possible peptic ulceration, heavy vaginal bleeding, severe hypertension, active pulmonary disease with cavitation, acute pancreatitis, pericarditis, bacterial endocarditis, severe liver disease, and oesophageal varices; also in the case of streptokinase, previous allergic reactions to either streptokinase or anistreplase (no longer available).

Prolonged persistence of antibodies to streptokinase and anistreplase (no longer available) can reduce the effectiveness of subsequent treatment; therefore, streptokinase should not be used again beyond 4 days of first administration of either streptokinase or anistreplase.

Side-effects Side-effects of thrombolytics are mainly nausea and vomiting and bleeding. When thrombolytics are used in myocardial infarction, reperfusion arrhythmias and recurrent ischaemia and angina may occur. Reperfusion may also cause cerebral and pulmonary oedema. Hypotension can also occur and can usually be controlled by elevating the patient’s legs, or by reducing the rate of infusion or stopping it temporarily. Back pain, fever, and convulsions have been reported. Bleeding is usually limited to the site of injection, but intracerebral haemorrhage or bleeding from other sites can occur. Serious bleeding calls for discontinuation of the thrombolytic and may require administration of coagulation factors and antifibrinolytic drugs (e.g. tranexamic acid).

Rarely further embolism may occur (either due to clots that break away from the original thrombus or to cholesterol crystal emboli). Thrombolytics can cause allergic reactions (including rash, swelling and uveitis) and anaphylaxis has been reported (for details of management see Allergic Emergencies, section 3.4.3). Guillain-Barré syndrome has been reported rarely after streptokinase treatment.

NICE guidance Alteplase for the treatment of acute ischaemic stroke (June 2007)

Alteplase, used in accordance with the licence for Actilyse®, is recommended for the treatment of acute ischaemic stroke.

Cautions Thrombolytic drugs should be used with caution if there is a risk of bleeding including that from venepuncture or invasive procedures. They should also be used with caution in external chest compression, pregnancy (Appendix 4), elderly, hypertension, conditions in which thrombolysis might give rise to embolic complications such as enlarged left atrium with atrial fibrillation (risk of dissolution of clot and subsequent embolisation), and recent or concurrent use of drugs that increase the risk of bleeding.

Side-effects see notes above; also risk of cerebral bleeding increased in acute stroke

Dose

- Myocardial infarction, accelerated regimen (initiated within 6 hours of symptom onset), 15 mg by intravenous injection, followed by intravenous infusion of 50 mg over 30 minutes, then 35 mg over 60 minutes (total dose 100 mg over 90 minutes); in patients less than 65 kg, 15 mg by intravenous injection, followed by intravenous infusion of...
0.75 mg/kg over 30 minutes, then 0.5 mg/kg over 60 minutes (max. total dose 100 mg over 90 minutes)

- Myocardial infarction, initiated within 6–12 hours of symptom onset, 10 mg by intravenous injection, followed by intravenous infusion of 50 mg over 60 minutes, then 4 infusions each of 10 mg over 30 minutes (total dose 100 mg over 3 hours; max. 1.5 mg/kg in patients less than 65 kg)

- Pulmonary embolism, 10 mg by intravenous injection over 1–2 minutes, followed by intravenous infusion of 90 mg over 2 hours; max. 1.5 mg/kg in patients less than 65 kg

- Acute stroke (treatment must begin within 3 hours of symptom onset), by intravenous administration over 60 minutes, 900 micrograms/kg (max. 90 mg); initial 10% of dose by intravenous injection, remainder by intravenous infusion; ELDERLY over 80 years not recommended

**Actilyse**® (Boehringer Ingelheim) *(INN)*

**Injection** powder for reconstitution, alteplase 10 mg (5.8 million units)/vial, net price per vial (with diluent) = £135.00; 20 mg (11.6 million units)/vial (with diluent and transfer device) = £180.00; 50 mg (29 million units)/vial (with diluent, transfer device, and infusion bag) = £300.00

Note 10 000-unit vial, 50 000-unit vial, and 250 000-unit vial also available from 'special-order' manufacturers or specialist-importing companies, see p. 939
2.11 Antifibrinolytic drugs and haemostatics

Fibrin dissolution can be impaired by the administration of tranexamic acid, which inhibits fibrinolysis. It can be used to prevent bleeding or to treat bleeding associated with excessive fibrinolysis (e.g. in prostatectomy, bladder surgery, in dental extraction in patients with haemophilia, in cinisation of the cervix, and in traumatic haemoptysis) and in the management of menorrhagia. Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombotic overdose.

Desmopressin (section 6.5.2) is used in the management of mild to moderate haemophilia and von Willebrand’s disease. It is also used for fibrinolytic response testing.

Etamsylate (ethamsylate) reduces capillary bleeding in testing.

Desmopressin (section 6.5.2) is used in the management of mild to moderate haemophilia and von Willebrand’s disease.

Tranexamic acid may also be used in hereditary angioedema, epistaxis, and in thrombotic overdose.

Blood products

ANTITHROMBIN III CONCENTRATE
Dried antithrombin III is prepared from human plasma

Indications congenital deficiency of antithrombin III

Side-effects nausea, flushing, headache, dizziness; rarely allergic reactions and fever

Available from BPL (Dried Antithrombin III)

Note Preparation of recombinant human antithrombin (antithrombin alfa) available from LEO (ATryn) indicated for the prophylaxis of venous thromboembolism in surgery in patients with congenital antithrombin deficiency

DRIED PROTHROMBIN COMPLEX
(Human Prothrombin Complex)
Dried prothrombin complex is prepared from human plasma by a suitable fractionation technique, and contains factor IX, together with variable amounts of factors II, VII, and X

Indications treatment and peri-operative prophylaxis of prothrombin of haemorrhage in patients with congenital deficiency of factors II, VII, IX, or X if purified specific coagulation factors not available; treatment and perioperative prophylaxis of haemorrhage in patients with acquired deficiency of factors II, VII, IX, or X (e.g. during warfarin treatment—see section 2.8.2)

Cautions risk of thrombosis, disseminated intravascular coagulation; history of myocardial infarction or coronary heart disease; hepatic disease; postoperative use

Contra-indications angina; recent myocardial infarction (except in life-threatening haemorrhage following overdosage of oral anticoagulants, and before induction of fibrinolytic therapy); history of heparin-induced thrombocytopenia

Side-effects thrombotic events (including disseminated intravascular coagulation); very rarely pyrexia, antibody formation, hypersensitivity reactions (including anaphylaxis); nephrotic syndrome also reported

Available from CSL Behring (Beriplex P/N▼)

DROTRECOGIN ALFA (ACTIVATED)
Recombinant activated protein C

Indications adjunctive treatment of severe sepsis with multiple organ failure—start treatment within 24 hours (and no later than 48 hours) after onset of organ failure

TRANEXAMIC ACID

Indications see notes above

Cautions renal impairment (Appendix 3); massive haematuria (avoid if risk of urteric obstruction); not for use in disseminated intravascular coagulation; irregular menstrual bleeding (establish cause before initiating therapy); pregnancy (Appendix 4); regular liver function tests in long-term treatment of hereditary angioedema

Contra-indications thromboembolic disease

Side-effects nausea, vomiting, diarrhoea (reduce dose); rarely disturbances in colour vision (discontinue), thromboembolic events, allergic skin reactions; giddiness and hypotension on rapid intravenous injection

Dose

• By mouth, local fibrinolysis, 1–1.5 g (or 15–25 mg/kg) 2–3 times daily

Menorrhagia (initiated when menstruation has started), 1 g 3 times daily for up to 4 days; max. 4 g daily

Hereditary angioedema, 1–1.5 g 2–3 times daily

Epistaxis, 1 g 3 times daily for 7 days

• By slow intravenous injection, local fibrinolysis, 0.5–1 g 3 times daily

• By continuous intravenous infusion, local fibrinolysis, following initial treatment by intravenous injection, 25–50 mg/kg over 24 hours

Cyklokapron® (Meda) Tablets, f/c, scored, tranexamic acid 500 mg, net price 60-tab pack = £14.30

Cyklokapron® (Pfizer) Injection, tranexamic acid 100 mg/mL, net price 5-ml amp = £1.55

ETAMSYLATE
(Ethamsylate)

Indications blood loss in menorrhagia

Contra-indications acute porphyria (see section 9.8.2)

Side-effects nausea, headache, rashes

Dose

500 mg 4 times daily during menstruation

Dicylene® (Sanofi-Synthelabo) Tablets, scored, etamsylate 500 mg, net price 100–tab pack = £8.78

TRANEXAMIC ACID

(Non-proprietary)

Tablets, tranexamic acid 500 mg 60-tab pack = £7.80

Drotrecogen alfa (activated) Recombinant activated protein C

Indications adjunctive treatment of severe sepsis with multiple organ failure—start treatment within 24 hours (and no later than 48 hours) after onset of organ failure
**FACTOR VIII INHIBITOR BYPASSING FRACTION**

Preparations with factor VIII inhibitor bypassing activity are prepared from human plasma.

**Indications**
treatment and prophylaxis of haemorrhage in patients with congenital factor VIII deficiency (haemophilia A) and factor VIII inhibitors; treatment of haemorrhage in non-haemophilic patients with acquired factor VIII inhibitors

**Contra-indications**
disseminated intravascular coagulation

**Side-effects**
paraeesthesia; pyrexia; allergic reactions including hypotension, flushing, urticaria, rash, and anaphylaxis

Available from Baxter (FEIBA)

**FACTOR IX FRACTION, DRIED**

Dried factor IX fraction is prepared from human plasma by a suitable fractionation technique; it may also contain clotting factors II, VII, and X

**Indications**
treatment and prophylaxis of haemorrhage in congenital factor IX deficiency (haemophilia B)

**Cautions**
risk of thrombosis—principally with former low purity products

**Contra-indications**
disseminated intravascular coagulation

**Side-effects**
gastro-intestinal disturbances; headache, dizziness; allergic reactions, including chills, fever

Available from CSL Behring (NovoSeven)

**FACTOR VIIa (RECOMBINANT)**

**Eptacog alfa (activated)**

**Indications**
treatment and prophylaxis of haemorrhage in patients with haemophilia A or B with inhibitors to factors VIII or IX, acquired haemophilia, factor VII deficiency, or Glanzmann's thrombasthenia

**Cautions**
risk of thrombosis or disseminated intravascular coagulation

**Side-effects**
very rarely, nausea, thrombotic events (including myocardial infarction and cerebrovascular accident), coagulation disorders, fever, pain, and allergic reactions including rash

Available from Novo Nordisk (NovoSeven)

**FACTOR VIII FRACTION, DRIED**

(Human Antihaemophilic Fraction, Dried)

Dried factor VIII fraction is prepared from human plasma by a suitable fractionation technique

**Indications**
treatment and prophylaxis of haemorrhage in patients with haemophilia A or B, acquired factor VIII deficiency, von Willebrand's disease

**Cautions**
monitor for development of factor VIII inhibitors; intravascular haemolysis after large or frequently repeated doses in patients with blood groups A, B, or AB—less likely with high potency concentrates

**Side-effects**
gastro-intestinal disturbances, taste disturbances; flushing, palpitation; dyspnoea, coughing; headache, dizziness, paraesthesia, drowsiness; blurred vision; antibody formation; hypersensitivity reactions including hypotension, angioedema, chills, fever, urticaria, and anaphylaxis

Available from Biotest UK (Haemocin ), CSL Behring (Hemate VP), BPL (Optivate , High Purity Factor VIII and von Willebrand factor concentrate; 60%), Grifols (Alphanate , Fanvido ), Octapharma (Octanate )

**Note**
Preparation of recombinant human antihaemophilic factor VIII (octocog alfa) available from CSL Behring (Helixate NexGen), Baxter (Advate ), Bayer (Kogenate-Bayer), Wyeth (ReFacto )

**PROTEIN C CONCENTRATE**

Protein C is prepared from human plasma

**Indications**
congenital protein C deficiency

**Cautions**
hypersensitivity to heparin

**Side-effects**
fever, arrhythmia, bleeding and thrombosis reported; rarely allergic reactions

Available from Baxter (Ceprotin )
2.12 Lipid-regulating drugs

Preventative measures should be taken in individuals with a high risk of developing cardiovascular disease (primary prevention) and to prevent recurrence of events in those with established cardiovascular disease (secondary prevention). Individuals at high risk include those who already have atherosclerotic disease, those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Preventative measures are also required for other individuals who may be at high risk of developing atherosclerotic cardiovascular disease; those with a 10-year risk of cardiovascular disease of 20% or more stand to benefit most from drug treatment. The risk is assessed on the basis of lipid concentration as well as smoking status, blood pressure, gender, and age; other risk factors, such as premature menopause, ethnicity, obesity, triglyceride concentration, chronic kidney disease, impaired glucose tolerance, and a family history of premature cardiovascular disease, should also be taken into account when assessing risk in individual patients.

Lowering the concentration of low-density lipoprotein (LDL) cholesterol and raising high-density lipoprotein (HDL) cholesterol slows the progression of atherosclerosis and may even induce regression. All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation. Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, lowering of raised blood pressure (section 2.5), the use of low-dose aspirin (section 2.9), and management of diabetes (section 6.1).

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken within a specialist centre. A statin (see below) reduces the risk of cardiovascular disease events, irrespective of serum cholesterol concentration, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. If statins are contra-indicated or not tolerated, a fibrate (p. 144) or a bile acid sequestrant (p. 143) may be considered for primary or secondary prevention, nicotinic acid (p. 146) is also an option for secondary prevention. Fibrates, bile acid sequestrants, or nicotinic acid should not be used in combination with a statin or ezetimibe.

Individuals at high risk include those who already have atherosclerotic disease, those with diabetes mellitus aged over 40 years, and those with familial hypercholesterolaemia. The risk also increases with age; those over 75 years are at particularly high risk, especially if they smoke or have hypertension.

Preventive measures are also required for other individuals who may be at high risk of developing atherosclerotic cardiovascular disease; those with a 10-year risk of cardiovascular disease of 20% or more stand to benefit most from drug treatment. The risk is assessed on the basis of lipid concentration as well as smoking status, blood pressure, gender, and age; other risk factors, such as premature menopause, ethnicity, obesity, triglyceride concentration, chronic kidney disease, impaired glucose tolerance, and a family history of premature cardiovascular disease, should also be taken into account when assessing risk in individual patients.

Lowering the concentration of low-density lipoprotein (LDL) cholesterol and raising high-density lipoprotein (HDL) cholesterol slows the progression of atherosclerosis and may even induce regression. All patients at high risk of cardiovascular disease should be advised to make lifestyle modifications that include beneficial changes to diet, exercise, weight management, alcohol consumption, and smoking cessation. Lipid-regulating drug treatment must be combined with advice on diet and lifestyle measures, lowering of raised blood pressure (section 2.5), the use of low-dose aspirin (section 2.9), and management of diabetes (section 6.1).

The prescribing of drug therapy in homozygous familial hypercholesterolaemia should be undertaken within a specialist centre. A statin (see below) reduces the risk of cardiovascular disease events, irrespective of serum cholesterol concentration, and is the drug of first choice for primary and secondary prevention of cardiovascular disease. If statins are contra-indicated or not tolerated, a fibrate (p. 144) or a bile acid sequestrant (p. 143) may be considered for primary or secondary prevention, nicotinic acid (p. 146) is also an option for secondary prevention. Fibrates, bile acid sequestrants, or nicotinic acid should not be used in combination with a statin or ezetimibe.

The statins (atorvastatin, fluvastatin, pravastatin, rosuvastatin, and simvastatin) competitively inhibit 3-hydroxy-3-methylglutaryl coenzyme A (HMG CoA) reductase, an enzyme involved in cholesterol synthesis, especially in the liver. Statins are more effective than other lipid-regulating drugs at lowering LDL-cholesterol concentration but they are less effective than the fibrates in reducing triglyceride concentration. However, statins reduce cardiovascular disease events and total mortality irrespective of the initial cholesterol concentration.

Statins should be considered for all patients, including the elderly, with symptomatic cardiovascular disease such as those with coronary heart disease (including history of angina or acute myocardial infarction), occlusive arterial disease (including peripheral vascular disease, non-haemorrhagic stroke, or transient ischaemic attacks). In patients with diabetes mellitus, the risk of developing cardiovascular disease depends on the duration and complications of diabetes, age, and concomitant risk factors. Statin therapy should be considered for all patients over 40 years with diabetes mellitus (type 1 and 2). In younger patients with diabetes, treatment with a statin should be considered if there is target-risk of myositis with lipid-regulating drugs.
organ damage, poor glycaemic control (HbA1c greater than 9%), low HDL-cholesterol and raised triglyceride concentration, hypertension, or a family history of premature cardiovascular disease.

Statins are also used for the prevention of cardiovascular disease events in asymptomatic individuals who are at increased risk (see p. 140). Statin treatment should also be considered if the total cholesterol concentration to HDL-cholesterol ratio exceeds 6.

Cautions Statins should be used with caution in those with a history of liver disease or with a high alcohol intake (use should be avoided in active liver disease). Hypothyroidism should be managed adequately before starting treatment with a statin (see p. 140). There is little information available on a rational approach to liver-function monitoring; however, a NICE guideline suggests that liver enzymes should be measured before treatment, and repeated within 3 months and at 12 months of starting treatment, unless indicated at other times by signs or symptoms suggestive of hepatotoxicity. Those with severe transaminases that are raised, but less than 3 times the upper limit of the reference range, should not be routinely excluded from statin therapy. Those with serum transaminases of more than 3 times the upper limit of the reference range should discontinue statin therapy. Statins should be used with caution in those with risk factors for myopathy, such as infections, hypothyroidism, or renal impairment secondary to myoglobinuria. Rhabdomyolysis with acute renal impairment secondary to myoglobinuria has also been reported.

Counselling Advise patient to report promptly unexplained muscle pain, tenderness, or weakness.

ATORVASTATIN

Indications primary hypercholesterolaemia, heterozygous familial hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with type 2 diabetes and at least one additional risk factor for cardiovascular disease

Cautions see notes above; also haemorrhagic stroke

Side-effects see notes above; also chest pain; back pain; less commonly anorexia, malaise, weight gain, hypoglycaemia, hyperglycaemia, tinnitus; rarely cholesterol jaundice, peripheral oedema; very rarely taste disturbances, gyanaecomastia, hearing loss, Stevens-Johnson Syndrome, and toxic epidermal necrolysis

Dose • Primary hypercholesterolaemia and combined hyperlipidaemia, usually 10 mg once daily; if necessary, may be increased at intervals of at least 4 weeks to max. 80 mg once daily; CHILD 10–17 years usually 10 mg once daily (limited experience with doses above 20 mg daily)
• Familial hypercholesterolaemia, initially 10 mg daily, increased at intervals of at least 4 weeks to 40 mg once daily; if necessary, further increased to max. 80 mg once daily (or 40 mg once daily combined with anion-exchange resin in heterozygous familial hypercholesterolaemia); CHILD 10–17 years initially 10 mg daily, increased if necessary after at least 4 weeks to 20 mg once daily (limited experience with higher doses)
• Prevention of cardiovascular events in type 2 diabetes, 10 mg once daily

Note Max. 10 mg daily with concomitant ciclosporin; max. 20 mg daily (or temporarily discontinue atorvastatin) with concomitant clarithromycin; close monitoring of liver function and, if symptomatic, of creatine kinase is required in patients receiving these drugs. Rhabdomyolysis with acute renal impairment secondary to myoglobinuria has also been reported.

Lipitor® (Pfizer) \[A\] Tablets, all U.K. atorvastatin (as calcium trihydrate) 10 mg, net price 28-tab pack = £18.03; 20 mg, 28-tab pack = £24.64; 40 mg 28-tab pack = £28.21; 80 mg, 28-tab pack = £28.21. Counselling, muscle effects, see notes above

FLUVASTATIN

Note The Scottish Medicines Consortium has advised (February 2004) that fluvastatin is accepted for restricted use for the secondary prevention of coronary events after percutaneous coronary angioplasty; if the patient has previously been receiving another statin, then there is no need to change the statin

Indications adjunct to diet in primary hypercholesterolaemia or combined (mixed) hyperlipidaemia (types IIa and IIb); adjunct to diet to slow
progression of coronary atherosclerosis in primary hypercholesterolaemia and concomitant coronary heart disease; prevention of coronary events after percutaneous coronary intervention

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; also very rarely vasculitis

**Dose**
- Hypercholesterolaemia or combined hyperlipidaemia, initially 20–40 mg daily in the evening, adjusted at intervals of at least 4 weeks; up to 80 mg daily may be required; **CHILD** under 18 years, not recommended
- Prevention of progression of coronary atherosclerosis, 40 mg daily in the evening
- Following percutaneous coronary intervention, 80 mg daily

**Lescol** (Novartis) (Pink)
- **Capsules**, pravastatin (as sodium salt) 20 mg (brown/orange), net price 28-cap pack = £15.26; 40 mg (brown/orange), 28-cap pack = £15.26, 56-cap pack = £30.53. Counselling, muscle effects, see notes above

**Modified release**
- **Lescol® XL** (Novartis) (Pink)
  - **Tablets**, m/r, yellow, pravastatin (as sodium salt) 80 mg, net price 28-tab pack = £19.20. Label: 25, counselling, muscle effects, see notes above
  - **Dose** 80 mg once daily (dose form not appropriate for initial dose titration in hypercholesterolaemia or combined hyperlipidaemia)

### PRAVASTATIN SODIUM

**Indications** adjunct to diet for primary hypercholesterolaemia or combined (mixed) hyperlipidaemias in patients who have not responded adequately to dietary control; adjunct to diet to prevent cardiovascular events in patients with hypercholesterolaemia; prevention of cardiovascular events in patients with previous myocardial infarction or unstable angina; reduction of hyperlipidaemia in patients receiving immunosuppressive therapy following solid-organ transplantation

**Cautions** see notes above; renal impairment (Appendix 3)

**Contra-indications** see notes above

**Side-effects** see notes above; less commonly abnormal urination (including dysuria, nocturia and frequency); very rarely fulminant hepatic necrosis

**Dose**
- Hypercholesterolaemia or combined hyperlipidaemias, 10–40 mg once daily at night, adjusted at intervals of at least 4 weeks
- Familial hypercholesterolaemia, **CHILD** 8–14 years 10–20 mg once daily at night, 14–18 years 10–40 mg once daily at night
- Prevention of cardiovascular events, 40 mg once daily at night
- Post-transplantation hyperlipidaemia, initially 20 mg once daily at night, increased if necessary (under close medical supervision) to max. 40 mg once daily at night

**Pravastatin** (Non-proprietary) (Pink)
- **Tablets**, pravastatin sodium 10 mg, net price 28-tab pack = £1.73; 20 mg, 28-tab pack = £2.22; 40 mg, 28-tab pack = £2.77. Counselling, muscle effects, see notes above

**Lipostat** (Squibb) (Pink)
- **Tablets**, all yellow, pravastatin sodium 10 mg, net price 28-tab pack = £15.05; 20 mg, 28-tab pack = £27.61; 40 mg, 28-tab pack = £27.61. Counselling, muscle effects, see notes above

### ROSUVASTATIN

**Indications** primary hypercholesterolaemia (type IIa including heterozygous familial hypercholesterolaemia), mixed dyslipidaemia (type IIb), or homozygous familial hypercholesterolaemia in patients who have not responded adequately to diet and other appropriate measures

**Cautions** see notes above; patients of Asian origin (see under Dose): max. dose 20 mg in patients with risk factors for myopathy or rhabdomyolysis (including personal or family history of muscular disorders or toxicity); renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3)

**Contra-indications** see notes above

**Side-effects** see notes above; also proteinuria; very rarely haematuria

**Dose**
- Initially 5–10 mg once daily increased if necessary at intervals of at least 4 weeks to 20 mg once daily, increased after further 4 weeks to 40 mg daily only in severe hypercholesterolaemia with high cardiovascular risk and under specialist supervision; **ELDERLY** initially 5 mg once daily; patient of **ASIAN** origin, initially 5 mg once daily increased if necessary to max. 20 mg daily

**Note** Initially 5 mg once daily with concomitant fibrate increased if necessary to max. 20 mg daily

**Crestor** (AstraZeneca) (Pink)
- **Tablets**, 1/c, rosuvastatin (as calcium salt) 5 mg (yellow), net price 28-tab pack = £18.03; 10 mg (pink), 28-tab pack = £18.03; 20 mg (pink), 28-tab pack = £26.02; 40 mg (pink), 28-tab pack = £29.69. Counselling, muscle effects, see notes above

### SIMVASTATIN

**Indications** primary hypercholesterolaemia, homozygous familial hypercholesterolaemia or combined (mixed) hyperlipidaemia in patients who have not responded adequately to diet and other appropriate measures; prevention of cardiovascular events in patients with atherosclerotic cardiovascular disease or diabetes mellitus

**Cautions** see notes above; renal impairment (Appendix 3)

**Contra-indications** see notes above

**Side-effects** see notes above; also rarely anaemia

**Dose**
- Primary hypercholesterolaemia, combined hyperlipidaemia, 10–20 mg daily at night, adjusted at intervals of at least 4 weeks; usual range 10–80 mg once daily at night
- Homozygous familial hypercholesterolaemia, 40 mg daily at night or 80 mg daily in 3 divided doses (with largest dose at night)
Bile acid sequestrants

Colestyramine, colestipol, and colestyramine (cholestyramine) are bile acid sequestrants used in the management of hypercholesterolaemia. They act by binding bile acids, preventing their reabsorption; this promotes hepatic conversion of cholesterol into bile acids; the resultant increased LDL-receptor activity of liver cells increases the clearance of LDL-cholesterol from the plasma. Bile acid sequestrants effectively reduce LDL-cholesterol but can aggravate hypertriglyceridaemia.

The Scottish Medicines Consortium (p. 3) has advised (January 2008) that colestyramine hydrochloride (Colestyramine) is not recommended for use within NHS Scotland for the treatment of primary hypercholesterolaemia as an adjunct to dietary measures, either alone or with a statin.

Cautions Bile acid sequestrants interfere with the absorption of fat-soluble vitamins; supplements of vitamins A, D, and K may be required when treatment is prolonged. Interactions: Appendix 1 (bile acid sequestrants)

Side-effects As bile acid sequestrants are not absorbed, gastro-intestinal side-effects predominate.

1. Simvastatin 10mg tablets can be sold to the public to reduce risk of first coronary event in individuals at moderate risk of coronary heart disease (approx. 10–15% risk of major event in 10 years), max. daily dose 10 mg and pack size of 28 tablets; treatment should form part of a programme to reduce risk of coronary heart disease; a proprietary brand Zocor Heart-Pro is on sale to the public

Constipation is common, but diarrhoea has occurred, as have nausea, vomiting, and gastro-intestinal discomfort. Hypertriglyceridaemia may be aggravated. An increased bleeding tendency has been reported due to hypoprothrombinaemia associated with vitamin K deficiency.

Counselling Other drugs should be taken at least 1 hour before or 4–6 hours after bile acid sequestrants to reduce possible interference with absorption. Colesevelam and a statin can be taken at the same time.

COLESEVELAM HYDROCHLORIDE

Indications primary hypercholesterolaemia as an adjunct to dietary measures, either alone or with a statin

Cautions see notes above; also gastro-intestinal motility disorders, major gastro-intestinal surgery, inflammatory bowel disease, hepatic impairment; pregnancy (Appendix 4); breastfeeding (Appendix 5)

Contra-indications bowel or biliary obstruction

Side-effects see notes above; also headache; myalgia

Dose

• Monotherapy, 3.75 g daily in 1–2 divided doses; max. 4.375 g daily

• Combination therapy with statin, 2.5–3.75 g daily in 1–2 divided doses

Cholestyramine COLESTYRAMINE (Cholestyramine)

Indications hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures; primary prevention of coronary heart disease in men aged 35–59 years with primary hypercholesterolaemia who have not responded to diet and other appropriate measures; pruritus associated with partial biliary obstruction and primary biliary cirrhosis (section 1.9.2); diarrhoeal disorders (section 1.9.2)

Cautions see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (colestyraralmine)

Contra-indications complete biliary obstruction (not likely to be effective)

Side-effects see notes above; intestinal obstruction reported rarely and hyperchloraemic acidosis reported on prolonged use

Dose

• Lipid reduction, initially 4 g daily increased by 4 g at weekly intervals to 12–24 g daily in 1–4 divided doses, then adjusted as required; max. 56 g daily

• Pruritus, see section 1.9.2

• Diarrhoeal disorders, see section 1.9.2

• CHILD 6–12 years, see BNF for Children

Note The contents of each sachet should be mixed with at least 150 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, and pulpy fruits with a high moisture content
Colestyramine (Non-proprietary) (TM)
Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £18.20. Label: 13, counselling, avoid other drugs at same time (see notes above) Excipients include aspartame (section 9.4.1)

Questran® (Bristol-Myers Squibb) (TM)
Powder, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £11.42. Label: 13, counselling, avoid other drugs at same time (see notes above) Excipients include sucrose 3.79g/sachet

Questran Light® (Bristol-Myers Squibb) (TM)
Powder, sugar-free, colestyramine (anhydrous) 4 g/sachet, net price 50-sachet pack = £16.99. Label: 13, counselling, avoid other drugs at same time (see notes above) Excipients include aspartame (section 9.4.1)

Ezetimibe
Indications adjunct to dietary measures and statin treatment in primary hypercholesterolaemia and homozygous familial hypercholesterolaemia (ezetimibe alone in primary hypercholesterolaemia if statin inappropriate or not tolerated); adjunct to dietary measures in homozygous sitosterolaemia
Cautions hepatic impairment (avoid if moderate or severe; Appendix 2); pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (ezetimibe)
Side-effects gastro-intestinal disturbances; headache; fatigue; myalgia; rarely arthralgia, hypersensitivity reactions (including rash, angioedema, and anaphylaxis); hepatitis; very rarely pancreatitis, cholelithiasis, cholecystitis, thrombocytopenia, raised creatine kinase, myopathy, and rhabdomyolysis

Dose • ADULT and CHILD over 10 years, 10 mg once daily
Ezetrol® (MSD, Schering-Plough) ▼ (TM)
Tablets, ezetimibe 10 mg, net price 28-tab pack = £26.31

Ezetimibe 10 mg, net price 28-tab pack = £26.31

COLESTIPOL HYDROCHLORIDE
Indications hyperlipidaemias, particularly type IIa, in patients who have not responded adequately to diet and other appropriate measures
Cautions see notes above; pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (colestipol)
Side-effects see notes above

Dose • Initially 5 g 1–2 times daily in liquid increased if necessary in 5-g increments at intervals of 1 month to max. 30 g daily (in 1–2 divided doses)

Note The contents of each sachet should be mixed with at least 100 mL of water or other suitable liquid such as fruit juice, skimmed milk, thin soups, yoghurt, and pulpy fruits with a high moisture content

Colestid® (Pharmacia) (TM)
Granules, yellow, colestipol hydrochloride 5 g/sachet, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

Colestid Orange, granules, yellow/orange, colestipol hydrochloride 5 g/sachet, with aspartame, net price 30 sachets = £15.05. Label: 13, counselling, avoid other drugs at same time (see notes above)

Ezetimibe
Ezetimibe inhibits the intestinal absorption of cholesterol. It is licensed as an adjunct to dietary manipulation in patients with primary hypercholesterolaemia in combination with a statin or alone (if a statin is inappropriate), in patients with homozygous familial hypercholesterolaemia in combination with a statin, and in patients with homozygous familial sitosterolaemia (phytosterolaemia). If ezetimibe is used in combination with a statin, there is an increased risk of rhabdomyolysis (see also CSM advice on p. 140).

NICE guidance
Ezetimibe for the treatment of primary hypercholesterolaemia (November 2007)
Ezetimibe, used in accordance with the licensed indications for Ezetrol®, is an option for the treatment of adults with primary hypercholesterolaemia.

Ezetimibe
Indications hyperlipidaemias, particularly type IIa, IIb, III, IV, and V in patients who have not responded adequately to diet and other appropriate measures; also see notes above
Cautions correct hypothyroidism before initiating treatment (see p. 140); hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3; see also under Myotoxicity below); interactions: Appendix 1 (fibrate)
Myotoxicity Special care needed in patients with renal disease, as progressive increases in serum creatinine concentration or failure to follow dosage guidelines may result in myotoxicity (rhabdomyolysis); discontinue if myotoxicity suspected or creatine kinase concentration increases significantly
**Contra-indications** hypoalbuminaemia, primary biliary cirrhosis, gall bladder disease, nephrotic syndrome, pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances, anorexia; less commonly cholestasis, weight gain, dizziness, headache, fatigue, drowsiness, renal impairment, raised serum creatinine (unrelated to renal impairment), erectile dysfunction, myotoxicity (with myasthenia or myalgia)—special risk in renal impairment (see Cautions), urticaria, pruritus, photosensitivity reactions; very rarely gallstones, hypoglycaemia, anaemia, leucopenia, thrombocytopenia, increased platelet count, alopecia, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**
- See preparations below

**Bezafibrate** (Non-proprietary) Tablets, bezafibrate 200 mg, net price 100-tab pack = £11.23. Label: 21
- Dose 200 mg 3 times daily; CHILD over 10 years, see BNF for Children

**Bezalip** (Roche) Tablets, f/c, bezafibrate 200 mg, net price 100-tab pack = £9.15. Label: 21
- Dose 200 mg 3 times daily; CHILD over 10 years, see BNF for Children

**Modified release** Bezafibrate (Non-proprietary) Tablets, m/r, bezafibrate 400 mg, net price 28-tab pack = £7.68. Label: 21, 25
- Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)
- Brands include Fibrazate XL, Zimbacol XL

**Bezalip® Mono** (Roche) Tablets, m/r, f/c, bezafibrate 400 mg, net price 30-tab pack = £8.09. Label: 21, 25
- Dose 400 mg once daily (dose form not appropriate in patients with renal impairment)

**CIPROFIBRATE**

**Indications** hyperlipidaemias of types IIa, IIb, III, and IV in patients who have not responded adequately to diet; also see notes above

**Cautions** see under Bezafibrate; renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3)

**Contra-indications** see under Bezafibrate

**Side-effects** see under Bezafibrate

**Dose**
- 100 mg daily

**Modalin®** (Winthrop) Tablets, scored, ciprofibrate 100 mg, Net price 28-tab pack = £17.66

**FENOFIBRATE**

**Indications** hyperlipidaemias of types IIa, IIb, III, IV, and V in patients who have not responded adequately to diet and other appropriate measures; also see notes above

**Cautions** see under Bezafibrate; liver function tests recommended every 3 months for first year (discontinue treatment if significantly raised); renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3)

**Contra-indications** gall bladder disease; photosensitivity to ketoprofen; severe hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see under Bezafibrate; also very rarely hepatitis, pancreatitis, and interstitial pneumopathies

**Dose**
- See preparations below

**Fenofibrate** (Non-proprietary) Capsules, fenofibrate (micronised) 200 mg, net price 28-cap pack = £14.23. Label: 21
- Dose 1 capsule daily (dose form not appropriate for children or in renal impairment)

**Lipantil®** (Solvay) Capsules, fenofibrate (micronised) 67 mg, net price 90-cap pack = £23.30. Label: 21
- Dose initially 3 capsules daily in divided doses; usual range 2–4 capsules daily. CHILD 4–15 years 1 capsule/20 kg daily

**Lipantil® Micro** Capsules, orange, fenofibrate (micronised) 200 mg, net price 28-cap pack = £17.95. Label: 21
- Dose initially 1 capsule daily (dose form not appropriate for children or in renal impairment)

**Supralip® 160** (Solvay) Capsules, orange/cream, fenofibrate (micronised) 267 mg, net price 28-cap pack = £21.75. Label: 21
- Dose severe hyperlipidaemia, 1 capsule daily (dose form not appropriate for children or in renal impairment)

**GEMFIBROZIL**

**Indications** hyperlipidaemias of types IIa, IIb, III, IV and V in patients who have not responded adequately to diet and other appropriate measures; primary prevention of cardiovascular disease in men with hyperlipidaemias that have not responded to diet and other appropriate measures; also see notes above

**Cautions** lipid profile, blood counts, and liver-function tests before initiating long-term treatment; preferably avoid use with statins (high risk of rhabdomyolysis); correct hypothyroidism before initiating treatment (see p. 140); elderly; renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); interactions: Appendix 1 (fibrates)

**Contra-indications** alcoholism, biliary-tract disease including gallstones; photosensitivity to fibrates; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances; headache, fatigue, vertigo; eczema, rash; less commonly atrial fibrillation; rarely pancreatitis, appendicitis, disturbances in liver function including hepatitis and cholestatic jaundice, dizziness, paraesthesia, sexual dysfunction, thrombocytopenia, anaemia, leucopenia, eosinophilia, bone-marrow suppression, myalgia, myopathy, myasthenia, myositis accompanied by increase in creatine kinase (discontinue if raised sig-
2 Cardiovascular system

2.12 Lipid-regulating drugs

BNF 57

nificantly), blurred vision, exfoliative dermatitis, alopecia, and photosensitivity)

**Dose**
- 1.2 g daily, usually in 2 divided doses; range 0.9–1.2 g daily; **CHILD** not recommended

**Gemfibrozil** (Non-proprietary) \(\text{Gemfibrozil} \) 300 mg, net price 112-cap pack = £46.70. Label: 22

**Capsules**, gemfibrozil 300 mg, net price 30-tab pack = £10.94. Label: 22

**Tablets**, gemfibrozil 600 mg, net price 30-tab pack = £33.30. Label: 22

**Lolid** (Pfizer) \(\text{Gemfibrozil} \) \(\text{Pfizer} \)

‘300’ capsules, white/maroon, gemfibrozil 300 mg, net price 112-cap pack = £35.57. Label: 22

‘600’ tablets, f/c, gemfibrozil 600 mg, net price 56-tab pack = £35.57. Label: 22

**Nicotinic acid group**

The value of **nicotinic acid** is limited by its side-effects, especially vasodilatation. In doses of 1.5 to 3 g daily it lowers both cholesterol and triglyceride concentrations by inhibiting synthesis; it also increases HDL-cholesterol. Nicotinic acid is licensed for use with a statin if the statin alone cannot adequately control dyslipidaemia (raised LDL-cholesterol, triglyceridaemia, and low HDL-cholesterol); it can be used alone if the patient is intolerant of statins (for advice on treatment of dyslipidaemia, including use of combination treatment, see p. 140). The Scottish Medicines Consortium has advised (January 2006) that **Niaspan** is not recommended for the treatment of dyslipidaemia.

**Acipimox** seems to have fewer side-effects than nicotinic acid but may be less effective in its lipid-modulating capabilities.

**ACIPIMOX**

**Indications** hyperlipidaemias of types IIb and IV in patients who have not responded adequately to diet and other appropriate measures

**Cautions** renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3)

**Contra-indications** peptic ulcer; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** vasodilatation, flushing, itching, rashes, urticaria, erythema; heartburn, epigastric pain, nausea, diarrhoea, headache, malaise, dry eyes; rarely angioedema, bronchospasm, anaphylaxis

**Dose**
- Usually 500–750 mg daily in divided doses

**Olibetam** (Pharmacia) \(\text{Olibetam} \) \(\text{Pharmacia} \)

**Capsules**, brown/pink, acipimox 250 mg, net price 90-cap pack = £46.33. Label: 21

**NICOTINIC ACID**

**Indications** adjunct to statin in dyslipidaemia or used alone if statin not tolerated (see also p. 140)

**Cautions** unstable angina, acute myocardial infarction, diabetes mellitus, gout, history of peptic ulceration; hepatic impairment (Appendix 2); renal impairment; pregnancy (Appendix 4); **interactions**: Appendix 1 (nicotinic acid)

**Contra-indications** arterial bleeding; active peptic ulcer disease; breast-feeding

**Side-effects** diarrhoea, nausea, vomiting, abdominal pain, dyspepsia; flushing; pruritus, rash; **less commonly** tachycardia, palpitation, shortness of breath, peripheral oedema, headache, dizziness, increase in uric acid, hypophosphataemia, prolonged prothrombin time, and reduced platelet count; **rarely** hypotension, syncope, rhinitis, insomnia, reduced glucose tolerance, myalgia, myopathy, and myasthenia; **very rarely** anorexia, rhabdomyolysis

**Note** Prostaglandin-mediated symptoms (such as flushing) can be reduced by low initial doses taken with meals or, if patient taking aspirin, aspirin dose should be taken 30 minutes before nicotinic acid

**Dose**
- See under preparation

**Modified release**

**Niaspan** (Abbott) \(\text{Niaspan} \) \(\text{Abbott} \)

**Tablets**, m/r, nicotinic acid 500 mg, net price 56-tab pack = £17.25. 750 mg, 56-tab pack = £26.25. 1 g, 56-tab pack = £34.75. 21-day starter pack of 7 × 375-mg tab with 7 × 500-mg tab and 7 × 750-mg tab = £14.00. Label: 21, 25

**Dose**
- 375 mg once daily at night (after a low-fat snack) for 1 week, then 500 mg once daily at night for 1 week, then 750 mg once daily at night for 1 week, then 1 g once daily at night for 4 weeks. Increased if necessary in steps of 500 mg at intervals of at least 4 weeks to max. 2 g daily; usual maintenance dose 1–2 g once daily at night

**Omega-3 fatty acid compounds**

The omega-3 fatty acid compounds comprise omega-3-acid ethyl esters (**Omacor**) and omega-3-marine triglycerides (**Maxepa**). Omega-3 fatty acid compounds may be used to reduce triglycerides, as an alternative to a fibrate and in addition to a statin, in patients with combined (mixed) hyperlipidaemia not adequately controlled with a statin alone. A triglyceride concentration exceeding 10 mmol/litre is associated with acute pancreatitis and lowering the concentration reduces this risk. The fat content of omega-3 fatty acid compounds (including excipients in the preparations) should be taken into consideration when treating hypertriglyceridaemia. There is little clinical trial evidence that the triglyceride lowering effect decreases the risk of cardiovascular disease.

The Scottish Medicines Consortium (p. 3) has advised (November 2002) that **omega-3-acid ethyl esters** (**Omacor**) is not recommended for use within NHS Scotland for the treatment of hypertriglyceridaemia.

**OMEGA-3-ACID ETHYL ESTERS**

**Indications** adjunct to diet and statin in type IIb or III hypertriglyceridaemia; adjunct to diet in type IV hypertriglyceridaemia; adjunct in secondary prevention in those who have had a myocardial infarction in the preceding 3 months

**Cautions** haemorrhagic disorders, anticoagulant treatment (bleeding time increased); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances; **less commonly** taste disturbances, dizziness, and hypersensitivity reactions; **rarely** hepatic disorders, headache, hyperglycaemia, acne, and rash; **very rarely** hypo-
tension, nasal dryness, urticaria, and increased white cell count

**Dose**

- See under preparation below

**Omacor** (Solvay)

Capsules, 1 g of omega-3-acid ethyl esters containing eicosapentaenoic acid 460 mg and docosahexaenoic acid 380 mg, net price 28-cap pack = £13.89, 100-cap pack = £49.60. Label: 21

**Dose** hypertriglyceridaemia, initially 2 capsules daily with food, increased if necessary to 4 capsules daily

Secondary prevention after myocardial infarction, 1 capsule daily with food

**OMEGA-3-MARINE TRIGLYCERIDES**

**Indications** adjunct in the reduction of plasma triglycerides in severe hypertriglyceridaemia

**Cautions** haemorrhagic disorders, anticoagulant treatment; aspirin-sensitive asthma; type 2 diabetes

**Side-effects** occasional nausea and belching

**Dose**

- See under preparations below

**Maxepa** (Seven Seas)

Capsules, 1 g (approx. 1.1 mL) concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg. Vitamin A content less than 100 units/g, vitamin D content less than 10 units/g, net price 200-cap pack = £27.28. Label: 21

**Dose** 5 capsules twice daily with food

Liquid, golden-coloured, concentrated fish oils containing eicosapentaenoic acid 170 mg, docosahexaenoic acid 115 mg/g (1.1 mL). Vitamin A content less than 100 units/g, vitamin D content less than 10 units/g, net price 150 mL = £20.46. Label: 21

**Dose** 5 mL twice daily with food

---

**2.13 Local sclerosants**

Ethanolamine oleate and sodium tetradecyl sulphate are used in sclerotherapy of varicose veins, and phenol is used in haemorrhoids (section 1.7.3).

**ETHANOLAMINE OLEATE**

(Monoethanolamine Oleate)

**Indications** sclerotherapy of varicose veins

**Cautions** extravasation may cause necrosis of tissues

**Contra-indications** inability to walk, acute phlebitis, oral contraceptive use, obese legs

**Side-effects** allergic reactions (including anaphylaxis)

**Ethanolamine Oleate** (UCB Pharma) (Non)

**Injection**, ethanolamine oleate 5%, net price 2-mL amp = £3.19, 5-mL amp = £2.28

**Dose** by slow injection into empty isolated segment of vein, 2–5 mL divided between 3–4 sites; repeated at weekly intervals

---

**SODIUM TETRADECYL SULPHATE**

**Indications** sclerotherapy of varicose veins

**Cautions** see under Ethanolamine Oleate

**Contra-indications** see under Ethanolamine Oleate

**Side-effects** see under Ethanolamine Oleate
3 Respiratory system

Asthma

Drugs used in the management of asthma include beta agonists (section 3.1.1), antimuscarinic bronchodilators (section 3.1.2), theophylline (section 3.1.3), corticosteroids (section 3.2), cromoglicate and nedocromil (section 3.3.1), and leukotriene receptor antagonists (section 3.3.2).

For tables outlining the management of chronic asthma and acute severe asthma see p. 149 and p. 150. For advice on the management of medical emergencies in dental practice, see p. 22.

Administration of drugs for asthma

Inhalation This route delivers the drug directly to the airways; the dose required is smaller than when given by mouth and side-effects are reduced. See also Inhaler Devices, section 3.1.5.

Solutions for nebulisation are available for use in acute severe asthma. They are administered over 5–10 minutes from a nebuliser, usually driven by oxygen in hospital. See also Nebulisers, section 3.1.5.

Oral The oral route is used when administration by inhalation is not possible. Systemic side-effects occur more frequently when a drug is given orally rather than by inhalation. Drugs given by mouth for the treatment of asthma include beta agonists, corticosteroids, theophylline, and leukotriene receptor antagonists.

Parenteral Drugs such as beta agonists, corticosteroids, and aminophylline can be given by injection in acute severe asthma when administration by nebulisation is inadequate or inappropriate. If the patient is being treated in the community, urgent transfer to hospital should be arranged.

Pregnancy and breast-feeding

It is particularly important that asthma should be well controlled during pregnancy; when this is achieved asthma has no important effects on pregnancy, labour, or on the fetus. Drugs for asthma should preferably be administered by inhalation to minimise exposure of the...
### Management of chronic asthma

Start at step most appropriate to initial severity; before initiating a new drug consider whether diagnosis is correct, check compliance and inhaler technique, and eliminate trigger factors for acute exacerbations.

#### Adult and Child over 5 years

### 1. Standard-dose inhaled corticosteroids (given through a metered-dose inhaler and in children a large-volume spacer):  
**Beclometasone dipropionate or budesonide** 100–400 micrograms twice daily;  
**CHILD** under 12 years 200–400 micrograms twice daily  
**Fluticasone propionate** 50–200 micrograms twice daily;  
**CHILD** 4–12 years 50–100 micrograms twice daily  
**Mometasone furoate** (given through a dry-powder inhaler) 200 micrograms twice daily

2. Alternatives to inhaled corticosteroids are leukotriene receptor antagonists, theophylline, inhaled cromoglicate, or inhaled nedocromil.

3. High-dose inhaled corticosteroids (given through a metered-dose inhaler and a large-volume spacer):  
**Beclometasone dipropionate or budesonide** 0.4–1 mg twice daily;  
**CHILD** 5–12 years 200–400 micrograms twice daily  
**Fluticasone propionate** 200–500 micrograms twice daily;  
**CHILD** 5–12 years 100–200 micrograms twice daily  
**Mometasone furoate** (given through a dry powder inhaler) 200–400 micrograms twice daily

4. Lung-function measurements cannot be used to guide management in those under 5 years.

Advice on the management of chronic asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated May 2008); updates available at [www.brit-thoracic.org.uk](http://www.brit-thoracic.org.uk)
### Management of acute asthma

#### Important
Patients with severe or life-threatening acute asthma may not be distressed and may not have all of these abnormalities; the presence of any should alert the doctor. Regard each emergency consultation as being for severe acute asthma until shown otherwise.

#### Moderate acute asthma
- Able to talk
- Respiration < 25 breaths/minute; CHILD 2–5 years < 50 breaths/minute, 5–12 years < 30 breaths/minute
- Pulse < 110 beats/minute; CHILD 2–5 years < 130 beats/minute, 5–12 years < 120 beats/minute
- Arterial oxygen saturation ≥ 92%
- Peak flow > 50% of predicted or best; CHILD 5–12 years > 50% of predicted or best

Treat at home or in surgery and assess response to treatment.

#### Severe acute asthma
- Cannot complete sentences in one breath; CHILD too breathless to talk or feed
- Use of accessory breathing muscles in children
- Respiration ≥ 25 breaths/minute; CHILD 2–5 years ≥ 50 breaths/minute; 5–12 years ≥ 30 breaths/minute
- Pulse ≥ 110 beats/minute; CHILD 2–5 years ≥ 130 beats/minute; 5–12 years ≥ 120 beats/minute
- Arterial oxygen saturation < 92%
- Peak flow 33–50% of predicted or best; CHILD 5–12 years < 50% of predicted or best

Send immediately to hospital.

#### Life-threatening acute asthma
- Silent chest, feeble respiratory effort, cyanosis
- Hypotension, bradycardia, dysrhythmia, exhaustion, agitation (in children), confusion, reduced level of consciousness, or coma
- Arterial oxygen saturation < 92%
- Peak flow < 33% of predicted or best; CHILD 5–12 years < 33% of predicted or best

Send immediately to hospital; consult with senior medical staff and refer to intensive care.

#### Follow up
Monitor symptoms and peak flow
Set up asthma action plan and check inhaler technique
Review by general practitioner within 48 hours; modify treatment according to the Management of Chronic Asthma table, p. 149

Advice on the management of acute asthma is based on the recommendations of the British Thoracic Society and Scottish Intercollegiate Guidelines Network (updated May 2008); updates available at [www.brit-thoracic.org.uk](http://www.brit-thoracic.org.uk).
Management of acute severe asthma

Acute severe asthma can be fatal and must be treated promptly and energetically. All patients with acute severe asthma should be given high-flow oxygen (if available) and an inhaled short-acting beta agonist via a large-volume spacer or nebuliser; give 4–10 puffs of salbutamol 100 micrograms/metered inhalation, each puff inhaled separately via a large-volume spacer, and repeat at 10–20 minute intervals if necessary. If there are life-threatening features, give salbutamol or terbutaline via an oxygen-driven nebuliser every 10–20 minutes, see p. 154 and p. 156. In all cases, a systemic corticosteroid (section 6.3.2) should be given. For adults, give prednisolone 40–50 mg by mouth for at least 5 days, or intravenous hydrocortisone 100 mg (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. For children, give prednisolone 1–2 mg/kg by mouth (max. 40 mg) for 3–5 days or intravenous hydrocortisone (under 1 year 25 mg, 1–5 years 50 mg, 6–12 years 100 mg) (preferably as sodium succinate) every 6 hours until conversion to oral prednisolone is possible. If the child has been taking an oral corticosteroid for more than a few days, then give prednisolone 2 mg/kg (CHILD under 2 years max. 40 mg, over 2 years max. 50 mg). In life-threatening asthma, also consider initial treatment with ipratropium by nebuliser (section 3.1.2).

Most patients do not require and do not benefit from the addition of intravenous aminophylline or of intravenous beta agonist; both cause more adverse effects than nebulised beta agonists. Nevertheless, an occasional patient who has not been taking theophylline may benefit from aminophylline infusion (see p. 159). Patients with severe asthma may be helped by magnesium sulphate [unlicensed indication] 1.2–2 g given by intravenous infusion over 20 minutes, but evidence of benefit is limited.

Treatment of acute severe asthma is safer in hospital where resuscitation facilities are immediately available. Treatment should never be delayed for investigations, patients should never be sedated, and the possibility of a pneumothorax should be considered.

If the patient's condition deteriorates despite pharmacological treatment, intermittent positive pressure ventilation may be needed.

For a table outlining the management of acute asthma, see p. 150.

Chronic obstructive pulmonary disease

Smoking cessation (section 4.10) reduces the progressive decline in lung function in chronic obstructive pulmonary disease (COPD, chronic bronchitis, or emphysema). Infection can complicate chronic obstructive pulmonary disease and may be prevented by vaccination (pneumococcal vaccine and influenza vaccine, section 14.4).

A trial of a high-dose inhaled corticosteroid or an oral corticosteroid is recommended for patients with moderate airflow obstruction to ensure that asthma has not been overlooked.

Symptoms of chronic obstructive pulmonary disease may be alleviated by an inhaled short-acting beta agonist (section 3.1.1.1) or a short-acting antimuscarinic bronchodilator (section 3.1.2) used as required.

When the airways obstruction is more severe, an inhaled short-acting antimuscarinic bronchodilator (section 3.1.2) given regularly should be added. In those who remain symptomatic or have two or more exacerbations in a year, a long-acting beta agonist or a long-acting antimuscarinic bronchodilator given regularly should be added; a short-acting antimuscarinic bronchodilator should be discontinued when a long-acting antimuscarinic bronchodilator is started. If symptoms persist or if the patient is unable to use an inhaler, oral modified-release aminophylline or theophylline (section 3.1.3) can be used.

In moderate or severe chronic obstructive pulmonary disease, either a combination of a long-acting beta agonist with an inhaled corticosteroid (section 3.2) or a long-acting antimuscarinic bronchodilator should be tried.

A mucolytic drug (section 3.7) may be considered for a patient with a chronic productive cough.

Long-term oxygen therapy (section 3.6) prolongs survival in patients with severe chronic obstructive pulmonary disease and hypoxaemia.

During an exacerbation of chronic obstructive pulmonary disease, bronchodilator therapy can be administered through a nebuliser if necessary and oxygen given if appropriate. Aminophylline can be given intravenously if response to nebulised bronchodilators is poor. A short course of oral corticosteroid (section 6.3.2), such as prednisolone 30 mg daily for 7–14 days, should be given if increased breathlessness interferes with daily activities. Antibacterial treatment (Table 1, section 5.1) is required when sputum becomes purulent or if there are other signs of infection.

Patients who have had an episode of hypercapnic respiratory failure should be given a 24% or 28% Venturi mask and an oxygen alert card (see p. 152) endorsed with the oxygen saturations required during previous exacerbations. Patients and their carers should be instructed to show the card to emergency healthcare providers in the event of an exacerbation, see also section 3.6.
Respiratory system

3.1.1 Adrenoceptor agonists

(Selective beta agonists)

3.1.1.1 Selective beta agonists

The selective beta agonists (selective beta-adrenoceptor agonists, selective beta stimulants) (section 3.1.1.1) such as salbutamol or terbutaline are the safest and most effective short-acting beta agonists for asthma. Less selective beta agonists such as orciprenaline (section 3.1.1.2) should be avoided whenever possible.

Adrenaline (epinephrine) (which has both alpha- and beta-adrenoceptor agonist properties) is used in the emergency management of allergic and anaphylactic reactions (section 3.4.3) and in the management of croup (see above).

Oxygen alert card

Name: ________________________________

I am at risk of type II respiratory failure with a raised CO level.

Please use my ____% Venturi mask to achieve an oxygen saturation of ____% to ____% during exacerbations.

Use compressed air to drive nebulisers (with nasal oxygen at 2 litres/minute). If compressed air not available, limit oxygen-driven nebulisers to 6 minutes.

Oxygen alert card based on British Thoracic Society guidelines for emergency oxygen use in adult patients (October 2008); available at www.brit-thoracic.org.uk

Croup

Mild croup is largely self-limiting, but treatment with a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg) by mouth may be of benefit. More severe croup (or mild croup that might cause complications) calls for hospital admission; a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg or prednisolone 1–2 mg/kg by mouth, section 6.3.2) should be administered before transfer to hospital. In hospital, dexamethasone 150 micrograms/kg (by mouth or by injection) or budesonide 2 mg (by nebulisation, section 3.2) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring in a dose of 400 micrograms/kg (max. 5 mg) repeated after 30 minutes if necessary; the effects of nebulised adrenaline last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

For more severe croup or croup that might cause complications, treatment with a single dose of a corticosteroid (e.g. dexamethasone 150 micrograms/kg or prednisolone 1–2 mg/kg by mouth, section 6.3.2) should be administered before transfer to hospital. In hospital, dexamethasone 150 micrograms/kg (by mouth or by injection) or budesonide 2 mg (by nebulisation, section 3.2) will often reduce symptoms; the dose may need to be repeated after 12 hours if necessary.

For severe croup not effectively controlled with corticosteroid treatment, nebulised adrenaline solution 1 in 1000 (1 mg/mL) should be given with close clinical monitoring in a dose of 400 micrograms/kg (max. 5 mg) repeated after 30 minutes if necessary; the effects of nebulised adrenaline last 2–3 hours and the child needs to be monitored carefully for recurrence of the obstruction.

3.1.1.2 Other adrenoceptor agonists

Pressurised-metered dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma. A spacer device (section 3.1.5) may improve drug delivery. At recommended inhaled doses the duration of action of salbutamol, terbutaline and fenoterol is about 3 to 5 hours and for salmeterol and formoterol 12 hours. The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta agonist should be stated explicitly to the patient. The patient should be advised to seek

Short-acting beta agonists

Mild to moderate symptoms of asthma respond rapidly to the inhalation of a selective short-acting beta agonist such as salbutamol or terbutaline. If beta agonist inhalation is needed more often than once daily, prophylactic treatment should be considered, using a stepped approach as outlined in the Management of Chronic Asthma table, p. 149. Regular treatment with an inhaled short-acting beta agonist is less effective than ‘as required’ inhalation and is not appropriate prophylactic treatment.

A short-acting beta agonist inhaled immediately before exertion reduces exercise-induced asthma; however, frequent exercise-induced asthma probably reflects poor overall control and calls for reassessment of asthma treatment.

Long-acting beta agonists

Formoterol (efomotorol) and salmeterol are longer-acting beta agonists which are administered by inhalation. Added to regular inhaled corticosteroid treatment, they have a role in the long-term control of chronic asthma (see Chronic Asthma table, p. 149) and they can be useful in nocturnal asthma. Salmeterol should not be used for the relief of an asthma attack; it has a slower onset of action than salbutamol or terbutaline. Formoterol is licensed for short-term symptom relief and for the prevention of exercise-induced bronchospasm; its speed of onset of action is similar to that of salbutamol.

CHM advice

To ensure safe use, the CHM has advised that for the management of chronic asthma, long-acting beta agonists (formoterol and salmeterol) should:

- be added only if regular use of standard-dose inhaled corticosteroids has failed to control asthma adequately;
- not be initiated in patients who have rapidly deteriorating asthma;
- be introduced at a low dose and the effect properly monitored before considering dose increase;
- be discontinued in the absence of benefit;
- be reviewed as clinically appropriate: stepping down therapy should be considered when good long-term asthma control has been achieved.

Patients should be advised to report any deterioration in symptoms following initiation of treatment with a long-acting beta agonist, see Management of Chronic Asthma table, p. 149.

Inhalation

Pressurised-metered dose inhalers are an effective and convenient method of drug administration in mild to moderate asthma. A spacer device (section 3.1.5) may improve drug delivery. At recommended inhaled doses the duration of action of salbutamol, terbutaline and fenoterol is about 3 to 5 hours and for salmeterol and formoterol 12 hours. The dose, the frequency, and the maximum number of inhalations in 24 hours of the beta agonist should be stated explicitly to the patient. The patient should be advised to seek...
medical advice when the prescribed dose of beta agonist fails to provide the usual degree of symptomatic relief because this usually indicates a worsening of the asthma and the patient may require a prophylactic drug such as an inhaled corticosteroid (see Chronic Asthma table, p. 149).

_Nebuliser (or respirator) solutions_ of salbutamol and terbutaline are used for the treatment of severe acute asthma in hospital or in general practice. Patients with a severe attack of asthma should preferably have oxygen during nebulisation since beta agonists can increase arterial hypoxaemia. For the use of nebulisers in chronic obstructive pulmonary disease, see section 3.1.5. The dose given by nebuliser is substantially higher than that given by inhaler. Patients should therefore be warned that it is dangerous to exceed the prescribed dose and they should seek medical advice if they fail to respond to the usual dose of the respirator solution. See also guidelines in section 3.1.5.

_CFC-free inhalers_ Chlorofluorocarbon (CFC) propellants in pressurised metered-dose inhalers are being replaced by hydrofluoroalkane (HFA) propellants. Patients receiving CFC-free inhalers should be reassured about the efficacy of the new inhalers and counselled that the aerosol may feel and taste different; any difficulty with the new inhaler should be discussed with the doctor or pharmacist.

**Oral** Oral preparations of beta agonists may be used by patients who cannot manage the inhaled route. They are sometimes used for children and the elderly, but inhaled beta agonists are more effective and have fewer side-effects. The longer-acting oral preparations, including bambuterol, may be of value in nocturnal asthma but they have a limited role and inhaled long-acting beta agonists are usually preferred.

**Parenteral** Salbutamol or terbutaline are given by intravenous infusion for severe asthma. The regular use of beta agonists by the subcutaneous route is not recommended since the evidence of benefit is uncertain and it may be difficult to withdraw such treatment once started. Patients supplied with a selective beta agonist injection for severe attacks should be advised to attend hospital immediately after using the injection, for further assessment. Beta agonists may also be given by intramascular injection.

**Children** Selective beta agonists are useful even in children under the age of 18 months. They are most effective by the inhaled route; a pressurised metered-dose inhaler should be used with a spacer device in children under 5 years (see NICE guidance, section 3.1.5). A beta agonist may also be given by mouth but administration by inhalation is preferred; a long-acting inhaled beta agonist may be used where appropriate (see Chronic Asthma table, p. 149). In severe attacks nebulisation using a selective beta agonist or ipratropium is advisable (see also Asthma tables, p. 149). For compound preparation containing fenoterol, see section 3.1.4.
Dose
- See under preparations below

Counselling Advise patients not to exceed prescribed dose, and to follow manufacturer's directions; if a previously effective dose of inhaled formoterol fails to provide adequate relief, a doctor's advice should be obtained as soon as possible

Formoterol (Non-proprietary) [AstraZeneca]
Dry powder for inhalation, formoterol fumarate 12 micrograms/metered inhalation, net price 120-dose unit = £24.80. Counselling, dose

Brands include Easyhaler Formoterol

Dose
- by inhalation of powder, asthma, ADULT and CHILD over 6 years, 12 micrograms twice daily, increased to 24 micrograms twice daily in more severe airways obstruction

Chronic obstructive pulmonary disease, 12 micrograms twice daily

Atimos Modulite® (Trinity-Chiesi) [Novartis]
Aerosol inhalation, formoterol fumarate 12 micrograms/metered inhalation, net price 100-dose unit = £31.28. Counselling, dose

Dose
- by aerosol inhalation, asthma, ADULT and CHILD over 12 years, 12 micrograms twice daily, increased to max. 24 micrograms twice daily in more severe airways obstruction

Chronic obstructive pulmonary disease, ADULT over 18 years, 12 micrograms twice daily; for symptom relief additional doses may be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

Foradil® (Novartis) [Novartis]
Dry powder for inhalation, formoterol fumarate 12 micrograms/capsule, net price 60-cap pack (with inhaler device) = £29.23. Counselling, dose

Dose
- by inhalation of powder, asthma, ADULT and CHILD over 5 years, 12 micrograms twice daily; increased to 24 micrograms twice daily in more severe airways obstruction

Chronic obstructive pulmonary disease, ADULT over 12 years, 12 micrograms twice daily

Oxis® (AstraZeneca) [AstraZeneca]
Turbolaler® [= dry powder inhaler], formoterol fumarate 6 micrograms/metered inhalation, net price 60-dose unit = £24.80; 12 micrograms/metered inhalation, 60-dose unit = £24.80. Counselling, dose

Dose
- by inhalation of powder, chronic asthma, 6–12 micrograms 1–2 times daily, increased up to 24 micrograms twice daily if necessary; occasionally up to 72 micrograms daily may be needed (max. single dose 36 micrograms); reassess treatment if additional doses required on more than 2 days a week; CHILD 6–18 years, 6–12 micrograms 1–2 times daily; occasionally up to 48 micrograms daily may be needed (max. single dose 12 micrograms)

Relief of bronchospasm, ADULT and CHILD over 6 years, 6–12 micrograms

Prevention of exercise-induced bronchospasm, 12 micrograms; for symptom relief additional doses can be taken to total max. 48 micrograms daily (max. single dose 24 micrograms)

Compound preparations
For compound preparations containing formoterol, see section 3.2

SALBUTAMOL
(Albuterol)

Indications
asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

Cautions
see notes above

Side-effects
see notes above

Dose
- by mouth (but use by inhalation preferred), 4 mg (elderly and sensitive patients initially 2 mg) 3–4 times daily; max. single dose 8 mg (but unlikely to provide much extra benefit or to be tolerated); CHILD under 2 years 100 micrograms/kg 4 times daily [unlicensed]; 2–6 years 1–2 mg 3–4 times daily, 6–12 years 2 mg 3–4 times daily

- by subcutaneous or intramuscular injection, 500 micrograms, repeated every 4 hours if necessary

- by slow intravenous injection (dilute to a concentration of 50 micrograms/mL), 250 micrograms, repeated if necessary; CHILD 1 month–2 years 5 micrograms/kg as a single dose [unlicensed]; 2–18 years 15 micrograms/kg (max. 250 micrograms) as a single dose [unlicensed]

- by intravenous infusion, initially 5 micrograms/minute, adjusted according to response and heart rate usually in range 3–20 micrograms/minute, or more if necessary; CHILD 1 month–18 years initially 1–5 micrograms/kg/minute, adjusted according to response and heart rate (doses above 2 micrograms/kg/minute in intensive care setting) [unlicensed]

- by aerosol inhalation (but see also Management of Acute Asthma table, p. 150, or Management of Chronic Asthma table, p. 149), 100–200 micrograms (1–2 puffs); for persistent symptoms up to 4 times daily; CHILD 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary; for persistent symptoms up to 4 times daily Prophylaxis of allergen- or exercise-induced bronchospasm, 200 micrograms (2 puffs); CHILD 100 micrograms (1 puff), increased to 200 micrograms (2 puffs) if necessary

- by inhalation of powder (but see also Management of Chronic Asthma table, p. 149), 200–400 micrograms; for persistent symptoms up to 4 times daily; CHILD over 5 years 200 micrograms; for persistent symptoms up to 4 times daily (for Asmazal Clickhaler®, Salbulin Novolizer®, and Ventolin Accuhaler® doses, see under preparations) Prophylaxis of allergen- or exercise-induced bronchospasm, 400 micrograms; CHILD 200 micrograms

- by inhalation of nebulised solution, chronic bronchospasm unresponsive to conventional therapy, severe acute asthma (but see also Management of Acute Asthma table, p. 150) or Management of Chronic Asthma table, p. 149), ADULT and CHILD over 18 months 2.5–5 mg, repeated up to 4 times daily; more frequently in severe cases; max. 40 mg daily; CHILD under 18 months (transient hypoxaemia may occur—consider supplemental oxygen), 2.5 mg up to 4 times daily or more frequently in severe cases

Oral
Salbutamol (Non-proprietary) [AstraZeneca]
Tablets, salbutamol (as sulphate) 2 mg, net price 28-tab pack = £12.71; 4 mg, 28-tab pack = £12.20

Oral solution, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = £1.27

Brands include Salapin (sugar-free)

Ventmax SR (Trinity) [Trinity]
Capsules, m/r, salbutamol (as sulphate) 4 mg (green/grey), net price 56-cap pack = £8.57; 8 mg (white), 56-cap pack = £10.28. Label: 25

Dose
- 8 mg twice daily; CHILD 3–12 years 4 mg twice daily
Ventolin® (A&H)  
Syrup, sugar-free, salbutamol (as sulphate) 2 mg/5 mL, net price 150 mL = £0.60

Parenteral
Ventolin® (A&H)  
Injection, salbutamol (as sulphate) 500 micrograms/mL, net price 1 mL amp = £0.40
Solution for intravenous infusion, salbutamol (as sulphate) 1 mg/mL. Dilute before use. Net price 5 mL amp = £2.58

Inhalation
Counselling
Advise patients not to exceed prescribed dose and to follow manufacturer's directions: if a previously effective dose of inhaled salbutamol fails to provide at least 3 hours relief, a doctor's advice should be obtained as soon as possible.
Patients receiving CFC-free inhalers should be reassured about their efficacy and counselled that aerosol may feel and taste different

Salbutamol (Non-proprietary)  
Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £2.88.
Counselling, dose
Excipients include CFC propellants
Aerosol inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £5.99. Counselling, dose, change to CFC-free inhaler
Excipients include HFA-134a (a non-CFC propellant)
Brands include Accuhaler® Salbutamol, PulmoNed® Salbutamol
Note
Can be supplied against a generic prescription but if CFC-free not specified will be reimbursed at price for CFC-containing inhaler
Dry powder for inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose unit = £3.46; 200 micrograms/metered inhalation, 100-dose unit = £5.05, 200-dose unit = £6.92. Counselling, dose
Excipients include HFA-134a (a non-CFC propellant)
Brands include Salamol
Dry powder for inhalation, salbutamol micrograms/metered inhalation, net price 200-dose unit = £4.95; 200-dose refill = £2.75. Counselling, dose
Dose
Acute bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 1–2 puffs; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma, p. 149).
Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 1–2 puffs
Salamol Easi-Breathe® (IVAX)  
Aerosol inhalation, salbutamol 100 micrograms/metered inhalation, net price 200-dose breath-activated unit = £6.30. Counselling, dose
Excipients include HFA-134a (a non-CFC propellant)
Salbutin Novolizer® (Meda)  
Dry powder for inhalation, salbutamol (as sulphate) 100 micrograms/metered inhalation, net price refillable 200-dose unit = £4.95, 200-dose refill = £2.75. Counselling, dose
Dose
Acute bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 200 micrograms; for persistent symptoms up to 800 micrograms daily (but see also Management of Chronic Asthma, p. 149).
CHILD 6–12 years 100–200 micrograms; for persistent symptoms up to 400 micrograms daily (but see also Management of Chronic Asthma, p. 149).
Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT 200 micrograms, CHILD 6–12 years 100–200 micrograms
Ventolin® (A&H)  
Accuhaler® (dry powder for inhalation), disk containing 60 blisters of salbutamol (as sulphate) 200 micrograms/b blister with Accuhaler®, device, net price = £5.12. Counselling, dose
Dose
Acute bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 200 micrograms; for persistent symptoms up to 4 times daily (but see also Management of Chronic Asthma, p. 149).
Prophylaxis of allergen- or exercise-induced bronchospasm, by inhalation of powder, ADULT and CHILD over 5 years, 200 micrograms
Evohaler® (aerosol inhalation), salbutamol (as sulphate) 100 micrograms/metered inhalation, net price 200-dose unit = £1.50. Counselling, dose, change to CFC-free inhaler
Excipients include HFA-134a (a non-CFC propellant)
Note
Can be supplied against a generic prescription but if CFC-free not specified will be reimbursed at price for CFC-containing inhaler
Nebules® (for use with nebuliser), salbutamol (as sulphate) 1 mg/mL, net price 20 x 2.5 mL (2.5 mg) = £1.75; 2 mg/mL, 20 x 2.5 mL (5 mg) = £2.95. May be diluted with sterile sodium chloride 0.9% if administration time in excess of 10 minutes is required
Respirator solution (for use with a nebuliser or ventilator), salbutamol (as sulphate) 5 mg/mL. Net price 20 mL = £2.27 (hosp. only). May be diluted with sterile sodium chloride 0.9%

Compound preparations
For compound preparations containing salbutamol, see section 3.1.4

Chronic Asthma table, see p. 149
Acute Severe Asthma table, see p. 150.

SALMETEROL
Indications
reversible Airways obstruction (including nocturnal asthma and prevention of exercise-induced bronchospasm) in patients requiring long-term regu-
lary bronchodilator therapy, see also Chronic Asthma table, p. 149; chronic obstructive pulmonary disease

**Note** Not for immediate relief of acute asthma attacks; existing corticosteroid therapy should not be reduced or withdrawn

**Cautions** see notes above

**Side-effects** see notes above; nausea, dizziness, arthralgia, and rash also reported

**Dose**
- **By inhalation,** asthma, 50 micrograms (2 puffs or 1 blister) twice daily; up to 100 micrograms (4 puffs or 2 blisters) twice daily in more severe airways obstruction; **CHILD** 5–12 years, 50 micrograms (2 puffs or 1 blister) twice daily
- Chronic obstructive pulmonary disease 50 micrograms (2 puffs or 1 blister) twice daily

**Counselling** Advise patients that salmeterol should not be used for relief of acute attacks, not to exceed prescribed dose, and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide adequate relief, a doctor’s advice should be obtained as soon as possible

**Serevent**

**Accuhaler** (dry powder for inhalation), disk containing 60 blisters of salmeterol (as xinafoate) 50 micrograms/blisterr with **Accuhaler** device, net price = £29.26. Counselling, dose

**Evohaler** aerosol inhalation, salmeterol (as xinafoate) 25 micrograms/metered inhalation, net price 120-dose unit = £29.26. Counselling, dose, change to CFC-free inhaler

**Diskhaler** (dry powder for inhalation), disks containing 4 blisters of salmeterol (as xinafoate) 50 micrograms/blisterr with **Diskhaler** device = £35.79, 15-disk refill = £35.15. Counselling, dose

**Compound preparations**

For **compound preparations** containing salmeterol, see section 3.2

**TERBUTALINE SULPHATE**

**Indications** asthma and other conditions associated with reversible airways obstruction; premature labour (section 7.1.3)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**
- **By mouth** (but use by inhalation preferred), initially 2.5 mg 3 times daily for 1–2 weeks, then up to 5 mg 3 times daily; **CHILD** 1 month–7 years 75 micrograms/kg 3 times daily; 7–15 years 2.5 mg 2–3 times daily
- **By subcutaneous or slow intravenous injection,** 250–500 micrograms up to 4 times daily; **CHILD** 2–15 years 10 micrograms/kg to a max. of 300 micrograms
- **By continuous intravenous infusion** as a solution containing 3–5 micrograms/mL, 90–300 micrograms/hour for 8–10 hours; **CHILD** 1 month–18 years, initially 2–4 micrograms/kg as a loading dose, then 1–10 micrograms/kg/hour according to response and heart rate (max. 300 micrograms/hour); high doses with close monitoring
- **By inhalation of powder** (**Turbohaler**), **ADULT** and **CHILD** over 5 years, 500 micrograms (1 inhalation);

for persistent symptoms up to 4 times daily (but see Management of Chronic Asthma table, p. 149)
- **By inhalation of nebulised solution,** 5–10 mg 2–4 times daily; additional doses may be necessary in severe acute asthma; **CHILD**, up to 3 years 2 mg, 3–6 years 3 mg; 6–8 years 4 mg, over 8 years 5 mg, 2–4 times daily

**Oral and parenteral**

**Bricanyl** (AstraZeneca)

**Tablets,** scored, terbutaline sulphate 5 mg, net price 20 = £82p

**Syrup,** sugar-free, terbutaline sulphate 1.5 mg/5 mL, net price 100 mL = £2.00

**Injection,** terbutaline sulphate 50 micrograms/mL, net price 1 mL amp = 30p; 5 mL amp = £1.40

**Inhalation**

**Counselling** Advise patients not to exceed prescribed dose and to follow manufacturer’s directions; if a previously effective dose of inhaled terbutaline fails to provide at least 3 hours relief, a doctor’s advice should be obtained as soon as possible

**Bricanyl** (AstraZeneca)

**Turbohaler** (= dry powder inhaler), terbutaline sulphate 50 micrograms/metered inhalation, net price 100-dose unit = £6.92. Counselling, dose

**Respules** (= single-dose units for nebulisation), terbutaline sulphate 2.5 mg/mL, net price 20 x 2 mL units (5-mg) = £4.04

**3.1.1.2 Other adrenoceptor agonists**

Ephedrine and the partially selective beta agonist, orciprenaline, are less suitable and less safe for use as bronchodilators than the selective beta agonists, because they are more likely to cause arrhythmias and other side-effects. They should be avoided whenever possible.

**Adrenaline (epinephrine) injection** (1 in 1000) is used in the emergency treatment of acute allergic and anaphylactic reactions (section 3.4.3), in angioedema (section 3.4.3), and in cardiopulmonary resuscitation (section 2.7.3). Adrenaline solution (1 in 1000) is used by nebulisation in the management of severe croup (section 3.1).

**EPHEDRINE HYDROCHLORIDE**

**Indications** reversible airways obstruction, but see notes above

**Cautions** hyperthyroidism, diabetes mellitus, ischaemic heart disease, hypertension, renal impairment, elderly; prostatic hypertrophy (risk of acute retention); interaction with MAOIs a disadvantage; **interactions:** Appendix 1 (sympathomimetics)

**Side-effects** tachycardia, anxiety, restlessness, insomnia common; also tremor, arrhythmias, dry mouth, cold extremities

**Dose**
- 15–60 mg 3 times daily; **CHILD** up to 1 year 7.5 mg 3 times daily, 1–5 years 15 mg 3 times daily, 6–12 years 30 mg 3 times daily
3.1.2 Antimuscarinic bronchodilators

Ipratropium can provide short-term relief in chronic asthma, but short-acting beta agonists act more quickly and are preferred. Ipratropium by nebulisation can be added to other standard treatment in life-threatening asthma or if acute asthma fails to improve with standard therapy (see Acute Asthma table, p. 150).

The aerosol inhalation of ipratropium can be used for short-term relief in mild chronic obstructive pulmonary disease in patients who are not using a long-acting antimuscarinic drug. Its maximal effect occurs 30–60 minutes after use; its duration of action is 3 to 6 hours and bronchodilation can usually be maintained with treatment 3 times a day.

Tiotropium, a long-acting antimuscarinic bronchodilator, is effective for the management of chronic obstructive pulmonary disease; it is not suitable for the relief of acute bronchospasm.

Cautions Antimuscarinic bronchodilators should be used with caution in patients with prostatic hyperplasia, bladder outflow obstruction, and those susceptible to angle-closure glaucoma (see below); interactions: Appendix 1 (antimuscarinics)

Glaucoma Acute angle-closure glaucoma reported with nebulised ipratropium, particularly when given with nebulised salbutamol (and possibly other beta agonists); care needed to protect patient’s eyes from nebulised salbutamol (and possibly other beta agonists); care needed to protect patient’s eyes from nebulised ipratropium, particularly when given with 

Side-effects Dry mouth is the most common side-effect of antimuscarinic bronchodilators; less commonly nausea and headache occur. Constipation, tachycardia, palpitation, paradoxical bronchospasm, urinary retention, blurred vision, angle-closure glaucoma, and hypersensitivity reactions including rash, urticaria, pruritus, and angioedema occur rarely.

Ipratropium Bromide

Indications reversible airways obstruction, particularly in chronic obstructive pulmonary disease; rhinitis (section 12.2.2)

Cautions see notes above; pregnancy (see p. 148 and Appendix 4); breast-feeding (see p. 148 and Appendix 5)

Side-effects see notes above

Dose

- By aerosol inhalation, 20–40 micrograms, 3–4 times daily; CHILD up to 6 years 20 micrograms 3 times daily, 6–12 years 20–40 micrograms 3 times daily
- By inhalation of powder, ADULT and CHILD over 12 years, 40 micrograms 3–4 times daily (may be doubled in less responsive patients)
- By inhalation of nebulised solution, reversible airways obstruction in chronic obstructive pulmonary disease, 250–500 micrograms 3–4 times daily

Acute bronchospasm (see also Acute Asthma table, p. 150), 500 micrograms repeated as necessary; CHILD under 5 years 125–250 micrograms, max. 1 mg daily; 6–12 years 250 micrograms, max. 1 mg daily

Counselling Advise patient not to exceed prescribed dose and to follow manufacturer’s directions

Ipratropium Bromide (Non-proprietary) Nebuliser solution, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £6.75, 60 × 1-mL = £21.78; 20 × 2-mL (500-microgram) = £7.43, 60 × 2-mL = £26.97. If dilution is necessary use only sterile sodium chloride 0.9%

Atrovent® (Boehringer Ingelheim) (dry powder for inhalation; for use with Atrovent Aerosolizer®), green, ipratropium bromide 40 micrograms, net price pack of 100 caps with Aerosolizer® = £14.53; 100 caps = £10.53. Counselling, dose

Note One Atrovent Aerocap is equivalent to 2 puffs of Atrovent metered aerosol inhalation

Aerosol inhalation, ipratropium bromide 20 micrograms/unit-dose metered inhaler, net price 200-dose unit = £4.21. Counselling, dose, change to CFC-free inhaler

Excipients include HFA-134a (a non-CFC propellant)

Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL unit-dose vials = £5.18, 60 × 1-mL vials = £15.55; 20 × 2-mL vials = £8.08, 60 × 2-mL vials = £18.24. If dilution is necessary use only sterile sodium chloride 0.9%

Ipratropium Steri-Neb® (IVAX) Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £8.72; 20 × 2-mL (500-microgram) = £9.94. If dilution is necessary use only sterile sodium chloride 0.9%

Respongine® (A&H) Nebuliser solution, isotonic, ipratropium bromide 250 micrograms/mL, net price 20 × 1-mL (250-microgram) unit-dose vials = £5.07; 20 × 2-mL (500-microgram) = £5.95. If dilution is necessary use only sterile sodium chloride 0.9%

Compound ipratropium preparations Section 3.1.4

Tiotropium

Indications maintenance treatment of chronic obstructive pulmonary disease

Cautions see notes above; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)
**THEOPHYLLINE**

**Indications** reversible airways obstruction, acute severe asthma: see also Management of Chronic and Acute Asthma (p. 149 and p. 150)

**Cautions** cardiac disease, hypertension, hyperkalaemia; peptic ulcer; epilepsy; elderly; fever; CSM advice on hypokalaemia risk, p. 153; avoid in acute porphyria (section 9.8.2); monitor plasma-theophylline concentration (see notes above); hepatic impairment (Appendix 2); pregnancy (see p. 148 and Appendix 4); breast-feeding (see p. 148 and Appendix 5); interactions: Appendix 1 (theophylline) and notes above

**Side-effects** tachycardia, palpitation, nausea and other gastro-intestinal disturbances, headache, CNS stimulation, insomnia, arrhythmias, and convulsions especially if given rapidly by intravenous injection; overdosage: see Emergency Treatment of Poisoning, p. 33

**Dose**

- See below

**Note** Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); 4–6 hours after a dose and at least 5 days after starting treatment; narrow margin between therapeutic and toxic dose, see also notes above

**Modified release**

- The rate of absorption from modified-release preparations can vary between brands. The Council of the Royal Pharmaceutical Society of Great Britain advises pharmacists that if a general practitioner prescribes a modified-release oral theophylline preparation without specifying a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

**Theophylline**

Theophylline is a bronchodilator used for asthma and stable chronic obstructive pulmonary disease; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. It may have an additive effect when used in conjunction with small doses of beta agonists; the combination may increase the risk of side-effects, including hypokalaemia (for CSM advice see p. 153).

Theophylline is metabolised in the liver; there is considerable variation in plasma-theophylline concentration particularly in smokers, in patients with hepatic impairment or heart failure, or if certain drugs are taken concurrently. The plasma-theophylline concentration is increased in heart failure, cirrhosis, viral infections, in the elderly, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is decreased in smokers and in chronic alcoholism and by drugs that induce liver metabolism. For other interactions of theophylline see Appendix 1.

Differences in the half-life of theophylline are important because its toxic dose is close to the therapeutic dose; particular care is required when introducing or withdrawing drugs that interact with theophylline. In most individuals a plasma-theophylline concentration of between 10–20 mg/litre is required for satisfactory bronchodilation, although a plasma-theophylline concentration of 10 mg/litre (or less) may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Theophylline is given by injection as aminophylline, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe attacks of asthma. It must be given by very slow intravenous injection (over at least 20 minutes); it is too irritant for intramuscular use. Measurement of plasma theophylline concentration may be helpful, and is essential if aminophylline is to be given to patients who have been taking theophylline, because serious side-effects such as convulsions and arhythmias can occasionally precede other symptoms of toxicity.

**THEOPHYLLINE**

**Indications** reversible airways obstruction, acute severe asthma: see also Management of Chronic and Acute Asthma (p. 149 and p. 150)

**Cautions** cardiac disease, hypertension, hyperkalaemia; peptic ulcer; epilepsy; elderly; fever; CSM advice on hypokalaemia risk, p. 153; avoid in acute porphyria (section 9.8.2); monitor plasma-theophylline concentration (see notes above); hepatic impairment (Appendix 2); pregnancy (see p. 148 and Appendix 4); breast-feeding (see p. 148 and Appendix 5); interactions: Appendix 1 (theophylline) and notes above

**Side-effects** tachycardia, palpitation, nausea and other gastro-intestinal disturbances, headache, CNS stimulation, insomnia, arrhythmias, and convulsions especially if given rapidly by intravenous injection; overdosage: see Emergency Treatment of Poisoning, p. 33

**Dose**

- See below

**Note** Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); 4–6 hours after a dose and at least 5 days after starting treatment; narrow margin between therapeutic and toxic dose, see also notes above

**Modified release**

- The rate of absorption from modified-release preparations can vary between brands. The Council of the Royal Pharmaceutical Society of Great Britain advises pharmacists that if a general practitioner prescribes a modified-release oral theophylline preparation without specifying a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

**Theophylline**

Theophylline is a bronchodilator used for asthma and stable chronic obstructive pulmonary disease; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. It may have an additive effect when used in conjunction with small doses of beta agonists; the combination may increase the risk of side-effects, including hypokalaemia (for CSM advice see p. 153).

Theophylline is metabolised in the liver; there is considerable variation in plasma-theophylline concentration particularly in smokers, in patients with hepatic impairment or heart failure, or if certain drugs are taken concurrently. The plasma-theophylline concentration is increased in heart failure, cirrhosis, viral infections, in the elderly, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is decreased in smokers and in chronic alcoholism and by drugs that induce liver metabolism. For other interactions of theophylline see Appendix 1.

Differences in the half-life of theophylline are important because its toxic dose is close to the therapeutic dose; particular care is required when introducing or withdrawing drugs that interact with theophylline. In most individuals a plasma-theophylline concentration of between 10–20 mg/litre is required for satisfactory bronchodilation, although a plasma-theophylline concentration of 10 mg/litre (or less) may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Theophylline is given by injection as aminophylline, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. **Indications** reversible airways obstruction, acute severe asthma: see also Management of Chronic and Acute Asthma (p. 149 and p. 150)

**Cautions** cardiac disease, hypertension, hyperkalaemia; peptic ulcer; epilepsy; elderly; fever; CSM advice on hypokalaemia risk, p. 153; avoid in acute porphyria (section 9.8.2); monitor plasma-theophylline concentration (see notes above); hepatic impairment (Appendix 2); pregnancy (see p. 148 and Appendix 4); breast-feeding (see p. 148 and Appendix 5); interactions: Appendix 1 (theophylline) and notes above

**Side-effects** tachycardia, palpitation, nausea and other gastro-intestinal disturbances, headache, CNS stimulation, insomnia, arrhythmias, and convulsions especially if given rapidly by intravenous injection; overdosage: see Emergency Treatment of Poisoning, p. 33

**Dose**

- See below

**Note** Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); 4–6 hours after a dose and at least 5 days after starting treatment; narrow margin between therapeutic and toxic dose, see also notes above

**Modified release**

- The rate of absorption from modified-release preparations can vary between brands. The Council of the Royal Pharmaceutical Society of Great Britain advises pharmacists that if a general practitioner prescribes a modified-release oral theophylline preparation without specifying a brand name, the pharmacist should contact the prescriber and agree the brand to be dispensed. Additionally, it is essential that a patient discharged from hospital should be maintained on the brand on which that patient was stabilised as an in-patient.

**Theophylline**

Theophylline is a bronchodilator used for asthma and stable chronic obstructive pulmonary disease; it is not generally effective in exacerbations of chronic obstructive pulmonary disease. It may have an additive effect when used in conjunction with small doses of beta agonists; the combination may increase the risk of side-effects, including hypokalaemia (for CSM advice see p. 153).

Theophylline is metabolised in the liver; there is considerable variation in plasma-theophylline concentration particularly in smokers, in patients with hepatic impairment or heart failure, or if certain drugs are taken concurrently. The plasma-theophylline concentration is increased in heart failure, cirrhosis, viral infections, in the elderly, and by drugs that inhibit its metabolism. The plasma-theophylline concentration is decreased in smokers and in chronic alcoholism and by drugs that induce liver metabolism. For other interactions of theophylline see Appendix 1.

Differences in the half-life of theophylline are important because its toxic dose is close to the therapeutic dose; particular care is required when introducing or withdrawing drugs that interact with theophylline. In most individuals a plasma-theophylline concentration of between 10–20 mg/litre is required for satisfactory bronchodilation, although a plasma-theophylline concentration of 10 mg/litre (or less) may be effective. Adverse effects can occur within the range 10–20 mg/litre and both the frequency and severity increase at concentrations above 20 mg/litre.

Theophylline is given by injection as aminophylline, a mixture of theophylline with ethylenediamine, which is 20 times more soluble than theophylline alone. Aminophylline injection is needed rarely for severe attacks of asthma. It must be given by very slow intravenous injection (over at least 20 minutes); it is too irritant for intramuscular use. Measurement of plasma theophylline concentration may be helpful, and is essential if aminophylline is to be given to patients who have been taking theophylline, because serious side-effects such as convulsions and arhythmias can occasionally precede other symptoms of toxicity.
severe, in patients whose night or daytime symptoms persist despite other therapy, who are not currently receiving theophylline, total daily requirement may be added as single evening or morning dose

### Aminophylline

**Note** Aminophylline is a stable mixture or combination of theophylline and ethylenediamine; the ethylenediamine contributes greater solubility in water.

**Indications** reversible airways obstruction, acute severe asthma

**Cautions** see under Theophylline

**Side-effects** see under Theophylline; also allergy to ethylenediamine can cause urticaria, erythema, and exfoliative dermatitis.

**Dose**

- See under preparations, below

**Note** Plasma-theophylline concentration for optimum response 10–20 mg/litre (55–110 micromol/litre); measure plasma-theophylline concentration 4–6 hours after dose by mouth and at least 5 days after starting oral treatment, measure plasma-theophylline concentration 4–6 hours after the start of intravenous infusion; narrow margin between therapeutic and toxic dose, see also notes above

**To avoid excessive dosage in obese patients, dose should be calculated on the basis of ideal weight for height**

### Aminophylline (Non-proprietary)

**Injection**, aminophylline 25 mg/mL, net price 10-ML amp = 72p

Brands include Minijet Aminophylline

**Dose** acute severe asthma or acute exacerbation of chronic obstructive pulmonary disease not previously treated with theophylline, by slow intravenous injection over at least 20 minutes (with close monitoring), 250–500 mg (5 mg/kg), then see below; **CHILD** 5 mg/kg, then see below

Acute severe asthma or acute exacerbation of chronic obstructive pulmonary disease, by intravenous infusion (with close monitoring), 500 micrograms/kg/hour, adjusted according to plasma-theophylline concentration; **CHILD** 6 months–9 years 1 mg/kg/hour, 10–16 years 800 micrograms/kg/hour, adjusted according to plasma-theophylline concentration

**Note** Patients taking oral theophylline or aminophylline should not normally receive intravenous aminophylline unless plasma-theophylline concentration is available to guide dosage.

**Modified release**

**Note** Advice about modified-release theophylline preparations on p. 158 also applies to modified-release aminophylline preparations

### Phyllocontin Continus® (Napp)

**Tablets**, m/r, yellow, f/c, aminophylline hydrate 225 mg, net price 56-tab pack = £2.58. Label: 25

**Dose** **ADULT** and **CHILD** body-weight over 40 kg initially 1 tablet twice daily, increased after 1 week to 2 tablets twice daily according to plasma-theophylline concentration

**Note** Brands of modified-release tablets containing aminophylline 225 mg include Norphyllin SR

**Forte tablets**, m/r, yellow, f/c, aminophylline hydrate 350 mg, net price 56-tab pack = £4.22. Label: 25

**Dose** initially 1 tablet twice daily, increased after 1 week to 2 tablets twice daily if necessary

**Note** Phyllocontin Continus Forte tablets are for smokers and other patients with shorter theophylline half-life (see notes above)

### 3.1.4 Compound bronchodilator preparations

In general, patients are best treated with single-ingredient preparations, such as a selective beta agonist (section 3.1.1.1) or ipratropium bromide (section 3.1.2), so that the dose of each drug can be adjusted. This flexibility is lost with compound bronchodilator preparations. However, a combination product may be appropriate for patients stabilised on individual components in the same proportion.

**For cautions, contra-indications and side-effects** see under individual drugs.

### Combivent® (Boehringer Ingelheim)

**Nebuliser solution**, isotonic, ipratropium bromide 500 micrograms, salbutamol (as sulphate) 2.5 mg/2.5-mL vial, net price 60 unit-dose vials = £25.08

**Dose** bronchodilation in chronic obstructive pulmonary disease, **by inhalation of nebulised solution**, **ADULT** and **CHILD** over 12 years, 1 vial (2.5 mL) 3–4 times daily

**Glaucoma** In addition to other potential side-effects acute angle-closure glaucoma has been reported with nebulised ipratropium—see also notes above

### Duvent® (Boehringer Ingelheim)

**Nebuliser solution**, isotonic, fenoterol hydrobromide 1.25 mg, ipratropium bromide 500 micrograms/4-mL vial, net price 20 unit-dose vials = £11.00

**Dose** acute severe asthma or acute exacerbation of chronic asthma, **by inhalation of nebulised solution**, **ADULT** and **CHILD** over 14 years, 1 vial (4 mL), may be repeated up to max. 4 vials in 24 hours

### Peak flow meters, inhaler devices and nebulisers

#### 3.1.5 Peak flow meters

Measurement of peak flow is particularly helpful for patients who are ‘poor perceivers’ and hence slow to detect deterioration in their asthma, and for those with moderate or severe asthma.

Standard-range peak flow meters are suitable for both adults and children; low-range peak flow meters are appropriate for severely restricted airflow in adults and children. Patients must be given clear guidelines as to the action they should take if their peak flow falls below a certain level. Patients can be encouraged to adjust some of their own treatment (within specified limits) according to changes in peak flow rate.

**Standard Range Peak Flow Meter**

Conforms to standard EN 13826

- **MicroPeak**, range 60–800 litres/minute, net price = £6.50, replacement mouthpiece = 38p (Micro Medical)
- **Mini-Wright**, range 60–800 litres/minute, net price = £6.86, replacement mouthpiece = 38p (Clement Clarke)
- **Personal Best**, range 60–800 litres/minute, net price = £6.48, replacement mouthpiece = 25p (Respiracare)
- **Piko-1**, range 15–999 litres/minute, net price = £9.50, replacement mouthpiece = 38p (nSPIRE Health)
- **Pocketpeak**, range 60–800 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health)
- **Vitalograph**, range 50–800 litres/minute, net price = £4.50 (children’s coloured version also available), replacement mouthpiece = 40p (Vitalograph)

**Note** Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used.
Low Range Peak Flow Meter
Compliant to standard EN 13826 except for scale range Mini-Wright, range 50–400 litres/minute, net price = £6.80, replacement mouthpiece = 38p (Clement Clarke)
Pocketpeak, range 50–400 litres/minute, net price = £6.53, replacement mouthpiece = 38p (nSPIRE Health)

Note: Readings from new peak flow meters are often lower than those obtained from old Wright-scale peak flow meters and the correct recording chart should be used.

Drug delivery devices

Inhaler devices
These include pressurised metered-dose inhalers, breath-activated inhalers, and dry powder inhalers. Many patients can be taught to use a pressurised metered-dose inhaler effectively but some patients, particularly the elderly and children, find them difficult to use. Spacer devices (see below) can help such patients because they remove the need to coordinate actuation with inhalation, and are effective particularly for children under 15 years. Alternatively, breath-activated inhalers are suitable for patients over 7 years and dry powder inhalers are suitable for those over 5 years. On changing from a pressurised metered-dose inhaler to a dry powder inhaler, patients may notice a lack of sensation in the mouth and throat previously associated with each actuation. Coughing may also occur.

The patient should be instructed carefully on the use of the inhaler and it is important to check that the inhaler continues to be used correctly because inadequate inhalation technique may be mistaken for a lack of response to the drug.

Able Spacer (Clement Clarke)
Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price standard device = £4.20; with infant, child or adult mask = £6.86

AeroChamber Plus (GSK)
Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price standard device (blue) = £4.43, with mask (blue) = £7.40; infant device (orange) with mask = £7.40; child device (yellow) with mask = £7.40

Babyhaler (A&H) Spacer device, for paediatric use with Flixotide, Seretide, Seretide and Ventolin inhalers, net price = £11.34

Haleraid (A&H) Inhalation aid, device to place over pressurised (aerosol) inhalers to aid when strength in hands is impaired (e.g. in arthritis). For use with Flixotide, Seretide, Seretide and Ventolin inhalers. Available as Haleraid -120 for 120-dose inhalers and Haleraid -200 for 200-dose inhalers, net price = 80p

Nebuchamber (AstraZeneca)
Spacer device, for use with Pulmicort aerosol inhalers, net price = £8.56

Nebuhaler (AstraZeneca)
Spacer device, large-volume device. For use with Pulmicort inhalers, with paediatric mask = £4.28

Optichamber (Respironics)
Spacer device, for use with all pressurised (aerosol) inhalers, net price = £4.28; with small or medium mask = £7.40

PARI Vortex Spacer (Pari)
Spacer device, medium-volume device. For use with all pressurised (aerosol) inhalers, net price with mouthpiece = £6.07, with mask for infant or child = £7.91; with adult mask = £9.97

Pocket Chamber (nSPIRE Health)
Spacer device, small-volume device. For use with all pressurised (aerosol) inhalers, net price = £4.18; with infant, small, medium, or large mask = £9.75

Volumatic (A&H)
Spacer inhaler, large-volume device. For use with Cenil Modulate, Flixotide, Seretide, Seretide and Ventolin inhalers, net price = £2.75; with paediatric mask = £2.75

Spacer devices
Spacer devices remove the need for co-ordination between actuation of a pressurised metered-dose inhaler and inhalation. The spacer device reduces the velocity of the aerosol and subsequent impaction on the oropharynx. In addition, the device allows more time for evaporation of the propellant so that a larger proportion of the particles can be inhaled and deposited in the lungs. Spacer devices are particularly useful for patients with poor inhalation technique, for children, for patients requiring higher doses, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Nebuhaler®, Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.

Use and care of spacer devices
Patients should inhale from the spacer device as soon as possible after actuation because the drug aerosol is very short-lived; single-dose actuation is recommended. Tidal breathing is as effective as single breaths. The device should be cleansed once a month in mild detergent and then allowed to dry in air; the mouthpiece should be wiped clean of detergent before use. More frequent cleaning should be avoided since any electrostatic charge may affect drug delivery. Spacer devices should be replaced every 6–12 months.

NICE guidance

Inhaler devices for children with chronic asthma (children under 5 years, August 2000; children 6–15 years, March 2002)
A child's needs, ability to develop and maintain effective technique, and likelihood of good compliance should govern the choice of inhaler and spacer device; only then should cost be considered. For children aged under 5 years:
- corticosteroid and bronchodilator therapy should be delivered by pressurised metered-dose inhaler and spacer device, with a facemask if necessary;
- if this is not effective, and depending on the child's condition, nebulised therapy may be considered and, in children over 3 years, a dry powder inhaler may also be considered (but see notes above).

For children aged 5–15 years:
- corticosteroid therapy should be routinely delivered by a pressurised metered-dose inhaler and spacer device;
- children and their carers should be trained in the use of the chosen device; suitability of the device should be reviewed at least annually. Inhaler technique and compliance should be monitored.

Spacer devices
Spacer devices are particularly useful for children under 5 years of age, for patients requiring higher doses of inhaled corticosteroids, for nocturnal asthma, and for patients prone to candidiasis with inhaled corticosteroids. The size of the spacer is important, the larger spacers with a one-way valve (Nebuhaler®, Volumatic®) being most effective. It is important to prescribe a spacer device that is compatible with the metered-dose inhaler, see devices below. Spacer devices should not be regarded as interchangeable; patients should be advised not to switch between spacer devices.
A nebuliser converts a solution of a drug into an aerosol for inhalation. It is used to deliver higher doses of drug to the airways than is usual with standard inhalers. The main indications for use of a nebuliser are:

- to deliver a beta agonist or ipratropium to a patient with an acute exacerbation of asthma or of chronic obstructive pulmonary disease;
- to deliver a beta agonist or ipratropium on a regular basis to a patient with severe asthma or reversible airways obstruction who has been shown to benefit from regular treatment with higher doses;
- to deliver prophylactic medication such as a corticosteroid to a patient unable to use other inhalational devices (particularly to a young child);
- to deliver an antibiotic (such as colistin) to a patient with chronic purulent infection (as in cystic fibrosis or bronchiectasis);
- to deliver budesonide to a child with severe croup;
- to deliver pentamidine for the prophylaxis and treatment of pneumocystis pneumonia.

The proportion of a nebuliser solution that reaches the lungs depends on the type of nebuliser and although it can be as high as 30%, it is more frequently close to 10% and sometimes below 10%. The remaining solution is left in the nebuliser as residual volume or it is deposited in the mouthpiece and tubing. The extent to which the nebulised solution is deposited in the airways or alveoli depends on particle size. Particles with a mass median diameter of 1–5 microns are deposited in the airways and are therefore appropriate for asthma whereas a particle size of 1–2 microns is needed for alveolar deposition of pentamidine to combat pneumocystis infection. The type of nebuliser is therefore chosen according to the deposition required and according to the viscosity of the solution (antibiotic solutions usually being more viscous).

Some jet nebulisers are able to increase drug output during inspiration and hence increase efficiency. The patient should be aware that the dose of a bronchodilator given by nebulisation is usually much higher than that from an aerosol inhaler.

The British Thoracic Society has advised that nebulised treatment. If prescribed, patients must:

- have clear instructions from doctor, specialist nurse or pharmacist on the use of the nebuliser and on peak-flow monitoring;
- be instructed not to treat acute attacks at home without also seeking help;
- receive an education program;
- have regular follow up including peak-flow monitoring and be seen by doctor, specialist nurse or physiotherapist.

Jet nebulisers

Jet nebulisers are more widely used than ultrasonic nebulisers. Most jet nebulisers require an optimum gas flow rate of 6–8 litres/minute and in hospital can be driven by piped air or oxygen; in acute asthma the nebuliser should be driven by oxygen. Domiciliary oxygen cylinders do not provide an adequate flow rate therefore an electrical compressor is required for domiciliary use.

For patients with chronic obstructive pulmonary disease and hypercapnia, oxygen can be dangerous and the nebuliser should be driven by air (see also p. 153). In exacerbations of chronic obstructive pulmonary disease, the nebuliser should be driven by compressed air in hypercapnia or acidosis. If oxygen is required, it should be given simultaneously by nasal cannula.

### Medics Lifecare Nebuliser Chamber

Jet nebuliser, disposable; for use with bronchodilators, antimuscarinics, corticosteroids, and antibacterials, replacement recommended every 2–3 months if used 4 times a day. Compatible with AC 2000 Hi Flo, World Traveller Hi Flo, and Econome, net price = £1.00

Jet nebuliser, consisting of mouthpiece, tubing, and nebuliser chamber, net price = £2.20; mask kits with tubing and nebuliser chamber also available, net price (adult) = £2.00; (child) = £1.10

Jet nebuliser, non-disposable, for hospital or home use; for use with bronchodilators, antibacterials, and corticosteroids, replacement recommended yearly if used 4 times a day. Compatible with PARI TurboBOY S, D, PARI JuniorBOY S, D, PAS Mobile S, D, and PARI WALK BOY compressors, net price = £16.05

Jet nebuliser, non-disposable, for hospital or home use; for use with bronchodilators, antibacterials, and corticosteroids, replacement recommended yearly if used 4 times a day. Compatible with PARI TurboBOY S, D, PARI JuniorBOY S, D, PAS Mobile S, D, and PARI WALK BOY compressors. Available separately for children aged less than 1 year, 1–4 years or 4–7 years, net price (with mask and connection tube) = £32.15
**Respiratory system**

**3.1.5 Peak flow meters, inhaler devices and nebulisers**

**BNF 57**

**Sidestream Durable** (Profile Respiratory)

Jet nebuliser, non-disposable, for home use; for use with bronchodilators; yearly replacement recommended if 4 six-minute treatments used per day. Compatible with Freeway Freedom and Porta-Neb, net price year pack = £20.40 (Porta-Neb), £29.00 (Freeway Freedom). Disposable Sidestream nebuliser also available.

**Ventstream** (Profile Respiratory)

Jet nebuliser, closed-system, for use with low flow compressors, compatible with Porta-Neb, and Freeway Freedom compressors; for use with antibacterials, bronchodilators, and corticosteroids, replacement recommended yearly if used 3 times a day, net price year pack with filter = £39.00 (Porta-Neb), £41.00 (Freeway Freedom).

**Home compressors with nebulisers**

**AC 2000 HI FLO** (Medix)

Home and hospital use, containing 1 Jet Nebuliser set with mouthpiece, 1 adult and 1 child mask, 1 spare inlet filter, filter spanner. Mains operated. Nebulises bronchodilators, corticosteroids, and antibacterials, net price = £117.00; carrying case available.

**AC 4000** (Medix)

Home and hospital use, containing 1 Jet Nebuliser set with mouthpiece, 1 adult and 1 child mask, 1 spare inlet filter, filter spanner. Mains operated. Nebulises bronchodilators, corticosteroids, and antibacterials, net price = £80.10.

**Aquilon** (Henleys)

Portable, home use, with 1 adult or 1 child mask and tubing. Mains operated; for use with bronchodilators, corticosteroids and antibacterials, net price = £82.50.

**Econone** (Medix)

Home, clinic and hospital use, used with 1 Jet Nebuliser set with mouthpiece, 1 adult and 1 child mask, 1 spare inlet filter, filter spanner. Mains operated. Nebulises bronchodilators, corticosteroids, and antibacterials. Mains operated, net price = £99.00.

**Freeway Freedom** (Profile Respiratory)

Portable, containing Sidestream Durable nebuliser, 1 adult mask, 1 child mask, 1 angled mouthpiece, 1 coiled Duratube. 4 inlet filters, charger and power lead, net price = £203.20; with Ventstream nebuliser, 1 straight mouthpiece, 1 coiled Duratube, 4 inlet filters, 1 aerosol hose, charger and power lead, net price = £203.20.

**PARI JuniorBOY S** (Pari)

Portable, for hospital or home use, containing PARI LC SPRINT Junior nebuliser with mouthpiece, mask, connection tube, and mains cable. Filter replacement recommended every 12 months. Compatible with PARI LC SPRINT, and PARI LC SPRINT BABY nebulisers, net price = £70.00.

**PARI TurboBOY S** (Pari)

Portable, for hospital or home use, containing PARI LC SPRINT nebuliser with adult mouthpiece, mask, connection tube and mains cable. Filter replacement recommended every 12 months. Compatible with PARI LC SPRINT, and PARI LC SPRINT BABY nebulisers, net price = £55.00.

**PARI BOY Mobile S** (Pari)

Portable, containing PARI LC SPRINT nebuliser with connection tube, mains cable, rechargeable battery, car battery adaptor, and carrying case. Compatible with PARI LC SPRINT, and PARI LC SPRINT BABY nebulisers. Nebulises bronchodilators, corticosteroids, and antibacterials, net price = £180.00.

**Porta-Neb** (Profile Respiratory)

Portable, containing Sidestream Durable nebuliser, 1 adult mask, 1 child mask, 1 angled mouthpiece, 1 coiled Duratube, 4 inlet filters. Mains operated, net price = £94.00; with Ventstream nebuliser, 1 straight mouthpiece, 1 coiled Duratube, 4 inlet filters, aerosol hose. Mains operated, net price = £104.80.

**De Vilbiss 5650** (De Vilbiss)

Home, clinic use, containing disposable nebuliser set, mouthpiece, mask, mains lead, tubing, thumb-valve. For use with bronchodilators, net price = £142.14.

**De Vilbiss 4650** (De Vilbiss)

Home, clinic and hospital use; with mouthpiece. Mains operated, net price = £93.95.

**Tourer** (Henleys)

Portable, home use, mains/car battery operated; for use with bronchodilators, corticosteroids and antibacterials, net price = £101.25.

**Ultima** (Henleys)

Portable, home use, rechargeable or mains/car battery operated. Nebulises bronchodilators and corticosteroids, net price = £156.00 (includes case).

**World Traveller HI FLO** (Medix)

Portable, containing 1 Jet Nebuliser set with mouthpiece, 1 adult and 1 child mask, 1 spare inlet filter, filter spanner. Battery, car, and mains operated; rechargeable battery pack available. Nebulises bronchodilators, corticosteroids, and antibacterials, net price excluding battery = £166.00; with battery = £216.00; carrying case available.

**Compressors**

**Omron CX3** (Omron)

Home and hospital use, mains operated, net price = £48.75.

**Omron compAIR CX** (Omron)

Home and hospital use, mains operated, net price = £56.78 (includes 1 adult mask, child mask, 5 spare filters, and carrying case).

**System 22 CR60** (Profile Respiratory)

Hospital use, high flow compressor. Mains operated, net price = £199.90. Also compatible with System 22 Antibiotic Tee for nebulisation of high viscosity drugs such as antibacterials.

**Turboneb** (Medix)

Home use, high flow compressor. Nebulises bronchodilators, corticosteroids, antibacterials, and pentamidine. Mains operated, net price = £125.00.

**Ultrasonic nebulisers**

Ultrasonic nebulisers produce an aerosol by ultrasonic vibration of the drug solution and therefore do not require a gas flow.

**F16 Wave** (Parkside)

Portable, adjustable delivery rate. Mains/car battery operated or rechargeable battery pack (supplied), net price = £130.00.

**Liberty** (Medix)

Portable, home and clinic use, containing disposable mouthpiece and chamber cover. Mains and car battery operated. Nebulises bronchodilators and antibacterials, net price £112.49.

**Omron MicroAIR** (Omron)

Portable, battery operated, net price = £149.96 (includes 1 adult mask, 1 child mask, and carrying case; mains adaptor also available).

**Omron NE-U17** (Omron)

Clinic and hospital use, mains operated, net price = £650.17.

**Ultra Neb 2000** (De Vilbiss)

Hospital, clinic, and home use, delivery rate adjustable. Supplied with stand, net price = £1205.00.

**Nebuliser diluent**

Nebulisation may be carried out using an undiluted nebuliser solution or it may require dilution beforehand. The usual diluent is sterile sodium chloride 0.9% (physiological saline).

**Sodium Chloride** (Non-proprietary)

Nebuliser solution, sodium chloride 0.9%, net price 20 × 2.5 mL = £5.49. Brands include Saline Steripoule, Saline Steri-Neb.
Corticosteroids

Corticosteroids are used for the management of reversible and irreversible airways disease. An inhaled corticosteroid used for 3–4 weeks may help to distinguish asthma from chronic obstructive pulmonary disease; clear improvement over 3–4 weeks suggests asthma.

Asthma Corticosteroids are effective in asthma; they reduce airway inflammation (and hence reduce oedema and secretion of mucus into the airway).

An inhaled corticosteroid is used regularly for prophylaxis of asthma when patients require a beta agonist more than twice a week, or if symptoms disturb sleep more than once a week, or if the patient has suffered exacerbations in the last 2 years requiring a systemic corticosteroid or a nebulised bronchodilator (see Management of Chronic Asthma table, p. 149). Regular use of inhaled corticosteroids reduces the risk of exacerbation of asthma.

Current and previous smoking reduces the effectiveness of inhaled corticosteroids and higher doses may be necessary.

Corticosteroid inhalers must be used regularly for maximum benefit; alleviation of symptoms usually occurs 3 to 7 days after initiation. Beclometasone dipropionate (beclometasone dipropionate), budesonide, fluticasone propionate, and mometasone furoate appear to be equally effective. Preparations that combine a corticosteroid with a long-acting beta agonist may be helpful for patients stabilised on the individual components in the same proportion.

In adults using an inhaled corticosteroid and a long-acting beta agonist for the prophylaxis of asthma (see step 3 of the Management of Chronic Asthma table, p. 149) but who are poorly controlled, Symbicort® (budesonide with formoterol) is licensed for use as a reliever (instead of a short-acting beta agonist), in addition to its regular use for the prophylaxis of asthma. Patients must be carefully instructed on the appropriate dose and management of exacerbations before initiating this therapy, see Symbicort® p. 166. This management approach has not been investigated with combination inhalers containing other corticosteroids and long-acting beta agonists.

Patients taking long-term oral corticosteroids for asthma can often be transferred to an inhaled corticosteroid but the transfer must be slow, with gradual reduction in the dose of the oral corticosteroid, and at a time when the asthma is well controlled.

High doses of inhaled corticosteroid can be prescribed for patients who respond only partially to standard doses with a long-acting beta agonist or another long-acting bronchodilator (see Management of Chronic Asthma table, p. 149). High doses should be continued only if there is clear benefit over the lower dose. The recommended maximum dose of an inhaled corticosteroid should not generally be exceeded. However, if a higher dose is required, then it should be initiated and supervised by a specialist. The use of high doses of inhaled corticosteroid can minimise the requirement for an oral corticosteroid.

Systemic corticosteroid therapy may be necessary during episodes of infection or if the asthma is worsening, when higher doses are needed and access of inhaled drug to small airways may be reduced; patients may need a reserve supply of tablets.

**Side-effects of inhaled corticosteroids** Inhaled corticosteroids have considerably fewer systemic effects than oral corticosteroids (section 6.3.2), but adverse effects have been reported.

High doses of inhaled corticosteroids (see Management of Chronic Asthma table, p. 149) used for prolonged periods can induce adrenal suppression. Inhaled corticosteroids have been associated with adrenal crisis and coma in children; excessive doses should be avoided. Patients using high doses of inhaled corticosteroids should be given a ‘steroid card’ (section 6.3.2) and specific written advice to consider corticosteroid replacement during an episode of stress, such as severe intercurrent illness or an operation.

**MHRA/CHM advice (July 2008)**

- Beclometasone dipropionate CFC-free pressurised metered-dose inhalers (Qvar® and Clenil Modulite®) are not interchangeable and should be prescribed by brand name; Qvar® has extra-fine particles, is more potent than traditional CFC-containing inhalers, and is approximately twice as potent as Clenil Modulite®
- Fostair® is a combination beclometasone dipropionate and formoterol fumarate CFC-free pressurised metered-dose inhaler; Fostair® has extra-fine particles and is more potent than traditional beclometasone dipropionate CFC-free inhalers

**3.2 Corticosteroids**

**Chronic obstructive pulmonary disease** In chronic obstructive pulmonary disease inhaled corticosteroid treatment may reduce exacerbations. An inhaled corticosteroid [unlicensed indication] should be considered (in addition to bronchodilator treatment) if the forced expiratory volume in 1 second (FEV1) is less than 50% of the predicted value and if the patient has had 2 or more exacerbations in a year which require antibacterial treatment or an oral corticosteroid.

**Cautions of inhaled corticosteroids** Systemic therapy may be required during periods of stress or when either airways obstruction or mucus prevent drug access to smaller airways. For advice on the use of corticosteroids in women with asthma who are pregnant or breast-feeding, see p. 148, and Appendix 4 and Appendix 5; interactions: Appendix 1 (corticosteroids)

**Paradoxical bronchospasm** The potential for paradoxical bronchospasm (calling for discontinuation and alternative therapy) should be borne in mind—mild bronchospasm may be prevented by inhalation of a short-acting beta agonist beforehand (or by transfer from an aerosol inhalation to a dry powder inhalation). CFC-free inhalers Chlorofluorocarbon (CFC) propellants in pressurised aerosol inhalers are being replaced by hydrofluoroalkane (HFA) propellants. Patients receiving CFC-free inhalers should be reassured about the efficacy of the new inhalers and counselled that the aerosol may feel and taste different; any difficulty with the new inhaler should be discussed with the doctor or pharmacist.

Doses for CFC-free corticosteroid inhalers may be different from those that contain CFCs, see also MHRA/CHM advice below.
High doses of inhaled corticosteroids have been associated with lower respiratory tract infections, including pneumonia, in older patients with chronic obstructive pulmonary disease.

Bone mineral density may be reduced following long-term inhalation of higher doses of corticosteroids, predisposing patients to osteoporosis (section 6.6). It is therefore sensible to ensure that the dose of an inhaled corticosteroid is no higher than necessary to keep a patient’s asthma under good control. Treatment with an inhaled corticosteroid can usually be stopped after a mild exacerbation as long as the patient knows that it is necessary to reinstate it should the asthma deteriorate or the peak flow rate fall.

In children, growth restriction associated with systemic corticosteroid therapy does not seem to occur with recommended doses of inhaled therapy; although initial growth velocity may be reduced, there appears to be no effect on achieving normal adult height. However, the CSM has recommended that the height of children receiving prolonged treatment of inhaled corticosteroid is monitored; if growth is slowed, referral to a paediatrician should be considered. Large-volume spacer devices should be used for administering inhaled corticosteroids in children under 5 years (see NICE guidance, section 3.1.5); they are also useful in older children and adults, particularly if high doses are required. Spacer devices increase airway deposition and reduce oropharyngeal deposition.

A small risk of glaucoma with prolonged high doses of inhaled corticosteroids has been reported; cataracts have also been reported with inhaled corticosteroids. Hoarseness and candidiasis of the mouth or throat have been reported, usually only with large doses (see also below). Hypersensitivity reactions (including rash and angioedema) have been reported rarely. Other side-effects that have been reported very rarely include paradoxical bronchospasm, anxiety, depression, sleep disturbances, and behavioural changes including hyperactivity and irritability.

Candidiasis The risk of oral candidiasis can be reduced by using a spacer device with the corticosteroid inhaler; rinsing the mouth with water (or cleaning a child’s teeth) after inhalation of a dose may also be helpful. Antifungal oral suspension or lozenges (section 12.3.2) can be used to treat oral candidiasis without discontinuing therapy.

Oral An acute attack of asthma should be treated with a short course of an oral corticosteroid starting with a high dose, e.g. prednisolone 40–50 mg daily for a few days. Patients whose asthma has deteriorated rapidly usually respond quickly to corticosteroids. The dose can usually be stopped abruptly in a mild exacerbation of asthma (see also Withdrawal of Corticosteroids, section 6.3.2) but it should be reduced gradually in those with poorer asthma control, to reduce the possibility of serious relapse. For the use of corticosteroids in the emergency treatment of acute severe asthma, see Management of Acute Asthma table, p. 150.

In chronic continuing asthma, when the response to other drugs has been inadequate, longer term administration of an oral corticosteroid may be necessary; in such cases high doses of an inhaled corticosteroid should be continued to minimise oral corticosteroid requirements. In chronic obstructive pulmonary disease prednisolone 30 mg daily should be given for 7–14 days; treatment can be stopped abruptly. Prolonged treatment with oral prednisolone is of no benefit and maintenance treatment is not normally recommended.

An oral corticosteroid should normally be taken as a single dose in the morning to reduce the disturbance to circadian cortisol secretion. Dosage should always be titrated to the lowest dose that controls symptoms. Regular peak-flow measurements help to optimise the dose.

**Parenteral** For the use of hydrocortisone injection in the emergency treatment of acute severe asthma, see Management of Acute Asthma table, p. 150.

---

**BECLOMETASONE DIPROPIONATE** (Becloethasone Dipropionate)

**Indications** prophylaxis of asthma (see also Management of Chronic Asthma table, p. 149)

**Cautions** see notes above

**Side-effects** see notes above

**Dose**

- By aerosol inhalation, see Management of Chronic Asthma table, p. 149 (important: for Clenil Modulite® and Qvar®, see under preparations)
- By inhalation of dry powder (important: for Asmacet® and Becodisks®, see under preparations), 200–400 micrograms twice daily; adjusted as necessary up to 800 micrograms twice daily; CHILD over 5 years 100–200 micrograms twice daily, adjusted as necessary

**Beclometasone** (Non-proprietary) \[\text{BECLOMETASONE DICLOFILMATE}\]

Aerosol inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £5.69; 100 micrograms/metered inhalation, 200-dose unit = £9.91; 200 micrograms/metered inhalation, 200-dose unit = £17.25; 250 micrograms/metered inhalation, 200-dose unit = £22.88. Label: 8, counselling, dose; also 10 and steroid card with high doses

Excipients include CFC propellants

**Brand include Beclozone**

Dry powder for inhalation, beclometasone dipropionate 100 micrograms/metered inhalation, net price 100-dose unit = £5.58; 200 micrograms/metered inhalation, 100-dose unit = £10.29, 200-dose unit = £15.60; 400 micrograms/metered inhalation, 100-dose unit = £20.41. Label: 8, counselling, dose; also 10 and steroid card with high doses

Excipients include Pulvinal beclometasone Dipropionate, Easyhaler beclometasone Dipropionate

**Inhalation powder, hard capsule** (for use with Cyclohaler® device), beclometasone dipropionate 100 micrograms, net price 120-cap pack = £15.99; 200 micrograms, 120-cap pack = £25.00; 400 micrograms, 120-cap pack = £32.25. Label: 8, counselling, dose; also 10 and steroid card with high doses

**Brand include Beclometasone Cyclocaps**

Asmabec Clickhaler® (UCB Pharma) \[\text{BECLOMETASONE DICLOFILMATE}\]

Dry powder for inhalation, beclometasone dipropionate 50 micrograms/metered inhalation, net price 200-dose unit = £6.68; 100 micrograms/metered inhalation, 200-dose unit = £9.81; 250 micrograms/metered inhalation, 100-dose unit = £12.31. Label: 8, counselling, dose; also 10 and steroid card with high doses

**Dose** by inhalation of powder; prophylaxis of asthma, 100–400 micrograms twice daily, adjusted as necessary, max. 1 mg twice daily; CHILD 6–12 years 50–200 micrograms twice daily, adjusted as necessary

Pulmicort® (AstraZeneca) [NH]
Aerosol inhalation, budesonide 200 micrograms/metered inhalation, net price 200-dose unit = £20.90. Label: 8, counselling, dose; also 10 and steroid card with high doses
Excipients include CFC propellants
Dose: by aerosol inhalation, ADULT and CHILD over 12 years, 200–400 micrograms twice daily, adjusted as necessary; max. 800 micrograms twice daily. CHILD 6–12 years, 50–400 micrograms twice daily adjusted as necessary

Turbohaler® (= dry powder inhaler), budesonide 100 micrograms/metered inhalation, net price 200-dose unit = £18.50; 200 micrograms/metered inhalation, 100-dose unit = £18.50; 400 micrograms/metered inhalation, 50-dose unit = £18.50. Label: 8, counselling, dose; also 10 and steroid card with high doses
Dose: by inhalation of powder, ADULT and CHILD over 12 years, 100–800 micrograms twice daily, adjusted as necessary, alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms (max. 800 micrograms) as a single dose in the evening. CHILD 5–12 years 100–400 micrograms twice daily, adjusted as necessary; alternatively, in mild to moderate asthma, for patients previously stabilised on a twice daily dose, 200–400 micrograms as a single dose in the evening

Respules® (= single-dose units for nebulisation), budesonide 250 micrograms/mL, net price 20 × 2 mL (500-microgram) unit = £32.00; 500 micrograms/mL, 20 × 2 mL (1-mg) unit = £44.64. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, dose, 10, steroid card
Dose: prophylaxis of asthma, by inhalation of nebulised suspension, ADULT and CHILD over 12 years, 1–2 mg twice daily, reduced to 0.5–1 mg twice daily; CHILD 3 months–12 years, 0.5–1 mg twice daily, reduced to 250–500 micrograms twice daily. Group, by inhalation of nebulised solution, 2 mg as a single dose (or as two 1-mg doses separated by 30 minutes)

Symbicort® (AstraZeneca) [NH]
Symbicort 100/6 Turbohaler® (= dry powder inhaler), budesonide 100 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £33.00. Label: 8, counselling, dose
Dose: by inhalation of powder, asthma maintenance therapy, 1–2 puffs twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained. CHILD 6–12 years, 2 puffs twice daily reduced to 1 puff once daily if control maintained. 12–17 years, 1–2 puffs twice daily reduced to 1 puff once daily if control maintained. Asthma, maintenance and reliever therapy, ADULT over 18 years, 2 puffs daily in 1–2 divided doses, for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs can be used for a limited time but medical assessment should be considered
Symbicort 200/6 Turbohaler® (= dry powder inhaler), budesonide 200 micrograms, formoterol fumarate 6 micrograms/metered inhalation, net price 120-dose unit = £38.00. Label: 8, counselling, dose; also 10 and steroid card with high doses
Dose: by inhalation of powder, asthma maintenance therapy, 1–2 puffs twice daily increased if necessary to max. 4 puffs twice daily, reduced to 1 puff once daily if control maintained. CHILD 12–17 years 1–2 puffs twice daily reduced to 1 puff once daily if control maintained. Asthma, maintenance and reliever therapy, ADULT over 18 years, 2 puffs daily in 1–2 divided doses, increased if necessary to 2 puffs twice daily; for relief of symptoms, 1 puff as needed up to max. 6 puffs at a time; max. 8 puffs daily; up to 12 puffs can be used for a limited time but medical assessment should be considered. Chronic obstructive pulmonary disease, 2 puffs twice daily
Symbicort 400/12 Turbohaler® (= dry powder inhaler), budesonide 400 micrograms, formoterol fumarate 12 micrograms/metered inhalation, net price 60-dose unit = £38.00. Label: 8, counselling, dose; also 10 and steroid card with high doses
Dose: by inhalation of powder, asthma maintenance therapy, 1 puff twice daily increased if necessary to max. 2 puffs twice daily, reduced to 1 puff once daily if control maintained. CHILD 12–17 years 1 puff twice daily reduced to 1 puff once daily if control maintained. Chronic obstructive pulmonary disease, 1 puff twice daily

Ciclesonide
Indications prophylaxis of asthma
Cautions see notes above
Side-effects see notes above
Dose
• By aerosol inhalation, ADULT and CHILD over 12 years, 160 micrograms daily as a single dose reduced to 80 micrograms daily if control maintained
Alvesco® (Nycomed) [NH]
Aerosol inhalation, ciclesonide 80 micrograms/metered inhalation, net price 120-dose unit = £28.56; 160 micrograms/metered inhalation, 60-dose unit = £16.80. 120-dose unit = £33.60. Label: 8, counselling, dose
Excipients include HFA-134a (a non-CFC propellant)

Fluticasone Propionate
Indications prophylaxis of asthma (see also Management of Chronic Asthma table, p. 149)
Cautions see notes above
Side-effects see notes above; also very rarely dyspepsia, hyperglycaemia, and arthralgia
Dose
• See preparations below
Flixotide® (A&H) [NH]
Accuhaler® (dry powder for inhalation), disk containing 60 blisters of fluticasone propionate 50 micrograms/blister with Accuhaler® device, net price = £6.38; 100 micrograms/blister with Accuhaler® device = £8.93; 250 micrograms/blister with Accuhaler® device = £21.28; 500 micrograms/blister with Accuhaler® device = £36.14. Label: 8, counselling, dose; also label 10 and steroid card with high doses
Note: Flixotide Accuhaler 250 micrograms and 500 micrograms are not indicated for children
Dose: by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily, increased according to severity of asthma (max. 1 mg twice daily). CHILD 5–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Diskhaler® (dry powder for inhalation), fluticasone propionate 50 micrograms/blister, net price 15 disks of 4 blisters with Diskhaler® device = £8.17, 15-disk refill = £7.64; 100 micrograms/blister, 15 disks of 4 blisters with Diskhaler® device = £12.71, 15-disk refill = £12.18; 250 micrograms/blister, 15 disks of 4 blisters with Diskhaler® device = £24.11, 15-disk refill = £23.58; 500 micrograms/blister, 15 disks of 4 blisters with Diskhaler® device = £40.05, 15-disk refill = £39.52. Label: 8, counselling, dose; also label 10 and steroid card with high doses
Note: Flixotide Diskhaler 250 micrograms and 500 micrograms are not indicated for children
Dose: by inhalation of powder, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily, increased according to severity of asthma (max. 1 mg twice daily). CHILD 5–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily
Evohaler® aerosol inhalation, fluticasone propionate 50 micrograms/metered inhalation, net price 120-dose unit = £5.44; 125 micrograms/metered inhalation, 120-dose unit = £21.26; 250 micrograms/metered inhalation, 120-dose unit = £36.14. Label: 8, counselling, dose, change to CFC-free inhaler; also label 10 and steroid card with high doses

Exipients include HFA-134a (a non-CFC propellant)

Note Flutotide Evohaler 125 micrograms and 250 micrograms not indicated for children

Dose by aerosol inhalation, prophylaxis of asthma, ADULT and CHILD over 16 years, 100–500 micrograms twice daily increased according to severity of asthma (max. 1 mg twice daily). CHILD 4–16 years, 50–100 micrograms twice daily adjusted as necessary; max. 200 micrograms twice daily

Nebulés® (=single-dose units for nebulisation) fluticasone propionate 250 micrograms/mL, net price 10 × 2-mL (500-microgram) unit = £9.34; 1 mg/mL, 10 × 2-mL (2-mg) unit = £37.35. May be diluted with sterile sodium chloride 0.9%. Label: 8, counselling, dose, 10, steroid card

Dose by inhalation of nebulised suspension, prophylaxis of asthma, ADULT and CHILD over 16 years, 0.5–2 mg twice daily; CHILD 4–16 years, 1 mg twice daily

**3.3.1 Cromoglicate and related therapy**

**MOMETASONE FURONATE**

**Indications** prophylaxis of asthma (see also Management of Chronic Asthma table, p. 149)

**Cautions** see notes above

**Side-effects** see notes above; also pharyngitis, headache; less commonly palpitation

**Dose**

- By inhalation of powder, 200–400 micrograms as a single dose in the evening or in 2 divided doses; dose increased to 400 micrograms twice daily if necessary; CHILD not recommended

Asmanex® (Schering-Plough) ▼ (Puff)

Twisthaler (= dry powder inhaler), mometasone furoate 200 micrograms/metered inhalation, net price 30-dose unit = £16.00, 60-dose unit = £24.00, 400 micrograms/metered inhalation, 30-dose unit = £22.20, 60-dose unit = £36.75. Label: 8, counselling, dose, 10, steroid card

Note The Scottish Medicines Consortium has advised (November 2003) that Asmanex is restricted for use following failure of first-line inhaled corticosteroids

**3.3.2 Leukotriene receptor antagonists**

**3.3.3 Cromoglicate and related therapy and leukotriene receptor antagonists**

**3.3.3.1 Cromoglicate and related therapy**

The mode of action of sodium cromoglicate and nedocromil is not completely understood. They may be of value in asthma with an allergic basis, but, in practice, it is difficult to predict who will benefit; they could probably be given for 4 to 6 weeks to assess response. Dose frequency is adjusted according to response but is usually 3 to 4 times a day initially; this may subsequently be reduced.

In general, prophylaxis with sodium cromoglicate is less effective than prophylaxis with corticosteroid inhalations (see Chronic Asthma table, p. 149). There is evidence of efficacy of nedocromil in children aged 5–12 years. Sodium cromoglicate is of no value in the treatment of acute attacks of asthma.
Sodium cromoglicate can prevent exercise-induced asthma. However, exercise-induced asthma may reflect poor overall control and the patient should be assessed. If inhalation of sodium cromoglicate causes bronchospasm, a selective beta agonist such as salbutamol or terbutaline should be inhaled a few minutes beforehand.

**SODIUM CROMOGLICATE**
(Sodium Cromoglycate)

**Indications** prophylaxis of asthma (see also Management of Chronic Asthma table, p. 149); food allergy (section 1.5); allergic conjunctivitis (section 11.4.2); allergic rhinitis (section 12.2.1)

**Cautions** discontinue if eosinophilic pneumonia occurs

**Side-effects** coughing, transient bronchospasm, and throat irritation; very rarely hypersensitivity reactions (including angioedema); rhinitis and headache also reported

**Dose**
- By aerosol inhalation, ADULT and CHILD, 10 mg (2 puffs) 4 times daily, increased in severe cases or during periods of risk to 6–8 times daily; additional doses may also be taken before exercise; maintenance 5 mg (1 puff) 4 times daily

Intel® (Sanofi-Aventis) [W]
Aerosol inhalation, sodium cromoglicate 5 mg/ metered inhalation, net price 112-dose unit = £15.44.
Label: 8, counselling, change to CFC-free inhaler
Excipients include HFA-227 (a non-CFC propellant)

**NEDOCROMIL SODIUM**

**Indications** prophylaxis of asthma (see also Management of Chronic Asthma table, p. 149)

**Side-effects** see under Sodium Cromoglicate; also headache, nausea, vomiting, dyspepsia and abdominal pain; bitter taste (masked by mint flavour)

**Dose**
- By aerosol inhalation, ADULT and CHILD over 6 years 4 mg (2 puffs) 4 times daily, when control achieved may be possible to reduce to twice daily
- Counselling Regular use is necessary

Tilade CFC-free Inhaler® (Sanofi-Aventis) ▼ [N]
Aerosol inhalation, mint-flavoured, nedocromil sodium 2 mg/metered inhalation. Net price 112-dose unit = £39.94. Label: 8, counselling, change to CFC-free inhaler
Excipients include HFA-227 (a non-CFC propellant)

**3.3.2 Leukotriene receptor antagonists**

The leukotriene receptor antagonists, montelukast and zafirlukast, block the effects of cysteinyl leukotrienes in the airways. They are effective in asthma when used alone or with an inhaled corticosteroid (see Chronic Asthma table, p. 149). Montelukast has not been shown to be more effective than a standard dose of inhaled corticosteroid but the two drugs appear to have an additive effect. The leukotriene receptor antagonists may be of benefit in exercise-induced asthma and in those with concomitant rhinitis but they are less effective in those with severe asthma who are also receiving high doses of other drugs.

Churg-Strauss syndrome has occurred very rarely in association with the use of leukotriene receptor antagonists; in many of the reported cases the reaction followed the reduction or withdrawal of oral corticosteroid therapy. The CSM has advised that prescribers should be alert to the development of eosinophilia, vasculitic rash, worsening pulmonary symptoms, cardiac complications, or peripheral neuropathy.

**MONTELUKAST**

**Indications** prophylaxis of asthma, see notes above and Chronic Asthma table, p. 149; symptomatic relief of seasonal allergic rhinitis in patients with asthma

**Cautions** pregnancy (see p. 148 and Appendix 4); breast-feeding (see p. 148 and Appendix 5); interactions: Appendix 1 (leukotriene antagonists)

**Side-effects** abdominal pain, thirst; hyperkinesia (in young children), headache; very rarely Churg-Strauss syndrome (see notes above); dry mouth, diarrhoea, dyspepsia, nausea, vomiting, hepatic disorders, pitting, oedema, increased bleeding, hypersensitivity reactions (including anaphylaxis and skin reactions), depression, suicidal thoughts and behaviour, tremor, asthenia, dizziness, hallucinations, paraesthesia, hypoaesthesia, sleep disturbances, abnormal dreams, agitation, aggression, seizures, arthralgia, and myalgia, also reported

**Dose**
- Prophylaxis of asthma, ADULT and CHILD over 15 years, 10 mg once daily in the evening. CHILD 6 months–6 years 4 mg once daily in the evening, 6–15 years 5 mg once daily in the evening
- Seasonal allergic rhinitis, ADULT and CHILD over 15 years, 10 mg once daily in the evening

Singular® (MSD) [N]
Chewable tablets, pink, cherry-flavoured, montelukast (as sodium salt) 4 mg, net price 28-tab pack = £25.69. Label: 23, 24
Excipients include aspartame equivalent to phenylalanine 674 micrograms/4-mg tablet and 842 micrograms/5-mg tablet (section 9.4.1)

Granules; montelukast (as sodium salt) 4 mg, net price 28-sachet pack = £25.69. Counselling, administration

Counselling Granules may be swallowed or mixed with cold food (but not fluid) and taken immediately

Tablets, beige, 10 mg. Montelukast (as sodium salt) 10 mg, net price 28-tab pack = £26.97

Note The Scottish Medicines Consortium has advised (June 2007) that Singular chewable tablets and granules are restricted for use as an alternative to low-dose inhaled corticosteroids for children 2-14 years with mild persistent asthma who have not recently had serious asthma attacks that required oral corticosteroid use and who are not capable of using inhaled corticosteroids; Singular chewable tablets and granules should be initiated by a specialist in paediatric asthma.

**ZAFIRLUKAST**

**Indications** prophylaxis of asthma, see notes above and Chronic Asthma table, p. 149

**Cautions** elderly, renal impairment (Appendix 3); pregnancy (see p. 148 and Appendix 4); interactions: Appendix 1 (leukotriene antagonists)

Hepatic disorders Patients or their carers should be told how to recognise development of liver disorder and advised
to seek medical attention if symptoms or signs such as persistent nausea, vomiting, malaise, or jaundice develop.

**Contra-indications** hepatic impairment; breast-feeding (see p. 148 and Appendix 5)

**Side-effects** gastro-intestinal disturbances, headache, insomnia, malaise; rarely bleeding disorders, hypersensitivity reactions including angioedema and skin reactions, arthralgia, myalgia, hepatitis, hyperbilirubinaemia, thrombocytopenia; very rarely Churg-Strauss syndrome (see notes above), agranulocytosis

**Dose**
- **ADULT** and **CHILD** over 12 years, 20 mg twice daily

**Accolate**
- **Tablets,** f/c, zafirlukast 20 mg, net price 56-tab pack = £28.26. Label: 23

# 3.4 Antihistamines, hyposensitisation, and allergic emergencies

## 3.4.1 Antihistamines

All antihistamines are of potential value in the treatment of nasal allergies, particularly seasonal allergic rhinitis (hay fever), and they may be of some value in vasomotor rhinitis. They reduce rhinorrhea and sneezing but are usually less effective for nasal congestion. Antihistamines are used topically in the eye (section 11.4.2), in the nose (section 12.2.1), and on the skin (section 13.3).

Oral antihistamines are also of some value in preventing urticaria and are used to treat urticarial rashes, pruritus, and insect bites and stings; they are also used in drug allergies. Injections of chlorphenamine (chlorpheniramine) or promethazine are used as an adjunct to adrenaline (epinephrine) in the emergency treatment of anaphylaxis and angioedema (section 3.4.3). For the use of antihistamines (including cinnarizine, cyclizine, and promethazine teoclate) in nausea and vomiting, see section 4.6. Buclizine is included as an anti-emetic in a preparation for migraine (section 4.7.4.1). For reference to the use of antihistamines for occasional insomnia, see section 4.1.1.

All older antihistamines cause sedation but **alimemazine** (trimeprazine) and promethazine may be more sedating whereas chlorphenamine and cyclizine (section 4.6) may be less so. This sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older, ‘sedating’ antihistamines is superior to another. Patients vary widely in their response. The sedating activity is sometimes used to manage the pruritus associated with some allergies. There is little evidence that any one of the older antihistamines is superior to another. Patients vary widely in their response. The sedating activity is some-

**Non-sedating antihistamines**

**Driving** Although drowsiness is rare, nevertheless patients should be advised that it can occur and may affect performance of skilled tasks (e.g. driving); excess alcohol should be avoided.

**CETIRIZINE HYDROCHLORIDE**

**Indications** symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

**Cautions** see notes above; also renal impairment (Appendix 3)

**Contra-indications** see notes above; also pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see notes above

**Dose**
- **ADULT** and **CHILD** over 6 years, 10 mg once daily or 5 mg twice daily; **CHILD** 1–2 years see **BNF for Children**, 2–6 years, hay fever, 5 mg once daily or 2.5 mg twice daily

**Cetirizine**
- **Tablets,** cetirizine hydrochloride 10 mg, net price 30-tab pack = 97p. Counselling, driving

**Cetirizine (Non-proprietary)**
- **Tablets,** cetirizine hydrochloride 10 mg, net price 30-tab pack = 97p. Counselling, driving

**Oral solution,** cetirizine hydrochloride 5 mg/5 mL, net price 200 mL = £2.43. Counselling, driving

**DESLORATADINE**

**Note** Desloratadine is a metabolite of loratadine

**Indications** symptomatic relief of allergic rhinitis and urticaria
**Respiratory system**

**Cautions** see notes above; also renal impairment (Appendix 3)

**Contra-indications** see notes above; also hypersensitivity to loratadine; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see notes above; rarely myalgia; very rarely hallucinations

**Dose**
- 5 mg once daily; **CHILD** 1–6 years 1.25 mg once daily, 6–12 years 2.5 mg once daily

**Neoclarityn** *(Schering-Plough)*

**Tablets**, blue, f/c, desloratadine 5 mg, net price 30-tab pack = £7.04. Counselling, driving

**Syrup**, desloratadine 2.5 mg/5 mL, net price 100 mL (bubblegum-flavour) = £7.04. Counselling, driving

**FEXOFENADINE HYDROCHLORIDE**

**Note** Fexofenadine is a metabolite of terfenadine

**Indications** see under Dose

**Cautions** see notes above; also pregnancy (Appendix 4)

**Contra-indications** see notes above; also breast-feeding (Appendix 5)

**Side-effects** see notes above

**Dose**
- Seasonal allergic rhinitis, 120 mg once daily; **CHILD** 6–12 years, 30 mg twice daily
- Chronic idiopathic urticaria, **ADULT** and **CHILD** over 12 years, 180 mg once daily

**Fexofenadine** *(Non-proprietary)*

**Tablets**, f/c, fexofenadine hydrochloride 120 mg, net price 30-tab pack = £5.92; 180 mg, 30-tab pack = £7.49. Label: 5, counselling, driving

**Telfast** *(Aventis Pharma)*

**Tablets**, f/c, peach, fexofenadine hydrochloride 30 mg, net price 60-tab pack = £5.68; 120 mg, 30-tab pack = £6.23; 180 mg, 30-tab pack = £7.89. Label: 5, counselling, driving

**LEVOCETIRIZINE HYDROCHLORIDE**

**Note** Levocetirizine is an isomer of cetirizine

**Indications** symptomatic relief of allergy such as hay fever, urticaria

**Cautions** see notes above; also renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above; very rarely weight gain

**Dose**
- **ADULT** and **CHILD** over 6 years, 5 mg once daily; **CHILD** 2–6 years 1.25 mg twice daily

**Xyzal** *(UCB Pharma)*

**Tablets**, f/c, levocetirizine hydrochloride 5 mg, net price 30-tab pack = £5.20. Counselling, driving

**Oral solution**, levocetirizine hydrochloride 2.5 mg/5 mL, net price 200 mL = £6.00. Counselling, driving

**LORATADINE**

**Indications** symptomatic relief of allergy such as hay fever, chronic idiopathic urticaria

**Cautions** see notes above

**Contra-indications** see notes above; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** see notes above

**Dose**
- **ADULT** and **CHILD** over 6 years 10 mg once daily; **CHILD** 2–6 years 5 mg once daily

**Loratadine** *(Non-proprietary)*

**Tablets**, loratadine 10 mg, net price 30-tab pack = £1.24. Counselling, driving

**Dental prescribing on NHS** Loratadine 10 mg may be prescribed

**Syrup**, loratadine 5 mg/5 mL, net price 100 mL = £5.16. Counselling, driving

**MIZOLASTINE**

**Indications** symptomatic relief of allergy such as hay fever, urticaria

**Cautions** see notes above

**Contra-indications** see notes above; also susceptibility to QT-interval prolongation (including cardiac disease and hypokalaemia); significant hepatic impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** see notes above; weight gain; anxiety, asthenia; less commonly arthralgia and myalgia

**Dose**
- **ADULT** and **CHILD** over 12 years, 10 mg once daily

**Mizollen** *(Sanofi-Aventis)*

**Tablets**, m/r, f/c, scored, mizolastine 10 mg, net price 30-tab pack = £5.77. Label: 25, counselling, driving

**Sedating antihistamines**

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); sedating effects enhanced by alcohol.

**ALIMEMAZINE TARTRATE** *(Trimeprazine tartrate)*

**Indications** urticaria and pruritus, premedication

**Cautions** see notes above; pregnancy (Appendix 4); see also section 4.2.1

**Contra-indications** see notes above; also renal impairment; breast-feeding (Appendix 5); see also section 4.2.1

**Side-effects** see notes above; see also section 4.2.1

**Dose**
- Urticaria and pruritus, 10 mg 2–3 times daily, in severe cases up to max. 100 mg daily has been used; **ELDERLY** 10 mg 1–2 times daily; **CHILD** under 2 years, see **BNF for Children**, 2–5 years 2.5 mg 3–4 times daily, 5–12 years 5 mg 3–4 times daily
- Premedication, **CHILD** 2–7 years up to 2 mg/kg 1–2 hours before operation

**Vallegan** *(Sanofi-Aventis)*

**Tablets**, blue, f/c, alimemazine tartrate 10 mg, net price 28-tab pack = £3.89. Label: 2

**Syrup**, straw-coloured, alimemazine tartrate 7.5 mg/5 mL, net price 100 mL = £4.44. Label: 2

**Syrup forte**, alimemazine tartrate 30 mg/5 mL, net price 100 mL = £6.86. Label: 2

**BNF 57**
CHLORPHENAMINE MALEATE
(Chlorpheniramine maleate)

**Indications** symptomatic relief of allergy such as hay fever, urticaria; emergency treatment of anaphylactic reactions (section 3.4.3)

**Cautions** see notes above; also pregnancy (Appendix 4) and breastfeeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- By mouth, 4 mg every 4–6 hours, max. 24 mg daily; CHILD under 1 year see BNF for Children, 1–2 years 1 mg twice daily; 2–6 years 1 mg every 4–6 hours, max. 6 mg daily; 6–12 years 2 mg every 4–6 hours, max. 12 mg daily
- By intramuscular injection or by intravenous injection over 1 minute, 10 mg, repeated if required up to 4 times in 24 hours; CHILD 1–6 months 250 micrograms/kg, repeated if required up to 4 times in 24 hours; 6 months–6 years 2.5 mg, repeated if required up to 4 times in 24 hours; 6–12 years 5 mg, repeated if required up to 4 times in 24 hours

Chlorphenamine (Non-proprietary)

**Tablets**, chlorphenamine maleate 4 mg, net price 28 = £1.12. Label: 2

**Dental prescribing on NHS** Chlorphenamine tablets may be prescribed

**Oral solution**, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.25. Label: 2

**Dental prescribing on NHS** Chlorphenamine oral solution may be prescribed

**Injection**, chlorphenamine maleate 10 mg/mL, net price 1-mL amp = £1.62

1. (TM) restriction does not apply where administration is for saving life in emergency

Piriton® (GSK Consumer Healthcare)

**Tablets**, yellow, scored, chlorphenamine maleate 4 mg, net price 28 = £1.62. Label: 2

**Syrup**, chlorphenamine maleate 2 mg/5 mL, net price 150 mL = £2.39. Label: 2

CLEMASTINE

**Indications** symptomatic relief of allergy such as hay fever, urticaria

**Cautions** see notes above; also pregnancy (Appendix 4) and breastfeeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- 1 mg twice daily, increased up to 6 mg daily if required; INFANT under 1 year not recommended, CHILD 1–3 years 250–500 micrograms twice daily; 3–6 years 500 micrograms twice daily; 6–12 years 0.5–1 mg twice daily

Tavegil® (Novartis Consumer Health)

**Tablets**, scored, clemastine (as hydrogen fumarate) 1 mg, Net price 60-tab pack = £2.35. Label: 2

CYPROHEPATIDNE HYDROCHLORIDE

**Indications** symptomatic relief of allergy such as hay fever, urticaria; migraine (section 4.7.4.2)

**Cautions** see notes above; also pregnancy (Appendix 4) and breastfeeding (Appendix 5)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Allergy, usual dose 4 mg 3–4 times daily; usual range 4–20 mg daily, max. 32 mg daily; INFANT under 2 years not recommended, CHILD 2–6 years 2 mg 2–3 times daily, max. 12 mg daily; 7–14 years 4 mg 2–3 times daily, max. 16 mg daily
- Migraine, 4 mg with a further 4 mg after 30 minutes if necessary; maintenance, 4 mg every 4–6 hours

Periactin® (MSD)

**Tablets**, scored, cyproheptadine hydrochloride 4 mg, net price 30-tab pack = 86p. Label: 2

HYDROXYZINE HYDROCHLORIDE

**Indications** pruritus, anxiety (short-term) (section 4.1.2)

**Cautions** see notes above

**Contra-indications** see notes above; also pregnancy (Appendix 4) and breastfeeding (Appendix 5)

**Side-effects** see notes above

**Dose**
- Pruritus, initially 25 mg at night increased if necessary to 25 mg 3–4 times daily; CHILD 6 months–6 years initially 5–15 mg daily increased if necessary to 50 mg daily in divided doses; over 6 years initially 15–25 mg daily increased if necessary to 50–100 mg daily in divided doses
- Anxiety (adults only), 50–100 mg 4 times daily

Atarax® (Alliance) (TM)

**Tablets**, both s/c, hydroxyzine hydrochloride 10 mg (orange), net price 84-tab pack = £1.82; 25 mg (green), 28-tab pack = £1.22. Label: 2

Ucerax® (UCB Pharma) (TM)

**Tablets**, f/c, scored, hydroxyzine hydrochloride 25 mg, net price 25-tab pack = £1.22. Label: 2

**Syrup**, hydroxyzine hydrochloride 10 mg/5 mL. Net price 200-mL pack = £1.78. Label: 2

KETOTIFEN

**Indications** allergic rhinitis

**Cautions** see notes above

**Contra-indications** pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Side-effects** see notes above; also excitation, irritability, nervousness; less commonly cystitis, rarely weight gain; very rarely Stevens-Johnson syndrome

**Dose**
- 1 mg twice daily with food increased if necessary to 2 mg twice daily; initial treatment in readily sedated patients 0.5–1 mg at night; CHILD 3 years and over, 1 mg twice daily

Zaditen® (Novartis) (TM)

**Tablets**, scored, ketotifen (as hydrogen fumarate) 1 mg, net price 60-tab pack = £10.75. Label: 2, 21

**Elirx**, ketotifen (as hydrogen fumarate), 1 mg/5 mL, net price 300 mL (strawberry-flavoured) = £12.73. Label: 2, 21
3.4.2 Allergen Immunotherapy

Immunotherapy using allergen vaccines containing house dust mite, animal dander (cat or dog), or extracts of grass and tree pollen can reduce symptoms of asthma and allergic rhinoconjunctivitis. A vaccine containing extracts of wasp and bee venom is used to reduce the risk of severe anaphylaxis and systemic reactions in individuals with hypersensitivity to wasp or bee venom. Desensitising vaccines should be avoided in pregnant women, in children under five years old, and in those taking beta-blockers (adrenaline may be ineffective in case of a hypersensitivity reaction), or ACE inhibitors (risk of severe anaphylactoid reactions).

Hypersensitivity reactions to immunotherapy (especially to wasp and bee venom extracts) can be life-threatening; bronchospasm usually develops within 1 hour and anaphylaxis within 30 minutes of injection. Therefore patients need to be monitored for 1 hour after injection. If symptoms or signs of hypersensitivity develop (e.g. rash, urticaria, bronchospasm, faintness), even when mild, the patient should be observed until these have resolved completely.

For details of the management of anaphylactic shock, see section 3.4.3.

Each set of allergen extracts usually contains vials for the administration of graded amounts of allergen to patients undergoing hyposensitisation. Maintenance sets containing vials at the highest strength are also available. Product literature must be consulted for details of allergens, vial strengths, and administration.

BEE AND WASP ALLERGEN EXTRACTS

Indications hypersensitivity to wasp or bee venom (see notes above)

Cautions see notes above and consult product literature

CSM advice The CSM has advised that facilities for cardiopulmonary resuscitation must be immediately available and patients monitored closely for one hour after each injection

Contra-indications see notes above and consult product literature

Side-effects consult product literature

Dose

- By subcutaneous injection, consult product literature

Pharmalgen® (ALK-Abelló)®

Bee venom extract (Apis mellifera) or wasp venom extract (Vespula spp.), net price initial treatment set = £59.77 (bee), £73.28 (wasp); maintenance treatment set = £69.54 (bee), £89.45 (wasp)

GRASS AND TREE POLLEN EXTRACTS

Indications treatment of seasonal allergic hay fever due to grass or tree pollen in patients who have failed to respond to anti-allergy drugs (see notes above)

Cautions see notes above and consult product literature

CSM advice The CSM has advised that facilities for cardiopulmonary resuscitation must be immediately available and patients monitored closely for one hour after each injection

Contra-indications see notes above and consult product literature

Side-effects see notes above and consult product literature

Dose

- See under preparations, below

Pollinex® (Allergy)®

Grasses and rye or tree pollen extract, net price initial treatment set (3 vials) and extension course treatment (1 vial) = £320.00

Dose By subcutaneous injection, consult product literature
Grass pollen extract

Grazax® (ALK-Abello®) \[\text{\footnotesize ALK-Abello®}\] Oral lyophilisates (= freeze-dried tablets), grass pollen extract 75 000 units, net price 30-tab pack = £67.50. Counselling, administration

Dose ADULT over 18 years, 1 tablet daily; start treatment at least 4 months before start of pollen season and continue for up to 3 years

Counselling Tablets should be placed under the tongue and allowed to disperse

Omalizumab

Omalizumab is a monoclonal antibody that binds to immunoglobulin E (IgE). It is licensed for use as additional therapy in individuals with proven IgE-mediated sensitivity to inhaled allergens, whose severe persistent allergic asthma cannot be controlled adequately with high-dose inhaled corticosteroid therapy. Omalizumab should be initiated by physicians experienced in the treatment of severe persistent asthma.

Churg-Strauss syndrome has occurred rarely in patients given omalizumab; the reaction is usually associated with the reduction of oral corticosteroid therapy. Churg-Strauss syndrome can present as eosinophilia, vasculitic rash, cardiac complications, worsening pulmonary symptoms, or peripheral neuropathy. Hypersensitivity reactions can also occur immediately following treatment with omalizumab or sometimes more than 24 hours after the first injection.

For details on the management of anaphylactic shock, see section 3.4.3.

NICE guidance

Omalizumab for severe persistent allergic asthma (November 2007)

Omalizumab is recommended as additional therapy for the prophylaxis of severe persistent allergic asthma in adults and children over 12 years, who cannot be controlled adequately with high-dose inhaled corticosteroids and long-acting beta agonists in addition to leukotriene receptor antagonists, theophylline, oral corticosteroids, oral beta agonists, and smoking cessation where clinically appropriate. The following conditions apply:

- confirmation of IgE-mediated allergy to a perennial allergen by clinical history and allergy skin testing;
- either 2 or more severe exacerbations of asthma requiring hospital admission within the previous year, or 3 or more severe exacerbations of asthma within the previous year, at least one of which required hospital admission, and a further 2 which required treatment or monitoring in excess of the patient’s usual regimen, in an accident and emergency unit.

Omalizumab should be initiated and monitored by a physician experienced in both allergy and respiratory medicine in a specialist centre, and discontinued at 16 weeks in patients who have not shown an adequate response to therapy.

OMALIZUMAB

Indications prophylaxis of allergic asthma (see notes above)

Cautions autoimmune disease; susceptibility to bemith infection—discontinue if infection does not respond to antihelminitic; hepatic impairment; renal impairment; pregnancy (Appendix 4)

Contra-indications breast-feeding (Appendix 5)

Side-effects headache; injection-site reactions; less commonly nausea, diarrhoea, dyspepsia, flushing, fatigue, dizziness, drowsiness, paraesthesia, weight gain, influenza-like symptoms, photosensitivity, hypersensitivity reactions (including hypotension, bronchospasm, laryngoeudema, rash, pruritus, and anaphylaxis); Churg-Strauss syndrome (see notes above), thrombocytopenia, arthralgia, myalgia, and alopecia also reported

Dose

- By subcutaneous injection, ADULT and CHILD over 12 years, according to immunoglobulin E concentration and body-weight, consult product literature

Xolair® (Novartis) \[\text{\footnotesize Novartis}\] Injection, powder for reconstitution, omalizumab, net price 150-mg vial = £256.15 (with solvent)

Excipients include sucrose 108 mg/vial

3.4.3 Allergic emergencies

Adrenaline (epinephrine) provides physiological reversal of the immediate symptoms (such as laryngeal oedema, bronchospasm, and hypotension) associated with hypersensitivity reactions such as anaphylaxis and angioedema.

Anaphylaxis

Anaphylactic shock requires prompt treatment of laryngeal oedema, bronchospasm, and hypotension. Atopic individuals are particularly susceptible. Insect stings are a recognised risk (in particular wasp and bee stings). Latex and certain foods, including eggs, fish, cow’s milk protein, peanuts, and tree nuts may also precipitate anaphylaxis. Medicinal products particularly associated with anaphylaxis include blood products, vaccines, hyposensitising (allergen) preparations, antibacterials, aspirin and other NSAIDs, heparin, and neuromuscular blocking drugs. In the case of drugs, anaphylaxis is more likely after parenteral administration; resuscitation facilities must always be available for injections associated with special risk. Anaphylactic reactions may also be associated with additives and excipients in foods and medicines. Reashed arachis (peanut) oil, which may be present in some medicinal products, is unlikely to cause an allergic reaction—nevertheless it is wise to check the full formula of preparations which may contain allergenic fats or oils.

First-line treatment of anaphylaxis includes securing the airway, restoration of blood pressure (laying the patient flat and raising the legs, or in the recovery position if unconscious or nauseated and at risk of vomiting) and administration of adrenaline (epinephrine) injection. Adrenaline is given intramuscularly in a dose of 500 micrograms \(0.5\text{ mL adrenaline injection 1 in 1000}\); a dose of 300 micrograms \(0.3\text{ mL adrenaline injection 1 in 1000}\) may be appropriate for immediate self-administration. The dose is repeated if necessary at
3.4.3 Allergic emergencies

5-minute intervals according to blood pressure, pulse, and respiratory function (important: possible need for intravenous route using dilute solution, see below). High-flow oxygen administration and intravenous fluids (section 9.2.2) are also of primary importance. An antihistamine (e.g. chlorphenamine), given by slow intravenous injection or intramuscular injection in a dose of 10 mg, see p. 171) is a useful adjunctive treatment, given after adrenaline injection and continued for 24 to 48 hours according to clinical response to prevent relapse. Patients receiving beta-blockers require special consideration (see under Adrenaline, p. 175).

Continuing respiratory deterioration requires further treatment with bronchodilators including inhaled or intravenous salbutamol (see p. 154), inhaled ipratropium (see p. 157), intravenous aminophylline (see p. 159), or intravenous magnesium sulphate [unlicensed indication] (see under Acute Severe Asthma, p. 151); in addition to oxygen, assisted respiration and possibly emergency tracheotomy may be necessary.

An intravenous corticosteroid e.g. hydrocortisone (as sodium succinate) in a dose of 200 mg (section 6.3.2) is of secondary value in the initial management of anaphylactic shock because the onset of action is delayed for several hours, but should be given to prevent further deterioration in severely affected patients and continued for 24 to 48 hours according to clinical response.

When a patient is so ill that there is doubt about the adequacy of the circulation, the initial injection of adrenaline may need to be given as a dilute solution by the intravenous route; for details of cautions, dose, and strength, see under Intravenous Adrenaline (Epinephrine), below.

Cardiopulmonary arrest may follow an anaphylactic reaction; resuscitation should be started immediately (see p. 123).

For advice on the management of medical emergencies in dental practice, see p. 21.

Patients who are suspected of having had an anaphylactic reaction should be referred to a specialist for specific allergy diagnosis; avoidance of the allergen is the principal treatment.

Intramuscular adrenaline (epinephrine)

The intramuscular route is the first choice route for the administration of adrenaline (epinephrine) in the management of anaphylactic shock. Adrenaline has a rapid onset of action after intramuscular administration and in the shocked patient its absorption from the intramuscular site is faster and more reliable than from the subcutaneous site (the intravenous route should be reserved for extreme emergency when there is doubt about the adequacy of the circulation; for details of cautions, dose and strength see under Intravenous Adrenaline (Epinephrine), below).

Patients with severe allergy should ideally be instructed in the self-administration of adrenaline by intramuscular injection (for details see under Self-administration of Adrenaline (Epinephrine), below).

Prompt injection of adrenaline is of paramount importance. The following adrenaline doses are based on the revised recommendations of the Working Group of the Resuscitation Council (UK).

### Dose of intramuscular injection of adrenaline (epinephrine) for anaphylactic shock

<table>
<thead>
<tr>
<th>Age</th>
<th>Dose</th>
<th>Volume of adrenaline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Child under 6 years</td>
<td>150 micrograms</td>
<td>0.15 mL¹</td>
</tr>
<tr>
<td>Child 6–12 years</td>
<td>300 micrograms</td>
<td>0.3 mL²</td>
</tr>
<tr>
<td>Adult and child 12–18 years</td>
<td>500 micrograms</td>
<td>0.5 mL²</td>
</tr>
</tbody>
</table>

¹ These doses may be repeated several times if necessary at 5-minute intervals according to blood pressure, pulse, and respiratory function.
² For advice on the use of the intravenous route for cardiac resuscitation, see section 2.7.3.

### Intravenous adrenaline (epinephrine)

When the patient is severely ill and there is real doubt about the adequacy of the circulation and absorption after intramuscular injection, adrenaline (epinephrine) can be given by slow intravenous injection in a dose of 50 micrograms (0.5 mL of the dilute 1 in 10 000 adrenaline injection) repeated according to response; if multiple doses are required, adrenaline should be given as a slow intravenous infusion stopping when a response has been obtained; children may respond to as little as 1 microgram/kg (0.01 mL/kg of the dilute 1 in 10 000 adrenaline injection) by slow intravenous injection over several minutes.

Intravenous adrenaline should be given only by those experienced in its use, in a setting where patients can be carefully monitored; it should only be given to children when intravenous access is already available.

Great vigilance is needed to ensure that the correct strength of adrenaline injection is used; anaphylactic shock kits need to make a very clear distinction between the 1 in 10 000 strength and the 1 in 1000 strength. It is also important that, where intramuscular injection might still succeed, time should not be wasted seeking intravenous access.

For reference to the use of the intravenous route for cardiac resuscitation, see section 2.7.3.

### Self-administration of adrenaline (epinephrine)

Individuals at considerable risk of anaphylaxis need to carry adrenaline (epinephrine) at all times and need to be instructed in advance how to inject it. In addition, the packs need to be labelled so that in the case of rapid collapse someone else is able to administer the adrenaline. It is important to ensure that an adequate supply is provided to treat symptoms until medical assistance is available.

Adrenaline for administration by intramuscular injection is available in ‘auto-injectors’, pre-assembled syringes fitted with a needle suitable for very rapid administration (if necessary by a bystander or a healthcare provider if it is the only preparation available). Anapen® and EpiPen® consist of a fully assembled syringe and needle delivering a dose of 300 micrograms of adrenaline by intramuscular injection; 150-microgram versions (Anapen® Junior, EpiPen® Jr) are also available for use in children.
ADRENALINE/EPINEPHRINE

Indications  emergency treatment of acute anaphylaxis; angioedema; cardiopulmonary resuscitation (section 2.7.3); priapism [unlicensed indication] (section 7.4.5)

Cautions heart disease, hypertension, arrhythmias, cerebrovascular disease, phaeochromocytoma, diabetes mellitus, hyperthyroidism; susceptibility to angle-closure glaucoma; elderly

Interactions Severe anaphylaxis in patients taking non-cardioselective beta-blockers may not respond to adrenaline, calling for intravenous salbutamol (see p. 154); adrenaline can cause severe hypertension and bradycardia in those taking non-cardioselective beta-blockers. Other interactions, see Appendix 1 (sympathomimetics).

Side-effects nausea, vomiting; tachycardia, arrhythmias, palpitation, cold extremities, hypertension (risk of cerebral haemorrhage); dyspnoea, pulmonary oedema (on excessive dosage or extreme sensitivity); anxiety, tremor, restlessness, headache, weakness, dizziness; hyperglycaemia; urinary retention; sweating; tissue necrosis at injection site and angle-closure glaucoma also reported

Dose
• Acute anaphylaxis, by intramuscular injection (preferably midline in anterolateral thigh) of 1 in 1000 (1 mg/mL) solution, see notes and table above
• Acute anaphylaxis when there is doubt as to the adequacy of the circulation, by slow intravenous injection of 1 in 10 000 (100 micrograms/mL) solution (extreme caution—specialist use only), see notes above

Important Intravenous route should be used with extreme care by specialists only, see notes above

Intramuscular or subcutaneous

1 Adrenaline/Epinephrine 1 in 1000 (Non-proprietary) [FW]

Injection, adrenaline (as acid tartrate) 1 mg/mL, net price 0.5-mL amp = 49p; 1-mL amp = 56p

1 Minijet® Adrenaline 1 in 1000 (UCB Pharma) [FW]

Injection, adrenaline (as hydrochloride) 1 in 1000 (1 mg/mL), net price 1 mL (with 25 gauge × 0.25 inch needle for subcutaneous injection) = £9.81, 1 mL (with 21 gauge × 1.5 inch needle for intramuscular injection) = £5.78 (both disposable syringes)

Excipients include sulphites

Intravenous

Extreme caution, see notes above

Adrenaline/Epinephrine 1 in 10 000, Dilute (Non-proprietary) [FW]

Injection, adrenaline (as acid tartrate) 100 micrograms/mL, 10-mL amp, 1-mL and 10-mL prefilled syringe

Minijet® Adrenaline 1 in 10 000 (UCB Pharma) [FW]

Injection, adrenaline (as hydrochloride) 1 in 10 000 (100 micrograms/mL), net price 3-mL prefilled syringe = £5.70; 10-mL prefilled syringe = £5.30

Excipients include sulphites

1. [FW] restriction does not apply to adrenaline injection 1 mg/mL where administration is for saving life in emergency

Intramuscular injection for self-administration

Anapen® (Lincoln Medical) [FW]

1 Anapen® 0.3 mg solution for injection (delivering a single dose of adrenaline 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 1.05-mL auto-injector device = £30.67

Excipients include sulphites

Note 0.75 mL of the solution remains in the auto-injector device after use

Dose by intramuscular injection, ADULT and CHILD over 30 kg, 300 micrograms repeated after 10–15 minutes as necessary

Anapen® Junior 0.15 mg solution for injection (delivering a single dose of adrenaline 150 micrograms), adrenaline 500 micrograms/mL (1 in 2000), net price 1.05-mL auto-injector device = £30.67

Excipients include sulphites

Note 0.75 mL of the solution remains in the auto-injector device after use

Dose by intramuscular injection, CHILD 15–30 kg, 150 micrograms repeated after 10–15 minutes as necessary

EpiPen® (ALK-Abelló) [FW]

EpiPen® Auto-Injector 0.3 mg (delivering a single dose of adrenaline 300 micrograms), adrenaline 1 mg/mL (1 in 1000), net price 2-mL auto-injector = £28.05

Excipients include sulphites

Note 1.7 mL of the solution remains in the Auto-injector after use

Dose by intramuscular injection, ADULT and CHILD over 30 kg, 300 micrograms repeated after 5–15 minutes as necessary

EpiPen® Jr Auto-injector 0.15 mg (delivering a single dose of adrenaline 150 micrograms), adrenaline 500 micrograms/mL (1 in 2000), net price 2-mL auto-injector = £28.05

Excipients include sulphites

Note 1.7 mL of the solution remains in the Auto-injector after use

Dose by intramuscular injection, CHILD 15–30 kg, 150 micrograms (but on the basis of a dose of 10 micrograms/kg, 300 micrograms may be more appropriate for some children) repeated after 5–15 minutes as necessary

Angioedema

Angioedema is dangerous if laryngeal oedema is present. In this circumstance adrenaline (epinephrine) injection and oxygen should be given as described under Anaphylaxis (see above); antihistamines and corticosteroids should also be given (see again above). Tracheal intubation may be necessary.

Hereditary angioedema The administration of C1 esterase inhibitor (in fresh frozen plasma or in partially purified form) can terminate acute attacks of hereditary angioedema, but is not practical for long-term prophylaxis. Icatibant is licensed for the treatment of acute attacks of hereditary angioedema in adults with C1 esterase inhibitor deficiency.

Tranexamic acid (section 2.11) and danazol (section 6.7.2) [unlicensed indication] are used for short-term and long-term prophylaxis of hereditary angioedema. Short-term prophylaxis is started several days before planned procedures (e.g. dental work) and continued for 2–5 days afterwards. Danazol should be avoided in children because of its androgenic effects.

ICATIBANT

Indications acute attacks of hereditary angioedema in patients with C1 esterase inhibitor deficiency

Cautions ischaemic heart disease, stroke; pregnancy (Appendix 4); breast-feeding (Appendix 5)
Side-effects  
nausea, abdominal pain; nasal congestion; headache, dizziness; asthena; rash, injection-site reactions; less commonly vomiting, weight gain, cough, asthma, fatigue, pyrexia, pharyngitis, flushing, and pruritus

Dose  
- By subcutaneous injection, ADULT over 18 years, 30 mg as a single dose, repeated after 6 hours if necessary; a third dose may be given after a further 6 hours (max. 3 doses in 24 hours)

Firazyr® (gerini) ▼ [H]
Injection, icatibant (as acetate) 10 mg/mL, net price 3-mL prefilled syringe = £1395.00

3.5 Respiratory stimulants and pulmonary surfactants

3.5.1 Respiratory stimulants

Respiratory stimulants (analectic drugs) have a limited place in the treatment of ventilatory failure in patients with chronic obstructive pulmonary disease. They are effective only when given by intravenous injection or infusion and have a short duration of action. Their use has largely been replaced by ventilatory support including nasal intermittent positive pressure ventilation. However, occasionally when ventilatory support is contra-indicated and in patients with hypercapnic respiratory failure who are becoming drowsy or comatose, respiratory stimulants in the short term may arouse patients sufficiently to co-operate and clear their secretions.

Respiratory stimulants can also be harmful in respiratory failure since they stimulate non-respiratory as well as respiratory muscles. They should only be given under expert supervision in hospital and must be combined with active physiotherapy. There is at present no oral respiratory stimulant available for long-term use in chronic respiratory failure.

Doxapram is given by continuous intravenous infusion. Frequent arterial blood gas and pH measurements are necessary during treatment to ensure correct dosage.

Doxapram Hydrochloride

Indications  see under Dose

Cautions  give with oxygen in severe irreversible airways obstruction or severely decreased lung compliance (because of increased work load of breathing); give with beta agonist in bronchoconstriction; hypertension (avoid if severe), impaired cardiac reserve; hepatic impairment, pregnancy (compelling reasons only); interactions: Appendix 1 (doxapram)

Contra-indications  severe hypertension, status asthmaticus, coronary artery disease, thyrotoxicosis, epilepsy, physical obstruction of respiratory tract

Side-effects  perineal warmth, dizziness, sweating, moderate increase in blood pressure and heart rate; side-effects reported in postoperative period (causal effect not established) include muscle fasciculation, hyperactivity, confusion, hallucinations, cough, dyspnoea, laryngospasm, bronchospasm, sinus tachycardia, bradycardia, extrasystoles, nausea, vomiting and salivation

Dose  
- Postoperative respiratory depression, by intravenous injection over at least 30 seconds, 1–1.5 mg/kg repeated if necessary after intervals of 1 hour or alternatively by intravenous infusion, 2–3 mg/minute adjusted according to response; CHILD not recommended

- Acute respiratory failure, by intravenous infusion, 1.5–4 mg/minute adjusted according to response (given concurrently with oxygen and whenever possible monitor with frequent measurement of blood gas tensions); CHILD not recommended

- Neonatal apnoea, see BNF for Children

Dopram® (Anpharm) ▼ [H]
Injection, doxapram hydrochloride 20 mg/mL. Net price 5-mL amp = £3.00

Intravenous infusion, doxapram hydrochloride 2 mg/mL in glucose 5%. Net price 500-mL bottle = £21.13

3.5.2 Pulmonary surfactants

Pulmonary surfactants are used in the management of respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. They may also be given prophylactically to those considered at risk of developing the syndrome.

Cautions  Continuous monitoring is required to avoid hyperoxaemia caused by rapid improvement in arterial oxygen concentration.

Side-effects  Pulmonary haemorrhage has been rarely reported. Pulmonary surfactants are used in the management of respiratory distress syndrome (hyaline membrane disease) in neonates and preterm neonates. They may also be given prophylactically to those considered at risk of developing the syndrome.

BERACTANT

Indications  treatment of respiratory distress syndrome in preterm neonates over 700 g; prophylaxis of respiratory distress syndrome in preterm neonates less than 32 weeks post-menstrual age

Cautions  see notes above

Side-effects  see notes above

Dose  
- By endotracheal tube, phospholipid 100 mg/kg equivalent to a volume of 4 mL/kg, preferably within 8 hours of birth; may be repeated within 48 hours at intervals of at least 6 hours for up to 4 doses

Survanta® (Abbott) ▼ [H]
Suspension, beractant (bovine lung extract) providing phospholipid 25 mg/mL, with lipids and proteins, net price 8-mL vial = £306.43
Oxygen should be regarded as a drug. It is prescribed for hypoxaemic patients to increase alveolar oxygen tension and decrease the work of breathing. The concentration of oxygen required depends on the condition being treated; the administration of an inappropriate concentration of oxygen can have serious or even fatal consequences.

Oxygen is probably the most common drug used in medical emergencies. It should be prescribed initially to achieve a normal or near-normal oxygen saturation; in most acutely ill patients with a normal or low arterial carbon dioxide ($P_{CO_2}$), oxygen saturation should be 94–98% oxygen saturation. However, in some clinical situations such as cardiac arrest and carbon monoxide poisoning (see also Emergency Treatment of Poisoning, p. 35) it is more appropriate to aim for the highest possible oxygen saturation until the patient is stable. A lower target of 88–92% oxygen saturation is indicated for patients at risk of hypercapnic respiratory failure, see below.

High concentration oxygen therapy, with concentrations of up to 60%, is safe in uncomplicated cases of conditions such as pneumonia, pulmonary thromboembolism, fibrosing alveolitis, shock, severe trauma, sepsis, or anaphylaxis. In such conditions low arterial oxygen ($P_O_2$) is usually associated with low or normal arterial carbon dioxide ($P_{CO_2}$), and therefore there is little risk of hyperventilation and carbon dioxide retention.

In acute severe asthma, the arterial carbon dioxide ($P_{CO_2}$) is usually subnormal but as asthma deteriorates it may rise steeply (particularly in children). These patients usually require high concentrations of oxygen and if the arterial carbon dioxide ($P_{CO_2}$) remains high despite other treatment, intermittent positive-pressure ventilation needs to be considered urgently. Where facilities for blood gas measurement are not immediately available, for example while transferring the patient to hospital, 40–60% oxygen delivered through a high-flow mask is recommended.

Low concentration oxygen therapy (controlled oxygen therapy) is reserved for patients at risk of hypercapnic respiratory failure, which is more likely in those with:

- chronic obstructive pulmonary disease;
- cystic fibrosis;
- non-cystic fibrosis bronchiectasis;
- severe kyphoscoliosis or severe ankylosing spondylitis;
- severe lung scarring caused by tuberculosis;
- musculoskeletal disorders with respiratory weakness, especially if on home ventilation;
- an overdose of opioids, benzodiazepines, or other drugs causing respiratory depression.

Treatment should be initiated in hospital because repeated blood gas measurements are required to determine the correct concentration. Until blood gases can be measured, initial oxygen should be given using a controlled concentration of 28% or less, titrated towards a target oxygen saturation of 88–92%. The aim is to provide the patient with enough oxygen to achieve an acceptable arterial oxygen tension without worsening carbon dioxide retention and respiratory acidosis. Patients may carry an oxygen alert card, see section 3.1.

### Domiciliary oxygen
Oxygen should only be prescribed for use in the home after careful evaluation in hospital by respiratory experts.

Patients should be advised of the risks of continuing to smoke when receiving oxygen therapy, including the risk of fire. Smoking cessation therapy (section 4.10) should be tried before home oxygen prescription.

### Air travel
Some patients with arterial hypoxaemia require supplementary oxygen for air travel. The patient’s requirement should be discussed with the airline before travel.

### Long-term oxygen therapy
Long-term administration of oxygen (usually at least 15 hours daily) prolongs survival in some patients with chronic obstructive pulmonary disease.

For assessment of long-term oxygen therapy requirements measurement of arterial blood gas tensions. Measurements should be taken on 2 occasions at least 3 weeks apart to demonstrate clinical stability, and not sooner than 4 weeks after an acute exacerbation of the disease. Long-term oxygen therapy should be considered for patients with:

- chronic obstructive pulmonary disease with $P_O_2 < 7.3$ kPa when breathing air during a period of clinical stability;
- chronic obstructive pulmonary disease with $P_O_2 7.3–8$ kPa in the presence of secondary polycythaemia, nocturnal hypoxaemia, peripheral oedema, or evidence of pulmonary hypertension;
- severe chronic asthma with $P_O_2 < 7.3$ kPa or persistent disabling breathlessness;
- interstitial lung disease with $P_O_2 < 8$ kPa and in patients with $P_O_2 > 8$ kPa with disabling dyspnoea;
- cystic fibrosis when $P_O_2 < 7.3$ kPa or if $P_O_2 7.3–8$ kPa in the presence of secondary polycythaemia.
3 Respiratory system

• nocturnal hypoxaemia, pulmonary hypertension, or peripheral oedema;
• pulmonary hypertension, without parenchymal lung involvement when $P O_2 < 8$ kPa;
• neuromuscular or skeletal disorders, after specialist assessment;
• obstructive sleep apnoea despite continuous positive airways pressure therapy, after specialist assessment;
• pulmonary malignancy or other terminal disease with disabling dyspnoea;
• heart failure with daytime $P O_2 < 7.3$ kPa when breathing air or with nocturnal hypoxaemia;
• paediatric respiratory disease, after specialist assessment.

Increased respiratory depression is seldom a problem in patients with stable respiratory failure treated with low concentrations of oxygen although it may occur during exacerbations; patients and relatives should be warned to call for medical help if drowsiness or confusion occur.

### Short-burst oxygen therapy

Oxygen is occasionally prescribed for short-burst (intermittent) use for episodes of breathlessness not relieved by other treatment in patients with severe chronic obstructive pulmonary disease, interstitial lung disease, heart failure, and in palliative care. It is important, however, that the patient does not rely on oxygen instead of obtaining medical help or taking more specific treatment. Short-burst oxygen therapy can be used to improve exercise capacity and recovery; it should only be continued if there is proven improvement in breathlessness or exercise tolerance.

### Ambulatory oxygen therapy

Ambulatory oxygen is prescribed for patients on long-term oxygen therapy who need to be away from home on a regular basis. Patients who are not on long-term oxygen therapy can be considered for ambulatory oxygen therapy if there is evidence of exercise-induced oxygen desaturation and of improvement in blood oxygen saturation and exercise capacity with oxygen. Ambulatory oxygen therapy is not recommended for patients with heart failure or those who smoke.

### Oxygen therapy equipment

Under the NHS oxygen may be supplied as oxygen cylinders. Oxygen flow can be adjusted as the cylinders are equipped with an oxygen flow meter with ‘medium’ (2 litres/minute) and ‘high’ (4 litres/minute) settings.

Oxygen concentrators are more economical for patients who require oxygen for long periods, and in England and Wales can be ordered on the NHS on a regional tendering basis (see below). A concentrator is recommended for a patient who requires oxygen for more than 8 hours a day (or 21 cylinders per month). Exceptionally, if a higher concentration of oxygen is required the output of 2 oxygen concentrators can be combined using a ‘Y’ connection.

A nasal cannula is usually preferred for long-term oxygen therapy from an oxygen concentrator. It can, however, produce dermatitis and mucosal drying in sensitive individuals.

Giving oxygen by nasal cannula allows the patient to talk, eat, and drink, but the concentration of oxygen is not controlled; this may not be appropriate for acute respiratory failure. When oxygen is given through a nasal cannula at a rate of 1–2 litres/minute the inspiratory oxygen concentration is usually low, but it varies with ventilation and can be high if the patient is under-ventilating.

### Arrangements for supplying oxygen

The following oxygen services may be ordered in England and Wales:

• emergency oxygen;
• short-burst (intermittent) oxygen therapy;
• long-term oxygen therapy;
• ambulatory oxygen.

The type of oxygen service (or combination of services) should be ordered on a Home Oxygen Order Form (HOOF); the amount of oxygen required (hours per day) and flow rate should be specified. The supplier will determine the appropriate equipment to be provided. Special needs or preferences should be specified on the HOOF.

The clinician should obtain the patient’s consent to pass on the patient’s details to the supplier and the fire brigade. The supplier will contact the patient to make arrangements for delivery, installation, and maintenance of the equipment. The supplier will also train the patient to use the equipment.

The clinician should send order forms to the supplier by facsimile (see below); a copy of the HOOF should be sent to the Primary Care Trust or Local Health Board. The supplier will continue to provide the service until a revised order is received, or until notified that the patient no longer requires the home oxygen service.

#### Oxygen concentrators

- **England**: BOC Medical
  - to order: Tel: 0800 136 603, Fax: 0800 169 9989
  - North East: Air Liquide
    - to order: Tel: 0500 823 773, Fax: 0800 781 4610
- **Scotland**: Air Products
  - to order: Tel: 0800 373 580, Fax: 0800 214 709

In **Scotland** refer the patient for assessment by a respiratory consultant. If the need for a concentrator is confirmed the consultant will arrange for the provision of a concentrator through the Common Services Agency. In **Northern Ireland** oxygen concentrators and cylinders should be prescribed on form HS21; oxygen concentrators are supplied by a local contractor. In **Scotland** and **Northern Ireland** prescriptions for oxy-
3.7 Mucolytics

Mucolytics are prescribed to facilitate expectoration by reducing sputum viscosity. In some patients with chronic obstructive pulmonary disease and a chronic productive cough, mucolytics can reduce exacerbations; mucolytic therapy should be stopped if there is no benefit after a 4-week trial. Steam inhalation with postural drainage is effective in bronchiectasis and in some cases of chronic bronchitis. Mucolytics should be used with caution in those with a history of peptic ulceration because they may disrupt the gastric mucosal barrier. For reference to dornase alfa and hypertonic saline, see below.

**CARBOCISTEINE**

**Indications**  
reduction of sputum viscosity, see notes above

**Cautions**  
see notes above; pregnancy (Appendix 4)

**Contra-indications**  
active peptic ulceration

**Side-effects**  
rarely  
active peptic ulceration; hyper-sensitivity reactions (including rash and anaphylaxis) also reported

**Dose**  
Initially 2.25 g daily in divided doses, then 1.5 g daily in divided doses as condition improves; CHILD 2–5 years 62.5–125 mg 4 times daily, 5–12 years 250 mg 3 times daily

**Carbocisteine** (Sanofi-Aventis)  
**Capsules**, carbocisteine 375 mg, net price 120-cap pack = £16.68  
**Brands include** Mucodyne

**Oral liquid**, carbocisteine 125 mg/5 mL, net price 300 mL = £4.57; 250 mg/5 mL, 300 mL = £5.84  
**Brands include** Mucodyne (cherry- and raspberry-flavoured) and Mucodyne (cinnamon- and rum-flavoured)

**ERDOSTEINE**

**Indications**  
symptomatic treatment of acute exacerbations of chronic bronchitis

**Cautions**  
see notes above; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

**Contra-indications**  
brainfeeding (Appendix 5)

**Side-effects**  
very rarely nausea, vomiting, diarrhoea, abdominal pain, taste disturbance, headache, rash, and urticaria

**Dose**  
**ADULT** over 18 years, 300 mg twice daily for up to 10 days

**Erdotin®** (KoGEN)  
**Capsules**, yellow/green, erdosteine 300 mg, net price 20-cap pack = £5.00  
**Note** The Scottish Medicines Consortium (October 2007) has advised that erdosteine (Erdotin®) is not recommended for the symptomatic treatment of acute exacerbations of chronic bronchitis

**MECYSTEINE HYDROCHLORIDE**  
(Methyl Cysteine Hydrochloride)

**Indications**  
reduction of sputum viscosity

**Cautions**  
see notes above

**Contra-indications**  
pregnancy; breast-feeding

**Dose**  
- 200 mg 4 times daily for 2 days, then 200 mg 3 times daily for 6 weeks, then 200 mg twice daily; **CHILD** 5–12 years 100 mg 3 times daily

**Visclease®** (Ranbaxy)  
**Tablets**, yellow, s/c, e/c, mecysteine hydrochloride 100 mg, net price 100 = £17.65. Label: 5, 22, 25

**Dornase alfa**

Dornase alfa is a genetically engineered version of a naturally occurring human enzyme which cleaves extra-cellular deoxyribonucleic acid (DNA). It is used in cystic fibrosis and is administered by inhalation using a jet nebuliser (section 3.1.5).

**DORNASE ALFA**

**Phosphorylated glycosylated recombinant human deoxyribonuclease 1 (rhDNase)**

**Indications**  
management of cystic fibrosis patients with a forced vital capacity (FVC) of greater than 40% of predicted to improve pulmonary function

**Cautions**  
pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**  
pharyngitis, voice changes, chest pain; occasionally laryngitis, rashes, urticaria, conjunctivitis

**Dose**  
**ADULT** and **CHILD** over 5 years, by inhalation of nebulised solution (by jet nebuliser), 2500 units (2.5 mg) once daily (patients over 21 years may benefit from twice daily dosage)

**Pulmozyme®** (Roche)  
**Nebuliser solution**, dornase alfa 1000 units (1 mg)/mL. Net price 2.5-mL (2500 units) vial = £17.57  
**Note** For use undiluted with jet nebulisers only; ultrasonic nebulisers are unsuitable

**Hypertonic sodium chloride**

Nebulised hypertonic sodium chloride solution is used to mobilise lower respiratory tract secretions in mucous consolidation (e.g. cystic fibrosis).

**MucoClear®** (Pari)  
**Nebuliser solution**, sodium chloride 6%, net price 20 × 4 mL = £12.98; 60 × 4 mL = £29.98  
**Dose** by inhalation of nebulised solution, 4 mL twice daily

3.8 Aromatic inhalations

Inhalations containing volatile substances such as eucalyptus oil are traditionally used and although the vapour may contain little of the additive it encourages deliberate inspiration of warm moist air which is often comforting in bronchitis; boiling water should not be used owing to the risk of scalding. Inhalations are also used for the relief of nasal obstruction in acute rhinitis or sinusitis. Menthol and eucalyptus inhalation is used to
Cough preparations

3.9 Cough suppressants

Cough may be a symptom of an underlying disorder, such as asthma (section 3.1.1), gastro-oesophageal reflux disease (section 1.1), or rhinitis (section 12.2.1), which should be addressed before prescribing cough suppressants. Cough may be a side-effect of another drug, such as an ACE inhibitor (section 2.5.5.1), or it can be associated with smoking or environmental pollutants. Cough can also have a significant habit component. When there is no identifiable cause, cough suppressants may be effective, for example if sleep is disturbed. They may cause sputum retention and this may be harmful in patients with chronic bronchitis and bronchiectasis.

Codeine may be effective but it is constipating and can cause dependence; dextromethorphan and pholcodine have fewer side-effects.

Sedating antihistamines are used as the cough suppressant component of many compound cough preparations on sale to the public; all tend to cause drowsiness which may reflect their main mode of action.

Children The use of cough suppressants containing codeine or similar opioid analgesics is not generally recommended in children and should be avoided altogether in children under 2 years.

MHRA/CHM advice (March 2008)
Children under 2 years should not be given over-the-counter cough and cold medicines containing the following ingredients:
- brompheniramine, chlorphenamine, or diphenhydramine (antihistamines);
- dextromethorphan or pholcodine (cough suppressants);
- guaifenesin or ipecacuanha (expectorants);
- phenylephrine, pseudoephedrine, ephedrine, oxymetazoline, or xylometazoline (decongestants).
Children over 2 years should not be given more than 1 cough or cold preparation at a time because different brands may contain the same active ingredient; care should be taken to give the correct dose.

CODEINE PHOSPHATE

Indications dry or painful cough; diarrhoea (section 1.4.2); pain (section 4.7.2)
Cautions see notes above and section 4.7.2
Contra-indications see section 4.7.2
Side-effects see section 4.7.2

Codeine Linctus, BP

Linctus (= oral solution), codeine phosphate 15 mg/5 mL. Net price 100 mL = 62p (diabetic, 34p)
Brands include Galcodine
Dose 5–10 mL 3–4 times daily; CHILD (but not generally recommended) 5–12 years, 2.5–5 mL
Note BP directs that when Diabetic Codeine Linctus is prescribed, Codeine Linctus formulated with a vehicle appropriate for administration to diabetics, whether or not labelled ‘Diabetic Codeine Linctus’, shall be dispensed or supplied

1. Can be sold to the public provided the maximum single dose does not exceed 5 mL.

Codeine Linctus, Paediatric, BP

Linctus (= oral solution), codeine phosphate 3 mg/5 mL. Net price 100 mL = 18p
Brands include Galcodine Paediatric
Dose CHILD (but not generally recommended) 2–5 years 5 mL 3–4 times daily
Note BP directs that Paediatric Codeine Linctus may be prepared extemporaneously by diluting Codeine Linctus with a suitable vehicle in accordance with the manufacturer’s instructions

Other preparations
Tablets, syrup, and injection section 4.7.2

PHOLCODINE

Indications dry or painful cough
Cautions see under Codeine Phosphate
Contra-indications see under Codeine Phosphate
Side-effects see under Codeine Phosphate

Pholcodine Linctus, BP

Linctus (= oral solution), pholcodine 5 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 1%. Net price 100 mL = 43p
Brands include Pavacol-D (sugar-free), Galenolph (sugar-free)
Dose 5–10 mL 3–4 times daily; CHILD (but not generally recommended, see notes above) 5–12 years 2.5–5 mL
Pholcodine Linctus, Strong, BP

Linctus (= oral solution), pholcodine 10 mg/5 mL in a suitable flavoured vehicle, containing citric acid monohydrate 2%. Net price 100 mL = 35p

Dose 5 mL 3–4 times daily

Brands include Galenphol

Galenphol® (Thornton & Ross)

Paediatric linctus (= oral solution), orange, sugar-free, pholcodine 2 mg/5 mL. Net price 90-mL pack = £1.11

Dose CHILD (but not generally recommended, see notes above) 2–5 years 5–10 mL 3 times daily; 6–12 years 10 mL 3 times daily

Palliative care

Diamorphine and methadone have been used to control distressing cough in terminal lung cancer although morphine is now preferred (see p. 16). In other circumstances they are contra-indicated because they induce sputum retention and ventilatory failure as well as causing opioid dependence. Methadone linctus should be avoided because it has a long duration of action and tends to accumulate.

**METHADONE HYDROCHLORIDE**

**Indications** cough in terminal disease

**Cautions** see notes in section 4.7.2

**Contra-indications** see notes in section 4.7.2

**Side-effects** see notes in section 4.7.2; longer-acting than morphine therefore effects may be cumulative

**Dose**

- See below

Methadone Linctus

Linctus (= oral solution), methadone hydrochloride 2 mg/5 mL in a suitable vehicle with a tolu flavour. Label: 2

Dose 2.5–5 mL every 4–6 hours, reduced to twice daily on prolonged use

**MORPHINE HYDROCHLORIDE**

**Indications** cough in terminal disease (see also Prescribing in Palliative Care p. 16)

**Cautions** see notes in section 4.7.2

**Contra-indications** see notes in section 4.7.2

**Side-effects** see notes in section 4.7.2

**Dose**

- Initially 5 mg every 4 hours

**Preparation**

Section 4.7.2

**3.9.2 Expectorant and demulcent cough preparations**

Expectorants are claimed to promote expulsion of bronchial secretions but there is no evidence that any drug can specifically facilitate expectoration. The assumption that sub-emetic doses of expectorants, such as ammonium chloride, ipecacuanha, and squill promote expectoration is a myth. However, a simple expectorant mixture may serve a useful placebo function and has the advantage of being inexpensive.

Demulcent cough preparations contain soothing substances such as syrup or glycerol and some patients believe that such preparations relieve a dry irritating cough. Preparations such as simple linctus have the advantage of being harmless and inexpensive; paediatric simple linctus is particularly useful in children.

Compound preparations are on sale to the public for the treatment of cough and colds but should not be used in children under 2 years; the rationale for some is dubious. Care should be taken to give the correct dose and to not use more than one preparation at a time, see MHRA/CHM advice, p. 180.

Ammonia and Ipecacuanha Mixture, BP

Mixture, ammonium bicarbonate 200 mg, liquorex liquid extract 0.5 mL, ipecacuanha tincture 0.3 mL, concentrated camphor water 0.1 mL, concentrated anise water 0.05 mL, double-strength chloroform water 5 mL, water to 10 mL. It should be recently prepared

Dose ADULT and CHILD over 12 years, 10–20 mL up to 4 times daily

Simple Linctus, BP

Linctus (= oral solution), citric acid monohydrate 2.5% in a suitable vehicle with an anise flavour. Net price 200 mL = 42p

Dose ADULT and CHILD over 12 years 5 mL 3–4 times daily

A sugar-free version is also available

Simple Linctus, Paediatric, BP

Linctus (= oral solution), citric acid monohydrate 0.625% in a suitable vehicle with an anise flavour. Net price 200 mL = 72p

Dose CHILD 1 month–12 years 5–10 mL 3–4 times daily

A sugar-free version is also available

**3.10 Systemic nasal decongestants**

Nasal decongestants for administration by mouth may not be as effective as preparations for local application (section 12.2.2) but they do not give rise to rebound nasal congestion on withdrawal. Pseudoephedrine is available over the counter; it has few sympathomimetic effects.

Systemic decongestants should be used with caution in diabetes, hypertension, hyperthyroidism, susceptibility to angle-closure glaucoma, prostatic hypertrophy, renal impairment (Appendix 3), pregnancy (Appendix 4), and ischaemic heart disease, and should be avoided in patients taking monoamine oxidase inhibitors; interactions: Appendix 1 (sympathomimetics).

**PSEUDOEPHEDRINE HYDROCHLORIDE**

**Indications** see notes above

**Cautions** see notes above

**Side-effects** tachycardia, anxiety, restlessness, insomnia; rarely hallucinations, rash; very rarely angle-closure glaucoma; urinary retention also reported

**Dose**

- 60 mg 3–4 times daily; CHILD 2–6 years 15 mg 3–4 times daily; 6–12 years 30 mg 3–4 times daily
3.10 Systemic nasal decongestants

1 **Galpseud** (Thornton & Ross)
   - Tablets, pseudoephedrine hydrochloride 60 mg, net price 20 = £1.06
   - Linctus, orange, sugar-free, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = 69p

2 **Sudafed** (Pfizer Consumer)
   - Tablets, red, f/c, pseudoephedrine hydrochloride 60 mg, net price 24 = £2.12
   - Elixir, red, pseudoephedrine hydrochloride 30 mg/5 mL, net price 100 mL = £1.48

1 Can be sold to the public provided no more than 720 mg of pseudoephedrine salts are supplied, and ephedrine base (or salts) are not supplied at the same time; for details see Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available)
4 Central nervous system

4.1 Hypnotics and anxiolytics

4.1.1 Hypnotics

4.1.2 Anxiolytics

4.1.3 Barbiturates

4.2 Drugs used in psychoses and related disorders

4.2.1 Antipsychotic drugs

4.2.2 Antipsychotic depot injections

4.2.3 Antimanic drugs

4.3 Antidepressant drugs

4.3.1 Tricyclic and related antidepressant drugs

4.3.2 Monoamine-oxidase inhibitors

4.3.3 Selective serotonin re-uptake inhibitors

4.3.4 Other antidepressant drugs

4.4 CNS stimulants and drugs used for attention deficit hyperactivity disorder

4.5 Drugs used in the treatment of obesity

4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract

4.5.2 Centrally acting appetite suppressants

4.6 Drugs used in nausea and vertigo

4.7 Analgesics

4.7.1 Non-opioid analgesics

4.7.2 Opioid analgesics

4.7.3 Neuropathic pain

4.7.4 Antimigraine drugs

4.7.4.1 Treatment of acute migraine

4.7.4.2 Prophylaxis of migraine

4.7.4.3 Cluster headache

4.8 Antiepileptic drugs

4.8.1 Control of epilepsy

4.8.2 Drugs used in status epilepticus

4.8.3 Febrile convulsions

4.9 Drugs used in parkinsonism and related disorders

4.9.1 Dopaminergic drugs used in parkinsonism

4.9.2 Antimuscarinic drugs used in parkinsonism

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

4.10 Drugs used in substance dependence

4.11 Drugs for dementia

Most anxiolytics (‘sedatives’) will induce sleep when given at night and most hypnotics will sedate when given during the day. Prescribing of these drugs is widespread but dependence (both physical and psychological) and tolerance occurs. This may lead to difficulty in withdrawing the drug after the patient has been taking it regularly for more than a few weeks (see Dependence and Withdrawal, below). Hypnotics and anxiolytics should therefore be reserved for short courses to alleviate acute conditions after causal factors have been established.

Benzodiazepines are the most commonly used anxiolytics and hypnotics; they act at benzodiazepine receptors which are associated with gamma-aminobutyric acid (GABA) receptors. Older drugs such as meprobamate and barbiturates (section 4.1.3) are not recommended—they have more side-effects and interactions than benzodiazepines and are much more dangerous in overdosage.

Paradoxical effects A paradoxical increase in hostility and aggression may be reported by patients taking benzodiazepines. The effects range from talkativeness and excitement to aggressive and antisocial acts. Adjustment of the dose (up or down) sometimes attenuates the impulses. Increased anxiety and perceptual disorders are other paradoxical effects. Increased hostility and aggression after barbiturates and alcohol usually indicates intoxication.

Driving Hypnotics and anxiolytics may impair judgement and increase reaction time, and so affect ability to drive or operate machinery; they increase the effects of alcohol. Moreover the hangover effects of a night dose may impair driving on the following day. See also Drugs and Driving under General Guidance, p. 3.

Dependence and withdrawal Withdrawal of a benzodiazepine should be gradual because abrupt withdrawal may produce confusion, toxic psychosis, convulsions, or a condition resembling delirium tremens.
A abrupt withdrawal of a barbiturate (section 4.1.3) is even more likely to have serious effects.

The benzodiazepine withdrawal syndrome may develop at any time up to 3 weeks after stopping a long-acting benzodiazepine, but may occur within a day in the case of a short-acting one. It is characterised by insomnia, anxiety, loss of appetite and of body-weight, tremor, perspiration, tinnitus, and perceptual disturbances. Some symptoms may be similar to the original complaint and encourage further prescribing; some symptoms may continue for weeks or months after stopping benzodiazepines.

A benzodiazepine can be withdrawn in steps of about one-eighth (range one-tenth to one-quarter) of the daily dose every fortnight. A suggested withdrawal protocol for patients who have difficulty is as follows:

1. Transfer patient to equivalent daily dose of diazepam preferably taken at night
2. Reduce diazepam dose every 2-3 weeks in steps of 2 or 2.5 mg if withdrawal symptoms occur, maintain this dose until symptoms improve
3. Reduce dose further, if necessary in smaller steps it is better to reduce too slowly rather than too quickly
4. Stop completely; time needed for withdrawal can vary from about 4 weeks to a year or more

Counselling may help; beta-blockers should only be tried if other measures fail; antidepressants should be used only where depression or panic disorder co-exist or emerge; avoid antipsychotics (which may aggravate withdrawal symptoms).

1. Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or subjecting the individual to unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
2. The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate and unsuitable.
3. Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or subjecting the individual to extreme distress.

**CSM advice**

1. Benzodiazepines are indicated for the short-term relief (two to four weeks only) of anxiety that is severe, disabling, or subjecting the individual to unacceptable distress, occurring alone or in association with insomnia or short-term psychosomatic, organic, or psychotic illness.
2. The use of benzodiazepines to treat short-term ‘mild’ anxiety is inappropriate and unsuitable.
3. Benzodiazepines should be used to treat insomnia only when it is severe, disabling, or subjecting the individual to extreme distress.

**4.1.1 Hypnotics**

Before a hypnotic is prescribed the cause of the insomnia should be established and, where possible, underlying factors should be treated. However, it should be noted that some patients have unrealistic sleep expectations, and others underestimate their alcohol consumption which is often the cause of the insomnia.

**Transcript**

- **Short-term insomnia** is usually related to an emotional problem or serious medical illness. It may last for a few weeks and may recur; a hypnotic can be useful but should not be given for more than three weeks (preferably only one week). Intermittent use is desirable with omission of some doses. A rapidly eliminated drug is generally appropriate.

- **Chronic insomnia** is rarely benefited by hypnotics and is sometimes due to mild dependence caused by injudicious prescribing of hypnotics. Psychiatric disorders such as anxiety, depression, and abuse of drugs and alcohol are common causes. Sleep disturbance is very common in depressive illness and early waking is often a useful pointer. The underlying psychiatric complaint should be treated, adapting the drug regimen to alleviate insomnia. For example, clomipramine or mirtazapine prescribed for depression will also help to promote sleep if taken at night. Other causes of insomnia include daytime cat-napping and physical causes such as pain, pruritus, and dyspnoea. Hypnotics should not be prescribed indiscriminately and routine prescribing is undesirable. They should be reserved for short courses in the acutely distressed. Tolerance to their effects develops within 3 to 14 days of continuous use and long-term efficacy cannot be assured. A major drawback of long-term use is that withdrawal can cause rebound insomnia and a withdrawal syndrome (section 4.1).

Where prolonged administration is unavoidable hypnotics should be discontinued as soon as feasible and the patient warned that sleep may be disturbed for a few days before normal rhythm is re-established; broken sleep with vivid dreams may persist for several weeks.

**Children** The prescribing of hypnotics to children, except for occasional use such as for night terrors and somnambulism (sleep-walking), is not justified.

**Elderly** Hypnotics should be avoided in the elderly, because the elderly are at greater risk of becoming ataxic and confused and so liable to fall and injure themselves.

**Dental procedures** Some anxious patients may benefit from the use of a hypnotic for 1 to 3 nights before the dental appointment. Hypnotics do not relieve pain, and if pain interferes with sleep an appropriate analgesic should be given. **Diazepam** (section 4.1.2), **nitrazepam** or **temazepam** are used at night for dental patients. Temazepam is preferred when it is important to minimise any residual effect the following day. For information on anxiolytics for dental procedures, see section 15.1.4.1.

**Benzodiazepines**

Benzodiazepines used as hypnotics include **nitrazepam** and **flurazepam** which have a prolonged action and may give rise to residual effects on the following day; repeated doses tend to be cumulative.
Loprazolam, lormetazepam, and temazepam act for a shorter time and they have little or no hangover effect. Withdrawal phenomena are more common with the short-acting benzodiazepines.

If insomnia is associated with daytime anxiety then the use of a long-acting benzodiazepine anxiolytic such as diazepam given as a single dose at night may effectively treat both symptoms.

For general guidelines on benzodiazepine prescribing see section 4.1.2 and for benzodiazepine withdrawal see section 4.1.

**NITRAZEPAM**

**Indications** insomnia (short-term use; see CSM advice, p. 184)

**Cautions** respiratory disease, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, marked personality disorder (Appendix 4), breast-feeding (Appendix 5); reduce dose in elderly and debilitated, and in hepatic impairment (avoid if severe; Appendix 2) and renal impairment (Appendix 3); avoid prolonged use (and abrupt withdrawal thereafter); acute porphyria (section 9.8.2); **interaction:** Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; severe hepatic impairment; sleep apnoea syndrome; not for use alone to treat depression or anxiety associated with depression) or chronic psychosis

**Side-effects** drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia may occur; dependence; see also section 15.1.4.1 for perioperative use

**Overdosage:** see Emergency Treatment of Poisoning, p. 32

**Dose**
- 5–10 mg at bedtime; **ELDERLY** (or debilitated) 2.5–5 mg; **CHILD** 1 month–2 years (infantile spasms) see BNF for Children

**Nitrazepam** (Non-proprietary) [FN]

| Tablets, nitrazepam 5 mg, net price 28 = £9.8p. | Label: 19 |
| Brains include Mogadon, Remnos |
| Dental prescribing on NHS Nitrazepam Tablets may be prescribed |
| Oral suspension, nitrazepam 2.5 mg/5 mL. Net price 150 mL = £5.30. | Label: 19 |
| Brains include Somnice |

**FLURAZEPAM**

**Indications** insomnia (short-term use; see CSM advice, p. 184)

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Side-effects** see under Nitrazepam

**Dose**
- 15–30 mg at bedtime; **ELDERLY** (or debilitated) 15 mg; **CHILD** not recommended

**Dalmame** (Valeant) [FN]

| Capsules, flurazepam (as hydrochloride), 15 mg (grey/yellow), net price 30-cap pack = £5.44; 30 mg (black/grey), 30-cap pack = £6.98. | Label: 19 |

**LORMETAZEPAM**

**Indications** insomnia (short-term use; see CSM advice, p. 184)

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Side-effects** see under Nitrazepam; shorter acting

**Dose**
- 1 mg at bedtime, increased to 1.5 or 2 mg if required; **ELDERLY** (or debilitated) 0.5 or 1 mg; **CHILD** not recommended

**Lormetazepam** (Non-proprietary) [FN]

| Tablets, lormetazepam 1 mg (as mesilate). Net price 28-tab pack = £18.00. | Label: 19 |

**TEMAZEPAM**

**Indications** insomnia (short-term use; see CSM advice, p. 184); see also section 15.1.4.1 for perioperative use

**Cautions** see under Nitrazepam

**Contra-indications** see under Nitrazepam

**Side-effects** see under Nitrazepam; shorter acting

**Dose**
- 10–20 mg at bedtime, exceptional circumstances 30–40 mg; **ELDERLY** (or debilitated) 10 mg at bedtime, exceptional circumstances 20 mg; **CHILD** not recommended

**Temazepam** (Non-proprietary) [FN]

| Tablets, temazepam 10 mg, net price 28-tab pack = £3.89; 20 mg, 28-tab pack = £1.64. | Label: 19 |
| Oral solution, sugar-free, temazepam 10 mg/5 mL, net price 300 mL = £18.96. | Label: 19 |
| Dental prescribing on NHS Temazepam Tablets or Oral Solution may be prescribed |

**Zaleplon, zolpidem, and zopiclone**

Zaleplon, zolpidem and zopiclone are non-benzodiazepine hypnotics, but they act at the benzodiazepine receptor. Zolpidem and zopiclone have a short duration of action; zaleplon is very short acting. All three drugs are not licensed for long-term use; dependence has been reported in a small number of patients.
Central nervous system

Stilnoct
Zolpidem (Non-proprietary)

ADULT
Dose
• ADULT over 18 years, 10 mg at bedtime; ELDERLY 5 mg

Side-effects
• diarrhoea, nausea, vomiting, vertigo,

Contra-indications
• sleep apnoea syndrome, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects
• amnesia, paraesthesia, drowsiness; dysmenorrhoea; less commonly nausea, anorexia, asthma, incoordination, confusion, impaired concentration, depression, depersonalisation, dizziness, hallucinations, disturbances of smell, hearing, speech, and vision; photosensitivity; paradoxical effects (see p. 183) and sleep-walking also reported

Contra-indications
• sleep apnoea syndrome, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects
• amnesia, paraesthesia, drowsiness; dysmenorrhoea; less commonly nausea, anorexia, asthma, incoordination, confusion, impaired concentration, depression, depersonalisation, dizziness, hallucinations, disturbances of smell, hearing, speech, and vision; photosensitivity; paradoxical effects (see p. 183) and sleep-walking also reported

Contra-indications
• marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects
• taste disturbance; less commonly nausea, vomiting; dizziness, drowsiness, dry mouth, headache; rarely amnesia, confusion, depression, hallucinations, nightmares; very rarely light headedness, incoordination; paradoxical effects (see p. 183) and sleep-walking also reported

Dose
• ADULT over 18 years, 7.5 mg at bedtime; ELDERLY initially 3.75 mg at bedtime increased if necessary

Zopiclon (Non-proprietary)

Indications
• insomnia (short-term use—up to 4 weeks)

Cautions
• sleep apnoea, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects
• light headedness, incoordination, confusion, alterations of vision; photosensitivity; less commonly nightmares; abdominal distention, flatulence, headache, skin reactions, changes in libido; paradoxical effects (see p. 183) and sleep-walking also reported

Contra-indications
• obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, severe hepatic impairment, psychotic illness, pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects
• diarrhoea, nausea, vomiting, vertigo, dizziness, headache, drowsiness, asthenia, amnesia; dependence, memory disturbances, nightmares, nocturnal restlessness, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 183) and sleep-walking also reported

Dose
• ADULT over 18 years, 10 mg at bedtime; ELDERLY (or debilitated) 5 mg

Zopidem (Non-proprietary)

Tablets, zopidem tartrate 5 mg, net price 28-tab pack = £1.63; 10 mg, 28-tab pack = £1.70. Label: 19

Stilnot® (Sanofi-Synthelabo)

Tablets, both f/c, zolpidem tartrate 5 mg, net price 28-tab pack = £3.08; 10 mg, 28-tab pack = £4.48. Label: 19

4.1.1 Hypnotics BNF 57

ZOPICLONE

Indications
• insomnia (short-term use—up to 4 weeks)

Cautions
• elderly; muscle weakness and myasthenia gravis, history of drug abuse, psychiatric illness; avoid prolonged use (risk of tolerance and withdrawal symptoms); hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving
Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications
• marked neuromuscular respiratory weakness including unstable myasthenia gravis, respiratory failure, severe sleep apnoea syndrome; breast-feeding (Appendix 5)

Side-effects
• taste disturbance; less commonly nausea, vomiting; dizziness, drowsiness, dry mouth, headache; rarely amnesia, confusion, depression, hallucinations, nightmares; very rarely light headedness, incoordination; paradoxical effects (see p. 183) and sleep-walking also reported

Dose
• ADULT over 18 years, 7.5 mg at bedtime; ELDERLY initially 3.75 mg at bedtime increased if necessary

Zopiclon (Non-proprietary)

Indications
• insomnia (short-term use—up to 4 weeks)

Cautions
• sleep apnoea, marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects
• light headedness, incoordination, confusion, alterations of vision; photosensitivity; less commonly nightmares; abdominal distention, flatulence, headache, skin reactions, changes in libido; paradoxical effects (see p. 183) and sleep-walking also reported

Contra-indications
• obstructive sleep apnoea, acute or severe respiratory depression, marked neuromuscular respiratory weakness including unstable myasthenia gravis, severe hepatic impairment, psychotic illness, pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects
• diarrhoea, nausea, vomiting, vertigo, dizziness, headache, drowsiness, asthenia, amnesia; dependence, memory disturbances, nightmares, nocturnal restlessness, depression, confusion, perceptual disturbances or diplopia, tremor, ataxia, falls, skin reactions, changes in libido; paradoxical effects (see p. 183) and sleep-walking also reported

Dose
• ADULT over 18 years, 10 mg at bedtime; ELDERLY (or debilitated) 5 mg

Zopidem (Non-proprietary)

Tablets, zopidem tartrate 5 mg, net price 28-tab pack = £1.63; 10 mg, 28-tab pack = £1.70. Label: 19

Stilnot® (Sanofi-Synthelabo)

Tablets, both f/c, zolpidem tartrate 5 mg, net price 28-tab pack = £3.08; 10 mg, 28-tab pack = £4.48. Label: 19

CHLORAL HYDRATE

Indications
• insomnia (short-term use)

Cautions
• reduce dose in elderly and debilitated; avoid prolonged use (and abrupt withdrawal thereafter); avoid contact with skin and mucous membranes; hepatic impairment (avoid if severe—Appendix 2); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving
Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications
• severe cardiac disease, gastritis, renal impairment (avoid if creatinine clearance less than 10 mL/minute); pregnancy; breast-feeding (Appendix 5); acute porphyria (section 9.8.2)

Side-effects
• gastric irritation (nausea and vomiting reported), abdominal distention, flatulence, headache, tolerance, dependence, excitement, delirium (especially on abrupt withdrawal), ketonuria, and rash

Dose
• See under preparations below
Chloral Mixture, BP 2000 (Chloral Oral Solution)

*Mixture*, chloral hydrate 500 mg/5 mL in a suitable vehicle. Extemporaneous preparations should be recently prepared according to the following formula: chloral hydrate 1 g, syrup 2 mL, water to 10 mL. Net price 100 mL = £5.3 p. Label: 19, 27

**Dose** 5–20 mL; **CHILD** 1–12 years 30–50 mg/kg (max. 1 g), taken well diluted with water at bedtime

Chloral Elixir, Paediatric, BP 2000 (Chloral Oral Solution, Paediatric)

*Elixir*, chloral hydrate 200 mg/5 mL (4%) in a suitable vehicle with a black currant flavour. Extemporaneous preparations should be recently prepared according to the following formula: chloral hydrate 200 mg, water 0.1 mL, black currant syrup 1 mL, syrup to 5 mL. Net price 100 mL = £1.02. Label: 1, 27

**Dose** CHILD 1 month–1 year 30–50 mg/kg, taken well diluted with water at bedtime

**Cloral betaine**

**Wellldorm** (Alphashow)

**Tablets**, blue-purple, 1/5, cloral betaine 707 mg (cloral hydrate 414 mg). Net price 30-tab pack = £7.90. Label: 19, 27

**Dose** ADULT and CHILD over 12 years, 1–2 tablets with water or milk at bedtime, max. 5 tablets (cloral hydrate 2 g) daily

**Elixir**, red, chloral hydrate 143.3 mg/5 mL. Net price 150-mL pack = £6.67. Label: 19, 27

**Dose** 15–45 mL (chloral hydrate 0.4–1.3 g) with water or milk, at bedtime, max. 70 mL (chloral hydrate 2 g) daily. CHILD 1 month–12 years, 1–1.75 mL/kg (chloral hydrate 30–50 mg/kg), max. 35 mL (chloral hydrate 1 g) daily

**TRICLOFOS SODIUM**

**Indications** insomnia (short-term use)

**Cautions** avoid prolonged use (and abrupt withdrawal thereafter); elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** cardiac disease; gastritis; acute porphyria (section 9.8.2); pregnancy; breast-feeding (Appendix 5)

**Side-effects** abdominal distension, flatulence, gastric irritation including nausea and vomiting, dependence, malaise, ataxia, drowsiness, headache, lightheadedness, vertigo, confusion, paranoiac excitement, nightmares, delirium (especially on abrupt withdrawal), ketonuria, blood disorders, skin reactions, and urticaria

**Dose**

- See under preparation below

Triclofos Oral Solution, BP (Triclofos Elixir)

**Oral solution**, triclofos sodium 500 mg/5 mL. Net price 300 mL = £28.23. Label: 19

**Dose** 10–20 mL; **CHILD** up to 1 year 25–30 mg/kg, 1–5 years 2–5 mL (250–500 mg triclofos sodium), 6–12 years 5–10 mL (0.5–1 g triclofos sodium)

**Clomethiazole** (Chlormethiazole) may be a useful hypnotic for elderly patients because of its freedom from hangover but, as with all hypnotics, routine administration is undesirable and dependence occurs. It is licensed for use as a hypnotic only in the elderly (and for very short-term use in younger adults to attenuate alcohol withdrawal symptoms, section 4.10).

**CLOMETHIAZOLE** (Chlormethiazole)

**Indications** see under Dose; alcohol withdrawal (section 4.10)

**Cautions** cardiac and respiratory disease (confusional state may indicate hypoxia), chronic pulmonary insufficiency, sleep apnoea syndrome; history of drug abuse; avoid prolonged use (and abrupt withdrawal thereafter); marked personality disorder; elderly; excessive sedation may occur (particularly with higher doses); hepatic impairment (especially if severe because sedation can mask hepatic coma; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** acute pulmonary insufficiency; alcohol-dependent patients who continue to drink

**Side-effects** nasal congestion and irritation (increased nasopharyngeal and bronchial secretions), conjunctival irritation, headache; rarely gastro-intestinal disturbances, paradoxical excitement, confusion, dependence, rash, urticaria, bullous eruption, anaphylaxis, alterations in liver enzymes

**Dose**

- Severe insomnia in the elderly (short-term use), 1–2 capsules (or 5–10 mL syrup) at bedtime; **CHILD** not recommended

- Restlessness and agitation in the elderly, 1 capsule (or 5 mL syrup) 3 times daily

- Alcohol withdrawal, initially 2–4 capsules, if necessary repeated after some hours; day 1 (first 24 hours), 9–12 capsules in 3–4 divided doses; day 2, 6–8 capsules in 3–4 divided doses; day 3, 4–6 capsules in 3–4 divided doses; then gradually reduced over days 4–6; total treatment for not more than 9 days

Heminevrin® (AstraZeneca)

**Capsules**, grey-brown, clomethiazole base 192 mg in an oily basis. Net price 60-cap pack = £4.78. Label: 19

**Syrup**, sugar-free, clomethiazole edisilate 250 mg/5 mL. Net price 300-mL pack = £4.00. Label: 19

**Note** For an equivalent therapeutic effect 1 capsule = 5 mL syrup

**Antihistamines**

Some antihistamines (section 3.4.1) such as promethazine are on sale to the public for occasional insomnia; their prolonged duration of action can often cause drowsiness the following day. The sedative effect of antihistamines may diminish after a few days of continued treatment; antihistamines are associated with headache, psychomotor impairment and antimuscarinic effects.

Promethazine is also popular for use in children, but the use of hypnotics in children is not usually justified.
4.1.2 Anxiolytics

**PROMETHAZINE HYDROCHLORIDE**

**Indications** night sedation and insomnia (short-term use); other indications (section 3.4.1, section 4.6)

**Cautions** section 3.4.1

**Contra-indications** section 3.4.1

**Side-effects** section 3.4.1

**Dose**
- **By mouth**, 25 mg at bedtime increased to 50 mg if necessary; **CHILD** under 2 years not recommended, 2–5 years 15–20 mg, 5–10 years 20–25 mg, at bedtime

**Preparations** Section 3.4.1

**Alcohol**

Alcohol is a poor hypnotic because the diuretic action interferes with sleep during the latter part of the night. Alcohol also disturbs sleep patterns, and so can worsen sleep disorders; **interactions**: Appendix 1 (alcohol).

**SODIUM OXYBATE**

**Indications** narcolepsy with cataplexy (under specialist supervision)

**Cautions** history of drug abuse or depression; epilepsy; elderly; respiratory disorders; heart failure and hypertension (high sodium content); risk of discontinuation effects including rebound cataplexy and withdrawal symptoms; acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); breast-feeding (Appendix 4); **interactions**: Appendix 1 (sodium oxybate)

**Contra-indications** pregnancy (Appendix 4)

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, anorexia; hypertension, peripheral oedema; dyspnoea; sleep disorders, confusion, disorientation, paraesthesia, hypoesthesia, impaired attention, depression, drowsiness, anxiety, dizziness, headache, tremor, asthenia, fatigue; urinary incontinence, nocturnal enuresis; arthralgia, muscle cramps; blurred vision; sweating; **less commonly** faecal incontinence, myoclonus, psychosis, paranoia, hallucination, agitation, amnesia, and rash; respiratory depression, dependence, seizures, suicidal ideation, and urticaria also reported

**Dose**
- **ADULT** over 18 years, initially 2.25 g on retiring and repeated 2.5–4 hours later, increased according to response in steps of 1.5 g daily in 2 divided doses at intervals of 1–2 weeks; max. 9 g daily in two divided doses

**Note** Dose titration should be repeated if restarting after interval of more than 14 days

**Counselling** Dilute each dose with 60 mL water; prepare both doses before retiring. Observe the same time interval (2–3 hours) each night between the last meal and the first dose

**BNF 57**

**Melatonin**

Melatonin is a pineal hormone; it is licensed for the short-term treatment of insomnia in adults over 55 years.

**MELATONIN**

**Indications** insomnia (short-term use)

**Cautions** renal impairment (Appendix 3); **interactions**: Appendix 1 (melatonin)

**Contra-indications** autoimmune disease; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** pharyngitis; back pain, headache, asthenia; **less commonly** abdominal pain, constipation, dry mouth, weight gain, drowsiness, dizziness, sleep disorders, restlessness, nervousness, irritability, and sweating; **rarely** flattulence, halitosis, hypersalivation, vomiting, hypertriglyceridaemia, aggression, agitation, fatigue, impaired memory, mood changes, hot flushes, priapism, increased libido, leucopenia, thrombocytopenia, muscle cramp, skin reaction, lacrimation, and visual disturbances

**Dose**
- **ADULT** over 55 years, 2 mg once daily 1–2 hours before bedtime for 3 weeks

**Circadin** (Lundbeck) ▼ ▼ ▼

Tablets, m/r, melatonin 2 mg, net price 21-tab pack = £10.77. Label: 2, 21, 25

**BNF 57**

**4.1.2 Anxiolytics**

Benzodiazepine anxiolytics can be effective in alleviating anxiety states. Although these drugs are often prescribed to almost anyone with stress-related symptoms, unhappiness, or minor physical disease, their use in many situations is unjustified. In particular, they are not appropriate for treating depression or chronic psychosis. In bereavement, psychological adjustment may be inhibited by benzodiazepines. In children anxiolytic treatment should be used only to relieve acute anxiety (and related insomnia) caused by fear (e.g. before surgery).

Anxiolytic treatment should be limited to the lowest possible dose for the shortest possible time (see CSM advice, section 4.1). Dependence is particularly likely in patients with a history of alcohol or drug abuse and in patients with marked personality disorders.

Anxiolytics, particularly the benzodiazepines, have been termed ‘minor tranquillisers’. This term is misleading because not only do they differ markedly from the antipsychotic drugs (‘major tranquillisers’) but their use is by no means minor. Antipsychotics, in low doses, are also sometimes used in severe anxiety for their sedative action but long-term use should be
avoided in view of a possible risk of tardive dyskinesia (section 4.2.1).

Some antidepressants (section 4.3) are licensed for use in anxiety and related disorders; see section 4.3 for a comment on their role in chronic anxiety, generalised and social anxiety disorder, and panic disorder. The use of antihistamines (e.g. hydroxyzine, section 3.4.1) for their sedative effect in anxiety is not appropriate.

**Beta-blockers** (section 2.4) do not affect psychological symptoms of anxiety, such as worry, tension, and fear, but they do reduce autonomic symptoms, such as palpitation and tremor; they do not reduce non-autonomic symptoms, such as muscle tension. Beta-blockers are therefore indicated for patients with predominantly somatic symptoms; this, in turn, may prevent the onset of worry and fear.

### Benzodiazepines

Benzodiazepines are indicated for the **short-term relief of severe anxiety**; long-term use should be avoided (see CSM advice, p. 184). Diazepam, alprazolam, clordiazepoxide, and clobazam have a sustained action. Shorter-acting compounds such as lorazepam and oxazepam may be preferred in patients with hepatic impairment but they carry a greater risk of withdrawal symptoms.

In **panic disorders** (with or without agoraphobia) resistant to antidepressant therapy (section 4.3), a benzodiazepine (lorazepam 3–5 mg daily or clonazepam 1–2 mg daily (section 4.8.1) [both unlicensed]) may be used; alternatively, a benzodiazepine may be used as short-term adjunctive therapy at the start of antidepressant treatment to prevent the initial worsening of symptoms.

Diazepam or lorazepam are very occasionally administered intravenously for the control of panic attacks. This route is the most rapid but the procedure is not without risk (section 4.8.2) and should be used only when alternative measures have failed. The intramuscular route has no advantage over the oral route.

For guidelines on benzodiazepine withdrawal, see p. 183.

### DIAZEPAM

**Indications** short-term use in anxiety or insomnia (see CSM advice, p. 184); adjunct in acute alcohol withdrawal; status epilepticus (section 4.8.2); febrile convulsions (section 4.8.3); muscle spasm (section 10.2.2); peri-operative use (section 15.1.4.1)

**Cautions** respiratory disease, muscle weakness and myasthenia gravis, history of drug or alcohol abuse, marked personality disorder, pregnancy (Appendix 4), breast-feeding (Appendix 5); reduce dose in elderly and debilitated, and in hepatic impairment (avoid if severe; Appendix 2), renal impairment (Appendix 3); avoid prolonged use (and abrupt withdrawal thereafter); special precautions for intravenous injection (section 4.8.2); acute porphyria (section 9.8.2); when given parenterally, close observation required until full recovery from sedation; **interactions**: Appendix 1 (anxiolytics and hypnotics)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** respiratory depression; marked neuromuscular respiratory weakness including unstable myasthenia gravis; acute pulmonary insufficiency; sleep apnoea syndrome; severe hepatic impairment; not for chronic psychosis; should not be used alone in depression or in anxiety with depression; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Side-effects** drowsiness and lightheadedness the next day; confusion and ataxia (especially in the elderly); amnesia; dependence; paradoxical increase in aggression (see also section 4.1); muscle weakness; **occasionally**: headache, vertigo, hypotension, salivation changes, gastro-intestinal disturbances, visual disturbances, dysarthria, tremor, changes in libido, incontinence, urinary retention; blood disorders and jaundice reported; skin reactions; on intravenous injection, pain, thrombophlebitis, and rarely apnoea; **overdose**: see Emergency Treatment of Poisoning, p. 32

**Dose**

- **By mouth**, anxiety, 2 mg 3 times daily increased if necessary to 15–30 mg daily in divided doses; **ELDERLY** (or debilitated) half adult dose

- **By intramuscular injection or slow intravenous injection** (into a large vein, at a rate of not more than 5 mg/minute), for severe acute anxiety, control of acute panic attacks, and acute alcohol withdrawal, 10 mg, repeated if necessary after not less than 4 hours

**Note** Only use intramuscular route when oral and intravenous routes not possible; special precautions for intravenous injection section 4.8.2.

- **By rectum** as rectal solution, acute anxiety and agitation, 500 micrograms/kg repeated after 12 hours as required; **ELDERLY** 250 micrograms/kg; **CHILD** not recommended

As suppositories, anxiety when oral route not appropriate, 10–30 mg (higher dose divided); dose form not appropriate for less than 10 mg

**Diazepam** (Non-proprietary) (SWN)

- **Tablets**, diazepam 2 mg, net price 28 = 95p; 5 mg, 28 = 98p; 10 mg, 28 = £1.08. Label: 2 or 19
  - Brands include Rimplap, Tensium

- **Oral solution**, diazepam 2 mg/5 mL, net price 100 mL = £6.75. Label: 2 or 19
  - Brands include Dialar

- **Strong oral solution**, diazepam 5 mg/5 mL, net price 100 mL-pack = £6.38. Label: 2 or 19
  - Brands include Dialar

**Injection** (solution), diazepam 5 mg/mL. Do not dilute (except for intravenous infusion, see Appendix 6). Net price 2-mL amp = 45p

- **Excipients** may include benzyl alcohol (avoid in neonates, see Excipients, p. 2), ethanol, propylene glycol

**Injection** (emulsion), diazepam 5 mg/mL. For intravenous injection or infusion, see Appendix 6. Net price 2-mL amp = 84p

- Brands include Diazemuls

**Rectal tubes** (= rectal solution), diazepam 2 mg/mL, net price 1.25-ML (2.5-mg) tube = 90p, 2.5-ML (5-mg) tube = £1.27; 4 mg/mL, 2.5-ML (10-mg) tube = £1.65

- Brands include Diazepam Rectubes, Stesolid

**Suppositories**, diazepam 10 mg, net price 6 = £10.20. Label: 2 or 19

- Brands include Valclor

**Dental prescribing on NHS** Diazepam Tablets or Diazepam Oral Solution 2 mg/5 mL may be prescribed
**ALPRAZOLAM**

**Indications**  
anxiety (short-term use; see CSM advice, p. 184)

**Cautions**  
see under Diazepam

**Contra-indications**  
see under Diazepam

**Side-effects**  
see under Diazepam

**Dose**

- 250–500 micrograms 3 times daily (ELDERLY or debilitated 250 micrograms 2–3 times daily), increased if necessary to a total of 3 mg daily; CHILD not recommended

**Alprazolam (Non-proprietary)**

- **Tablets**, alprazolam 250 micrograms, net price 60-tab pack = £2.97; 500 micrograms, 60-tab pack = £5.69. Label: 2
- **Brands** include Xanax

**CHLORDIAZEPoxide HYDROCHLORIDE**

**Indications**  
anxiety (short-term use; see CSM advice, p. 184); adjunct in acute alcohol withdrawal (section 4.10)

**Cautions**  
see under Diazepam

**Contra-indications**  
see under Diazepam

**Side-effects**  
see under Diazepam

**Dose**

- Anxiety: 10 mg 3 times daily increased if necessary to 60–100 mg daily in divided doses; ELDERLY (or debilitated) half adult dose; CHILD not recommended

**Chlordiazepoxide (Non-proprietary)**

- **Capsules**, chlordiazepoxide hydrochloride 5 mg, net price 20 = 50p; 10 mg, 20 = 84p. Label: 2
- **Brands** include Librium, Tropium

**Chlordiazepoxide Hydrochloride (Non-proprietary)**

- **Tablets**, chlordiazepoxide hydrochloride 5 mg, net price 20 = £1.58; 10 mg, 20 = £3.19. Label: 2

**LORAZEPAM**

**Indications**  
short-term use in anxiety or insomnia (see CSM advice, p. 184); status epilepticus (section 4.8.2); peri-operative (section 15.1.4.1)

**Cautions**  
see under Diazepam; short acting; when given parenterally, facilities for managing respiratory depression with mechanical ventilation must be at hand

**Contra-indications**  
see under Diazepam

**Side-effects**  
see under Diazepam

**Dose**

- **By mouth**, anxiety, 1–4 mg daily in divided doses; ELDERLY (or debilitated) half adult dose  
  Insomnia associated with anxiety, 1–2 mg at bedtime; CHILD not recommended

- **By intramuscular or slow intravenous injection** (into a large vein), acute panic attacks, 25–30 micrograms/kg (usual range 1.5–2.5 mg), repeated every 6 hours if necessary; CHILD not recommended

**Note** 
Only use intramuscular route when oral and intravenous routes not possible

**Lorazepam (Non-proprietary)**

- **Tablets**, lorazepam 1 mg, net price 28-tab pack = £8.28; 2.5 mg, 28-tab pack = £15.08. Label: 2 or 19

**Injection**, lorazepam 4 mg/mL. Net price 1-mL amp = 37p

**Excipients** include benzyl alcohol, propylene glycol (see Excipients, p. 2)

**Brands** include Ativan

**Note** 
For intramuscular injection it should be diluted with an equal volume of water for injections or physiological saline (but only use when oral and intravenous routes not possible)

**OXAZEPAM**

**Indications**  
anxiety (short-term use; see CSM advice, p. 184)

**Cautions**  
see under Diazepam; short acting

**Contra-indications**  
see under Diazepam

**Side-effects**  
see under Diazepam

**Dose**

- Anxiety, 15–30 mg (elderly or debilitated 10–20 mg) 3–4 times daily; CHILD not recommended

- Insomnia associated with anxiety, 15–25 mg (max. 50 mg) at bedtime; CHILD not recommended

**Oxazepam (Non-proprietary)**

- **Tablets**, oxazepam 10 mg, net price 28-tab pack = £6.17; 15 mg, 28-tab pack = £6.52. Label: 2

**Buspirone**

Buspirone is thought to act at specific serotonin (5HT) receptors. Response to treatment may take up to 2 weeks. It does not alleviate the symptoms of benzodiazepine withdrawal. Therefore a patient taking a benzodiazepine still needs to have the benzodiazepine withdrawn gradually; it is advisable to do this before starting buspirone. The dependence and abuse potential of buspirone is low; it is, however, licensed for short-term use only (but specialists occasionally use it for several months).

**BUSBIRONE HYDROCHLORIDE**

**Indications**  
anxiety (short-term use)

**Cautions**  
does not alleviate benzodiazepine withdrawal (see notes above); hepatic impairment (Appendix 2); renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3); interactions: Appendix 1 (anxiolytics and hypnotics)

**Driving**  
May affect performance of skilled tasks (e.g. driving); effects of alcohol may be enhanced

**Contra-indications**  
epilepsy; acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects**  
nausea; dizziness, headache, nervousness, excitement; rarely dry mouth, tachycardia, palpitation, chest pain, drowsiness, confusion, seizures, fatigue, and sweating

**Dose**

- **ADULT** over 18 years, 5 mg 2–3 times daily, increased as necessary every 2–3 days; usual range 15–30 mg daily in divided doses; max. 45 mg daily

**Buspirone Hydrochloride (Non-proprietary)**

- **Tablets**, buspirone hydrochloride 5 mg, net price 30-tab pack = £17.34; 10 mg, 30-tab pack = £19.67. Counselling, driving
The very short-acting barbiturate thiopental is used in anaesthesia (section 4.8.1) but its use as a sedative is unjustified. Avoid prolonged use, abrupt withdrawal may precipitate convulsions; interactions: Appendix 1 (anxiolytics and hypnotics).

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Contra-indications insomnia caused by pain; acute porphyria (section 9.8.2); children, young adults, elderly and debilitated patients, also patients with history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5).

Side-effects drowsiness, incoordination; less commonly nausea, vomiting, constipation, liver damage, bradycardia, hypotension, syncope, hyperventilation, anorexia, respiratory depression, agitation, confusion, hyperkinesia, ataxia, CNS depression, sleep disorders, hallucinations, anxiety, dizziness, headache, paradoxical excitement, impaired memory, fever, and megaloblastic anaemia.

Dose • See under preparations below.

Sodium Amytal® (Flynn) Capsules, blue, amobarbital (amobarbitone) sodium 60 mg, net price 20 = £3.43. Label: 19.

Dose 60–200 mg at bedtime (important: but see also contra-indications).

Soneryl® (Flynn) Tablets, pink, scored, butobarbital (butobarbitone) 100 mg. Net price 56-tab pack = £10.65. Label: 19.

Dose 100–200 mg at bedtime (important: but see also contra-indications).

Preparations containing secobarbital (quinalbarbitone) Seconal Sodium® (Flynn) Capsules, orange, secobarbital (quinalbarbitone) sodium 100 mg, 20 = £6.96. Label: 19.

Dose 100 mg at bedtime (important: but see also contra-indications).

Tuinal® (Flynn) Capsules, orange/blue, a mixture of amobarbital (amobarbitone) sodium 50 mg, secobarbital (quinalbarbitone) sodium 50 mg. Net price 20 = £3.88. Label: 19.

Dose 1–2 capsules at bedtime (important: but see also contra-indications).

Note Prescriptions need only specify ‘Tuinal capsules’.

4.1.3 Barbiturates

The intermediate-acting barbiturates have a place only in the treatment of severe intractable insomnia in patients already taking barbiturates; they should be avoided in the elderly. The long-acting barbiturate phenobarbital is still sometimes of value in epilepsy (section 4.8.1) but its use as a sedative is unjustified. The very short-acting barbiturate thiopental is used in anaesthesia (section 15.1.1).

BARBITURATES

Indications severe intractable insomnia only in patients already taking barbiturates; see also notes above.

Cautions avoid use where possible; dependence and tolerance readily occur; abrupt withdrawal may precipitate serious withdrawal syndrome (rebound insomnia, anxiety, tremor, dizziness, nausea, convulsions, delirium, and death); repeated doses are cumulative and can cause excessive sedation; depression and suicidal ideation; shock; respiratory disease (avoid if dyspnoea or obstruction present); hepatic impairment (avoid if severe; Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (barbiturates).

Driving Drowsiness may persist the next day and affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Contra-indications insomnia caused by pain; acute porphyria (section 9.8.2); children, young adults, elderly and debilitated patients, also patients with history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5).

Side-effects drowsiness, incoordination; less commonly nausea, vomiting, constipation, liver damage, bradycardia, hypotension, syncope, hyperventilation, anorexia, respiratory depression, agitation, confusion, hyperkinesia, ataxia, CNS depression, sleep disorders, hallucinations, anxiety, dizziness, headache, paradoxical excitement, impaired memory, fever, and megaloblastic anaemia.

Dose • See under preparations below.

Sodium Amytal® (Flynn) Capsules, blue, amobarbital (amobarbitone) sodium 60 mg, net price 20 = £3.43. Label: 19.

Dose 60–200 mg at bedtime (important: but see also contra-indications).

Soneryl® (Flynn) Tablets, pink, scored, butobarbital (butobarbitone) 100 mg. Net price 56-tab pack = £10.65. Label: 19.

Dose 100–200 mg at bedtime (important: but see also contra-indications).

Preparations containing secobarbital (quinalbarbitone) Seconal Sodium® (Flynn) Capsules, orange, secobarbital (quinalbarbitone) sodium 100 mg, 20 = £6.96. Label: 19.

Dose 100 mg at bedtime (important: but see also contra-indications).

Tuinal® (Flynn) Capsules, orange/blue, a mixture of amobarbital (amobarbitone) sodium 50 mg, secobarbital (quinalbarbitone) sodium 50 mg. Net price 20 = £3.88. Label: 19.

Dose 1–2 capsules at bedtime (important: but see also contra-indications).

Note Prescriptions need only specify ‘Tuinal capsules’.

4.2 Drugs used in psychoses and related disorders

4.2.1 Antipsychotic drugs

4.2.2 Antipsychotic depot injections

4.2.3 Antimanic drugs

Advice of Royal College of Psychiatrists on doses above BNF upper limit. Unless otherwise stated, doses in the BNF are licensed doses—any higher dose is...
4.2.1 Antipsychotic drugs

Antipsychotic drugs are also known as 'neuroleptics' and (misleadingly) as 'major tranquillisers'. Antipsychotic drugs generally tranquillise without impairing consciousness and without causing paradoxical excitement but they should not be regarded merely as tranquillisers. For conditions such as schizophrenia the tranquillising effect is of secondary importance. In the short term they are used to calm disturbed patients whatever the underlying psychopathology, which may be schizophrenia, brain damage, mania, toxic delirium, or agitated depression. Antipsychotic drugs are used to alleviate severe anxiety but this too should be a short-term measure.

Schizophrenia Antipsychotic drugs relieve florid psychotic symptoms such as thought disorder, hallucinations, and delusions, and prevent relapse. Although they are usually less effective in apathetic withdrawn patients, they sometimes appear to have an activating influence. Patients with acute schizophrenia generally respond better than those with chronic symptoms.

Long-term treatment of a patient with a definite diagnosis of schizophrenia may be necessary even after the first episode of illness in order to prevent the illness from becoming chronic. Withdrawal of drug treatment requires careful surveillance because the patient who appears well on medication may suffer a disastrous relapse if treatment is withdrawn inappropriately. In addition the need for continuation of treatment may not become immediately evident because relapse is often delayed for several weeks after cessation of treatment.

Antipsychotic drugs are considered to act by interfering with dopaminergic transmission in the brain by blocking dopamine D receptors, which may give rise to the extrapyramidal effects described below, and also to hyperprolactinaemia. Antipsychotic drugs may also affect cholinergic, alpha-adrenergic, histaminergic, and serotoninergic receptors.

Cautions and contra-indications Antipsychotics should be used with caution in patients with hepatic impairment (Appendix 2), renal impairment (Appendix 3), cardiovascular disease, Parkinson's disease (may be exacerbated by antipsychotics), epilepsy (and conditions predisposing to epilepsy), depression, myasthenia gravis, prostatic hypertrophy, or a susceptibility to angle-closure glaucoma. Caution is also required in severe respiratory disease and in patients with a history of jaundice or who have blood dyscrasias (perform blood counts if unexplained infection or fever develops). As photosensitisation may occur with higher dosages, patients should avoid direct sunlight.

Antipsychotic drugs may be contra-indicated in comatose states, CNS depression, and phaeochromocytoma. Most antipsychotics are best avoided during pregnancy, unless essential (Appendix 4) and it is advisable to discontinue breast-feeding during treatment (Appendix 5). Interactions: Appendix 1 (antipsychotics).

Prescribing for the elderly The balance of risks and benefit should be considered before prescribing antipsychotic drugs for elderly patients. In elderly patients with dementia, antipsychotic drugs are associated with a small increased risk of mortality and an increased risk of stroke or transient ischaemic attack. Furthermore, elderly patients are particularly susceptible to postural hypotension and to hyper- and hypothermia in hot or cold weather.

It is recommended that:

- Antipsychotic drugs should not be used in elderly patients to treat mild to moderate psychotic symptoms.
- Treatment should be reviewed regularly.

Driving Drowsiness may affect performance of skilled tasks (e.g. driving or operating machinery), especially at start of treatment; effects of alcohol are enhanced.

Withdrawal Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects Extrapyramidal symptoms are the most troublesome. They occur most frequently with the piperazine phenothiazines (fluphenazine, perphenazine, prochlorperazine, and trifluoperazine), the butyrophenones (benperidol and haloperidol), and the depot preparations. They are easy to recognise but cannot be predicted accurately because they depend on the dose, the type of drug, and on individual susceptibility.
Extrapyramidal symptoms consist of:

- **parkinsonian symptoms** (including tremor), which may occur more commonly in adults or the elderly and may appear gradually;
- **dystonia** (abnormal face and body movements) and **dyskinesia**, which occur more commonly in children or young adults and appear after only a few doses;
- **akathisia** (restlessness), which characteristically occurs after large initial doses and may resemble an exacerbation of the condition being treated; and
- **tardive dyskinesia** (rhythmic, involuntary movements of tongue, face, and jaw), which usually develops on long-term therapy or with high dosage, but it may develop on short-term treatment with low doses—short-lived tardive dyskinesia may occur after withdrawal of the drug.

**Parkinsonian symptoms** remit if the drug is withdrawn and may be suppressed by the administration of **antimuscarinic** drugs (section 4.9.2). However, routine administration of such drugs is not justified because not all patients are affected and because they may unmask or worsen tardive dyskinesia.

**Tardive dyskinesia** is of particular concern because it may be irreversible on withdrawing therapy and treatment is usually ineffective. However, some manufacturers suggest that drug withdrawal at the earliest signs of tardive dyskinesia (fine vermiform movements of the tongue) may halt its full development. Tardive dyskinesia occurs fairly frequently, especially in the elderly, and treatment must be carefully and regularly reviewed.

**Hypotension** and **interference with temperature regulation** are dose-related side-effects and are liable to cause dangerous falls and hypothermia or hyperthermia in the elderly.

**Neuroleptic malignant syndrome** (hyperthermia, fluctuating level of consciousness, muscle rigidity, and autonomic dysfunction with pallor, tachycardia, labile blood pressure, sweating, and urinary incontinence) is a rare but potentially fatal side-effect of some drugs. Discontinuation of the antipsychotic is essential because there is no proven effective treatment, but cooling, bromocriptine, and dantrolene have been used. The syndrome, which usually lasts for 5–7 days after drug discontinuation, may be unduly prolonged if depot preparations have been used.

Other side-effects include: drowsiness; apathy; agitation, excitement and insomnia; convulsions; dizziness; headache; confusion; gastro-intestinal disturbances; nasal congestion; antimuscarinic symptoms (such as dry mouth, constipation, difficulty with micturition, and blurred vision; very rarely, precipitation of angle-closure glaucoma); cardiovascular symptoms (such as hypertension, tachycardia, and arrhythmias); ECG changes (cases of sudden death have occurred); endocrine effects such as menstrual disturbances, galactorrhoea, gynaecomastia, impotence, and weight gain; blood dyscrasias (such as agranulocytosis and leucopenia), photosensitisation, contact sensitisation and rashes, and jaundice (including cholestatic); corneal and lens opacities, and purplish pigmentation of the skin, cornea, conjunctiva, and retina.

**Overdosage**: for poisoning with phenothiazines and related compounds, see Emergency Treatment of Poisoning, p. 33.

**Classification of antipsychotics**

The **phenothiazine** derivatives can be divided into 3 main groups.

**Group 1**: chlorpromazine, levomepromazine (methotrimeprazine), and promazine, generally characterised by pronounced sedative effects and moderate antimuscarinic and extrapyramidal side-effects.

**Group 2**: pericyazine and pipotiazine, generally characterised by moderate sedative effects, marked antimuscarinic effects, but fewer extrapyramidal side-effects than groups 1 or 3.

**Group 3**: fluphenazine, perphenazine, prochlorperazine, and trifluoperazine, generally characterised by fewer sedative effects, fewer antimuscarinic effects, but more pronounced extrapyramidal side-effects than groups 1 and 2.

Drugs of other chemical groups resemble the phenothiazines of group 3 in their clinical properties. They include the **butyrophenones** (benperidol and haloperidol); **diphenylbutylpiperidines** (pimozide); **thioxanthenes** (flupentixol and zuclopenthixol); and the **substituted benzamides** (salpine). For details of the newer antipsychotic drugs amisulpride, clozapine, olanzapine, quetiapine, risperidone, sertindole, and zotepine, see under Atypical Antipsychotics, p. 197.

**Choice** As indicated above, the various drugs differ somewhat in predominant actions and side-effects. Selection is influenced by the degree of sedation required and the patient’s susceptibility to extrapyramidal side-effects. However, the differences between antipsychotic drugs are less important than the great variability in patient response; moreover, tolerance to secondary effects such as sedation usually develops. The atypical antipsychotics may be appropriate if extrapyramidal side-effects are a particular concern (see under Atypical Antipsychotics, below). Clozapine is used for schizophrenia when other antipsychotics are ineffective or not tolerated.

Prescribing of more than one antipsychotic at the same time is not recommended; it may constitute a hazard and there is no significant evidence that side-effects are minimised.

**Chlorpromazine** is still widely used despite the wide range of adverse effects associated with it. It has a marked sedating effect and is useful for treating violent patients without causing stupor. Agitated states in the elderly can be controlled without confusion, a dose of 10 to 25 mg once or twice daily usually being adequate.

**Flupentixol** (flupentixol) and **pimozide** (see CSM warning, p. 196) are less sedating than chlorpromazine.

**Sulpiride** in high doses controls florid positive symptoms, but in lower doses it can have an alerting effect on apathetic withdrawn schizophrenics.

**Fluphenazine**, **haloperidol**, and **trifluoperazine** are also of value but their use is limited by the high incidence of extrapyramidal symptoms. Haloperidol may be preferred for the rapid control of hyperactive psychotic states; it causes less hypotension than chlorpromazine and is therefore also popular for agitation and restlessness in the elderly, despite the high incidence of extrapyramidal side-effects.
Promazine is not sufficiently active by mouth to be used as an antipsychotic drug; it has been used to treat agitation and restlessness in the elderly (see Other uses, below).

Other uses Nausea and vomiting (section 4.6), choreas, motor tics (section 4.9.3), and intractable hiccup (see under Chlorpromazine Hydrochloride and under Haloperidol). 
Benperidol is used in deviant antisocial sexual behaviour but its value is not established; see also section 6.4.2 for the role of cyproterone acetate.

Psychomotor agitation should be investigated for an underlying cause; it can be managed with low doses of chlorpromazine or haloperidol used for short periods. Antipsychotic drugs can be used with caution for the short-term treatment of severe agitation and restlessness in the elderly (but see p. 192).

### Equivalent doses of oral antipsychotics

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication.

**Important** These equivalences must not be extrapolated beyond the maximum dose for the drug. Higher doses require careful titration in specialist units and the equivalences shown here may not be appropriate.

### Dosage

After an initial period of stabilisation, in most patients, the total daily oral dose can be given as a single dose. For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 191.

### BENPERIDOL

**Indications** control of deviant antisocial sexual behaviour (but see notes above)

**Cautions** see notes above; also manufacturer advises regular blood counts and liver function tests during long-term treatment

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- 0.25–1.5 mg daily in divided doses, adjusted according to response; ELDERLY (or debilitated) initially half adult dose; CHILD not recommended

Anquil® (Concord)

| Tablets, scored, benperidol 250 micrograms, net price 112-tab pack = £104.00. Label: 2 |

**Note** The proprietary name Anquil has been used for benperidol tablets

---

### Chlorpromazine Hydrochloride

**Warning** Owing to the risk of contact sensitisation, pharmacists, nurses, and other health workers should avoid direct contact with chlorpromazine; tablets should not be crushed and solutions should be handled with care

**Indications** see under Dose; antiemetic in palliative care (section 4.6)

**Cautions** see notes above; also patients should remain supine and the blood pressure monitored for 30 minutes after intramuscular injection

**Contra-indications** see notes above

**Side-effects** see notes above; also intramuscular injection may be painful, cause hypotension and tachycardia, and give rise to nodule formation

**Dose**

- **By mouth**, schizophrenia and other psychoses, mania, short-term Adjunctive management of severe anxiety, psychomotor agitation, excitement, and violent or dangerously impulsive behaviour initially 25 mg 3 times daily (or 75 mg at night), adjusted according to response, to usual maintenance dose of 75–300 mg daily (but up to 1 g daily may be required in psychoses); ELDERLY (or debilitated) third to half adult dose; CHILD (childhood schizophrenia and autism) 1–6 years 500 micrograms/kg every 4–6 hours (max. 40 mg daily); 6–12 years 10 mg 3 times daily (max. 75 mg daily)

Intractable hiccup, 25–50 mg 3–4 times daily

- **By deep intramuscular injection**, (for relief of acute symptoms but see also Cautions and Side-effects), 25–50 mg every 6–8 hours; CHILD, 1–6 years 500 micrograms/kg every 6–8 hours (max. 40 mg daily); 6–12 years 500 micrograms/kg every 6–8 hours (max. 75 mg daily)

Induction of hypothermia (to prevent shivering), 25–50 mg every 6–8 hours; CHILD 1–12 years, initially 0.5–1 mg/kg, followed by maintenance 500 micrograms/kg every 4–6 hours

- **By rectum** in suppositories as chlorpromazine base 100 mg every 6–8 hours [unlicensed]

**Note** For equivalent therapeutic effect 100 mg chlorpromazine base given rectally as a suppository = 20–25 mg chlorpromazine hydrochloride by intramuscular injection = 40–50 mg of chlorpromazine base or hydrochloride by mouth

**Chlorpromazine (Non-proprietary)**

| Tablets, coated, chlorpromazine hydrochloride 25 mg, 28-tab pack = £3.35; 50 mg, 28-tab pack = £3.40; 100 mg, 28-tab pack = £3.57. Label: 2, 11 |

**Brands include** Chloractil

**Oral solution**, chlorpromazine hydrochloride 25 mg/5 mL, net price 150 mL = £1.47, 100 mg/5 mL, 150 mL = £3.57. Label: 2, 11

**Injection**, chlorpromazine hydrochloride 25 mg/mL, net price 1 mL amp = 60p; 2 mL amp = 63p

**Suppositories**, chlorpromazine 25 mg and 100 mg. Label: 2, 11

Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

**Largactil** (Sanofi-Aventis)

**Injection**, chlorpromazine hydrochloride 25 mg/mL. Net price 2 mL amp = 63p
**FLUPENTIXOL**  
(Flupenthixol)

**Indications**  
schizophrenia and other psychoses, particularly with apathy and withdrawal but not mania or psychomotor hyperactivity; depression (section 4.3.4)

**Cautions**  
see notes above; avoidance in acute porphyria (section 9.8.2)

**Contra-indications**  
see notes above; also subarachnoid

**Side-effects**  
see notes above; occasionally raised

**Dose**
- Psychosis, initially 3–9 mg twice daily adjusted according to the response; max. 18 mg daily; **ELDERLY** (or debilitated) initially quarter to half adult dose; **CHILD** not recommended

**Depixol**® (Lundbeck)

Tablets, yellow, s/c, flupentixol 3 mg (as dihydrochloride). Net price 20 = £2.78. Label: 2

**Depot preparation**
Section 4.2.2

---

**HALOPERIDOL**

**Indications**  
see under Dose; motor tics (section 4.9.3)

**Cautions**  
see notes above; also subarachnoid

**Contra-indications**  
see notes above

**Side-effects**  
see notes above, but less sedating and fewer antimuscarinic or hypotensive symptoms; pigmentation and photosensitivity reactions rare; extrapyramidal symptoms, particularly dystonic reactions rare; weight loss; hypoglycaemia; inappropriate antidiuretic hormone secretion

**Dose**
- Schizophrenia and other psychoses, mania, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, **ADULT** and **CHILD** over 12 years, **by mouth**, initially 0.5–3 mg 2–3 times daily or 3–5 mg 2–3 times daily in severely affected or resistant patients; in resistant schizophrenia up to 30 mg daily may be needed; adjusted according to response to lowest effective maintenance dose (as low as 5–10 mg daily); **ELDERLY** (or debilitated) initially half adult dose
- **By intramuscular** or **by intravenous injection**, **ADULT** over 18 years, initially 2–10 mg, then every 4–8 hours according to response to total max. 18 mg daily; severely disturbed patients may require initial dose of up to 18 mg; **ELDERLY** (or debilitated) initially half adult dose
- Agitation and restlessness in the elderly, **by mouth**, initially 0.5–1.5 mg once or twice daily
- Short-term adjunctive management of severe anxiety, **by mouth**, **ADULT** over 18 years, 500 micrograms twice daily
- Intractable hiccup, **by mouth**, **ADULT** over 18 years, 1.5 mg 3 times daily adjusted according to response
- Nausea and vomiting, see Prescribing in Palliative Care, p. 17
- **By intramuscular** or **by intravenous injection**, 1–2 mg

**Haloperidol** (Non-proprietary)

Tablets, haloperidol 500 micrograms, net price 28-tab pack = £1.73; 5 mg, 28 = £0.98. Label: 2

**Docz**® (Rosemont)

Oral liquid, sugar-free, haloperidol 1 mg/mL. Net price 100-mL pack = £4.72. Label: 2

**Haldol**® (Janssen-Cilag)

Tablets, both scored, haloperidol 5 (blue), net price 20 = £1.53; 10 mg (yellow), 20 = £2.99. Label: 2

Oral liquid, sugar-free, haloperidol 2 mg/mL. Net price 100-mL pack (with pipette) = £4.72. Label: 2

**Injection**, haloperidol 5 mg/mL. Net price 1-mL amp = 30p

**Serenace**® (IVAX)

Capsules, green, haloperidol 500 micrograms, net price 30-cap pack = £8.81. Label: 2

Tablets, haloperidol 1.5 mg, net price 30-tab pack = £1.73; 5 mg (pink), 30-tab pack = £4.90; 10 mg (pale pink), 30-tab pack = £8.81. Label: 2

Oral liquid, sugar-free, haloperidol 2 mg/mL. Net price 500-mL pack = £43.83. Label: 2

**Depot preparation**
Section 4.2.2

---

**LEVOMEPROMAZINE**  
(Methotrimeprazine)

**Indications**  
see under Dose

**Cautions**  
see notes above; patients receiving large initial doses should remain supine

**Elderly**  
**Risk of postural hypotension**; not recommended for ambulant patients over 50 years unless risk of hypotensive reaction assessed

**Contra-indications**  
see notes above

**Side-effects**  
see notes above; occasionally raised erythrocyte sedimentation rate occurs

**Dose**
- Schizophrenia, **by mouth** initially 25–50 mg daily in divided doses increased as necessary; bedpatients initially 100–200 mg daily usually in 3 divided doses, increased if necessary to 1 g daily; **ELDERLY**; see Cautions
- Pain in palliative care, see p. 16
- Restlessness and confusion in palliative care, see p. 18; **CHILD** 1–18 years, see BNF for Children
- Nausea and vomiting in palliative care, by mouth, see p. 17, or by subcutaneous infusion, see p. 18; **CHILD** 1 month–18 years, see BNF for Children

**Noziman**® (Link)

Tablets, scored, levomepromazine maleate 25 mg, net price 84-tab pack = £20.26. Label: 2

**Injection**, levomepromazine hydrochloride 25 mg/mL, net price 1-mL amp = £2.01

---

**PERICYAZINE**  
(Periciazine)

**Indications**  
see under Dose

**Cautions**  
see notes above

**Contra-indications**  
see notes above; renal impairment
Side-effects see notes above; more sedating; hypotension common when treatment initiated; respiratory depression

Dose

- Schizophrenia and other psychoses, initially 75 mg daily in divided doses increased at weekly intervals by steps of 25 mg according to response; usual max. 300 mg daily (elderly initially 15–30 mg daily); CHILD and INFANT over 1 year (schizophrenia or behavioural disorders only), initially, 500 micrograms daily for 10-kg child, increased by 1 mg for each additional 5 kg body-weight to max. total daily dose of 10 mg; dose may be gradually increased according to response but maintenance should not exceed twice initial dose

- Short-term adjunctive management of severe anxiety, psychomotor agitation, and violent or dangerously impulsive behaviour, initially 15–30 mg (elderly 5–10 mg) daily divided into 2 doses, taking the larger dose at bedtime, adjusted according to response; CHILD not recommended

Neulactil® (Winthrop) Tablets, all yellow, scored, pericyazine 2.5 mg, net price 84-tab pack = £9.23; 10 mg, 84-tab pack = £24.95. Label: 2

Syrup forte, brown, pericyazine 10 mg/5 mL. Net price 100-mL pack = £12.08. Label: 2

PERPHENAZINE

Indications see under Dose; antiemetic (section 4.6)

Cautions see notes above

Contra-indications see notes above; also agitation and restlessness in the elderly

Side-effects see notes above; less sedating; extrapyramidal symptoms, especially dystonia, more frequent, particularly at high dosage; rarely systemic lupus erythematosus

Dose

- Schizophrenia and other psychoses, mania, short-term adjunctive management of anxiety, severe psychomotor agitation, excitement, and violent or dangerously impulsive behaviour, initially 4 mg 3 times daily adjusted according to the response; max. 24 mg daily; ELDERLY quarter to half adult dose (but see Cautions); CHILD under 14 years not recommended

Fentazin® (Goldshield) Tablets, both s/c, perphenazine 2 mg, net price 20 = £4.48; 4 mg, 20 = £5.27. Label: 2

PROMAZINE HYDROCHLORIDE

Indications see under Dose

Cautions see notes above; also cerebral arteriosclerosis

Contra-indications see notes above

Side-effects see notes above; also haemolytic anaemia

Dose

- Short-term adjunctive management of psychomotor agitation, 100–200 mg 4 times daily; CHILD not recommended

- Agitation and restlessness in elderly, 25–50 mg 4 times daily; CHILD not recommended

Promazine (Non-proprietary) Tablets, coated, promazine hydrochloride 25 mg, net price 20 = £1.32; 50 mg, 20 = £3.48. Label: 2

Orap® (Janssen-Cilag) Tablets, scored, green, pimozide 4 mg, net price 20 = £5.70. Label: 2

PIMOZIDE

Indications see under Dose

Cautions see notes above

CSM warning Following reports of sudden unexplained death, the CSM recommends ECG before treatment. The CSM also recommends that patients on pimozide should have an annual ECG (if the QT interval is prolonged, treatment should be reviewed and either withdrawn or dose reduced under close supervision) and that pimozide should not be given with other antipsychotic drugs (including depot preparations), tricyclic antidepressants or other drugs which prolong the QT interval, such as certain antimalarials, antihistamines and certain antihistamines and should not be given with drugs which cause electrolyte disturbances (especially diuretics)

Contra-indications see notes above; history of arrhythmias or congenital QT prolongation

Side-effects see notes above; less sedating; serious arrhythmias reported; glycosuria and, rarely, hypotension reported

Dose

- Schizophrenia, ADULT and CHILD over 12 years, initially 2 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; usual dose range 2–20 mg daily; ELDERLY half usual starting dose

- Monosymptomatic hypochondriacal psychosis, paranoid psychosis, ADULT and CHILD over 12 years, initially 4 mg daily, increased according to response in steps of 2–4 mg at intervals of not less than 1 week; max. 16 mg daily; ELDERLY half usual starting dose
SULPIRIDE

**Indications** schizophrenia

**Cautions** see notes above; also excited, agitated, or aggressive patients (even low doses may aggravate symptoms); renal impairment (avoid if creatinine clearance less than 10 mL/minute)

**Contra-indications** see notes above; also acute porphyria (section 9.8.2)

**Side-effects** see notes above; also hepatitis

**Dose**
- **ADULT** and **CHILD** over 14 years, 200–400 mg twice daily; max. 800 mg daily in predominantly negative symptoms, and 2.4 g daily in mainly positive symptoms; **ELDERLY**, lower initial dose, increased gradually according to response

Sulpiride (Non-proprietary)

- **Tablets**, sulpiride 200 mg, net price 30-tab pack = £6.92, 56-tab pack = £6.46; 400 mg, 30-tab pack = £12.12. Label: 2

Dolmatil® (Sanofi-Synthelabo)

- **Tablets**, both scored, sulpiride 200 mg, net price 100-tab pack = £13.85; 400 mg, 100-tab pack = £36.29. Label: 2

Sulpor® (Rosemont)

- **Oral solution**, sugar-free, lemon- and aniseed-flavoured, sulpiride 200 mg/5 mL, net price 150 mL = £25.38. Label: 2

TRIFLUOPERAZINE

**Indications** see under Dose; antiemetic (section 4.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; extrapyramidal symptoms more frequent, especially at doses exceeding 6 mg daily; pancytopenia; thrombocytopenia; hypopyrexia; anorexia

**Dose**
- **Schizophrenia and other psychoses**, short-term adjunctive management of psychomotor agitation, excitement, and violent or dangerous impulsive behaviour, **ADULT** and **CHILD** over 12 years, initially 5 mg twice daily, increased by 5 mg daily after 1 week, then at intervals of 3 days, according to the response; **ELDERLY** reduce initial dose by at least half
- **Short-term adjunctive management of severe anxiety**, **ADULT** and **CHILD** over 12 years, 2–4 mg daily in divided doses, increased if necessary to 6 mg daily; **CHILD** 3–5 years up to 1 mg daily, 6–12 years up to 4 mg daily; **ELDERLY** reduce initial dose by at least half

Trifluoperazine (Non-proprietary)

- **Tablets**, coated, trifluoperazine (as hydrochloride) 1 mg, net price 20 = £1.22; 5 mg, 20 = £1.06. Label: 2
- **Oral solution**, trifluoperazine (as hydrochloride) 5 mg/5 mL. Net price 150 mL = £9.33. Label: 2

Stelazine® (Goldshield)

- **Tablets**, both blue, f/c, trifluoperazine (as hydrochloride) 1 mg, net price 20 = 61p; 5 mg, 20 = 87p. Label: 2
- **Syrup**, sugar-free, yellow, trifluoperazine (as hydrochloride) 1 mg/5 mL, net price 200-mL pack = £2.95. Label: 2

ZUCLOPENTHIXOL ACETATE

**Indications** short-term management of acute psychosis, mania, or exacerbations of chronic psychosis

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- By deep intramuscular injection into the gluteal muscle or lateral thigh, 50–150 mg **ELDERLY** 50–100 mg, if necessary repeated after 2–3 days (1 additional dose may be needed 1–2 days after the first injection); max. cumulative dose 400 mg per course and max. 4 injections; max. duration of treatment 2 weeks—if maintenance treatment necessary change to an oral antipsychotic 2–3 days after last injection, or to a longer acting antipsychotic depot injection given concomitantly with last injection of zuclopenthixol acetate; **CHILD** not recommended

Clopixol Acuphase® (Lundbeck)

- **Injection** (oily), zuclopenthixol acetate 50 mg/mL, net price 1-mL amp = £4.84; 2-mL amp = £9.33

**Depot preparation** Section 4.2.2

ZUCLOPENTHIXOL

**Indications** schizophrenia and other psychoses

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2)

**Contra-indications** see notes above; apathetic or withdrawn states

**Side-effects** see notes above; urinary frequency or incontinence; weight loss (less common than weight gain)

**Dose**
- **By mouth**, initially 20–30 mg daily in divided doses, increasing to a max. of 150 mg daily if necessary; usual maintenance dose 20–50 mg daily; **ELDERLY** (or debilitated) initially quarter to half adult dose; **CHILD** not recommended

Clopixol® (Lundbeck)

- **Tablets**, f/c, pink, zuclopenthixol (as dihydrochloride) 2 mg, net price 100 = £2.99; 10 mg, 100 = £8.06; 25 mg, 100 = £16.12. Label: 2

**Depot preparation** Section 4.2.2

Atypical antipsychotic drugs

The ‘atypical’ antipsychotic drugs amisulpride, aripiprazole, clozapine, olanzapine, paliperidone, quetiapine, risperidone, and zotepine may be better tolerated than other antipsychotic drugs; extrapyramidal symptoms may be less frequent than with older antipsychotic drugs.

Aripiprazole, clozapine, olanzapine, quetiapine, and serindole cause little or no elevation of prolactin concentrations; when changing from other antipsychotic drugs, a reduction in prolactin may increase fertility.
Clozapine is licensed for the treatment of schizophrenia only in patients unresponsive to, or intolerant of, conventional antipsychotic drugs. It can cause agranulocytosis and its use is restricted to patients registered with a clozapine patient monitoring service (see under preparations, below).

Sertindole has been reintroduced following an earlier suspension of the drug because of concerns about arrhythmias; its use is restricted to patients who are enrolled in clinical studies and who are intolerant of at least one other antipsychotic.

The Scottish Medicines Consortium (p. 3) has advised (March 2008) that paliperidone (Invega®) is not recommended for use within NHS Scotland.

<table>
<thead>
<tr>
<th>NICE guidance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Atypical antipsychotics for schizophrenia (June 2002)</td>
</tr>
<tr>
<td>NICE has recommended:</td>
</tr>
<tr>
<td>● the atypical antipsychotics (amisulpride, olanzapine, quetiapine, risperidone, and zotepine) should be considered when choosing first-line treatment of newly diagnosed schizophrenia;</td>
</tr>
<tr>
<td>● an atypical antipsychotic is considered the treatment option of choice for managing an acute schizophrenic episode when discussion with the individual is not possible;</td>
</tr>
<tr>
<td>● an atypical antipsychotic should be considered for an individual who is suffering unacceptable side-effects from a conventional antipsychotic;</td>
</tr>
<tr>
<td>● an atypical antipsychotic should be considered for an individual in relapse whose symptoms were previously inadequately controlled;</td>
</tr>
<tr>
<td>● changing to an atypical antipsychotic is not necessary if a conventional antipsychotic controls symptoms adequately and the individual does not suffer unacceptable side-effects;</td>
</tr>
<tr>
<td>● clozapine should be introduced if schizophrenia is inadequately controlled despite the sequential use of two or more antipsychotics (one of which should be an atypical antipsychotic) each for at least 6–8 weeks.</td>
</tr>
</tbody>
</table>

Cautions and contra-indications While atypical antipsychotics have not generally been associated with clinically significant prolongation of the QT interval, they should be used with care if prescribed with other drugs that increase the QT interval. Atypical antipsychotics should be used with caution in patients with cardiovascular disease, or a history of epilepsy; they should be used with great caution in the elderly (see p. 192); interactions: Appendix 1 (antipsychotics).

Driving Atypical antipsychotics may affect performance of skilled tasks (e.g. driving); effects of alcohol are enhanced.

Withdrawal Withdrawal of antipsychotic drugs after long-term therapy should always be gradual and closely monitored to avoid the risk of acute withdrawal syndromes or rapid relapse.

Side-effects Side-effects of the atypical antipsychotics include weight gain, dizziness, postural hypotension (especially during initial dose titration) which may be associated with syncope or reflex tachycardia in some patients, extrapyramidal symptoms (usually mild and transient and which respond to dose reduction or to an antimuscarinic drug), and occasionally tardive dyskinesia on long-term administration (discontinue drug on appearance of early signs). Hyperglycaemia and sometimes diabetes can occur, particularly with clozapine and olanzapine; monitoring weight and plasma glucose may identify the development of hyperglycaemia. Neuroleptic malignant syndrome has been reported rarely. Hypersalivation associated with clozapine therapy can be treated with hyoscine hydrobromide (unlicensed indication) (p. 228).

### AMISULPRIDE

**Indications** schizophrenia

**Contra-indications** see notes above; also phaeochromocytoma, prolactin-dependent tumours; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see notes above; also insomnia, anxiety, agitation, drowsiness, gastro-intestinal disorders such as constipation, nausea, vomiting, and dry mouth; hyperprolactinaemia; occasionally bradycardia; rarely seizures

**Dose**

- Acute psychotic episode, 400–800 mg daily in 2 divided doses, adjusted according to response; max. 1.2 g daily; CHILD under 15 years not recommended
- Predominantly negative symptoms, 50–300 mg daily; CHILD under 15 years not recommended

**Amisulpride (Non-proprietary)**

- **Tablets**, amisulpride 50 mg, net price 60-tab pack = £19.00; 100 mg, 60-tab pack = £33.73; 200 mg, 60-tab pack = £56.47; 400 mg, 60-tab pack = £112.45. Label: 2

**Solan®** (Sanofi-Synthelabo)

- **Tablets**, scored, amisulpride 50 mg, net price 60-tab pack = £23.69; 100 mg, 60-tab pack = £36.72; 200 mg, 60-tab pack = £61.38; 400 mg, 60-tab pack = £122.76. Label: 2

**Solution**, 100 mg/mL, net price 60 mL (caramel flavour) = £30.69. Label: 2

### ARIPIPRAZOLE

**Indications** see under Dose

**Contra-indications** see notes above; cerebrovascular disease; elderly (reduce initial dose); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

**Side-effects** see notes above; breast-feeding (Appendix 5)

**AMISULPRIDE**

**Cautions** see notes above; also Parkinson’s disease; renal impairment (Appendix 3)

**AMISULPRIDE**

**Indications** schizophrenia

**Contra-indications** see notes above; also phaeochromocytoma, prolactin-dependent tumours; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** see notes above; also insomnia, anxiety, agitation, drowsiness, gastro-intestinal disorders such as constipation, nausea, vomiting, and dry mouth; hyperprolactinaemia; occasionally bradycardia; rarely seizures

**Dose**

- Acute psychotic episode, 400–800 mg daily in 2 divided doses, adjusted according to response; max. 1.2 g daily; CHILD under 15 years not recommended
- Predominantly negative symptoms, 50–300 mg daily; CHILD under 15 years not recommended

**Amisulpride (Non-proprietary)**

- **Tablets**, amisulpride 50 mg, net price 60-tab pack = £19.00; 100 mg, 60-tab pack = £33.73; 200 mg, 60-tab pack = £56.47; 400 mg, 60-tab pack = £112.45. Label: 2

**Solan®** (Sanofi-Synthelabo)

- **Tablets**, scored, amisulpride 50 mg, net price 60-tab pack = £23.69; 100 mg, 60-tab pack = £36.72; 200 mg, 60-tab pack = £61.38; 400 mg, 60-tab pack = £122.76. Label: 2

**Solution**, 100 mg/mL, net price 60 mL (caramel flavour) = £30.69. Label: 2

### ARIPIPRAZOLE

**Indications** see under Dose

**Cautions** see notes above; cerebrovascular disease; elderly (reduce initial dose); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

**Contra-indications** see notes above; breast-feeding (Appendix 5)

**Side-effects** see notes above; gastro-intestinal disturbances; tachycardia; fatigue, insomnia, akathisia; drowsiness, restlessness, tremor, headache, asthenia; blurred vision; less commonly depression; very rarely anorexia, dysphagia, oropharyngeal spasm, laryngospasm, hepatitis, jaundice, hypersalivation, pancreatitis, oedema, thromboembolism, arrhythmias, bradycardia, hypertension, chest pain, agitation, anxiety, speech disorder, suicidal ideation, seizures, hyponatraemia, stiffness, myalgia, rhabdomyolysis, priapism, urinary retention and incontinence, blood disorders, sweating, alopecia, photosensitivity reactions, rash, weight loss, and impaired temperature regulation; with injection, dry mouth
**Dose**

- **Schizophrenia, by mouth, ADULT** over 18 years 10–15 mg once daily, usual maintenance 15 mg once daily; max. 30 mg once daily
- **Mania, by mouth, ADULT** over 18 years, 15 mg once daily, increased if necessary; max. 30 mg once daily
- **Control of agitation and disturbed behaviour in schizophrenia, by intramuscular injection, ADULT** over 18 years, initially 5.25–15 mg (usual dose 9.75 mg) as a single dose followed by 5.25–15 mg after 2 hours if necessary; max. 3 injections daily; max. daily combined oral and parenteral dose 30 mg

**Abilify**® (Bristol-Myers Squibb) (BNF)

| Tablets | aripiprazole 5 mg (blue), net price 28-tab pack = £101.63; 10 mg (pink), 28-tab pack = £101.63; 15 mg (yellow), 28-tab pack = £101.63; 30 mg (pink), 28-tab pack = £203.26. Label: 2 |
| Orodispersible tablets | aripiprazole 10 mg (pink), net price 28-tab pack = £101.63; 15 mg (yellow), 28-tab pack = £101.63. Label: 2, counselling, administration |

**CLOZAPINE**

**Indications** schizophrenia (including psychosis in Parkinson’s disease) in patients unresponsive to, or intolerant of, conventional antipsychotic drugs

**Cautions** see notes above; elderly; monitor leucocyte and differential blood counts (see Agranulocytosis, (Appendix 5)); hypersalivation, dry mouth, nausea, vomiting, anorexia; tachycardia, ECG changes, hypertension; drowsiness, headache, tremor, seizures, fatigue, impaired temperature regulation; urinary incontinence and retention; leucopenia, eosinophilia, leucocytosis; blurred vision; sweating; less commonly agranulocytosis (important: see Cautions); rarely dysphagia, hepatitis, cholestatic jaundice, pancreatitis, circulatory collapse, arrhythmia, myocardiitis (important: see Cautions), pericarditis, thrombomembolism, agitation, confusion, delirium, anaemia; very rarely parotid gland enlargement, intestinal obstruction (see Cautions), cardiomyopathy, myocardial infarction, respiratory depression, priapism, interstitial nephritis, thrombocytopenia, thrombocytopenia, hyperlipidaemia, angle-closure glaucoma, fulminating hepatic necrosis, and skin reactions

**Dose**

- **Schizophrenia, ADULT** over 16 years, 12.5 mg once or twice (ELDERLY 12.5 mg once) on first day then 25–50 mg (ELDERLY 25–37.5 mg) on second day then increased gradually (if well tolerated) in steps of 25–50 mg daily (ELDERLY max. increment 25 mg daily) over 14–21 days up to 300 mg daily in divided doses (larger dose at night, up to 200 mg daily may be taken as a single dose at bedtime); if necessary may be further increased in steps of 50–100 mg once (preferably) or twice weekly; usual dose 200–450 mg daily (max. 900 mg daily)

**Note** Restarting after interval of more than 2 days, 12.5 mg once or twice on first day (but may be feasible to increase more quickly than on initiation)—extreme caution if previous respiratory or cardiac arrest with initial dosing

- **Psychosis in Parkinson’s disease, ADULT** over 16 years, 12.5 mg at bedtime then increased according to response in steps of 12.5 mg up to twice weekly; usual dose range 25–37.5 mg at bedtime, usual max. 50 mg daily; exceptionally, dose may be increased further in steps of 12.5 mg weekly to max. 100 mg daily in 1–2 divided doses

**Clozaril**® (Novartis) (BNF)

| Tablets | both yellow, clozapine 25 mg (scored), net price 28-tab pack = £6.17, 84-tab pack (hosp. only) = £18.49; 100 mg, 28-tab pack = £24.64, 84-tab pack (hosp. only) = £73.92. Label: 2, 10, patient information leaflet |

**Note** Patient, prescriber, and supplying pharmacist must be registered with the Clozaril Patient Monitoring Service—takes several days to do this
### Denzapine (Merz) \( ^{\text{TM}} \)

**Tablets**, both yellow, scored, clozapine 25 mg, net price 28-tab pack = £6.17, 84-tab pack = £18.49; 100 mg, 28-tab pack = £24.64, 84-tab pack = £73.92. Label: 2, 10, patient information leaflet

**Note** Patient, prescriber, and supplying pharmacist must be registered with the Denzapine Patient Monitoring Service—takes several days to do this

**Zaponex** (IVAX) \( ^{\text{TM}} \)

**Tablets**, both yellow, scored, clozapine 25 mg, net price 84-tab pack = £22.17; 100 mg, 84-tab pack = £50.00. Label: 2, 10, patient information leaflet

**Note** Patient, prescriber, and supplying pharmacist must be registered with the Zaponex Treatment Access System—takes several days to do this

### OLANZAPINE

**Indications** see under Dose

**Cautions** see notes above; also prostatic hypertrophy, susceptibility to angle-closure glaucoma, paralytic ileus, diabetes mellitus (risk of exacerbation or keto-acidosis), low leucocyte or neutrophil count, bone-marrow depression, hypersesinophilic disorders, myeloproliferative disease, Parkinson's disease; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4)

**CNS and respiratory depression** Blood pressure, pulse and respiratory rate should be monitored for at least 4 hours after intramuscular injection, particularly in those also receiving another antipsychotic or benzodiazepine

**Contra-indications** breast-feeding (Appendix 5); for injection, acute myocardial infarction, unstable angina, severe hypotension or bradycardia, sick sinus syndrome, recent heart surgery

**Side-effects** see notes above; also mild, transient abdominal pain, diaphoresis, bradycardia, first-degree AV block, bundle branch block; drowsiness, headache, asthenia; less commonly tachycardia, arrhythmias, ischaemia, oedema, seizures, nightmare, syncope, menstrual disturbances, erectile dysfunction, galactorrhoea, and gynaecomastia

**Dose**

- **ADULT** over 18 years, 6 mg once daily in the morning, adjusted if necessary; usual range 3–12 mg daily
- **Counselling** Always take with breakfast or always take on an empty stomach

**Invega** (Janssen-Cilag) \( ^{\text{TM}} \)

**Tablets**, m/r, paliperidone 3 mg (white), net price 28-tab pack = £97.28; 6 mg (beige), 28-tab pack = £97.28; 9 mg (pink), 28-tab pack = £145.92. Label: 2, 25, counselling, administration

### PALPERIDONE

**Note** Paliperidone is a metabolite of risperidone

**Indications** schizophrenia

**Cautions** see notes above; predisposition to gastrointestinal obstruction; elderly patients with dementia and risk factors for stroke; Parkinson’s disease; severe hepatic impairment; renal impairment (avoid if creatinine clearance less than 10 mL/minute); pregnancy (Appendix 4)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** see notes above; also abdominal pain, dry mouth, hypersalivation, vomiting; tachycardia, bradycardia, first-degree AV block, bundle branch block; drowsiness, headache, asthenia; less commonly palpitation, arrhythmias, ischaemia, oedema, seizures, nightmare, syncope, menstrual disturbances, erectile dysfunction, galactorrhoea, and gynaecomastia

**Dose**

- **ADULT** over 18 years, 5 mg/mL, net price 10-mg vial = £3.48

### QUETIAPINE

**Indications** schizophrenia; treatment of episodes ofmania either alone or with mood stabilisers

**Cautions** see notes above; also hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); cerebrovascular disease

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** see notes above; also dry mouth, constipation, dyspepsia; tachycardia, peripheral oedema; drowsiness, headache, asthenia; leucopenia, neutropenia; rhinitis; less commonly elevated plasma-triglyceride and -cholesterol concentrations, seizures, and eosinophilia; rarely jaundice and priapism; very rarely hepatitis, angioedema, and Stevens-Johnson syndrome

---

**Note** When one or more factors present that might result in slower metabolism (e.g. female gender, elderly, non-smoker) consider lower initial dose and more gradual dose increase

**Zyprexa** (Lilly) \( ^{\text{TM}} \)

**Tablets**, 1/c, olanzapine 2.5 mg, net price 28-tab pack = £33.29; 5 mg, 28-tab pack = £48.78; 7.5 mg, 56-tab pack = £146.34; 10 mg, 28-tab pack = £79.45, 15 mg (blue), 28-tab pack = £119.18; 20 mg (pink), 28-tab pack = £158.90. Label: 2

**Ondispersible tablet** (Velotab)\(^{\text{TM}}\), yellow, olanzapine 5 mg, net price 28-tab pack = £48.78; 10 mg, 28-tab pack = £79.45; 15 mg, 28-tab pack = £119.18; 20 mg, 28-tab pack = £158.90. Label: 2, counselling, administration

**Excipients** include aspartame (section 9.4.1)

**Counselling** Velotab may be placed on the tongue and allowed to dissolve or dispersed in water, orange juice, apple juice, milk, or coffee

**Injection**, powder for reconstitution, olanzapine 5 mg/mL, net price 10-mg vial = £3.48
Dose

- Schizophrenia, ADULT over 18 years, 25 mg twice daily on day 1, 50 mg twice daily on day 2, 100 mg twice daily on day 3, 150 mg twice daily on day 4, then adjusted according to response, usual range 300–450 mg daily in 2 divided doses; max. 750 mg daily; ELDERLY initially 25 mg daily as a single dose, increased in steps of 25–50 mg daily in 2 divided doses; CHILD 12–18 years, see BNF for Children

- Mania, ADULT over 18 years, 50 mg twice daily on day 1, 100 mg twice daily on day 2, 150 mg twice daily on day 3, 200 mg twice daily on day 4, then adjusted according to response in steps of up to 200 mg daily to max. 800 mg daily; usual range 400–800 mg daily in 2 divided doses; ELDERLY initially 25 mg daily as a single dose, increased in steps of 25–50 mg daily in 2 divided doses

Seroquel® (AstraZeneca) Tablets, f/c, quetiapine (as fumarate) 25 mg (peach), net price 60-tab pack = £33.83; 100 mg (yellow), 60-tab pack = £113.10; 150 mg (pale yellow), 60-tab pack = £113.10; 200 mg (white), 60-tab pack = £113.10; 300 mg (white), 60-tab pack = £170.00. Label: 2

Modiﬁed release Seroquel® XL (AstraZeneca) Tablets, m/r, quetiapine (as fumarate) 50 mg (peach), net price 60-tab pack = £67.66; 200 mg (yellow), 60-tab pack = £113.10; 300 mg (pale yellow), 60-tab pack = £170.00; 400 mg (white), 60-tab pack = £226.20. Label: 2, 23, 25

Dose schizophrenia, mania, ADULT over 18 years, 300 mg once daily on day 1, then 600 mg once daily on day 2, then adjusted according to response; dose range 400–800 mg daily; ELDERLY initially 50 mg once daily adjusted according to response in steps of 50 mg daily

Risperdal® (Janssen-Cilag) Tablets, f/c, scored, risperidone 500 micrograms (brown-red), net price 20-tab pack = £7.06; 1 mg (white), 20-tab pack = £11.61, 60-tab pack = £34.84; 2 mg (orange), 60-tab pack = £68.69; 3 mg (yellow), 60-tab pack = £101.01; 4 mg (green), 60-tab pack = £133.34; 6 mg (yellow), 28-tab pack = £94.28. Label: 2

Orodispensible tablets (Quicklet®), pink, risperidone 500 micrograms, net price 28-tab pack = £11.43; 1 mg, 28-tab pack = £18.39; 2 mg, 28-tab pack = £34.66; 3 mg, 28-tab pack = £50.34; 4 mg, 28-tab pack = £64.84. Label: 2, counselling, administration

Excipients include aspartame (section 9.4.1)

Counselling Tablets should be placed on the tongue, allowed to dissolve and swallowed

Liquid, risperidone 1 mg/mL, net price 100 mL = £56.12. Label: 2

Note Liquid may be diluted with mineral water, orange juice or black coffee (should be taken immediately)

Depot preparation Section 4.2.2

SERTINDOLE

Indications schizophrenia, see also notes above

Cautions see notes above; hepatic impairment (Appendix 2); correct hypokalaemia or hypomagnesaemia before treatment; monitor ECG during treatment; monitor blood pressure during dose titration and early maintenance therapy (risk of postural hypotension)

Contra-indications see notes above; pregnancy (Appendix 4); breast-feeding (Appendix 5), severe hepatic impairment. QT interval prolongation (ECG required before and during treatment—consult product literature); concomitant administration of drugs which prolong QT interval (see interactions); uncorrected hypokalaemia or hypomagnesaemia

Side-effects see notes above; prolonged QT interval, peripheral oedema, dry mouth, rhi­nitis, nasal congestion, dyspnoea, paraesthesia, abnormal ejaculation (decreased volume); rarely seizures, hyperglycaemia

Dose

- Psychoses, 2 mg in 1–2 divided doses on first day then 4 mg in 1–2 divided doses on second day (slower titration appropriate in some patients); usual dose range 4–6 mg daily; doses above 10 mg daily only if benefit considered to outweigh risk (max. 16 mg daily); ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily; CHILD 12–15 years see BNF for Children

- Mania, initially 2 mg once daily, increased if necessary in steps of 1 mg daily; usual dose range 1–6 mg daily; ELDERLY initially 500 micrograms twice daily increased in steps of 500 micrograms twice daily to 1–2 mg twice daily

ZOTEPINE

Indications schizophrenia

Cautions see notes above; personal or close family history of epilepsy; withdrawal of concomitantly prescribed CNS depressants; QT interval prolongation—ECG required (before treatment and at each dose increase) in patients at risk of arrhythmias; monitor plasma electrolytes particularly before treatment and at each dose increase; hepatic impairment (Appendix 2); renal impairment (Appendix 3); prostatic hyper-
Central nervous system

4.2.2 Antipsychotic depot injections

Long-acting depot injections are used for maintenance therapy especially when compliance with oral treatment is unreliable. However, depot injections of conventional antipsychotics may give rise to a higher incidence of extrapyramidal reactions than oral preparations; extrapyramidal reactions occur less frequently with atypical antipsychotics such as risperidone.

**Dose**
- Initially 25 mg 3 times daily increased according to response at intervals of 4 days to max. 100 mg 3 times daily; **ELDERLY** initially 25 mg twice daily increased according to response to max. 75 mg twice daily; **CHILD** and **ADOLESCENT** under 18 years not recommended**

Zoleptil® (Healthcare Logistics) (BNF 57)
Tablets, s/c, zotepine 25 mg (white), net price 30-tab pack = £21.50, 90-tab pack = £42.98, 50 mg (yellow), 30-tab pack = £28.65, 90-tab pack = £57.30; 100 mg (pink), 30-tab pack = £47.28, 90-tab pack = £94.55. Label: 2

**Choice** There is no clear-cut division in the use of the conventional antipsychotics, but **zuclopenthixol** may be suitable for the treatment of agitated or aggressive patients whereas **flupentixol** can cause over-excitement in such patients. The incidence of extrapyramidal reactions is similar for the conventional antipsychotics.

**Cautions** See section 4.2.1. Treatment requires careful monitoring for optimum effect. When transferring from oral to depot therapy, dosage by mouth should be reduced gradually.

**Contra-indications** See section 4.2.1. Do not use in children.

**Side-effects** See section 4.2.1. Pain may occur at injection site and occasionally erythema, swelling, and nodules. For side-effects of specific antipsychotics see under the relevant drug.

**FLUPENTIXOL DECANOATE** (Flupenthixol Decanoate)

**Indications** maintenance in schizophrenia and other psychoses

**Cautions** see notes on p. 192 and also under Flupentixol (section 4.2.1) and notes above; an alternative antipsychotic may be necessary if symptoms such as aggression or agitation appear

**Contra-indications** see notes on p. 192 and also under Flupentixol (section 4.2.1) and notes above

**Side-effects** see notes on p. 192 and also under Flupentixol (section 4.2.1) and notes above, but may have a mood elevating effect

**Dose**
- By deep intramuscular injection into the upper outer buttock or lateral thigh, test dose 20 mg, then after at least 7 days 20–40 mg repeated at intervals

**Dosage** Individual responses to neuroleptic drugs are very variable and to achieve optimum effect, dosage and dosage interval must be titrated according to the patient’s response. For the advice of The Royal College of Psychiatrists on doses above the BNF upper limit, see p. 192.

**Equivalent doses of depot antipsychotics**

These equivalences are intended only as an approximate guide; individual dosage instructions should also be checked; patients should be carefully monitored after any change in medication

of 2–4 weeks, adjusted according to response; max. 400 mg weekly; usual maintenance dose 50 mg every 4 weeks to 300 mg every 2 weeks; **ELDERLY** initially quarter to half adult dose; **CHILD** not recommended

**Depixol**® (Lundbeck) [monograph]

**Injection** (oily), flupentixol decanoate 20 mg/mL. Net price 1-mL amp = £1.52; 2-mL amp = £2.54

**Depixol Conc.**® (Lundbeck) [monograph]

**Injection** (oily), flupentixol decanoate 100 mg/mL. Net price 0.5-mL amp = £3.42; 1-mL amp = £6.25

**Depixol Low Volume**® (Lundbeck) [monograph]

**Injection** (oily), flupentixol decanoate 200 mg/mL. Net price 1-mL amp = £19.52

**FLUPHENAZINE DECANOATE**

**Indications** maintenance in schizophrenia and other psychoses

**Cautions** see notes on p. 192 and also notes above; also marked cerebral atherosclerosis

**Side-effects** see notes on p. 192 and notes above; less sedating and fewer antimuscarinic or hypotensive symptoms, particularly dystonic reactions and akathisia, more frequent; systemic lupus erythematosus, inappropriate anti-diuretic hormone secretion, oedema, also reported; extrapyramidal symptoms usually appear a few hours after injection and continue for about 2 days but may be delayed

**Dose**

- By deep intramuscular injection into the gluteal muscle, test dose 12.5 mg (6.25 mg in elderly), then after 4–7 days 12.5–100 mg repeated at intervals of 14–35 days, adjusted according to response; **CHILD** not recommended

**Fluphenazine decanoate** (Non-proprietary) [monograph]

**Injection** (oily), fluphenazine decanoate 25 mg/mL. Net price 1-mL amp = £2.35; 100 mg/mL, 0.5-mL amp = £4.50, 1-mL amp = £8.79

Exipients include sesame oil

**Moducate**® (Sanofi-Synthelabo) [monograph]

**Injection** (oily), fluphenazine decanoate 25 mg/mL. Net price 0.5-mL amp = £1.35, 1-mL amp = £2.35, 2-mL amp = £4.62

Exipients include sesame oil

**Moducate Concentrate**® (Sanofi-Synthelabo) [monograph]

**Injection** (oily), fluphenazine decanoate 100 mg/mL. Net price 0.5-mL amp = £4.66, 1-mL amp = £9.10

Exipients include sesame oil

**HALOPERIDOL**

**Indications** maintenance in schizophrenia and other psychoses

**Cautions** see notes on p. 192 and also under Haloperidol (section 4.2.1) and notes above

**Contra-indications** see notes on p. 192 and also under Haloperidol (section 4.2.1) and notes above

**Side-effects** see notes on p. 192 and also under Haloperidol (section 4.2.1) and notes above

**Dose**

- By deep intramuscular injection into the gluteal muscle, initially 50 mg every 4 weeks, if necessary increasing by 50-mg increments to 300 mg every 4 weeks; higher doses may be needed in some patients; **ELDERLY** initially 12.5–25 mg every 4 weeks; **CHILD** not recommended

**Note** If 2-weekly administration preferred, doses should be halved

**Haldol Decanoate**® (Janssen-Cilag) [monograph]

**Injection** (oily), haloperidol (as decanoate) 50 mg/mL. Net price 1-mL amp = £4.05; 100 mg/mL, 1-mL amp = £5.36

Exipients include sesame oil

**ZUCLOPENTHIXOL DECANOATE**

**Indications** maintenance in schizophrenia and paranoid psychoses

**Cautions** see notes on p. 192 and notes above

**Contra-indications** see notes on p. 192 and notes above

**Side-effects** see notes on p. 192 and notes above

**Dose**

- By deep intramuscular injection into the gluteal muscle, patients taking oral risperidone up to 4 mg daily, initially 25 mg every 2 weeks; patients taking oral risperidone over 4 mg daily, initially 37.5 mg every 2 weeks; dose adjusted at intervals of at least 4 weeks in steps of 12.5 mg to max. 50 mg (**ELDERLY** initial 5–10 mg; **CHILD** not recommended)

**Note** During initiation risperidone by mouth may need to be continued for 4–6 weeks; risperidone by mouth may also be used during dose adjustment of depot injection

**Risperdal Consta**® (Janssen-Cilag) [monograph]

**Injection**, powder for reconstitution, risperidone 25-mg vial, net price = £82.92; 37.5-mg vial = £115.84; 50-mg vial = £148.55 (all with diluent)

**Central nervous system**
### Antimanic drugs

**Side-effects** see notes on p. 192 and notes above

**Dose**
- By deep intramuscular injection into the upper outer buttock or lateral thigh, test dose 100 mg, followed after at least 7 days by 200–500 mg or more, repeated at intervals of 1–4 weeks, adjusted according to response; max. 600 mg weekly; **ELDERLY** quarter to half usual starting dose; **CHILD** not recommended

**Clopixol** *(Lundbeck)*
- **Injection** (oily), zuclopenthixol decanoate 200 mg/mL, net price 1-mL amp = £3.15
- **Clopixol Conc.** *(Lundbeck)*
- **Injection** (oily), zuclopenthixol decanoate 500 mg/mL, net price 1-mL amp = £7.44

### Benzodiazepines

Use of benzodiazepines (section 4.1) may be helpful in the initial stages of treatment until lithium achieves its full effect; they should not be used for long periods because of the risk of dependence.

### Antipsychotic drugs

In an acute attack of mania, treatment with an antipsychotic drug (section 4.2.1) is usually required because it may take a few days for lithium to exert its antimanic effect. Lithium may be given concurrently with the antipsychotic drug, and treatment with the antipsychotic gradually tailed off as lithium becomes effective. Alternatively, lithium therapy may be commenced once the patient’s mood has been stabilised with the antipsychotic. The adjunctive use of atypical antipsychotics such as olanzapine (section 4.2.1) and risperidone with either lithium or valproic acid may also be of benefit.

High doses of haloperidol or flupentixol may be hazardous when used with lithium; irreversible toxic encephalopathy has been reported.

### Carbamazepine

Carbamazepine (section 4.8.1) may be used for the prophylaxis of bipolar disorder (manic-depressive disorder) in patients unresponsive to lithium; it seems to be particularly effective in patients with rapid-cycling manic-depressive illness (4 or more affective episodes per year).

### Valproic acid

Valproic acid (as the semisodium salt) is licensed for the treatment of manic episodes associated with bipolar disorder. It may be useful in patients unresponsive to lithium.

Sodium valproate (section 4.8.1) has also been used, but it is unlicensed for this indication.
**Interactions** Lithium toxicity is made worse by sodium depletion, therefore concurrent use of diuretics (particularly thiazides) is hazardous and should be avoided. For other interactions with lithium, see Appendix 1 (lithium).

**Withdrawal** While there is no clear evidence of withdrawal or rebound psychosis, abrupt discontinuation of lithium increases the risk of relapse. If lithium is to be discontinued, the dose should be reduced gradually over a period of a few weeks and patients should be warned of possible relapse if it is discontinued abruptly.

**LITHIUM CARBONATE**

**Indications** treatment and prophylaxis of mania, bipolar disorder, and recurrent depression (see also notes above); aggressive or self-mutilating behaviour

**Cautions** measure serum-lithium concentration regularly (every 3 months on stabilised regimens), measure renal function and thyroid function every 6–12 months on stabilised regimens and advise patient to seek attention if symptoms of hypothyroidism develop (women at greater risk) e.g. lethargy, feeling cold; maintain adequate sodium and fluid intake; test renal function before initiating and if evidence of toxicity, avoid in renal impairment (Appendix 3), cardiac disease, and conditions with sodium imbalance such as Addison's disease; reduce dose or discontinue in diaphoresis, vomiting and intercurrent infection (especially if sweating profusely); psoriasis (risk of exacerbation); pregnancy (Appendix 4), breast-feeding (Appendix 5), elderly (reduce dose), diuretic treatment, myasthenia gravis; surgery (section 15.1); avoid abrupt withdrawal (see notes above); interactions: Appendix 1 (lithium)

**Counselling** Patients should maintain adequate fluid intake and avoid dietary changes which reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above)

**Side-effects** gastrointestinal disturbances, fine tremor, renal impairment (particularly impaired urinary concentration and polyuria), polydipsia, leucocytosis; also weight gain and oedema (may respond to dose reduction); hyperparathyroidism and hypercalcaemia reported; signs of intoxication are blurred vision, increasing gastrointestinal disturbances (anorexia, vomiting, diarrhoea), muscle weakness, increased CNS disturbances (mild drowsiness and sluggishness increasing to giddiness with ataxia, coarse tremor, lack of co-ordination, dysarthria), and require withdrawal of treatment; with severe overdosage (serum-lithium concentration above 2 mmol/litre) hyperreflexia and hyperextension of limbs, convulsions, toxic psychoses, syncope, renal failure, circulatory failure, coma, and occasionally, death; goitre, raised anti-diuretic hormone concentration, hypothyroidism, hypokalaemia, ECG changes, and kidney changes may also occur; see also Emergency Treatment of Poisoning, p. 33

**Dose**

- See under preparations below, adjusted to achieve a serum-lithium concentration of 0.4–1 mmol/litre 12 hours after a dose on days 4–7 of treatment, then every week until dosage has remained constant for 4 weeks and every 3 months thereafter; doses are initially divided throughout the day, but once daily administration is preferred when serum-lithium concentration stabilised

**Note** Preparations vary widely in bioavailability, changing the preparation requires the same precautions as initiation of treatment

**Note** Lithium carbonate 200 mg = lithium citrate 509 mg

**Camcolit** (Norgine) Tablets, f/c, scored, lithium carbonate 250 mg (Li+ 6.8 mmol), net price 20 = 64p. Label: 10, lithium card, counselling, see above

**Camcolit 400** tablets, m/r, f/c, scored, lithium carbonate 400 mg (Li+ 10.8 mmol), net price 20 = 86p. Label: 10, lithium card, 25, counselling, see above

**Dose** (see Dose above for advice on bioavailability and serum monitoring)

**Note** Camcolit 400 also available as Lithionate (TEVA UK)

**Liskonum** (GSK) Tablets, m/r, f/c, scored, lithium carbonate 450 mg (Li+ 12.2 mmol), net price 60-tab pack = £2.88. Label: 10, lithium card, 25, counselling, see above

**Dose** (see Dose above for advice on bioavailability and serum monitoring)

**Note** Liskonum 450 also available as Lithionate (GSK)

**Priadel** (Sanofi-Synthelabo) Tablets, m/r, both scored, lithium carbonate 200 mg (Li+ 5.4 mmol), net price 20 = 48p; 400 mg (Li+ 10.8 mmol), 20 = 70p. Label: 10, lithium card, 25, counselling, see above

**Dose** (see Dose above for advice on bioavailability and serum monitoring)

**Note** Priadel 400 also available as Lithonate (TEVA UK)

**Liquid**, see under Lithium Citrate below

**LITHIUM CITRATE**

**Indications** see under Lithium Carbonate and notes above

**Cautions** see under Lithium Carbonate and notes above

**Counselling** Patients should maintain an adequate fluid intake and should avoid dietary changes which might reduce or increase sodium intake; lithium treatment cards are available from pharmacies (see above)

**Side-effects** see under Lithium Carbonate and notes above

**Dose**

- See under preparations below, adjusted to achieve serum-lithium concentration of 0.4–1 mmol/litre as described under Lithium Carbonate

**Note** Preparations vary widely in bioavailability, changing the preparation requires the same precautions as initiation of treatment

**Note** Lithium carbonate 200 mg = lithium citrate 509 mg
Antidepressants are effective for treating moderate to severe depression associated with psychomotor and physiological changes such as loss of appetite and sleep disturbance; improvement in sleep is usually the first benefit of therapy. They are also effective for dysthymia (lower grade chronic depression). Antidepressant drugs are not generally effective in mild depression, and cognitive behavioural therapy should be considered initially; however, a trial of antidepressant therapy may be considered in cases refractory to psychological treatments or those associated with psychosocial or medical problems. Drug treatment of mild depression may also be considered in patients with a history of moderate or severe depression.

**Choice** The major classes of antidepressants include the tricyclics and related antidepressants, the selective serotonin re-uptake inhibitors (SSRIs), and the monoamine oxidase inhibitors (MAOIs). A number of antidepressants cannot be accommodated easily into this classification; these are included in section 4.3.4.

There is little to choose between the different classes of antidepressants in terms of efficacy, so choice should be based on the individual patient’s requirements, including the presence of concomitant disease, existing therapy, suicide risk, and previous response to antidepressant therapy. Since there may be an interval of 2 weeks before the antidepressant action takes place, electroconvulsive treatment may be required in severe depression when delay is hazardous or intolerable.

SSRIs are better tolerated and are safer in overdose than other classes of antidepressants and should be considered first-line for treating depression. In patients with unstable angina or who have had a recent myocardial infarction, sertraline has been shown to be safe.

Tricyclic antidepressants have similar efficacy to SSRIs but are more likely to be discontinued because of side-effects; toxicity in overdose is also a problem. See section 4.3.1 for more details.

MAOIs have dangerous interactions with some foods and drugs, and should be reserved for use by specialists. Although anxiety is often present in depressive illness (and may be the presenting symptom), the use of an antipsychotic or an anxiolytic may mask the true diagnosis. Anxiolytics (section 4.1.2) or antipsychotics (section 4.2.1) should therefore be used with caution in depression but they are useful adjuncts in agitated patients.

See also section 4.2.3 for references to the management of bipolar disorders.

**St John’s wort** (*Hypericum perforatum*) is a popular unlicensed herbal remedy for treating mild depression. However, preparations of St John’s wort can induce drug metabolising enzymes and a number of important interactions with conventional drugs have been identified, see Appendix 1 (St John’s wort). The amount of active ingredient can vary between different preparations of St John’s wort and switching from one to another can change the degree of enzyme induction. Furthermore, when a patient stops taking St John’s wort, concentrations of interacting drugs may increase, leading to toxicity. Antidepressants should not be used with St John’s wort because of the potential for interaction.

**Hyponatraemia and antidepressant therapy**

Hyponatraemia (usually in the elderly and possibly due to inappropriate secretion of antidiuretic hormone) has been associated with all types of antidepressants; however, it has been reported more frequently with SSRIs than with other antidepressants. The CSM has advised that hyponatraemia should be considered in all patients who develop drowsiness, confusion, or convulsions while taking an antidepressant.

**Suicidal behaviour and antidepressant therapy**

The use of antidepressants has been linked with suicidal thoughts and behaviour; children, young adults, and patients with a history of suicidal behaviour are particularly at risk. Where necessary patients should be monitored for suicidal behaviour, self-harm, or hostility, particularly at the beginning of treatment or if the dose is changed.

**Management** Patients should be reviewed every 1–2 weeks at the start of antidepressant treatment. Treatment should be continued for at least 4 weeks (6 weeks in the elderly) before considering whether to switch antidepressant due to lack of efficacy. In cases of partial response, continue for a further 2 weeks (elderly patients may take longer to respond).

Following remission, antidepressant treatment should be continued at the same dose for at least 6 months (about 12 months in the elderly). Patients with a history of recurrent depression should continue to receive maintenance treatment for at least 2 years.
Failure to respond Failure to respond to initial treatment with an SSRI may require an increase in the dose, or switching to a different SSRI or mirtazapine; in patients with atypical depression, an MAOI such as phenelzine may be effective. Other second-line choices include mianserin, moclobemide, and reboxetine. Other tricyclic antidepressants and venlafaxine should be considered for more severe forms of depression; dosulepin (dothiepin) and irreversible MAOIs should only be prescribed by specialists. Failure to respond to a second antidepressant may require the addition of another antidepressant of a different class, or an augmenting agent such as lithium, but such adjunctive treatment should be initiated only by doctors with special experience of these combinations. Electroconvulsive therapy may be initiated in severe refractory depression.

Withdrawal Gastro-intestinal symptoms of nausea, vomiting, and anorexia, accompanied by headache, dizziness, ‘chills’, and insomnia, and sometimes by hypomania, panic-anxiety, and extreme motor restlessness may occur if an antidepressant (particularly an MAOI) is stopped suddenly after regular administration for 8 weeks or more. The dose should preferably be reduced gradually over about 4 weeks, or longer if withdrawal symptoms emerge (6 months in patients who have been on long-term maintenance treatment). SSRIs have been associated with a specific withdrawal syndrome (section 4.3.3).

Anxiety disorders and obsessive-compulsive disorder Management of acute anxiety generally involves the use of a benzodiazepine or buspirone (section 4.1.2). For chronic anxiety (of longer than 4 weeks’ duration) it may be appropriate to use an antidepressant. Combined therapy with a benzodiazepine may be required until the antidepressant takes effect. Generalised anxiety disorder, a form of chronic anxiety, is treated with an SSRI such as escitalopram or paroxetine; pregabalin and venlafaxine are also licensed for the treatment of generalised anxiety disorder. Panic disorder, obsessive-compulsive disorder, post-traumatic stress disorder, and phobic states such as social anxiety disorder are treated with SSRIs. Clomipramine or imipramine can be used second-line in panic disorder (unlicensed); clomipramine can also be used second-line for obsessive-compulsive disorder. Moclobemide is licensed for the treatment of social anxiety disorder.

Choice Tricyclic and related antidepressants block the re-uptake of both serotonin and noradrenaline, although to different extents. For example, clomipramine is more selective for serotonergic transmission, and imipramine is more selective for noradrenergic transmission. Tricyclic and related antidepressant drugs can be roughly divided into those with additional sedative properties and those that are less sedating. Agitated and anxious patients tend to respond best to the sedative compounds, whereas withdrawn and apathetic patients will often obtain most benefit from the less sedating ones. Those with sedative properties include amitriptyline, clomipramine, dosulepin (dothiepin), doxepin, mianserin, trazodone, and trimipramine. Those with less sedative properties include imipramine, lofepramine, and nortriptyline.

Tricyclic and related antidepressants also have varying degrees of antimuscarinic side-effects and cardio toxicity in overdosage, which may be important in individual patients. Lofepramine has a lower incidence of side-effects and is less dangerous in overdosage but is infrequently associated with hepatic toxicity. Imipramine is also well established, but has more marked antimuscarinic side-effects than other tricyclic and related antidepressants. Amitriptyline and dosulepin (dothiepin) are effective but they are particularly dangerous in overdosage (see Overdosage, below) and are not recommended for the treatment of depression; doxepin (dothiepin) should only be prescribed by specialists.

Children and adolescents Evidence of the efficacy of tricyclic antidepressants for depression in children has not been established; see also CSM advice, p. 212.

Side-effects Arrhythmias and heart block occasionally follow the use of tricyclic antidepressants, particularly amitriptyline, and may be a factor in the sudden death of patients with cardiac disease. They are also sometimes associated with convulsions (and should be prescribed with special caution in epilepsy as they lower the convulsive threshold). Hepatic and haematological reactions may occur and have been particularly associated with mianserin.

Other side-effects of tricyclic and related antidepressants include drowsiness, dry mouth, blurred vision (very rarely precipitation of angle-closure glaucoma), constipation, and urinary retention (all attributed to antimuscarinic activity), and sweating. The patient should be encouraged to persist with treatment as some tolerance to these side-effects seems to develop. They are reduced if low doses are given initially and then gradually increased, but this must be balanced against the need to obtain a full therapeutic effect as soon as possible. Gradual introduction of treatment is particularly important in the elderly, who, because of the hypoensive effects of these drugs, are prone to attacks of dizziness or even syncope. Another side-effect to which
the elderly are particularly susceptible is hyponatraemia
(see Hyponatraemia and Antidepressant Therapy on p. 206).

Neuroleptic malignant syndrome (section 4.2.1) may, very rarely, arise in the course of antidepressant treatment. Suicide risk has been linked with antidepressants (see p. 206).

Overdosage Limited quantities of tricyclic antidepressants should be prescribed at any one time because their cardiovascular effects are dangerous in overdose. In particular, overdose with dosulepin (dothiepin) and amitriptyline is associated with a relatively high rate of fatality. For advice on overdosage see Emergency Treatment of Poisoning, p. 31.

Withdrawal If possible tricyclic and related antidepressants should be withdrawn slowly (see also section 4.3).

Interactions A tricyclic or related antidepressant (or an SSRI or related antidepressant) should not be started until 2 weeks after stopping an MAOI (3 weeks if starting clomipramine or imipramine). Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine). For guidance relating to the reversible monoamine oxidase inhibitors, moclobemide, see p. 212. For other tricyclic antidepressant interactions, see Appendix 1 (antidepressants, tricyclic and antidepressants, tricyclic (related)).

Tricyclic antidepressants

**AMITRIPTYLINE HYDROCHLORIDE**

**Indications** depressive illness (but not recommended, see notes above); nocturnal enuresis in children (section 7.4.2); neuropathic pain [unlicensed] (section 4.7.3); migraine prophylaxis [unlicensed] (section 4.7.4.2)

**Cautions** cardiac disease (particularly with arrhythmias, see Contra-indications below), history of epilepsy, pregnancy (Appendix 4), breast-feeding (Appendix 5), elderly, hepatic impairment (avoid if severe; Appendix 2), thyroid disease, phaeochromocytoma, history of mania, psychoses (may aggravate psychotic symptoms), susceptibility to angle-closure glaucoma, history of urinary retention, concurrent electroconvulsive therapy; if possible avoid abrupt withdrawal; anaesthesia (increased risk of arrhythmias and hypotension, see surgery section 15.1); acute porphyria (section 9.8.2); see section 7.4.2 for additional nocturnal enuresis warnings; interactions: Appendix 1 (antidepressants, tricyclic)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** recent myocardial infarction, arrhythmias (particularly heart block), not indicated in manic phase, severe liver disease

**Side-effects** dry mouth, sedation, blurred vision (disturbance of accommodation, increased intra-ocular pressure), constipation, nausea, difficulty with micturition; cardiovascular side-effects (such as ECG changes, arrhythmias, postural hypotension, tachycardia, syncope, particularly with high doses); sweating, tremor, rashes and hypersensitivity reactions (including urticaria, photosensitivity), behavioural disturbances (particularly children), hypomania or mania, confusion or delirium (particularly elderly), headache, interference with sexual function, blood sugar changes; increased appetite and weight gain (occasionally weight loss); endocrine side-effects such as testicular enlargement, gynaecomastia, galactorrhoea; also convulsions (see also Cautions), movement disorders and dyskinesias, dysarthria, paraesthesia, taste disturbances, tinnitus, fever, agranulocytosis, leucopenia, eosinophilia, purpura, thrombocytopenia, hyponatraemia (see Hyponatraemia and Antidepressant Therapy, p. 206), abnormal liver function tests (jaundice); for a general outline of side-effects see also notes above; **overdosage:** see Emergency Treatment of Poisoning, p. 31 (high rate of fatality—see notes above)

**Dose**

- Depression (but not recommended, see notes above), initially 75 mg (elderly and adolescents 30–75 mg) daily in divided doses or as a single dose at bedtime increased gradually as necessary to 150–200 mg.
- **CHILD** under 16 years not recommended for depression
- Nocturnal enuresis, **CHILD** 7–10 years 10–20 mg, 11–16 years 25–50 mg at night; max. period of treatment (including gradual withdrawal) 3 months—full physical examination before further course
- Neuropathic pain [unlicensed indication], initially 10–25 mg daily at night, increased if necessary to 75 mg daily; higher doses under specialist supervision
- Migraine prophylaxis [unlicensed indication], initially 10 mg at night, increased if necessary to maintenance of 50–75 mg at night

**Amitriptyline** (Non-proprietary) (PM)

**Tablets**, coated, amitriptyline hydrochloride 10 mg, net price 28 = 97p; 25 mg, 28 = 97p; 50 mg, 28 = £1.12. Label: 2

**Oral solution**, amitriptyline hydrochloride 25 mg/5 mL, net price 150 mL = £13.30; 50 mg/5 mL, 150 mL = £14.48. Label: 2

**Compound preparations**

**Triptafen®** (Goldshield) (PM)

**Tablets**, pink, s/c, amitriptyline hydrochloride 25 mg, perphenazine 2 mg. Net price 20 = £5.10. Label: 2

**Dose** depression with anxiety, **ADULT** and **CHILD** over 14 years, 1 tablet 3 times daily, increased if necessary to 4 tablets daily (with last dose at bedtime); review treatment if no response within 4 weeks; discontinue after 3 months

**Triptafen-M®** (Goldshield) (PM)

**Tablets**, pink, s/c, amitriptyline hydrochloride 10 mg, perphenazine 2 mg. Net price 20 = £4.56. Label: 2

**Dose** mild to moderate depression with anxiety, **ADULT** and **CHILD** over 14 years, 1 tablet 3 times daily, increased if necessary to 4 tablets daily (with last dose at bedtime); review treatment if no response within 4 weeks; discontinue after 3 months

**CLOMIPRAMINE HYDROCHLORIDE**

**Indications** depressive illness, phobic and obsessional states; adjunctive treatment of cataplexy associated with narcolepsy

**Cautions** see under Amitriptyline Hydrochloride
Adjunctive treatment of cataplexy associated with
Prothiaden (Non-proprietary)
Initially 75 mg (Dose)
Side-effects see under Amitriptyline Hydrochloride
Contra-indications see under Amitriptyline Hydrochloride
see under Amitriptyline Hydrochloride

Clomipramine (Non-proprietary) (Novartis)
Capsules, clomipramine hydrochloride 10 mg, net price 28-cap pack = £2.27; 25 mg, 28-cap pack = £2.65; 50 mg, 28-cap pack = £3.38. Label: 2

Anafranil® (Novartis) (Flm)
Capsules, clomipramine hydrochloride 10 mg (yellow/caramel), net price 84-cap pack = £3.23; 25 mg (orange/caramel), 84-cap pack = £6.35; 50 mg (grey/caramel), 56-cap pack = £8.06. Label: 2

Modified release
Anafranil SR® (Novartis) (Flm)
Tablets, m/r, grey-red, l/c, clomipramine hydrochloride 75 mg. Net price 28-tab pack = £8.83. Label: 2, 25
Dose see above, to be taken once daily

DOSULEPIN HYDROCHLORIDE (Dothiepin hydrochloride)
Indications depressive illness, particularly where sedation is required
Cautions see under Amitriptyline Hydrochloride
Contra-indications see under Amitriptyline Hydrochloride
Side-effects see under Amitriptyline Hydrochloride (high rate of fatality—see notes above)
Dose

DOXEPIN
Indications depressive illness, particularly where sedation is required; pruritus in eczema (section 13.3)
Cautions see under Amitriptyline Hydrochloride
Contra-indications see under Amitriptyline Hydrochloride
Side-effects see under Amitriptyline Hydrochloride

Dose

IMIPRAMINE HYDROCHLORIDE
Indications depressive illness; nocturnal enuresis in children (section 7.4.2)
Cautions see under Amitriptyline Hydrochloride
Contra-indications see under Amitriptyline Hydrochloride
Side-effects see under Amitriptyline Hydrochloride, but less sedating

Dose

LOFEPRAMINE
Indications depressive illness
Cautions see under Amitriptyline Hydrochloride
Contra-indications see under Amitriptyline Hydrochloride; hepatic and severe renal impairment
Side-effects see under Amitriptyline Hydrochloride, but less sedating, lower incidence of antimuscarinic effects and less dangerous in overdosage; hepatic disorders reported
Dose

Lofepramine (Non-proprietary) (Flm)
Tablets, lofepramine 70 mg (as hydrochloride). Net price 56-tab pack = £20.35. Label: 2
Brands include Fropax

Oral suspension, lofepramine 70 mg/5 mL (as hydrochloride). Net price 150 mL = £22.22. Label: 2
Brands include Lomont (sugar-free)
4 Central nervous system

**4.3.1 Tricyclic and related antidepressant drugs**

---

### Nortriptyline

**Indications**
- Depressive illness; nocturnal enuresis in children (section 7.4.2); neuropathic pain (section 4.7.3)

**Cautions**
- See under Amitriptyline Hydrochloride; manufacturer advises plasma-nortriptyline concentration monitoring if dose above 100 mg daily; but evidence of practical value uncertain

**Contra-indications**
- See under Amitriptyline Hydrochloride

**Side-effects**
- See under Amitriptyline Hydrochloride, but less sedating

**Dose**
- Depression, low dose initially increased as necessary to 75–100 mg daily in divided doses or as a single dose (max. 150 mg daily); ADOLESCENT and ELDERLY 30–50 mg daily in divided doses; CHILD not recommended for depression
- Nocturnal enuresis, child 7 years 10 mg, 8–11 years 10–20 mg, over 11 years 25–35 mg at night; max period of treatment (including gradual withdrawal) 3 months—full physical examination and ECG before further course
- Neuropathic pain [unlicensed], initially 10–25 mg daily at night, increased if necessary to 75 mg daily; higher doses under specialist supervision

**Allergon** (King) Tablets, nortriptyline (as hydrochloride) 10 mg, net price 20 = £2.48; 25 mg (orange, scored), 20 = £4.80. Label: 2

---

### Trimipramine

**Indications**
- Depressive illness, particularly where sedation is required

**Cautions**
- See under Amitriptyline Hydrochloride

**Contra-indications**
- See under Amitriptyline Hydrochloride

**Side-effects**
- See under Amitriptyline Hydrochloride

**Dose**
- Initially 50–75 mg daily in divided doses or as a single dose at bedtime, increased as necessary to 150–300 mg daily; ELDERLY initially 10–25 mg 3 times daily, maintenance half adult dose may be sufficient; CHILD not recommended

**Surmontil** (Aventis Pharma) Tablets, green/white, trimipramine 50 mg (as maleate). Net price 28-caps pack = £7.91. Label: 2

---

### Related antidepressants

Tricyclic-related antidepressant drugs have a lower incidence of antimuscarinic side-effects than older tricyclics. The tricyclic-related antidepressant drugs may also be associated with a lower risk of cardiotoxicity in overdosage.

---

### Mianserin Hydrochloride

**Indications**
- Depressive illness, particularly where sedation is required

**Cautions**
- See under Amitriptyline Hydrochloride; interactions: Appendix 1 (antidepressants, tricyclic (related))

**Blood counts**
- A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop.

**Contra-indications**
- See under Amitriptyline Hydrochloride

**Side-effects**
- See under Amitriptyline Hydrochloride, fewer and milder antimuscarinic and cardiovascular effects; leucopenia, agranulocytosis and aplastic anaemia (particularly in the elderly); jaundice; arthritides, arthralgia

**Dose**
- Initially 30–40 mg (elderly 30 mg) daily in divided doses or as a single dose at bedtime, increased gradually as necessary; usual dose range 50–90 mg; CHILD not recommended

**Mianserin** (Non-proprietary) Tablets, mianserin hydrochloride 10 mg, net price 28-caps pack = £7.10; 20 mg, 28-caps pack = £4.12; 30 mg, 28-caps pack = £11.23. Label: 2, 25

---

### Trazodone Hydrochloride

**Indications**
- Depressive illness, particularly where sedation is required; anxiety

**Cautions**
- See under Amitriptyline Hydrochloride; interactions: Appendix 1 (antidepressants, tricyclic (related))

**Contra-indications**
- See under Amitriptyline Hydrochloride

**Side-effects**
- See under Amitriptyline Hydrochloride but fewer antimuscarinic and cardiovascular effects; rarely priapism (discontinue immediately)

**Dose**
- Depression, initially 150 mg (elderly 100 mg) daily in divided doses after food or as a single dose at bedtime; may be increased to 300 mg daily; hospital patients up to max. 600 mg daily in divided doses; CHILD not recommended
- Anxiety, 75 mg daily, increasing if necessary to 300 mg daily; CHILD not recommended

**Trazodone** (Non-proprietary) Tablets, trazodone hydrochloride 50 mg, net price 84-caps pack = £8.07; 100 mg, 56-caps pack = £8.00. Label: 2, 21

---

### Molinepaxin

**Indications**
- Anxiety, 75 mg daily, increasing if necessary to 300 mg daily; CHILD not recommended

**Contra-indications**
- See under Amitriptyline Hydrochloride, interactions: Appendix 1 (antidepressants, tricyclic (related))

**Blood counts**
- A full blood count is recommended every 4 weeks during the first 3 months of treatment; clinical monitoring should continue subsequently and treatment should be stopped and a full blood count obtained if fever, sore throat, stomatitis, or other signs of infection develop.

**Contra-indications**
- See under Amitriptyline Hydrochloride

**Side-effects**
- See under Amitriptyline Hydrochloride, fewer and milder antimuscarinic and cardiovascular effects; leucopenia, agranulocytosis and aplastic anaemia (particularly in the elderly); jaundice; arthritides, arthralgia

**Dose**
- Initially 30–40 mg (elderly 30 mg) daily in divided doses or as a single dose at bedtime, increased gradually as necessary; usual dose range 50–90 mg; CHILD not recommended

**Mianserin** (Non-proprietary) Tablets, mianserin hydrochloride 10 mg, net price 28-caps pack = £7.10; 20 mg, 28-caps pack = £4.12; 30 mg, 28-caps pack = £11.23. Label: 2, 25

---

### Related antidepressants

Tricyclic-related antidepressant drugs have a lower incidence of antimuscarinic side-effects than older tricyclics. The tricyclic-related antidepressant drugs may also be associated with a lower risk of cardiotoxicity in overdosage.

---

### Mianserin Hydrochloride

**Indications**
- Depressive illness, particularly where sedation is required
Monoamine-oxidase inhibitors (MAOIs)

Monoamine-oxidase inhibitors are used much less frequently than tricyclic and related antidepressants, or SSRIs and related antidepressants because of the dangers of dietary and drug interactions and the fact that it is easier to prescribe MAOIs when tricyclic antidepressants have been unsuccessful than vice versa. Tranylcypromine is the most hazardous of the MAOIs because of its stimulant action. The drugs of choice are phенел зине or isocarboxazid which are less stimulant and therefore safer.

Phobic patients and depressed patients with atypical, hypochondriacal, or hysterical features are said to respond best to MAOIs. However, MAOIs should be tried in any patients who are refractory to treatment with other antidepressants as there is occasionally a dramatic response. Response to treatment may be delayed for 3 weeks or more and may take an additional 1 or 2 weeks to become maximal.

Withdrawal If possible MAOIs should be withdrawn slowly (see also section 4.3).

Interactions MAOIs inhibit monoamine oxidase, thereby causing an accumulation of amine neurotransmitters. The metabolism of some amine drugs such as indirect-acting sympathomimetics (present in many cough and decongestant preparations, section 3.10) is also inhibited and their pressor action may be potentiated; the pressor effect of tyramine (in some foods, such as mature cheese, pickled herring, broad bean pods, and Bovril®, Oxet®, Marmite® or any similar meat or yeast extract or fermented soya bean extract) may also be dangerously potentiated. These interactions may cause a dangerous rise in blood pressure. An early warning symptom may be a throbbing headache. Patients should be advised to eat only fresh foods and avoid food that is suspected of being stale or ‘going off’. This is especially important with meat, fish, poultry or offal; game should be avoided. The danger of interaction persists for up to 2 weeks after treatment with MAOIs is discontinued. Patients should also avoid alcoholic drinks or de-alcoholised (low alcohol) drinks.

Other antidepressants should not be started for 2 weeks after treatment with MAOIs has been stopped (3 weeks if starting clomipramine or imipramine). Some psychiatrists use selected tricyclics in conjunction with MAOIs but this is hazardous, indeed potentially lethal, except in experienced hands and there is no evidence that the combination is more effective than when either constituent is used alone. The combination of tranylcypromine with clomipramine is particularly dangerous.

Conversely, an MAOI should not be started until at least 7–14 days after a tricyclic or related antidepressant (3 weeks in the case of clomipramine or imipramine) has been stopped.

In addition, an MAOI should not be started for at least 2 weeks after a previous MAOI has been stopped (then started at a reduced dose).

For other interactions with MAOIs including those with opioid analgesics (notably pethidine), see Appendix 1 (MAOIs). For guidance on interactions relating to the reversible monoamine oxidase inhibitor, moclobemide, see p. 212; for guidance on interactions relating to SSRIs, see p. 213.

4.3.2 Monoamine-oxidase inhibitors

Indications depressive illness

Cautions diabetes mellitus, cardiovascular disease, epilepsy, blood disorders, concurrent electroconvulsive therapy; elderly (great caution); monitor blood pressure (risk of postural hypotension and hypertensive responses—discontinue if palpitations or frequent headaches); if possible avoid abrupt withdrawal; severe hypertensive reactions to certain drugs and foods; avoid in agitated patients; acute porphyria (section 9.8.2); pregnancy (Appendix 4) and breastfeeding; surgery (section 15.1); interactions: Appendix 1 (MAOIs)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications hepatic impairment or abnormal liver function tests (Appendix 2); cerebrovascular disease, phaeochromocytoma; not indicated in manic phase

Side-effects commonly postural hypotension (especially in elderly) and dizziness; less common side-effects include drowsiness, insomnia, headache, weakness and fatigue, dry mouth, constipation and other gastro-intestinal disturbances, oedema, myoclonic movement, hyperreflexia, elevated liver enzymes; agitation and tremors, nervousness, euphoria, arrhythmias, blurred vision, ny statmus, difficulty in micturition, sweating, convulsions, rashes, purpura, leucopenia, sexual disturbances, and weight gain with inappropriate appetite may also occur; psychotic episodes with hypomanic behaviour, confusion, and hallucinations may be induced in susceptible persons; suicidal behaviour (see p. 206); jaundice has been reported and, on rare occasions, fatal progressive hepatic necrosis; paraesthesia, peripheral neuritis, peripheral neuropathy may be due to pyridoxine deficiency; hyponatraemia (see Hypo- nataemia and Antidepressant Therapy, p. 206)

Dose

• 15 mg 3 times daily, increased if necessary to 4 times daily after 2 weeks (hospital patients, max. 30 mg 3 times daily), then reduced gradually to lowest possible maintenance dose (15 mg on alternate days may be adequate); CHILD not recommended

Nardil® (Concord) tablets, oral, f/c, phenelzine (as sulphate) 15 mg, net price 20 = £3.99. Label: 3, 10, patient information leaflet

Phenelzine

Indications depressive illness

Cautions see under Phenelzine

Contra-indications see under Phenelzine

Side-effects see under Phenelzine

Dose

• Initially 30 mg daily in single or divided doses until improvement occurs (increased after 4 weeks if necessary to max. 60 mg daily for 4–6 weeks under close supervision), then reduced to usual maintenance dose 10–20 mg daily (but up to 40 mg daily may
4.3.3 Selective serotonin re-uptake inhibitors

Moclobemide

Moclobemide is indicated for major depression and social anxiety disorder; it is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant. It is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant. It is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant.

Interactions Moclobemide is claimed to cause less inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant more frequent than with other MAOIs; liver damage less frequent than with phenelzine.

Dose

- Initially 10 mg twice daily not later than 3 p.m., increasing the second daily dose to 20 mg after 1 week if necessary; doses above 30 mg daily under close supervision only; usual maintenance dose 10 mg daily.
- CHILD not recommended

Tranylcypromine

Tranylcypromine is indicated for major depression and related antidepressants. For a general comment on the management of depression and on the comparison between tricyclic and related antidepressants and the SSRIs and related antidepressants, see section 4.3.4

Reversible MAOIs

Moclobemide

Moclobemide is indicated for major depression and social anxiety disorder; it is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant.

Interactions Moclobemide is claimed to cause less inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant more frequent than with other MAOIs; liver damage less frequent than with phenelzine.

Dose

- Initially 10 mg twice daily not later than 3 p.m., increasing the second daily dose to 20 mg after 1 week if necessary; doses above 30 mg daily under close supervision only; usual maintenance dose 10 mg daily.
- CHILD not recommended

Tranylcypromine

Tranylcypromine is indicated for major depression and related antidepressants. For a general comment on the management of depression and on the comparison between tricyclic and related antidepressants and the SSRIs and related antidepressants, see section 4.3.

Reversible MAOIs

Moclobemide is indicated for major depression and social anxiety disorder; it is reported to act by reversible inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant.

Interactions Moclobemide is claimed to cause less inhibition of monoamine oxidase type A (it is therefore termed a RIMA). It should be reserved as a second-line antidepressant more frequent than with other MAOIs; liver damage less frequent than with phenelzine.

Dose

- Initially 10 mg twice daily not later than 3 p.m., increasing the second daily dose to 20 mg after 1 week if necessary; doses above 30 mg daily under close supervision only; usual maintenance dose 10 mg daily.
- CHILD not recommended

Tranylcypromine

Tranylcypromine is indicated for major depression and related antidepressants. For a general comment on the management of depression and on the comparison between tricyclic and related antidepressants and the SSRIs and related antidepressants, see section 4.3.
Cautions SSRIs should be used with caution in patients with epilepsy (avoid if poorly controlled, discontinue if convulsions develop), cardiac disease, diabetes mellitus, susceptibility to angle-closure glaucoma, a history of mania or bleeding disorders (especially gastro-intestinal bleeding), and if used with other drugs that increase the risk of bleeding, hepatic impairment (Appendix 2), renal impairment (Appendix 3), pregnancy (Appendix 4), and breast-feeding (Appendix 5). They should also be used with caution in those receiving concurrent electroconvulsive therapy (prolonged seizures reported with fluoxetine). SSRIs may also impair performance of skilled tasks (e.g. driving). Interactions: see below and Appendix 1 (antidepressants, SSRI).

Withdrawal Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, sleep disturbances, fatigue, influenza-like symptoms, and sweating are the most common features of abrupt withdrawal of an SSRI or marked reduction of the dose; the dose should be tapered over a few weeks to avoid these effects.

Interactions An SSRI or related antidepressant should not be started until 2 weeks after stopping an MAOI. Conversely, an MAOI should not be started until at least a week after an SSRI or related antidepressant has been stopped (2 weeks in the case of sertraline, at least 5 weeks in the case of fluoxetine). For guidance relating to the reversible monoamine oxidase inhibitor, moclobemide, see above. For other SSRI antidepressant interactions, see Appendix 1 (antidepressants, SSRI).

Contra-indications SSRIs should not be used if the patient enters a manic phase.

Side-effects SSRIs are less sedating and have fewer antimuscarinic and cardiotoxic effects than tricyclic antidepressants (section 4.3). Side-effects of the SSRIs include gastro-intestinal effects (dose-related and fairly common)—include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, constipation); anorexia with weight loss (increased appetite and weight gain also reported) and hypersensitivity reactions including rash (consider discontinuation—may be sign of impending serious systemic reaction, possibly associated with vasculitis), urticaria, angioedema, anaphylaxis, arthralgia, myalgia and photosensitivity; other side-effects include dry mouth, nervousness, anxiety, headache, insomnia, tremor, dizziness, asthenia, hallucinations, drowsiness, convulsions (see Cautions above), galactorrhoea, sexual dysfunction, urinary retention, sweating, hypomana or mania (see Cautions above), movement disorders and dyskinesias, visual disturbances, hypotension (see Hypotension and Antidepressant Therapy, p. 206), and bleeding disorders including ecchymoses and purpura. Suicidal behaviour has been linked with antidepressants (see p. 206). Angle-closure glaucoma may very rarely be precipitated by treatment with SSRIs.

Dose
- Depressive illness, 20 mg once daily increased if necessary in steps of 20 mg daily at intervals of 3–4 weeks; max. 60 mg daily (ELDERLY over 65 years, max. 40 mg daily); CHILD under 18 years, see BNF for Children and CSM advice, p. 212
- Panic disorder, ADULT over 18 years, initially 10 mg daily increased gradually if necessary in steps of 10 mg daily, usual dose 20–30 mg daily; max. 60 mg daily (ELDERLY over 65 years, max. 40 mg daily)

Note 8 mg (4 drops) Cipramil oral drops is equivalent in therapeutic effect to 10-mg citalopram tablet

Citalopram (Non-proprietary) Tablets, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £1.08; 20 mg, 28-tab pack = £1.25; 40 mg, 28-tab pack = £1.46. Counselling, driving

Cipramil® (Lundbeck) Tablets, f/c, citalopram (as hydrobromide) 10 mg, net price 28-tab pack = £8.97; 20 mg (scored), 28-tab pack = £14.91; 40 mg, 28-tab pack = £25.20. Counselling, driving

Oral drops, sugar-free, citalopram (as hydrochloride) 40 mg/mL, net price 15 mL = £20.16. Counselling, driving, administration

Dose depressive illness, 16 mg daily as a single dose increased if necessary in steps of 16 mg daily at intervals of 3–4 weeks; max. 48 mg daily (ELDERLY over 65 years, max. 32 mg daily); CHILD under 18 years, see BNF for Children and CSM advice, p. 212

Panic disorder, initially 8 mg daily as a single dose increased gradually if necessary in steps of 8 mg, usual dose 16–24 mg daily, max. 48 mg daily, (ELDERLY over 65 years, max. 32 mg daily); CHILD under 18 years not recommended.

Excipients include alcohol

Note 8 mg (4 drops) Cipramil oral drops can be considered equivalent in therapeutic effect to 10-mg citalopram tablet

Mix with water, orange juice, or apple juice before taking

ESCITALOPRAM

Note Escitalopram is the active enantiomer of citalopram

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also sinusitis, yawning; fatigue, restlessness, abnormal dreams, paraesthesia; pyrexia; less commonly taste disturbance, bruxism, syncope, tachycardia, oedema, confusion, menstrual disturbances, epistaxis, mydriasis, tinnitus, pruritus, and alopecia; rarely bradycardia, aggression, and depersonalisation; hepatitis, postural hypotension, QT interval prolongation, and thrombocytopenia also reported; paradoxical increased anxiety during initial treatment of panic disorder (reduce dose)

Dose
- ADULT over 18 years, depressive illness, generalised anxiety disorder, and obsessive-compulsive disorder, 10 mg once daily increased if necessary to max. 20 mg daily; ELDERLY initially half adult dose, lower maintenance dose may be sufficient; CHILD not recommended (see CSM advice, p. 212)
- ADULT over 18 years, panic disorder, initially 5 mg once daily increased to 10 mg daily after 7 days; max. 20 mg daily; ELDERLY initially half adult dose, lower maintenance dose may be sufficient
Central nervous system

• ADULT over 18 years, social anxiety disorder, initially 10 mg once daily adjusted after 2–4 weeks; usual dose 5–20 mg daily

Cipralex® (Lundbeck) 

Tablets, f/c, escitalopram (as oxalate) 5 mg, net price 28-tab pack = £8.97; 10 mg (scored), 28-tab pack = £14.91; 20 mg (scored), 28-tab pack = £25.20. Counselling, driving

Oral drops, sugar-free, escitalopram (as oxalate) 10 mg/mL, net price 28 mL = £18.82. Counselling, driving, administration

Note: Can be mixed with water, orange juice, or apple juice before taking

The Scottish Medicines Consortium (p. 3) has advised that escitalopram (Cipralex®) is not recommended within NHS Scotland for the treatment of social anxiety disorder (April 2008)

FLUOXETINE

Indications see under Dose

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also vasodilatation, postural hypotension, pharyngitis, dyspnoea, chills, taste disturbances, sleep disturbances, euphoria, confusion, yawning, impaired concentration, changes in blood sugar, alopecia, urinary frequency; rarely pulmonary inflammation and fibrosis; very rarely hepatitis, toxic epidermal necrolysis, and neuroleptic malignant syndrome-like event

Dose

• Major depression, 20 mg once daily increased after 3–4 weeks if necessary, and at appropriate intervals thereafter; max. 60 mg once daily (ELDERLY usual max. 40 mg once daily but 60 mg can be used); CHILD 8–18 years, 10 mg once daily increased after 1–2 weeks if necessary, max. 20 mg once daily (but see also CSM advice, p. 212)

• Bulimia nervosa, ADULT over 18 years, 60 mg once daily

• Obsessive-compulsive disorder, ADULT over 18 years, 20 mg once daily; if inadequate response after 2 weeks increase gradually to max. 60 mg once daily (ELDERLY usual max. 40 mg once daily but 60 mg can be used)

Long duration of action Consider the long half-life of fluoxetine when adjusting dosage (or in overdosage)

Fluoxetine (Non-proprietary) 

Capsules, fluoxetine (as hydrochloride) 20 mg, net price 30-cap pack = £1.02; 60 mg, 30-cap pack = £5.76. Counselling, driving

Brands include: Oxitin

Liquid, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £7.41. Counselling, driving

Brands include: Prasep

Prozac® (Lilly) 

Capsules, fluoxetine (as hydrochloride) 20 mg (green/yellow), net price 30-cap pack = £14.21. Counselling, driving

Liquid, fluoxetine (as hydrochloride) 20 mg/5 mL, net price 70 mL = £13.26. Counselling, driving

FLUOXETINE MALEATE

Indications depressive illness, obsessive-compulsive disorder

Cautions see notes above

CSM advice The CSM has advised that concomitant use of fluvoxamine and theophylline or aminophylline should usually be avoided; see also interactions: Appendix 1 (antidepressants, SSRIs)

Contra-indications see notes above

Side-effects see notes above; palpititation, tachycardia (may also cause bradycardia); rarely postural hypotension, confusion, ataxia, paraesthesia, malaise, taste disturbances, neuroleptic malignant syndrome-like event, abnormal liver function tests, usually symptomatic (discontinue treatment)

Dose

• Depression, ADULT over 18 years, initially 50–100 mg daily in the evening, increased gradually if necessary to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100 mg daily

• Obsessive-compulsive disorder, initially 50 mg in the evening increased gradually if necessary after some weeks to max. 300 mg daily (over 150 mg in divided doses); usual maintenance dose 100–300 mg daily;

CHILD over 8 years initially 25 mg daily increased if necessary in steps of 25 mg every 4–7 days to max. 200 mg daily (over 50 mg in 2 divided doses)

Note: If no improvement in obsessive-compulsive disorder within 10 weeks, treatment should be reconsidered

Fluvoxamine (Non-proprietary) 

Tablets, fluvoxamine maleate 50 mg, net price 60-tab pack = £6.80; 100 mg, 30-tab pack = £8.34. Counselling, driving

Faverin® (Solvay) 

Tablets, f/c, scored, fluvoxamine maleate 50 mg, net price 60-tab pack = £17.10; 100 mg, 30-tab pack = £17.10. Counselling, driving

PAROXETINE

Indications major depression, obsessive-compulsive disorder, panic disorder; social anxiety disorder; post-traumatic stress disorder; generalised anxiety disorder

Cautions see notes above; also achlorhydria or high gastric pH (reduced absorption of oral suspension)

CSM advice Extrapyramidal reactions (including orofacial dyskinesia) and withdrawal syndrome are reported to the CSM more commonly with paroxetine than with other SSRIs

Contra-indications see notes above

Side-effects see notes above; also yawning; raised cholesterol; less commonly arrhythmias, transient changes in blood pressure, confusion, urinary incontinence; rarely panic attacks and paradoxical increased anxiety during initial treatment of panic disorder (reduce dose), depersonalisation, and neuroleptic malignant syndrome-like event; very rarely peripheral oedema, acute glaucoma, hepatic disorders (e.g. hepatitis), and priapism

Dose

• Major depression, social anxiety disorder, post-traumatic stress disorder, generalised anxiety disorder, ADULT over 18 years, usually 20 mg each morning, higher doses on specialist advice only (see also CSM advice, below); max. 50 mg daily (ELDERLY 40 mg daily);

CHILD not recommended (see CSM advice, p. 212)

• Obsessive-compulsive disorder, ADULT over 18 years, initially 20 mg each morning, increased gradually in steps of 10 mg to usual dose of 40 mg daily, higher doses on specialist advice only (see also CSM advice, below); max. 60 mg daily (ELDERLY 40 mg daily)
● Panic disorder, **ADULT** over 18 years, initially 10 mg each morning, increased gradually in steps of 10 mg to usual dose of 40 mg daily; higher doses on specialist advice only (see also CSM advice; below); max. 60 mg daily (**ELDERLY** 40 mg daily)

**CSM advice** The recommended dose for the treatment of depression, social anxiety disorder, generalised anxiety disorder, and post-traumatic stress disorder is 20 mg daily and for obsessive-compulsive disorder and panic disorder it is 40 mg daily. There is no evidence that higher doses are more effective

**Paroxetine** (Non-proprietary) *(Pfizer)*

**Tablets**, paroxetine (as hydrochloride) 20 mg, net price 30-tab pack = £2.92; 30 mg, 30-tab pack = £6.46. Label: 21, counselling, driving

**Seroxat** *(GSK)* *(Pfizer)*

**Tablets**, f/c, scored, paroxetine (as hydrochloride) 10 mg, net price 28-pc pack = £12.32; 20 mg, 30-tab pack = £13.21; 30 mg (blue), 30-tab pack = £23.18. Label: 21, counselling, driving

**Oral suspension**, orange, sugar-free, paroxetine (as hydrochloride) 10 mg/5 mL. Net price 150-mL pack = £9.49. Label: 5, 21, counselling, driving

---

**SERTRALINE**

**Indications** depressive illness, obsessive-compulsive disorder (under specialist supervision in children), post-traumatic stress disorder in women

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above; pancreatitis, hepatitis, jaundice, liver failure, tachycardia, postural hypotension, amnesia, paraesthesia, aggression, urinary incontinence, and menstrual irregularities also reported

**Dose**

- Depressive illness, initially 50 mg daily, increased if necessary by increments of 50 mg over several weeks to max. 200 mg daily; usual maintenance dose 50 mg daily; **CHILD** under 18 years, see **BNF for Children** and CSM advice, p. 212
- Obsessive-compulsive disorder, **ADULT** and **CHILD** over 12 years initially 50 mg daily, increased if necessary in steps of 50 mg over several weeks; usual dose range 50–200 mg daily; **CHILD** 6–12 years initially 25 mg daily, increased to 50 mg daily after 1 week, further increased if necessary in steps of 50 mg at intervals of at least 1 week (max. 200 mg daily)
- Post-traumatic stress disorder, **ADULT** over 18 years, initially 25 mg daily, increased after 1 week to 50 mg daily; if response is partial and if drug tolerated, dose increased in steps of 50 mg over several weeks to max. 200 mg daily

**Sertraline** (Non-proprietary) *(Pfizer)*

**Tablets**, sertraline (as hydrochloride) 50 mg, net price 28-tab pack = £1.37; 100 mg, 28-tab pack = £1.80. Counselling, driving

**Lustral** *(Pfizer)*

**Tablets**, f/c, sertraline (as hydrochloride) 50 mg (scored), net price 28-tab pack = £17.82; 100 mg, 28-tab pack = £29.16. Counselling, driving

---

**DULOXETINE**

**Indications** major depressive disorder; generalised anxiety disorder; diabetic neuropathy (section 6.1.5); stress urinary incontinence (section 7.4.2)

**Cautions** section 7.4.2; pregnancy (Appendix 4)

**Contra-indications** section 7.4.2

**Side-effects** section 7.4.2

**Note** In diabetic neuropathy, discontinue if inadequate response after 2 months; review treatment at least every 3 months

**Cymbalta** *(Lilly)* *(Pfizer)*

**Capsules**, duloxetine (as hydrochloride) 30 mg (white/blue), net price 28-cp pack = £22.40; 60 mg (green/blue), 28-cp pack = £27.72. Label: 2

**Note** The Scottish Medicines Consortium has advised (September 2006) that duloxetine (Cymbalta) should be restricted for use by specialists when other treatments for diabetic peripheral neuropathic pain are unsuitable or inadequate

**Yentreve** *(Lilly)* *(Pfizer)*

Section 7.4.2 (stress urinary incontinence)

---

**FLUPENTIXOL** *(Flupenthixol)* *(Lilly)*

**Indications** depressive illness; psychoses (section 4.2.1)
4 Central nervous system

**Mirtazapine** (Non-proprietary) (BNF 57)

- **Indications** - major depression
- **Cautions** - cardiovascular disease (including cardiac disorders and cerebral arteriosclerosis), senile confusional states, parkinsonism, hepatic impairment (Appendix 2); renal impairment (Appendix 3); avoid in excitable and overactive patients; acute porphyria (section 9.8.2); see also section 4.2.1; **interactions**: Appendix 1 (antipsychotics)
- **Side-effects** - restlessness, insomnia; hypomania reported; rarely dizziness, tremor, visual disturbances, headache, hyperprolactinaemia, extrapyramidal symptoms; suicidal behaviour (see p. 206)
- **Dose**
  - **ADULT** over 18 years, initially 1 mg (elderly 500 micrograms) in the morning, increased after 1 week to 2 mg (elderly 1 mg) if necessary; max. 3 mg (elderly 2 mg) daily, doses above 2 mg (elderly 1 mg) being divided in 2 portions, second dose not after 4 p.m. Discontinue if no response after 1 week at max. dosage
  - **CHILD** under 18 years not recommended (see Appendix 4; breast-feeding (Appendix 5); **interactions**: Appendix 1 (mirtazapine)
- **Contra-indications** - pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Fluanxol** (Lundbeck) (BNF 57)

- **Tablets**, yellow, s/c, flupentixol (as dihydrochloride) 500 micrograms, net price 60-tab pack = £2.88; 1 mg, 60-tab pack = £4.86. Label: 2, counselling, administration

**Zispin SolTab** (Organon) (BNF 57)

- **Orodispersible tablets**, mirtazapine 15 mg, net price 6-tab pack = £3.84, 30-tab pack = £19.19; 30 mg, 30-tab pack = £19.19; 45 mg, 30-tab pack = £19.19. Label: 2, counselling, administration

**REBOXETINE**

- **Indications** - major depression
- **Cautions** - history of cardiovascular disease and epilepsy; bipolar disorder; urinary retention; prostatic hypertrophy; susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; hepatic impairment (Appendix 2); renal impairment (Appendix 3); **interactions**: Appendix 1 (reboxetine)
- **Contra-indications** - pregnancy (Appendix 4); breast-feeding (Appendix 5)
- **Side-effects** - nausea, dry mouth, constipation, anorexia; tachycardia, palpitation, vasodilation, postural hypotension; headache, insomnia, dizziness; chills; impotence; urinary retention; impaired visual accommodation; sweating; lowering of plasma-potassium concentration on prolonged administration in the elderly; very rarely angle-closure glaucoma: also reported vomiting, hypertension, paraesthesia, agitation, anxiety, irritability, hallucinations, aggression, cold extremities, and rash; suicidal behaviour (see p. 206)
- **Dose**
  - 4 mg twice daily increased if necessary after 3–4 weeks to 10 mg daily in divided doses, max. 12 mg daily; **CHILD** under 18 years and **ELDERLY** not recommended

**Edronax** (Pharmacia) (BNF 57)

- **Tablets**, scored, reboxetine (as mesilate) 4 mg, net price 60-tab pack = £18.91. Counselling, driving

**TRYPТОPHAN** (L-Tryptophan)

- **Indications** - see notes above
- **Cautions** - eosinophilia-myalgia syndrome has been reported (withhold treatment if increased eosinophil count, myalgia, arthralgia, fever, dyspnoea, neuro-pathy, oedema or skin lesions develop until possibility of eosinophilia-myalgia syndrome excluded); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (tryptophan)
- **Contra-indications** - history of eosinophilia-myalgia syndrome following use of tryptophan
- **Side-effects** - drowsiness, nausea, headache, light-headedness, suicidal behaviour (see p. 206); eosinophilia-myalgia syndrome, see Cautions

**Dose**

- 1 g 3 times daily; max. 6 g daily; **ELDERLY** lower dose may be appropriate especially in renal or hepatic impairment; **CHILD** not recommended

**Optimax** (Merck) (BNF 57)

- **Tablets**, scored, tryptophan 500 mg. Net price 84-tab pack = £23.47. Label: 3

---

**Central nervous system**

**4** Other antidepressant drugs

**216**
**VENLAFAXINE**

**Indications** major depression, generalised anxiety disorder

**Cautions** heart disease (monitor blood pressure); history of epilepsy; susceptibility to angle-closure glaucoma; concomitant use of drugs that increase risk of bleeding, history of bleeding disorders; hepatic impairment (avoid if severe—Appendix 2); renal impairment (avoid if severe—Appendix 3); breastfeeding (Appendix 5); interactions: Appendix 1 (venlafaxine)

**Driving** May affect performance of skilled tasks (e.g. driving)

**Withdrawal** Gastro-intestinal disturbances, headache, anxiety, dizziness, paraesthesia, tremor, sleep disturbances, and sweating are most common features of withdrawal if treatment stopped abruptly or if dose reduced markedly; dose should be reduced over several weeks

**Contra-indications** conditions associated with high risk of cardiac arrhythmia, uncontrolled hypertension; pregnancy (Appendix 4)

**Side-effects** constipation, nausea, anorexia, weight changes, diarrhoea, dyspepsia, vomiting, abdominal pain; hypertension, palpitation, vasodilatation, changes in serum cholesterol; chills, pyrexia, dysphonia, yawning; dizziness, dry mouth, insomnia, nervousness, drowsiness, asthenia, headache, abnor-mal dreams, agitation, anxiety, confusion, hypertonia, paraesthesia, tremor; urinary frequency, sexual dys-function, menstrual disturbances; arthralgia, myalgia; visual disturbances, mydriasis (very rarely angle-closure glaucoma); tinnitus; sweating, pruritus, rash; less commonly bruxism, taste disturbance, hypotension and postural hypotension, arrhythmias, syndrome of inappropriate anti-diuretic hormone secretion (see Hyponatraemia and Antidepressant Therapy, p. 206), apathy, hallucinations, myoclonus, urinary retention, bleeding disorders (including ecchymosis and rarely haemorrhage), alopecia, hypersensitivity reactions including angioedema, urticaria, photosensitivity; rarely hepatitis, ataxia, incoordination, speech disor-der, mania and hypomania, seizures, and neuroleptic malignant syndrome, Stevens-Johnson syndrome; very rarely pancreatitis, QT interval prolongation, aggression, delirium, extrapyramidal symptoms including akathisia, hyperprolactinaemia, blood dys-crasias, rhadomyolysis; suicidal behaviour (doses over 300 mg under specialist supervision; see also p. 206)

**Dose**

- Depression. **ADULT** over 18 years, initially 75 mg daily in 2 divided doses increased if necessary after at least 3–4 weeks to 150 mg daily in 2 divided doses; severely depressed or hospitalised patients, increased further if necessary in steps of up to 75 mg every 2–3 days; max. 375 mg daily; **CHILD** under 18 years not recommended (see CSM advice, p. 212)
- Generalised anxiety disorder and social anxiety dis-order, see under preparations below

**Efexor®** (Wyeth) Tablets, peach, venlafaxine (as hydrochloride) 37.5 mg, net price 28-tab pack = £11.71, 56-tab pack = £23.41; 75 mg, 28-tab pack = £19.52, 56-tab pack = £39.03. Label: 3, counselling, driving

**Modified release**

**Efexor® XL** (Wyeth) Capsules, m/r, venlafaxine (as hydrochloride) 75 mg (peach), net price 14-cap pack = £11.71, 28-cap pack = £23.41; 150 mg (orange) 14–cap pack = £19.52, 28-cap pack = £39.03. Label: 3, 25, counselling, driving

**Dose** depression, **ADULT** over 18 years, 75 mg once daily; increased if necessary after at least 2 weeks to 150 mg once daily; max. 225 mg once daily; **CHILD** under 18 years not recommended (see CSM advice, p. 212)

**Generalised anxiety disorder, ADULT** over 18 years, 75 mg once daily; discontinue if no response after 8 weeks

**Social anxiety disorder, ADULT** over 18 years, 75 mg once daily; discontinue if no response after 12 weeks

Central nervous system stimulants include the amphetamines (notably dexamfetamine) and related drugs (e.g. methylphenidate). They have very few indications in particular, should **not** be used to treat depression, obesity, senility, debility, or for relief of fatigue. Methylphenidate and atomoxetine are used for the management of attention deficit hyperactivity disorder (ADHD) in children and adolescents as part of a comprehensive treatment programme. Growth is not generally affected but it is advisable to monitor growth during treatment. Dexamfetamine (dexamphetamine) is an alternative in children who do not respond to other drugs. CNS stimulants should only be prescribed to children with severe and persistent symptoms and when the diagnosis of ADHD has been confirmed by a specialist; treatment may be continued by general prac-titioners, under a shared-care arrangement. Treatment often needs to be continued into adolescence, and may need to be continued into adulthood.

**NICE guidance**

Methylphenidate, atomoxetine, and dexamfetamine for attention deficit hyperactivity disorder (March 2006) Methylphenidate, atomoxetine, and dexamfetamine are options for the treatment of ADHD in children and adolescents as part of a comprehensive treatment programme. Choice of drug should take into consideration:

- co-morbid conditions (such as tic disorders, Tourette syndrome, and epilepsy);
- different adverse effects of the drugs;
- potential for drug misuse;
- preferences of the child and carers.

**Modafinil** is used for the treatment of daytime sleepi-ness associated with narcolepsy or obstructive sleep apnoea syndrome; dependence with long-term use cannot be excluded and it should therefore be used with caution. Dexamfetamine and methylphenidate [unlicensed indi-cation] are also used to treat narcolepsy.

**ATOMOXETINE**

**Indications** attention deficit hyperactivity disorder (initiated by a specialist physician experienced in managing the condition)
**Central nervous system**

**Cautions** cardiovascular disease including hypertension and tachycardia; monitor growth in children; QT interval prolongation (avoid concomitant administration of drugs that prolong QT interval); history of seizures; susceptibility to angle-closure glaucoma; hepatic impairment (see Hepatic Disorders below; Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (atomoxetine) Hepatic disorders Following rare reports of hepatic disorders, the CSM has advised that patients and carers should be advised of the risk and be told how to recognise symptoms; prompt medical attention should be sought in case of abdominal pain, unexplained nausea, malaise, darkening of the urine or jaundice.

Suicidal ideation Following reports of suicidal thoughts and behaviour, the CSM has advised that patients and their carers should be informed about the risk and told to report clinical worsening, suicidal thoughts or behaviour, irritability, agitation, or depression.

**Side-effects** anorexia, dry mouth, nausea, vomiting, abdominal pain, constipation, dyspepsia, flatulence; palpitation, tachycardia, increased blood pressure, postural hypotension, hot flushes; sleep disturbance, dizziness, headache, fatigue, lethargy, depression, anxiety, irritability, tremor, rigors; urinary retention, prostatitis, sexual dysfunction, menstrual disturbances; mydriasis, conjunctivitis; dermatitis, pruritus, rash, sweating, weight changes; less commonly suicidal ideation (see Suicidal Ideation, above), cold extremities; very rarely hepatic disorders (see Hepatic Disorders, above), seizures, angle-closure glaucoma, and Raynaud’s phenomenon.

**Dose**

- **ADOLESCENT** body-weight over 70 kg, initially 40 mg daily for 7 days then increased according to response to usual maintenance dose 80 mg daily; max. 100 mg daily; **CHILD** over 6 years and **ADOLESCENT** body-weight up to 70 kg, initially 500 micrograms/kg daily for 7 days then increased according to response to usual maintenance dose 1.2 mg/kg daily (higher dose unlikely to be beneficial).

Note Total daily dose may be given either as a single dose in the morning or in 2 divided doses with last dose no later than early evening.

**Special cautions in children** Monitor height and weight as growth restriction may occur during prolonged therapy (drug-free periods may allow catch-up in growth but withdraw slowly to avoid inducing depression or renewed hyperactivity). In psychotic children may exacerbate behavioural disturbances and thought disorder.

**Driving** May affect performance of skilled tasks (e.g. driving); effects of alcohol unpredictable.

**Contra-indications** cardiovascular disease including moderate to severe hypertension, hyperexcitability or agitated states, hyperthyroidism, history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5).

**Side-effects** insomnia, restlessness, irritability and excitability, nightmares, nervousness, night terrors, euphoria, tremor, dizziness, headache; convulsions (see also Cautions); dependence and tolerance, sometimes psychosis; anorexia, gastro-intestinal symptoms, growth restriction in children (see also under Cautions); dry mouth, sweating, tachycardia (and anginal pain), palpitation, increased blood pressure; visual disturbances; cardiomyopathy reported with chronic use; central stimulants have provoked choreoathetoid movements, tics and Tourette syndrome in predisposed individuals (see also Cautions above); very rarely angle-closure glaucoma; overdosage: see Emergency Treatment of Poisoning, p. 33.

**Dose**

- Narcolepsy, 10 mg (ELDERLY, 5 mg) daily in divided doses increased by 10 mg (ELDERLY, 5 mg) daily at intervals of 1 week to a max. of 60 mg daily.
- Refractory attention deficit hyperactivity disorder, 10 mg (older children have received max. 40 mg daily); maintenance dose given in 2–3 divided doses.

**Dexedrine®** (UCB Pharma) Tablets, scored, dexamfetamine sulphate 5 mg. Net price 28-tab pack = £3.00. Counselling, driving.

---

**METHYLPHENIDATE HYDROCHLORIDE**

**Indications** attention deficit hyperactivity disorder (under specialist supervision); narcolepsy [unlicensed indication].

**Cautions** monitor growth (if prolonged treatment), blood pressure and full blood count; epilepsy (discontinue if increased seizure frequency); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; pregnancy (Appendix 4); interactions: Appendix 1 (sympathomimetics).

**Contra-indications** anxiety or agitation; severe depression, suicidal ideation; tics or a family history of Tourette syndrome; drug or alcohol dependence; psychosis; hyperthyroidism; cardiovascular disease; breast-feeding (Appendix 5).

**Side-effects** abdominal pain, nausea, vomiting, dyspepsia, dry mouth, anorexia, reduced weight gain; tachycardia, palpitation, arrhythmias, changes in blood pressure; cough, nasopharyngitis; tics (very rarely Tourette Syndrome), insomnia, nervousness, asthenia, depression, irritability, aggression, headache, drowsiness, dizziness, movement disorders; fever; arthralgia; rash, pruritus, alopecia; less commonly diarrhoea, dyspnoea, abnormal dreams, confusion, suicidal ideation, urinary frequency, haematuria, muscle cramps, epistaxis; rarely angina, growth

---

**Dexamfetamine SULPHATE**

(Dexamphetamine sulphate)

**Indications** narcolepsy, refractory attention deficit hyperactivity disorder (under specialist supervision).

**Cautions** mild hypertension (contra-indicated if moderate or severe)—monitor blood pressure; history of epilepsy (discontinue if convulsions occur); tics and Tourette syndrome (use with caution)—discontinue if tics occur; monitor growth in children (see also below); susceptibility to angle-closure glaucoma; avoid abrupt withdrawal; data on safety and efficacy of long-term use not complete; acute porphyria (section 9.8.2); interactions: Appendix 1 (sympathomimetics).

**Special cautions in children** Monitor height and weight as growth restriction may occur during prolonged therapy.

---

**Central nervous system**

**218 4.4 CNS stimulants and drugs used for ADHD**

**BNF 57**
restriction, visual disturbances; very rarely hepatic dysfunction, myocardial infarction, cerebral arteritis, psychosis, neuroleptic malignant syndrome, tolerance and dependence, blood disorders including leucopenia and thrombocytopenia, angle-closure glaucoma, exfoliative dermatitis, erythema multiforme

**Dose**

- Attention deficit hyperactivity disorder, CHILD 4–6 years [unlicensed], 2.5 mg twice daily increased if necessary at weekly intervals by 2.5 mg daily to max. 14.4 mg/kg daily in divided doses; CHILD over 6 years, initially 5 mg 1–2 times daily, increased if necessary at weekly intervals by 5–10 mg daily to max. 60 mg daily in divided doses; discontinue if no response after 1 month, also suspend every 1–2 years to assess child's condition

**Evening dose** If effect wears off in evening (with rebound hyperactivity) a dose at bedtime may be appropriate (establish need with trial bedtime dose)

- Narcolepsy [unlicensed indication], 10–60 mg (usually 20–30 mg) daily in divided doses before meals

**Methylphenidate Hydrochloride** (Non-proprietary)

**MODAFINIL**

**Indications** daytime sleepiness associated with narcolepsy, obstructive sleep apnoea syndrome, and chronic shift work

**Cautions** monitor blood pressure and heart rate in hypertensive patients (but see Contra-indications); history of psychosis, depression, mania, alcohol or drug abuse; discontinue treatment if psychiatric symptoms develop; possibility of dependence; discontinue treatment if rash develops; hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (modafinil)

**Contra-indications** moderate to severe uncontrolled hypertension, arrhythmia; history of left ventricular hypertrophy, cor pulmonale, or of clinically significant signs of CNS stimulant-induced mitral valve prolapse (including ischaemic ECG changes, chest pain and arrhythmias); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** dry mouth, appetite changes, gastrointestinal disturbances (including nausea, diarrhoea, constipation, and dyspepsia), abdominal pain; tachycardia, vasodilatation, chest pain, palpitation; head-ache (uncommonly migraine), anxiety, sleep disturb-ances, dizziness, drowsiness, depression, confusion, paraesthesia, asthenia; visual disturbances; less com-monly flatulence, reflux, vomiting, mouth ulcers, glossitis, dysphagia, taste disturbance, weight changes, hypertension, hypotension, bradycardia, arrhythmia, peripheral oedema, hypercholesterol-aeemia, rhi-nitis, dyspnoea, epistaxis, dyskinesia, amnesia, emotional lability, tremor, decreased libido, agitation, aggression, hyperglycaemia, thirst, urinary frequency, menstrual disturbances, eosinophilia, leucopenia, myasthenia, muscle cramps, hyperton-ia, myalgia, arthralgia, dry eye, sinusitis, acne, sweating, rash, and pruritus; also reported: psychosis, mania, delusions, hallucinations, suicidal ideation, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**

- Narcolepsy and obstructive sleep apnoea syndrome, ADULT over 12 years, initially 200 mg daily, either in 2 divided doses morning and at noon or as a single dose in the morning, dose adjusted according to response to 200–400 mg daily in 2 divided doses or as a single dose; ELDERLY initiate at 100 mg daily; CHILD 5–12 years, see BNF for Children

**Cocaine**

Cocaine is a drug of addiction which causes central nervous stimulation. Its clinical use is mainly as a topical local anaesthetic (section 15.2). It has been included in
4.5 Drugs used in the treatment of obesity

4.5.1 Anti-obesity drugs acting on the gastro-intestinal tract

Obesity is associated with many health problems including cardiovascular disease, diabetes mellitus, gallstones and osteoarthritis. Factors that aggravate obesity may include depression, other psychosocial problems, and some drugs.

The main treatment of the obese individual is a suitable diet, carefully explained to the individual, with appropriate support and encouragement; the individual should also be advised to increase physical activity. Smoking cessation (while maintaining body weight) may be worthwhile before attempting supervised weight loss since cigarette smoking may be more harmful than obesity. Attendance at groups (e.g. 'weight-watchers') helps some individuals.

Obesity should be managed in an appropriate setting by staff who have been trained in the management of obesity; the individual should receive advice on diet and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions.

An anti-obesity drug should be considered only for those with a body mass index (BMI, individual’s body-weight divided by the square of the individual's height) of 30 kg/m² or greater in whom at least 3 months of managed care involving supervised diet, exercise and behaviour modification fails to achieve a realistic reduction in weight. In the presence of risk factors (such as diabetes, coronary heart disease, hypertension, and obstructive sleep apnoea), it may be appropriate to choose orlistat for those who have a high BMI and lifestyle modification and be monitored for changes in weight as well as in blood pressure, blood lipids and other associated conditions.

Drugs specifically licensed for the management of obesity are orlistat (section 4.5.1), sibutramine and rimonabant (both section 4.5.2). There is little evidence to guide selection between these drugs, but it may be appropriate to choose orlistat for those who have a high intake of fats whereas sibutramine or rimonabant may be chosen for those who cannot control their eating.

Combination therapy involving more than one anti-obesity drug is contra-indicated until further information about efficacy and long-term safety is available.

Thyroid hormones have no place in the treatment of obesity except in biochemically proven hypothyroid patients. The use of diuretics, cholinic gonadotrophin, or amphetamines is not appropriate for weight reduction.

4.5.2 Centrally acting appetite suppressants

Orlistat, a lipase inhibitor, reduces the absorption of dietary fat. It is used in conjunction with a mildly hypocaloric diet in individuals with a body mass index (BMI) of 30 kg/m² or more or in individuals with a BMI of 28 kg/m² in the presence of other risk factors such as type 2 diabetes, hypertension, or hypercholesterolaemia.

Orlistat should be used in conjunction with other lifestyle measures to manage obesity (section 4.5); treatment should only be continued beyond 12 months after discussing potential benefits and risks with the patient. On stopping orlistat, there may be a gradual reversal of weight loss.

Some of the weight loss in those taking orlistat probably results from individuals reducing their fat intake to avoid severe gastro-intestinal effects including steatorrhoea. Vitamin supplementation (especially of vitamin D) may be considered if there is concern about deficiency of fat-soluble vitamins.

The most commonly used bulk-forming drug is methylcellulose (section 1.6.1). It is claimed to reduce intake by producing a feeling of satiety but there is little evidence to support its use in the management of obesity.

**ORLISTAT**

*Indications* adjunct in obesity (see notes above)

*Caution* may impair absorption of fat-soluble vitamins; pregnancy (Appendix 4); *interactions*: Appendix 1 (orlistat)

*Multivitamins* If a multivitamin supplement is required, it should be taken at least 2 hours after orlistat dose or at bedtime

*Contra-indications* chronic malabsorption syndrome; cholestasis; breast-feeding (Appendix 5)

*Side-effects* oily leakage from rectum, flatulence, faecal urgency, liquid or oily stools, faecal incontinence, abdominal distension and pain (gastro-intestinal effects minimised by reduced fat intake), tooth and gingival disorders; respiratory infections; fatigue, anxiety, headache; menstrual disturbances, urinary-tract infection; hypoglycaemia; rarely rectal bleeding; very rarely diverticulitis, cholelithiasis, hepatitis, and bullous eruptions

**Dose**

- **ADULT** over 18 years, 120 mg taken immediately before, during, or up to 1 hour after each main meal (up to max. 360 mg daily); continue treatment beyond 12 weeks only if weight loss since start of treatment exceeds 5% (target for initial weight loss may be lower in patients with type 2 diabetes);

- **CHILD** over 12 years, initiated by specialist only [unlicensed use]

*Note* If a meal is missed or contains no fat, the dose of orlistat should be omitted

**Xenical** (Roche) (NH)

*Capsules* turquoise, orlistat 120 mg, net price 84-cap pack = £33.58
Sibutramine inhibits the re-uptake of noradrenaline and serotonin. It is used in the adjunctive management of obesity in individuals with a body mass index (BMI) of 30 kg/m² or more (and no associated co-morbidity) or in individuals with a BMI of 27 kg/m² or more in the presence of other risk factors such as type 2 diabetes or dyslipidaemia. Sibutramine is not licensed for use for longer than 1 year; on stopping sibutramine, there may be a gradual reversal of weight loss.

Rimonabant is a cannabinoid receptor antagonist for the adjunctive management of obesity in individuals with a BMI of 30 kg/m² or more, or in individuals with a BMI above 27 kg/m² in the presence of other risk factors such as type 2 diabetes or dyslipidaemia. On stopping rimonabant, there may be a gradual reversal of weight loss.

Dose

Side-effects

nausea, vomiting, diarrhoea, dry mouth, anorexia, depression (see above), anxiety, irritability, nervousness, sleep disorders, impaired memory, dizziness, paraesthesia, hypoesthesia, sciatica, hot flush, asthenia, impaired attention; tendonitis, muscle cramp; pruritus, hyperhidrosis; less commonly hicups, anger, aggression, suicidal ideation; rarely hallucinations

Dose

● Initially 10 mg daily in the morning, increased if weight loss less than 2 kg after 4 weeks to 15 mg daily; discontinue if weight loss less than 2 kg after 4 weeks at higher dose (see also Discontinuation of Treatment below); max. period of treatment 1 year; CHILD over 12 years, initiated by specialist only [unlicensed use]; ELDERLY over 65 years not recommended

Discontinuation of treatment Discontinue treatment if:

● weight loss after 3 months less than 5% of initial body-weight;
● weight loss stabilises at less than 5% of initial body-weight;
● individuals regain 3 kg or more after previous weight loss

In individuals with co-morbid conditions, treatment should be continued only if weight loss is associated with other clinical benefits

SiBUTRAMINE HYDROCHLORIDE

Indications adjunct in obesity (see notes above)

Cautions monitor blood pressure and pulse rate (every 2 weeks for first 3 months then monthly for 3 months then at least every 3 months)—discontinue if blood pressure exceeds 145/90 mmHg or if systolic or diastolic pressure raised by more than 10 mmHg or if pulse rate raised by 10 beats per minute at 2 consecutive visits; sleep apnoea syndrome (increased risk of hypertension); epilepsy; open-angle glaucoma, susceptibility to angle-closure glaucoma; history of ocular hypertension; monitor for pulmonary hypertension; family history of motor or vocal tics, history of depression; predisposition to bleeding, concomitant use of drugs that increase risk of bleeding; hepatic impairment (avoid if severe; Appendix 2); renal impairment (avoid if creatinine clearance less than 30 mL/minute; Appendix 3); interactions: Appendix 1 (sibutramine)

Contra-indications history of major eating disorders; psychiatric illness, Tourette syndrome; history of coronary artery disease, congestive heart failure, tachycardia, peripheral arterial occlusive disease, arrhythmias, and of cerebrovascular disease; uncontrolled hypertension; hypertrophy; prostatic hypertrophy; phaeochromocytoma; history of drug or alcohol abuse; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects constipation, dry mouth, nausea, taste disturbances, diarrhoea, vomiting, gastro-intestinal haemorrhage, haemorrhoid aggregation; tachycardia, palpitation, arrhythmias, hypertension, flushing; insomnia, lightheadedness, paraesthesia, headache, anxiety, depression, seizures, transient memory disturbance; sexual dysfunction, menstrual disturbances, urinary retention; thrombocytopenia; blurred vision; sweating, alopecia, cutaneous bleeding disorders, hypersensitivity reactions including Henoch-Schönlein purpura, rash, urticaria, angioedema and anaphylaxis; interstitial nephritis, glomerulonephritis; rarely headache and increased appetite on withdrawal; very rarely angle-closure glaucoma

Dose

● Initially 10 mg daily in the morning, increased if weight loss less than 2 kg after 4 weeks to 15 mg daily; discontinue if weight loss less than 2 kg after 4 weeks at higher dose (see also Discontinuation of Treatment below); max. period of treatment 1 year; CHILD over 12 years, initiated by specialist only [unlicensed use]; ELDERLY over 65 years not recommended

Discontinuation of treatment Discontinue treatment if:

● weight loss after 3 months less than 5% of initial body-weight;
● weight loss stabilises at less than 5% of initial body-weight;
● individuals regain 3 kg or more after previous weight loss

In individuals with co-morbid conditions, treatment should be continued only if weight loss is associated with other clinical benefits
4.6 Drugs used in nausea and vertigo

Antiemetics should be prescribed only when the cause of vomiting is known because otherwise they may delay diagnosis, particularly in children. Antiemetics are unnecessary and sometimes harmful when the cause can be treated, such as in diabetic ketoacidosis, or in digoxin or anti-epileptic overdose.

If antiemetic drug treatment is indicated, the drug is chosen according to the aetiology of vomiting.

**Antihistamines** are effective against nausea and vomiting resulting from many underlying conditions. There is no evidence that any one antihistamine is superior to another but their duration of action and incidence of adverse effects (drowsiness and antimuscarinic effects) differ.

The phenothiazines are dopamine antagonists and act centrally by blocking the chemoreceptor trigger zone. They are of considerable value for the prophylaxis and treatment of nausea and vomiting associated with diffuse neoplastic disease, radiation sickness, and the emesis caused by drugs such as opioids, general anaesthetics, and cytotoxics. Prochlorperazine, perphenazine, and trifluoperazine are less sedating than chlorpromazine; severe dystonic reactions sometimes occur with phenothiazines, especially in children. Other antipsychotic drugs including haloperidol and levomepromazine (methotrimeprazine) are also used for the relief of nausea (see Palliative Care, p. 17). Some phenothiazines are available as rectal suppositories, which can be useful in patients with persistent vomiting or with severe nausea; prochlorperazine can also be administered as a buccal tablet which is placed between the upper lip and the gum.

**Metoclopramide** is an effective antiemetic and its activity closely resembles that of the phenothiazines. Metoclopramide also acts directly on the gastro-intestinal tract and it may be superior to the phenothiazines for emesis associated with gastroduodenal, hepatic, and biliary disease. In postoperative nausea and vomiting, metoclopramide in a dose of 10 mg has limited efficacy. High-dose metoclopramide injection is now less commonly used for cytotoxic-induced nausea and vomiting. As with the phenothiazines, metoclopramide can induce acute dystonic reactions involving facial and skeletal muscle spasms and oculargic crises. These dystonic effects are more common in the young (especially girls and young women) and the very old; they usually occur shortly after starting treatment with metoclopramide and subside within 24 hours of stopping it. Injection of an antiparkinsonian drug such as procyclidine (section 4.9.2) will abort dystonic attacks.

**Domperidone** acts at the chemoreceptor trigger zone; it is used for the relief of nausea and vomiting, especially when associated with cytotoxic therapy. It has the advantage over metoclopramide and the phenothiazines of being less likely to cause central effects such as sedation and dystonic reactions because it does not readily cross the blood-brain barrier. In Parkinson’s disease, it is used to prevent nausea and vomiting during treatment with apomorphine and also to treat nausea caused by other dopaminergic drugs (section 4.9.1). Domperidone is also used to treat vomiting due to emergency hormonal contraception (section 7.3.5).

**Dolasetron, granisetron, and ondansetron**, are specific 5HT antagonists which block 5HT receptors in the gastro-intestinal tract and in the CNS. They are of value in the management of nausea and vomiting in patients receiving cytotoxics and in postoperative nausea and vomiting. **Palonosetron** is licensed for prevention of nausea and vomiting associated with moderately or highly emetogenic cytotoxic chemotherapy.

**Dexamethasone** (section 6.3.2) has antiemetic effects and it is used in vomiting associated with cancer chemotherapy. It can be used alone or with metoclopramide, prochlorperazine, lorazepam, or a 5HT antagonist (section 8.1).

**Aprepitant** and fosaprepitant are neurokinin 1 receptor antagonists licensed for the prevention of acute and delayed nausea and vomiting associated with cisplatin-based cytotoxic chemotherapy; they are given with dexamethasone and a 5HT antagonist.

**Nabilone** is a synthetic cannabinoid with antiemetic properties. It may be used for nausea and vomiting caused by cytotoxic chemotherapy that is unresponsive to conventional antiemetics. Side-effects such as drowsiness and dizziness occur frequently with standard doses.

**Vomiting during pregnancy**

Nausea in the first trimester of pregnancy is generally mild and does not require drug therapy. On rare occasions if vomiting is severe, short-term treatment with an antihistamine, such as promethazine, may be required. **Prochlorperazine or metoclopramide** may be considered as second-line treatments. If symptoms do not settle in 24 to 48 hours then specialist opinion should be sought. Hyperemesis gravidarum is a more serious condition, which requires intravenous fluid and electrolyte replacement and sometimes nutritional support. Supplementation with thiamine must be considered in order to reduce the risk of Wernicke’s encephalopathy.

**Postoperative nausea and vomiting**

The incidence of postoperative nausea and vomiting depends on many factors including the anaesthetic used, the type and duration of surgery, and the patient’s sex. The aim is to prevent postoperative nausea and vomiting from occurring. Drugs used include some phenothiazines (e.g. prochlorperazine), metoclopramide (but 10-mg dose has limited efficacy and higher parenteral doses associated with greater side-effects), 5HT antagonists, antihistamines (such as cyclizine), and dexamethasone. A combination of two antiemetic drugs acting at different sites may be needed in resistant postoperative nausea and vomiting.

**Motion sickness**

Antiemetics should be given to prevent motion sickness rather than after nausea or vomiting develop. The most effective drug for the prevention of motion sickness is hyoscine. A transdermal hyoscine patch provides prolonged activity but it needs to be applied several hours before travelling. The sedating antihistamines are slightly less effective against motion sickness, but are generally better tolerated than hyoscine. If a sedative
effect is desired promethazine is useful, but generally a slightly less sedating antihistamine such as cyclizine or cinnarizine is preferred. The 5HT agonists, domperidone, metoclopramide, and the phenothiazines (except the antihistamine phenothiazine promethazine) are ineffectivemotion sickness.

Other vestibular disorders

Management of vestibular diseases is aimed at treating the underlying cause as well as treating symptoms of the balance disturbance and associated nausea and vomiting. Vertigo and nausea associated with Ménière’s disease and middle-ear surgery can be difficult to treat.

Betahistine is an analogue of histamine and is claimed to reduce endolymphatic pressure by improving the microcirculation. Betahistine is licensed for vertigo, tinnitus, and hearing loss associated with Ménière’s disease.

A diuretic alone or combined with salt restriction may provide some benefit in vertigo associated with Ménière’s disease; antihistamines (such as cinnarizine), and phenothiazines (such as prochlorperazine) are also used. Where possible, prochlorperazine should be reserved for the treatment of acute symptoms.

For advice to avoid the inappropriate prescribing of drugs (notably phenothiazines) for dizziness in the elderly, see Prescribing for the Elderly, p. 19.

Cytotoxic chemotherapy

For the management of nausea and vomiting induced by cytotoxic chemotherapy, see section 8.1.

Palliative care

For the management of nausea and vomiting in palliative care, see p. 17 and p. 18.

Migraine

For the management of nausea and vomiting associated with migraine, see p. 247.

Antihistamines

Cinnarizine

**Indications** vestibular disorders, such as vertigo, tinnitus, nausea, and vomiting in Ménière’s disease; motion sickness

**Cautions** section 3.4.1; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Contra-indications** section 3.4.1

**Side-effects** section 3.4.1; also rarely weight gain, sweating, lichen planus, and lupus-like skin reactions

**Dose**

- Vestibular disorders, 30 mg 3 times daily; CHILD 5–12 years 15 mg 3 times daily
- Motion sickness, 30 mg 2 hours before travel then 15 mg every 8 hours during journey if necessary;

Cyclizine

**Indications** nausea, vomiting, vertigo, motion sickness, labyrinthine disorders

**Cautions** section 3.4.1; severe heart failure; may counteract haemodynamic benefits of opioids; interactions: Appendix 1 (antihistamines)

**Contra-indications** section 3.4.1

**Side-effects** section 3.4.1

**Dose**

- By mouth, cyclizine hydrochloride 50 mg up to 3 times daily; CHILD 6–12 years 25 mg up to 3 times daily
- By intramuscular or intravenous injection, cyclizine lactate 50 mg 3 times daily

Valoid® (Amphipharm)

**Tablets**, scored, cyclizine hydrochloride 50 mg. Net price 20 = £1.48. Label: 2

Injection, cyclizine lactate 50 mg/mL. Net price 1-mL amp = 49p

Promethazine Hydrochloride

**Indications** nausea, vomiting, vertigo, labyrinthine disorders, motion sickness; other indications (section 3.4.1, section 4.1.1, section 15.1.4.1)

**Cautions** section 3.4.1; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Contra-indications** section 3.4.1

**Side-effects** section 3.4.1 but more sedating; intramuscular injection may be painful

**Dose**

- Motion sickness prevention, 20–25 mg at bedtime on night before travel, repeat following morning if necessary; CHILD under 2 years not recommended, 2–5 years 5 mg at night and following morning if necessary, 5–10 years 10 mg at night and following morning if necessary

Preparations

Section 3.4.1

Promethazine Teocluate

**Indications** nausea, vertigo, labyrinthine disorders, motion sickness (acts longer than the hydrochloride)

**Cautions** section 3.4.1; also pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Contra-indications** section 3.4.1
PROCHLORPERAZINE

Indications severe nausea, vomiting, vertigo, labyrinthine disorders (see notes above); other indications section 4.2.1

Cautions see under Prochlorperazine (section 4.2.1); oral route only for children (avoid if under 10 kg); elderly (see notes above)

Contra-indications see under Prochlorperazine (section 4.2.1)

Side-effects see under Prochlorperazine (section 4.2.1); extrapyramidal symptoms, particularly in children, elderly, and debilitated

Dose
Note Doses are expressed as prochlorperazine maleate or mesilate; 1 mg prochlorperazine maleate = 1 mg prochlorperazine mesilate

By mouth, nausea and vomiting, acute attack, 20 mg initially then 10 mg after 2 hours; prevention 5–10 mg 2–3 times daily; CHILD (over 10 kg only) 250 micrograms/kg 2–3 times daily

Labyrinthine disorders, 5 mg 3 times daily, gradually increased if necessary to 30 mg daily in divided doses, then reduced after several weeks to 5–10 mg daily; CHILD not recommended

By deep intramuscular injection, nausea and vomiting, 12.5 mg when required followed if necessary after 6 hours by an oral dose, as above; CHILD and ADOLESCENT under 18 years, see BNF for Children

Prochlorperazine (Non-proprietary)  
Tablets, prochlorperazine maleate 5 mg, net price 28 = £2.09, 84 = £4.14. Label: 2

Stemetil® (Castlemead)  
Tablets, prochlorperazine maleate 5 mg (off-white), net price 84-tab pack = £6.18. Label: 2

Syrup, straw-coloured, prochlorperazine mesilate 5 mg/5 mL. Net price 100-mL pack = £3.48. Label: 2

Injection, prochlorperazine mesilate 12.5 mg/mL. Net price 1-mL amp = 54p

Buccal preparation

1 Buccastem® (R&C)  
Tablets (buccal), pale yellow, prochlorperazine maleate 3 mg. Net price 5 x 10-tab pack = £5.75. Label: 2, counselling, administration, see under Dose below

Dose ADULT and CHILD over 12 years, 1–2 tablets twice daily, tablets are placed high between upper lip and gum and left to dissolve

1. Prochlorperazine maleate can be sold to the public for adults over 18 years (provided packs do not contain more than 24 mg) for the treatment of nausea and vomiting in previously diagnosed migraine only (max. daily dose 12 mg)

TRIFLUOPERAZINE

Indications severe nausea and vomiting (see notes above); other indications section 4.2.1

Cautions section 4.2.1

Contra-indications section 4.2.1

Side-effects section 4.2.1; extrapyramidal symptoms, particularly in children, elderly, and debilitated
**Domperidone and metoclopramide**

### Domperidone

**Indications**
- Nausea and vomiting, dyspepsia, gastrointestinal reflux

**Cautions**
- Children; renal impairment (Appendix 3); breastfeeding (Appendix 5); interactions: Appendix 1 (domperidone)

**Contra-indications**
- Prolactinoma, hepatic impairment; where increased gastrointestinal motility harmful; pregnancy (Appendix 4)

**Side-effects**
- Rarely gastrointestinal disturbances (including cramps) and hyperprolactinaemia; very rarely extrapyramidal effects and rashes

**Dose**
- By mouth, adult and child body-weight over 35 kg, 10–20 mg 3–4 times daily; max. 80 mg daily; child body-weight 35 kg (nausea and vomiting only), 250–500 micrograms/kg 3–4 times daily; max. 2.4 mg/kg daily
- By rectum, adult and child body-weight over 35 kg, 60 mg twice daily; child 15–35 kg (nausea and vomiting only), 30 mg twice daily; child body-weight under 15 kg, not recommended

**Motilium**
- Tablets, 10 mg (as maleate), net price 30-tab pack = £1.37, 100-tab pack = £2.55

**DOMPERIDONE**
- Tablets, 10 mg (as maleate), net price 30-tab pack = £1.37, 100-tab pack = £2.55

**Note**
- Daily dose of motoclopramide should not normally exceed 500 micrograms/kg, particularly for children and young adults (restricted use, see above)

### Metoclopramide Hydrochloride

**Indications**
- Adults, nausea and vomiting, particularly in gastrointestinal disorders (section 1.2) and treatment with cytotoxics or radiotherapy; migraine (section 4.7.4.1)

**Patients under 20 years**
- Use restricted to severe intractable vomiting of known cause, vomiting of radiotherapy and cytotoxics, aid to gastrointestinal intubation, premedication; dose should be determined on the basis of body-weight

**Cautions**
- Elderly, young adults, and children (measure dose accurately, preferably with a pipette); atopic allergy (including asthma); may mask underlying disorders such as cerebral irritation; acute porphyria (section 9.8.2); epilepsy; hepatic impairment (Appendix 2), renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (metoclopramide)

**Contra-indications**
- Gastro-intestinal obstruction, perforation or haemorrhage; 3–4 days after gastro-intestinal surgery; phaeochromocytoma; breastfeeding (Appendix 5)

**Side-effects**
- Extrapyramidal effects (especially in children and young adults—see p. 222), hyperprolactinaemia, occasionally tardive dyskinesia on prolonged administration; also reported, anxiety, confusion, drowsiness, restlessness, diarrhoea, depression, neuroleptic malignant syndrome, rashes, pruritus, oedema; cardiac conduction abnormalities reported following intravenous administration; rarely methaemoglobinemia (more severe in G6PD deficiency)

**Dose**
- By mouth or by intramuscular injection or by intravenous injection over 1–2 minutes, nausea and vomiting, 10 mg (5 mg in young adults) 15–19 years under 60 kg) 3 times daily; child up to 1 year (up to 10 kg) 100 micrograms/kg (max. 1 mg) twice daily; 1–3 years (10–14 kg) 1 mg 2–3 times daily, 3–5 years (15–19 kg) 2 mg 2–3 times daily; 5–9 years (20–29 kg) 2.5 mg 3 times daily, 9–15 years (30 kg and over) 5 mg 3 times daily

- **Note**
- Daily dose of metoclopramide should not normally exceed 500 micrograms/kg, particularly for children and young adults (restricted use, see above)

- For diagnostic procedures, as a single dose 5–10 minutes before examination, 10–20 mg (10 mg in young adults 15–19 years); child under 3 years of age, 3–5 years 2 mg, 5–9 years 2.5 mg, 9–14 years 5 mg

**Metoclopramide**
- Tablets, metoclopramide hydrochloride 10 mg, net price 28-tab pack = 80p
- Oral solution, metoclopramide hydrochloride 5 mg/5 mL, net price 200-mL pack = £3.83
- Note Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription

**Injection**, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 26p

**Maxolon**
- Tablets, scored, metoclopramide hydrochloride 10 mg, net price 84-tab pack = £5.25
- Syrup, sugar-free, metoclopramide hydrochloride 5 mg/5 mL, net price 200-mL pack = £3.83
- Paediatric liquid, sugar-free, metoclopramide hydrochloride 1 mg/mL, net price 15-mL pack with pipette = £1.51. Counselling, use of pipette

**Injection**, metoclopramide hydrochloride 5 mg/mL, net price 2-mL amp = 27p

**High-dose (with cytotoxic chemotherapy only)**

**Maxolon High Dose**
- Injection, metoclopramide hydrochloride 5 mg/mL, net price 20-mL amp = £2.67

- For dilution and use as an intravenous infusion in nausea and vomiting associated with cytotoxic chemotherapy only
- **Dose** by continuous intravenous infusion (preferred method), initially (before starting chemotherapy), 2–4 mg/kg over 15–20 minutes, then 3–5 mg/kg over 8–12 hours; max. in 24 hours, 10 mg/kg

- **By intermittent intravenous infusion,** initially (before starting chemotherapy), up to 2 mg/kg over at least 15 minutes then up to 2 mg/kg every 15 minutes every 2 hours; max. in 24 hours, 10 mg/kg
4 Central nervous system

4.6 Drugs used in nausea and vertigo

DOLASETRON MESILATE

Indications see under Dose

Contra-indications prolonged QT interval, cardiac conduction disorders

Side-effects diarrhoea, constipation, dyspepsia, abdominal pain, flatulence, anorexia, taste disturbance; tachycardia, bradycardia, ECG changes, flushing; fever, shivering; headache, sleep disorder, fatigue, dizziness, drowsiness, hypersensitivity reactions including rash, rarely intestinal obstruction, pancreatitis, jaundice, oedema, cardiac arrhythmia, bronchospasm, seizures, very rarely severe hypotension following intravenous injection

Dose
• Prevention of nausea and vomiting induced by cytotoxic chemotherapy, by intravenous injection (over 30 seconds) or by intravenous infusion, ADULT over 18 years, 100 mg 30 minutes before treatment
• Prevention of postoperative nausea and vomiting by intravenous injection (over 30 seconds) or by intravenous infusion, ADULT over 18 years, 12.5 mg at cessation of anaesthesia,
• Treatment of postoperative nausea and vomiting, by intravenous injection (over 30 seconds) or by intravenous infusion, ADULT over 18 years, 12.5 mg

Anzemet® (Amdipharm) ▼ (FM)
Injection, dolasetron mesilate 20 mg/mL, net price 0.625-mL (12.5-mg) amp = £4.00, 5-mL (100-mg) amp = £13.00

GRANISETRON

Indications see under Dose

Contra-indications pregnancy (Appendix 4) and breast-feeding (Appendix 5)

Side-effects constipation, headache, rash; hypersensitivity reactions reported; rarely movement disorders

Dose
• Nausea and vomiting induced by cytotoxic chemotherapy or radiotherapy, by mouth, 1–2 mg within 1 hour before start of treatment, then 2 mg daily in 1–2 divided doses during treatment; when intravenous infusion also used, max. combined total 9 mg in 24 hours; CHILD 20 micrograms/kg (max. 1 mg) within 1 hour before start of treatment, then 20 micrograms/kg (max. 1 mg) twice daily for up to 5 days during treatment

By intravenous injection (diluted in 15 mL sodium chloride 0.9% and given over not less than 30 seconds) or by intravenous infusion (over 5 minutes), prevention, 3 mg before start of cytotoxic therapy (up to 2 additional 3-mg doses may be given within 24 hours); treatment, as for prevention (the two additional doses must not be given less than 10 minutes apart); max. 9 mg in 24 hours; CHILD, by intravenous infusion, (over 5 minutes), prevention, 40 micrograms/kg (max. 3 mg) before start of cytotoxic therapy; treatment, as for prevention—one additional dose of 40 micrograms/kg (max. 3 mg) may be given within 24 hours (not less than 10 minutes after initial dose)
• Postoperative nausea and vomiting, by intravenous injection (diluted to 5 mL and given over 30 seconds), prevention, 1 mg before induction of anaesthesia, treatment, 1 mg, given as for prevention; max. 2 mg in one day; CHILD not recommended

Kyrtil® (Roche) ▼ (FM)
Tablets, 1, c, granisetron (as hydrochloride) 1 mg, net price 10-tab pack = £65.49; 2 mg, 5-tab pack = £65.49
Sterile solution, granisetron (as hydrochloride) 1 mg/mL, for dilution and use as injection or infusion, net price 1-mL amp = £8.60, 3-mL amp = £25.79

ONDANSETRON

Indications see under Dose

Contra-indications QT interval prolongation (avoid concomitant administration of drugs that prolong QT interval); hepatic impairment (Appendix 2); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (ondansetron)

Side-effects constipation; headache; flushing; injection site-reactions; less commonly hiccups, hypotension, bradycardia, chest pain, arrhythmias, movement disorders, seizures; on intravenous administration, rarely dizziness, transient visual disturbances (very rarely transient blindness); suppositories may cause rectal irritation

Dose
• Moderately emetogenic chemotherapy or radiotherapy, by mouth, 8 mg 1–2 hours before treatment or by rectum, 16 mg 1–2 hours before treatment or by intramuscular injection or slow intravenous injection, 8 mg immediately before treatment then by mouth, 8 mg every 12 hours for up to 5 days or by rectum, 16 mg daily for up to 5 days; CHILD, by slow intravenous injection or by intravenous infusion over 15 minutes, 5 mg/m immediately before chemotherapy then 4 mg by mouth every 12 hours for up to 5 days
• Severely emetogenic chemotherapy, by intramuscular injection or slow intravenous injection, 8 mg immediately before treatment, where necessary followed by 2 further doses of 8 mg at intervals of 2–4 hours (or followed by 1 mg/hour by continuous intravenous infusion for up to 24 hours) then by mouth, 8 mg every 12 hours for up to 5 days or by rectum, 16 mg daily for up to 5 days; CHILD, by slow intravenous injection or by intravenous infusion over at least 15 minutes, 32 mg immediately before treatment or by rectum, 16 mg 1–2 hours before treatment then by mouth, 8 mg every 12 hours for up to 5 days or by rectum, 16 mg daily for up to 5 days; CHILD, by slow intravenous injection, 5 mg/m immediately

Modified release

Maxolon SR® (Shire) ▼ (FM)
Capsules, m/r, clear, enclosing white granules, metoclopramide hydrochloride 15 mg. Net price 56-cap pack = £7.01. Label: 25

Dose patients over 20 years, 1 capsule twice daily

Compound preparations (for migraine)

Section 4.7.4.1

5HT3 antagonists
before chemotherapy then 4 mg by mouth every 12 hours for up to 5 days

- Prevention of postoperative nausea and vomiting, by mouth, 16 mg 1 hour before anaesthesia or 8 mg 1 hour before anaesthesia followed by 8 mg at intervals of 8 hours for 2 further doses
- Alternatively, by intramuscular or slow intravenous injection, 4 mg at induction of anaesthesia; CHILD over 2 years, by slow intravenous injection, 100 micrograms/kg (max. 4 mg) before, during, or after induction of anaesthesia

- Treatment of postoperative nausea and vomiting, by intramuscular or slow intravenous injection, 4 mg; CHILD over 2 years, by slow intravenous injection, 100 micrograms/kg (max. 4 mg)

### Ondansetron

**Ondansetron (Non-proprietary)**

- Tablets, ondansetron (as hydrochloride) 4 mg, net price 30-tab pack = £89.69; 8 mg, 10-tab pack = £59.71
  - Brands include Ondemet
- Injection, ondansetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.39, 4-mL amp = £10.79
  - Brands include Ondemet

### Zofran® (GSK)

- Tablets, yellow, f/c, ondansetron (as hydrochloride) 4 mg, net price 30-tab pack = £107.91; 8 mg, 10-tab pack = £71.94
- Oral lyophilisates (Zofran Mel®), ondansetron 4 mg, net price 10-tab pack = £35.97; 8 mg, 10-tab pack = £71.94. Counselling, administration
  - Excipients include aspartame (section 9.4.1)
- Counselling Tablets should be placed on the tongue, allowed to disperse and swallowed

### Syrup

- Sugar-free, strawberry-flavoured, ondansetron (as hydrochloride) 4 mg/5 mL, net price 50-mL pack = £35.97
- Injection, ondansetron (as hydrochloride) 2 mg/mL, net price 2-mL amp = £5.99; 4-mL amp = £11.99
- Suppositories, ondansetron 16 mg, net price 1 = £14.39

### PALONOSETRON

**Indications** prevention of nausea and vomiting induced by moderately and severely emetogenic chemotherapy

**Caution** history of constipation; intestinal obstruction; concomitant administration of drugs that prolong QT interval; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Driving** Dizziness or drowsiness may affect performance of skilled tasks (e.g. driving)

**Side-effects** diarrhoea, constipation; headache, dizziness; less commonly dyspepsia, abdominal pain, dry mouth, flatulence, changes in blood pressure, tachycardia, bradycardia, arrhythmia, myocardial ischaemia, hiccups, drowsiness, asthenia, insomnia, anxiety, euphoria, paraesthesia, peripheral neuropathy, anorexia, motion sickness, influenza-like symptoms, urinary retention, glycosuria, hyperglycaemia, electrolyte disturbance, arthralgia, eye irritation, amiblopyria, tinitus, rash, pruritus

**Dose**

- By intravenous injection (over 30 seconds), 250 micrograms as a single dose 30 minutes before treatment; do not repeat dose within 7 days; CHILD and ADOLESCENT under 18 years not recommended

**Aloxi® (IS Pharmaceuticals)**

- Injection, palonosetron (as hydrochloride) 50 micrograms/mL, net price 5-mL amp = £55.89

### Neurokinin receptor antagonist

#### Aprepitant

**Indications** adjunct to dexamethasone and a 5HT antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**Caution** hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (aprepitant)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** hiccups, dyspepsia, diarrhoea, constipation, anorexia; asthenia, headache, dizziness; less commonly weight changes, dry mouth, colitis, flatulence, stomatitis, abdominal pain, gastro-oesophageal reflux, duodenal ulcer, oedema, bradycardia, cough, disorientation, euphoria, anxiety, confusion, thirst, abnormal dreams, hyperglycaemia, polyuria, anaemia, dysuria, haematuria, myalgia, conjunctivitis, pharyngitis, sneezing, tinitus, sweating, oily skin, pruritus, rash, acne, photosensitivity, flushing, hypotension

**Dose**

- ADULT over 18 years 125 mg 1 hour before chemotherapy, then 80 mg daily as a single dose for the next 2 days; consult product literature for dose of concomitant corticosteroid and 5HT antagonist

### Emend® (MSD)

- Capsules, aprepitant 80 mg (white), net price 2-cap pack = £31.61; 125 mg (white/pink), 5-cap pack = £79.03; 3-day pack of one 125-mg capsule and two 80-mg capsules = £47.42

### Fosaprepitant

**Note** Fosaprepitant is a prodrug of aprepitant

**Indications** adjunct to dexamethasone and a 5HT antagonist in preventing nausea and vomiting associated with moderately and highly emetogenic chemotherapy

**Caution** hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (aprepitant)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** anorexia, constipation, diarrhoea, dyspepsia, hiccups; asthenia, dizziness, headache; less commonly weight changes, abdominal pain, colitis, dry mouth, duodenal ulcer, flatulence, gastro-oesophageal reflux, stomatitis, taste disturbances, bradycardia, oedema, cough, abnormal dreams, anxiety, disorientation, confusion, euphoria, thirst, hyperglycaemia, dysuria, polyuria, flushing, neutropenia, anaemia, haematuria, hyponatraemia, myalgia, conjunctivitis, pharyngitis, sneezing, tinitus, flushing, oily skin, pruritus, rash, acne, photosensitivity, flushing, pruritus, oily skin, sweating

**Dose**

- By intravenous infusion, over 15 minutes, ADULT over 18 years, 115 mg 30 minutes before chemotherapy on day 1 of cycle (followed by aprepitant on days 2 and 3 of cycle); consult product literature for...
dose of concomitant corticosteroid and SHT antagonist

Ivemend® (MSD) ▼ (MSD)
Injection, powder for reconstitution, fosaprepitant (as dimeglumine), net price 115-mg vial = £20.55
The Scottish Medicines Consortium (p. 3) has advised (September 2008) that fosaprepitant (Ivemend®) is accepted for restricted use for the prevention of acute and delayed nausea and vomiting associated with highly emetogenic cisplatin-based chemotherapy

Cannabinoid

NABILONE

Indications nausea and vomiting caused by cytotoxic chemotherapy, unresponsive to conventional antiemetics (under close observation, preferably in hospital setting)

Cautions history of psychiatric disorder; elderly; hypertension; heart disease; adverse effects on mental state can persist for 48–72 hours after stopping; pregnancy (Appendix 4); interactions: Appendix 1 (nabilone)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications severe hepatic impairment; breast-feeding (Appendix 5)

Side-effects drowsiness, vertigo, euphoria, dry mouth, ataxia, visual disturbance, concentration difficulties, sleep disturbance, dysphoria, hypotension, headache and nausea; also confusion, disorientation, hallucinations, psychosis, depression, decreased coordination, tremors, tachycardia, decreased appetite, and abdominal pain

Behavioural effects Patients should be made aware of possible changes of mood and other adverse behavioural effects

Dose

• Initially 1 mg twice daily, increased if necessary to 2 mg twice daily, throughout each cycle of cytotoxic therapy and, if necessary, for 48 hours after the last dose of each cycle; max. 6 mg daily given in 3 divided doses. The first dose should be taken the night before initiation of cytotoxic treatment and the second dose 1–3 hours before the first dose of cytotoxic drug; ADOLESCENT and CHILD under 18 years consult local treatment protocol [unlicensed use]

Nabilone (Valeant) (MSD)
Capsules, blue/white, nabilone 1 mg. Net price 20-cap pack = £125.84. Label: 2, counselling, behavioural effects

Hyoscine

HYOSCINE HYDROBROMIDE
(Scopolamine Hydrobromide)

Indications motion sickness; hypersalivation associated with clozapine therapy; premedication (section 15.1.3); excessive respiratory secretions (see Precautions in Palliative Care, p. 16)

Cautions 15.1.3); excessive respiratory secretions (see Precautions in Palliative Care, p. 16)

Contra-indications section 1.2

Side-effects section 1.2

Dose

• Motion sickness, by mouth, ADULT and CHILD over 10 years, 150–300 micrograms up to 30 minutes before start of journey repeated every 6 hours if required; max. 900 micrograms daily; CHILD 3–4 years 75 micrograms up to 30 minutes before start of journey repeated after 6 hours if required, max. 150 micrograms daily; 4–10 years 75–150 micrograms up to 30 minutes before start of journey repeated every 6 hours if required; max. 450 micrograms daily

• Hypersalivation associated with clozapine therapy [unlicensed indication], by mouth, ADULT over 16 years, 300 micrograms up to 3 times daily; max. 900 micrograms daily

Joy Rides® (GSK Consumer Healthcare)
Chewable tablets, raspberry-flavoured, hyoscine hydrobromide 150 micrograms, net price 12-tab pack = £1.49. Label: 2, 24

Kwells® (Bayer Consumer Care)
Chewable tablets, scored, hyoscine hydrobromide 150 micrograms (Kwells® Kids) (white), net price 12-tab pack = £1.52; 300 micrograms (pink), 12-tab pack = £1.52. Label: 2, 24

Patches

Scopoderm TTS® (Novartis Consumer Health) Patch, self-adhesive, pink, releasing hyoscine approx. 1 mg/72 hours when in contact with skin. Net price 2 = £4.30. Label: 19, counselling, see below

Dose motion sickness prevention, apply 1 patch to hairless area of skin behind ear 5–6 hours before journey; replace if necessary after 72 hours, siting replacement patch behind other ear, CHILD under 10 years not recommended

Counselling Explain accompanying instructions to patient and in particular emphasise advice to wash hands after handling and to wash application site after removing, and to use one patch at a time

Parenteral preparations
Section 15.1.3

Other drugs for Ménière’s disease

Betalistine has been promoted as a specific treatment for Ménière’s disease.

BETAHISTINE DIHYDROCHLORIDE

Indications vertigo, tinnitus and hearing loss associated with Ménière’s disease

Cautions asthma, history of peptic ulcer; pregnancy and breast-feeding; interactions: Appendix 1 (betahistine)

Contra-indications phaeochromocytoma

Side-effects gastro-intestinal disturbances; headache, rashes and pruritus reported

Dose

• Initially 16 mg 3 times daily, preferably with food; maintenance 24–48 mg daily; CHILD not recommended

Betalistine Dihydrochloride (Non-proprietary) Tablets, betahistine dihydrochloride 8 mg, net price 84-tab pack = £2.85, 120-tab pack = £1.56; 16 mg, 84-tab pack = £2.38. Label: 21
4.7 Analgesics

4.7.1 Non-opioid analgesics

The non-opioid drugs (section 4.7.1), paracetamol and aspirin (and other NSAIDs), are particularly suitable for pain in musculoskeletal conditions, whereas the opioid analgesics (section 4.7.2) are more suitable for moderate to severe pain, particularly of visceral origin.

Pain in palliative care For advice on pain relief in palliative care, see p. 15.

Pain in sickle-cell disease The pain of mild sickle-cell crises is managed with paracetamol, a NSAID, codeine, or dihydrocodeine. Severe crises may require the use of morphine or diamorphine; concomitant use of a NSAID may potentiate analgesia and allow lower doses of the opioid to be used. Pethidine should be avoided if possible because accumulation of a neurotoxic metabolite can precipitate seizures; the relatively short half-life of pethidine necessitates frequent injections.

Dental and orofacial pain Analgesics should be used judiciously in dental care as a temporary measure until the cause of the pain has been dealt with.

Dental pain of inflammatory origin, such as that associated with pulpsitis, apical infection, localized osteitis (dry socket) or pericoronitis is usually best managed by treating the infection, providing drainage, restorative procedures, and other local measures. Analgesics provide temporary relief of pain (usually for about 1 to 7 days) until the causative factors have been brought under control. In the case of pulpsitis, intra-osseous treatment with another NSAID which may be helpful but it should only be prescribed on a short-term basis during the acute phase. Analgesics such as aspirin (section 4.7.1) or ibuprofen (section 10.1.1) may also be required.

For the management of neuropathic pain, persistent idiopathic facial pain, and trigeminal neuralgia, see section 4.7.3.

Dysmenorrhoea Use of an oral contraceptive prevents the pain of dysmenorrhoea which is generally associated with ovulatory cycles. If treatment is necessary paracetamol or a NSAID (section 10.1.1) will generally provide adequate relief of pain. The vomiting and severe pain associated with dysmenorrhoea in women with endometriosis may call for an antiemetic (in addition to an analgesic). Antispasmodics (such as alverine citrate, section 1.2) have been advocated for dysmenorrhoea but the antispasmodic action does not generally provide significant relief.

4.7.1 Non-opioid analgesics

Aspirin is indicated for headache, transient musculoskeletal pain, dysmenorrhoea and pyrexia. In inflammatory conditions, most physicians prefer anti-inflammatory treatment with another NSAID which may be better tolerated and more convenient for the patient. Aspirin is used increasingly for its antiplatelet properties (section 2.9). Aspirin tablets or dispersible aspirin tablets are adequate for most purposes as they act rapidly. Gastric irritation may be a problem; it is minimised by taking the dose after food. Enteric-coated preparations are available, but have a slow onset of action and are therefore unsuitable for single-dose analgesic use (though their prolonged action may be useful for night pain).
Aspirin interacts significantly with a number of other drugs and its interaction with warfarin is a special hazard, see interactions: Appendix 1 (aspirin).

Paracetamol is similar in efficacy to aspirin, but has no demonstrable anti-inflammatory activity; it is less irri-
tant to the stomach and for that reason is now generally preferred to aspirin, particularly in the elderly. Over-
dosage with paracetamol is particularly dangerous as it may cause hepatic damage which is sometimes not
apparent for 4 to 6 days (see Emergency Treatment of
Poisoning, p. 29).

Nefopam may have a place in the relief of persistent
pain unresponsive to other non-opioid analgesics. It
causes little or no respiratory depression, but sympatho-
mimetic and antimuscarnic side-effects may be trou-lesome.

Non-steroidal anti-inflammatory analgesics
( NSAIDs, section 10.1.1) are particularly useful for
the treatment of patients with chronic disease accompanied
by pain and inflammation. Some of them are also used
in the short-term treatment of mild to moderate pain
including transient musculoskeletal pain but paracetam-
ol is now often preferred, particularly in the elderly
(see also p. 20). They are also suitable for the relief of
pain in dysmenorrhoea and to treat pain caused by
secondary bone tumours, many of which produce lysis
of bone and release prostaglandins (see Prescribing in
Palliative Care, p. 15). Selective inhibitors of cyclo-oxy-
genase-2 may be used in preference to non-selective
NSAIDs for patients at high risk of developing serious
gastro-intestinal side-effects. NSAIDs including ketoro-
lac are also used for peri-operative analgesia (section
15.1.4.2).

A non-opioid analgesic administered by intrathecal infu-
sion (ziconotide (Prialt® ▼), available from Eisai) is
licensed for the treatment of chronic severe pain;
ziconotide can be used by a hospital specialist as an
adjunct to opioid analgesics.

Dental and orofacial pain Most dental pain is
relieved effectively by NSAIDs (section 10.1.1). Aspirin
(below) is effective against mild to moderate dental
pain; dispersible tablets provide a rapidly absorbed
form of aspirin suitable for most purposes.

The analgesic effect of paracetamol in mild to moder-
ate dental pain is probably less than that of aspirin, but
it does not affect bleeding time or interact significantly
with warfarin. Moreover, it is less irritant to the stomach.
Paracetamol is a suitable analgesic for children; sugar-
free versions can be requested by specifying ‘sugar-free’
on the prescription.

For further information on the management of dental
and orofacial pain, see p. 229.

Compound analgesic preparations
Compound analgesic preparations that contain a simple
analgesic (such as aspirin or paracetamol) with an
opioid component reduce the scope for effective titra-
tion of the individual components in the management of
pain of varying intensity.

Compound analgesic preparations containing paraceta-
mol or aspirin with a low dose of an opioid analgesic (e.g.
8 mg of codeine phosphate per compound tablet) are
commonly used, but the advantages have not been
substantiated. The low dose of the opioid may be
enough to cause opioid side-effects (in particular, con-
stipation) and can complicate the treatment of over-
dosage (see p. 51) yet may not provide significant
additional relief of pain.

A full dose of the opioid component (e.g. 60 mg codeine
phosphate) in compound analgesic preparations effec-
tively augments the analgesic activity but is associated
with the full range of opioid side-effects (including
nausea, vomiting, severe constipation, drowsiness, respi-
atory depression, and risk of dependence on long-term
administration). For details of the side-effects of opioid
analgesics, see p. 233 (important: the elderly are par-
cularly susceptible to opioid side-effects and should
receive lower doses).

In general, when assessing pain, it is necessary to weigh
up carefully whether there is a need for a non-opioid and
an opioid analgesic to be taken simultaneously.

For information on the use of combination analgesic
preparations in dental and orofacial pain, see p. 229.

Caffeine is a weak stimulant that is often included, in
small doses, in analgesic preparations. It is claimed that
the addition of caffeine may enhance the analgesic
effect, but the alerting effect, mild habit-forming effect
and possible provocation of headache may not always
be desirable. Moreover, in excessive dosage or on with-
drawal caffeine may itself induce headache.

Co-proxamol tablets (dextropropoxyphene in combina-
tion with paracetamol) are no longer licensed because
doctor safety concerns, particularly toxicity in overdose. Co-
proxamol tablets [unlicensed] may still be prescribed for
patients who find it difficult to change, because, for
example, alternatives are not effective or suitable.

A8.5.1 Non-opioid analgesics

Indications mild to moderate pain, pyrexia; anti-
platelet (section 2.9)

Cautions asthma, allergic disease, hepatic impairment
(Appendix 2), renal impairment (Appendix 3), dehy-
dration; preferably avoid during fever or viral infection
in children (risk of Reye’s syndrome, see below);
pregnancy (Appendix 4); elderly; G6PD-deficiency
(section 9.1.5); concomitant use of drugs that increase
risk of bleeding; interactions: Appendix 1 (aspirin)

Contra-indications children under 16 years and in
breast-feeding (Reye’s syndrome, see below; Appen-
dix 5), previous or active peptic ulceration, haemoph-
ilia; not for treatment of gout

Hypersensitivity Aspirin and other NSAIDs are contra-
indicated in patients with a history of hypersensitivity to
aspirin or any other NSAID—can be used in whom
attacks of asthma, angioedema, urticaria or rhinitis have
been precipitated by aspirin or any other NSAID

Reye’s syndrome Owing to an association with Reye’s
syndrome, the CSM has advised that aspirin-containing
preparations should not be given to children under 16 years,
unless specifically indicated, e.g. for Kawasaki syndrome

Side-effects generally mild and infrequent but high
incidence of gastro-intestinal irritation with slight
asymptomatic blood loss, increased bleeding time,
bronchospasm and skin reactions in hypersensitive
patients. Prolonged administration, see section 10.1.1.

Overdosage: see Emergency Treatment of Poisoning,
p. 29

ASPIRIN
(Acetylsalicylic Acid)

4.7.1 Non-opioid analgesics BNF 57

Central nervous system
infusion; important: liver damage (and less frequently renal damage) following overdose, see Emergency Treatment of Poisoning, p. 29

Dose

- By mouth, 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD under 50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily

- By rectum, ADULT and CHILD over 12 years 0.5–1 g every 4–6 hours to a max. 4 g daily; CHILD under 3 months, see BNF for Children, 3 months–1 year 60–125 mg, 1–5 years 125–250 mg, 5–12 years 250–500 mg; these doses may be repeated every 4–6 hours as necessary (max. 4 doses in 24 hours)

- By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily

- By rectum, ADULT and CHILD under 16 years not recommended (see Reye’s Syndrome, above)

- By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily

- By rectum, ADULT and CHILD over 12 years 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD under 3 months, see BNF for Children, 3 months–1 year 60–125 mg, 1–5 years 125–250 mg, 5–12 years 250–500 mg; these doses may be repeated every 4–6 hours as necessary (max. 4 doses in 24 hours)

- By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily

- By rectum, ADULT and CHILD under 16 years not recommended (see Reye’s Syndrome, above)

- By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily

- By rectum, ADULT and CHILD over 12 years 0.5–1 g every 4–6 hours to a max. of 4 g daily; CHILD under 3 months, see BNF for Children, 3 months–1 year 60–125 mg, 1–5 years 125–250 mg, 5–12 years 250–500 mg; these doses may be repeated every 4–6 hours as necessary (max. 4 doses in 24 hours)

- By intravenous infusion over 15 minutes, ADULT and CHILD over 50 kg, 1 g every 4–6 hours, max. 4 g daily; ADULT and CHILD 10–50 kg, 15 mg/kg every 4–6 hours, max. 60 mg/kg daily; NEONATE and CHILD less than 10 kg, 7.5 mg/kg every 4–6 hours, max. 30 mg/kg daily

- By rectum, ADULT and CHILD under 16 years not recommended (see Reye’s Syndrome, above)
Central nervous system

4.7.1 Non-opioid analgesics

1. Can be sold to the public in certain circumstances; for exemptions see Medicines, Ethics and Practice, No. 32, London, Pharmaceutical Press, 2008 (and subsequent editions as available)

Perfadgan® (Bristol-Myers Squibb) ▼ (NF)

**Intravenous infusion**, paracetamol 10 mg/mL, net price 50-mL vial = £1.80, 100-mL vial = £1.98

**Co-codamol 8/500**

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed.

**Co-codamol 8/500 (Non-proprietary)** (NF) ▼

**Tablets**, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg), net price 30-tab pack = £1.05. Label: 29, 30

**Brands include Panadeine**

**Dose**

1–2 tablets every 4–6 hours; max. 8 tablets daily; **CHILD** 6–12 years ½–1 tablet, max. 4 tablets daily

**Effervescent or dispersible tablets**, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg). Net price 100-tab pack = £4.62. Label: 13, 29, 30

**Brands include Paracodol**

**Note** The Drug Tariff allows tablets of co-codamol labelled ‘dispersive’ to be dispensed against an order for ‘effervescent’ and vice versa

**Dose**

1–2 tablets in water every 4–6 hours; max. 8 tablets daily; **CHILD** 6–12 years ½–1 tablet, max. 4 tablets daily

**Capsules**, co-codamol 8/500 (codeine phosphate 8 mg, paracetamol 500 mg). Net price 10-cap pack = £1.10, 20-cap pack = £1.66. Label: 29, 30

**Brands include Paracodol**

**Dose**

1–2 capsules every 4 hours; max. 8 capsules daily

**Co-codamol 15/500**

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and paracetamol 500 mg should be dispensed (see preparations above).

See warnings and notes on p. 230 (**important**: special care in elderly—reduce dose)

Codipar® (Goldshield) (NF) ▼

**Caplets** (= tablets), co-codamol 15/500 (codeine phosphate 15 mg, paracetamol 500 mg). Net price 100-tab pack = £8.25. Label: 2, 29, 30

**Dose**

1–2 caplets every 4 hours; max. 8 caplets daily; **CHILD** not recommended

**Co-codamol 30/500**

When co-codamol tablets, dispersible (or effervescent) tablets, or capsules are prescribed and **no strength is stated**, tablets, dispersible (or effervescent) tablets, or capsules, respectively, containing codeine phosphate 8 mg and on paracetamol 500 mg should be dispensed (see preparations above).

See warnings and notes on p. 230 (**important**: special care in elderly—reduce dose)

Co-codamol 30/500 (Non-proprietary) (NF) ▼

**Tablets (and caplets)**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £3.97. Label: 2, 29, 30

**Dose**

1–2 tablets every 4 hours; max. 8 tablets daily; **CHILD** not recommended

**Capsules**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £5.32. Label: 2, 29, 30

**Brands include Medocodene, Zapain**

**Dose**

1–2 capsules every 4 hours; max. 8 capsules daily; **CHILD** not recommended

**Effervescent tablets**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-tab pack = £9.89. Label: 2, 13, 29, 30

**Brands include Medocodene Effervescent** (contains Na+ 13.6 mmol/tablet)

**Dose**

1–2 tablets in water every 4 hours; max. 8 tablets daily; **CHILD** not recommended

Kapake® (Galen) (NF) ▼

**Tablets**, scored, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 30-tab pack = £2.26 (hosp. only), 100-tab pack = £7.10. Label: 2, 29, 30

**Dose**

1–2 tablets every 4 hours; max. 8 tablets daily; **CHILD** not recommended

**Capsules**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg), net price 100-cap pack = £7.10. Label: 2, 29, 30

**Dose**

1–2 capsules every 4 hours; max. 8 capsules daily; **CHILD** not recommended

**Effervescent tablets**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Contains Na+ 16.9 mmol/tablet; avoid in renal impairment, net price 100-tab pack = £8.30. Label: 2, 13, 29, 30

**Dose**

2 tablets in water every 4 hours; max. 8 tablets daily; **CHILD** not recommended

Solpadol® (Sanofi-Synthelabo) (NF) ▼

**Caplets** (= tablets), co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Net price 100-cap pack = £7.54. Label: 2, 29, 30

**Dose**

2 caplets every 4 hours; max. 8 caplets daily; **CHILD** not recommended

**Capsules**, grey/purple, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Net price 100-cap pack = £7.54. Label: 2, 29, 30

**Dose**

1–2 capsules every 4 hours; max. 8 capsules daily; **CHILD** not recommended

**Effervescent tablets**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Contains Na+ 16.9 mmol/tablet; avoid in renal impairment. Net price 32-tab pack = £2.69, 100-tab pack = £9.05. Label: 2, 13, 29, 30

**Dose**

2 tablets in water every 4 hours; max. 8 tablets daily; **CHILD** not recommended

Tylex® (UCB Pharma) (NF) ▼

**Capsules**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Net price 100-cap pack = £8.01. Label: 2, 29, 30

**Dose**

1–2 capsules every 4 hours; max. 8 capsules daily; **CHILD** not recommended

**Effervescent tablets**, co-codamol 30/500 (codeine phosphate 30 mg, paracetamol 500 mg). Contains Na+ 13.6 mmol/tablet; avoid in renal impairment. Net price 100-tab pack = £8.80. Label: 2, 13, 29, 30

**Excipients** include aspartame 25 mg/tablet (section 9.4.1)

**Dose**

1–2 tablets in water every 4 hours; max. 8 tablets daily; **CHILD** not recommended
### Opioid analgesics

Opioid analgesics are usually used to relieve moderate to severe pain particularly of visceral origin. Repeated administration may cause dependence and tolerance, but this is no deterrent in the control of pain in terminal illness, for guidelines see Prescribing in Palliative Care, p. 15. Regular use of a potent opioid may be appropriate for certain cases of chronic non-malignant pain; treatment should be supervised by a specialist and the patient should be assessed at regular intervals.

**Cautions**

Opioids should be used with caution in patients with impaired respiratory function (avoid in chronic obstructive pulmonary disease) and asthma (avoid during an acute attack), hypotension, shock, myasthenia gravis, prostatic hypertrophy, obstructive or inflammatory bowel disorders, diseases of the biliary tract, and convulsive disorders. A reduced dose is recommended in elderly or debilitated patients, in hepatic impairment (avoid if severe; Appendix 2) and renal impairment (avoid if severe; Appendix 3), in hypothyroidism, and in adrenocortical insufficiency. Repeated use of opioid analgesics is associated with the development of psychological and physical dependence; although this is rarely a problem with therapeutic use, caution is advised if prescribing for patients with a history of drug dependence. Avoid abrupt withdrawal after long-term treatment. Transdermal preparations (fentanyl or buprenorphine patches) are not suitable for acute pain or in those patients whose analgesic requirements are changing rapidly because the long time to steady state prevents rapid titration of the dose. For prescribing in pregnancy and breast-feeding, see Appendix 4 and Appendix 5, respectively. Interactions: Appendix 1 (opioid analgesics; important: special hazard with pethidine and possibly other opioids and MAOIs).

**Palliative Care**

In the control of pain in terminal illness, the cautions listed above should not necessarily be a deterrent to the use of opioid analgesics.

### Contra-indications

Opioid analgesics should be avoided in patients with acute respiratory depression and when there is a risk of paralytic ileus. They are also contra-indicated in conditions associated with raised intracranial pressure and in head injury (opioid analgesics interfere with pupillary responses vital for neurological assessment). Comatose patients should not be treated with opioid analgesics.

### Side-effects

Opioid analgesics share many side-effects, although qualitative and quantitative differences exist. The most common side-effects include nausea and vomiting (particularly in initial stages), constipation, dry mouth, and biliary spasm; larger doses produce muscle rigidity, hypotension, and respiratory depression (for reversal of opioid-induced respiratory depression, see section 15.1.7). Other common side-effects of opioid
analgesics include bradycardia, tachycardia, palpitation, oedema, postural hypotension, hallucinations, vertigo, euphoria, dysphoria, mood changes, dependence, dizziness, confusion, drowsiness, sleep disturbances, headache, sexual dysfunction, difficulty with micturition, urinary retention, ureteric spasm, miosis, visual disturbances, sweating, flushing, rash, urticaria, and pruritus. Overdose: see Emergency Treatment of Poisoning, p. 31.

Driving  Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced.

Choice  Morphine remains the most valuable opioid analgesic for severe pain although it frequently causes nausea and vomiting. It is the standard against which other opioid analgesics are compared. In addition to relief of pain, morphine also confers a state of euphoria and mental detachment.

Morphine is the opioid of choice for the oral treatment of severe pain in palliative care. It is given regularly every 4 hours (or every 12 or 24 hours as modified-release preparations). For guidelines on dosage adjustment in palliative care, see p. 15.

Buprenorphine has both opioid agonist and antagonist properties and may precipitate withdrawal symptoms, including pain, in patients dependent on other opioids. It has abuse potential and may itself cause dependence. It has a much longer duration of action than morphine and sublingually is an effective analgesic for 6 to 8 hours. Unlike most opioid analgesics, the effects of buprenorphine are only partially reversed by naloxone.

Codeine is effective for the relief of mild to moderate pain but is too constipating for long-term use.

Diphenoxylate (in combination with atropine, as co-phenotrope) is used in acute diarrhoea (section 1.4.2). (in combination with atropine, as co-phenotrope) is used in acute diarrhoea (section 1.4.2). Dipipanone used alone is less sedating than morphine but the only preparation available contains an antieptic and is therefore not suitable for regular regimens in palliative care.

Diamorphine (heroin) is a powerful opioid analgesic. It is used most widely. Methadone is less sedating than morphine and acts for longer periods. In prolonged use, methadone should not be administered more often than twice daily to avoid the risk of accumulation and opioid overdosage. Methadone may be used instead of morphine in the occasional patient who experiences excitation (or exacerbation of pain) with morphine.

Oxycodone has an efficacy and side-effect profile similar to that of morphine. It is used primarily for control of pain in palliative care.

Papaveretum is rarely used; morphine is easier to prescribe and less prone to error with regard to the strength and dose.

Pentazocine has both agonist and antagonist properties and precipitates withdrawal symptoms, including pain in patients dependent on other opioids. By injection it is more potent than dihydrocodeine or codeine, but hallucinations and thought disturbances may occur. It is not recommended and, in particular, should be avoided after myocardial infarction as it may increase pulmonary and aortic blood pressure as well as cardiac work.

Pethidine produces prompt but short-lasting analgesia; it is less constipating than morphine, but even in high doses is a less potent analgesic. It is not suitable for severe continuing pain. It is used for analgesia in labour; however, other opioids, such as morphine or diamorphine, are often preferred for obstetric pain.

Tramadol produces analgesia by two mechanisms: an opioid effect and an enhancement of serotonergic and adrenergic pathways. It has fewer of the typical opioid side-effects (notably, less respiratory depression, less constipation and less addiction potential); psychiatric reactions have been reported.

Dose  The dose of opioids in the BNF may need to be adjusted individually according to the degree of analgesia and side-effects; patients’ response to opioids varies widely.

Postoperative analgesia  The use of intra-operative opioids affects the prescribing of postoperative analgesics and in many cases delays the need for a post-operative analgesic. A postoperative opioid analgesic should be given with care since it may potentiate any residual respiratory depression (for the treatment of opioid-induced respiratory depression, see section 15.1.7). Non-opioid analgesics are also used for post-operative pain (section 15.1.4.2).

Morphine is used most widely. Tramadol is not as effective in severe pain as other opioid analgesics. Buprenorphine may antagonise the analgesic effect of previously administered opioids and is generally not recommended. Pethidine is metabolised to norpethidine which may accumulate, particularly in renal impairment; norpethidine stimulates the central nervous system and may cause convulsions.

Opioids are also given epidurally [unlicensed route] in the postoperative period but are associated with side-effects such as pruritus, urinary retention, nausea and vomiting; respiratory depression can be delayed, particularly with morphine.

For details of patient-controlled analgesia (PCA) to relieve postoperative pain, consult hospital protocols. Formulations specifically designed for PCA are available (Pharma-Ject® Morphine Sulphate).

Dental and orofacial pain  Opioid analgesics are relatively ineffective in dental pain. Like other opioids, dihydrocodeine often causes nausea and vomiting which limits its value in dental pain; if taken for more than a few doses it is also liable to cause constipation. Dihydrocodeine is not very effective in postoperative dental pain.
Pethidine can be taken by mouth, but for optimal effect, it needs to be given by injection. Its efficacy in post-operative dental pain is not proven and its use in dentistry is likely to be minimal. The side-effects of pethidine are similar to those of dihydrocodeine and, apart from constipation, pethidine is also more likely to cause them. Dependence is unlikely if very few tablets are prescribed on very few occasions; nevertheless, dental surgeons need to be aware of the possibility that addicts may seek to acquire supplies.

For the management of dental and orofacial pain, see p. 229.

Addicts Although caution is necessary, addicts (and ex-addicts) may be treated with analgesics in the same way as other people when there is a real clinical need. Doctors do not require a special licence to prescribe opioid analgesics for addicts for relief of pain due to organic disease or injury.

**BUPRENORPHINE**

**Indications** see under Dose and under Patches; opioid dependence (section 4.10)

**Cautions** see notes above; also impaired consciousness; effects only partially reversed by naloxone

**Fever or external heat** Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

**Contra-indications** see notes above

**Side-effects** see notes above; can induce mild withdrawal symptoms in patients dependent on opioids; also diarrhoea, abdominal pain, anorexia, dyspepsia; vasodilatation; dyspnoea; paraesthesia, asthenia, fatigue, agitation, anxiety, less commonly fluctuence, taste disturbance, angina, hypertension, syncope, hypoxia, wheezing, cough, restlessness, depersonalisation, dysoria, impaired memory, hypoesthesia, tremor, influenza-like symptoms, pyrexia, rhinitis, rigors, muscle cramp, myalgia, tinnitus, dry eye, and dry skin; rarely paralytic ileus, dysphagia, impaired concentration, and psychosis; very rarely retching, hyperventilation, hiccup, and muscle fasciculation

**Dose**

- Moderate to severe pain, by sublingual administration, 200–400 micrograms every 6–8 hours; CHILD over 6 years, 16–25 kg, 100 micrograms every 6–8 hours; 25–37.5 kg, 100–200 micrograms every 6–8 hours; 37.5–50 kg, 200–300 micrograms every 6–8 hours
- By intramuscular or slow intravenous injection, 300–600 micrograms every 6–8 hours; CHILD over 6 months 3–6 micrograms/kg every 6–8 hours (max. 9 micrograms/kg)
- Premedication, by sublingual administration, 400 micrograms
- By intramuscular injection, 300 micrograms
- Intra-operative analgesia, by slow intravenous injection, 300–450 micrograms

**Temgesic®** (Scherling-Plough) Tablets (sublingual), buprenorphine (as hydrochloride), 200 micrograms, net price 50-tab pack = £5.33; 400 micrograms, 50-tab pack = £10.66. Label: 2, 26

**Injection**, buprenorphine (as hydrochloride) 300 micrograms/mL, net price 1-ML amp = 49p

**Patches**

**BuTrans®** (Napp) Patches, self-adhesive, beige, buprenorphine, ‘5’ patch (releasing 5 micrograms/hour for 96 hours), net price 4 = £16.69; ‘52.5’ patch (releasing 52.5 micrograms/hour for 96 hours), 4 = £25.04; ‘70’ patch (releasing 70 micrograms/hour for 96 hours), 4 = £33.37. Label: 2

- **Dose** severe chronic pain unresponsive to non-opioid analgesics, ADULT over 18 years, initially one ‘5 micrograms/hour’ patch; apply to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 7 days and siting replacement patch on a different area (avoid same area for at least 3 weeks)
- **Dose adjustment** When starting, analgesic effect should not be evaluated until the system has been worn for 72 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at 3-day intervals using a patch of the next strength or 2 patches of the same strength (applied at same time to avoid confusion). Max. 2 patches can be used at any one time

**Transtec®** (Napp) Patches, self-adhesive, skin-coloured, buprenorphine, ‘35’ patch (releasing 35 micrograms/hour for 96 hours), net price 4 = £16.69; ‘52.5’ patch (releasing 52.5 micrograms/hour for 96 hours), 4 = £25.04; ‘70’ patch (releasing 70 micrograms/hour for 96 hours), 4 = £33.37. Label: 2

- **Dose** moderate to severe chronic cancer pain and severe pain unresponsive to non-opioid analgesics, ADULT over 18 years, apply to dry, non-irritated, non-hairy skin on upper torso, removing after no longer than 96 hours and siting replacement patch on a different area (avoid same area for at least 6 days). Patients who have not previously received strong opioid analgesic, initially, one ‘35 micrograms/hour’ patch replaced after no longer than 96 hours, patients who have received strong opioid analgesic, initial dose based on previous 24-hour opioid requirement, consult product literature
- **Dose adjustment** When starting, analgesic effect should not be evaluated until the system has been worn for 24 hours (to allow for gradual increase in plasma-buprenorphine concentration)—if necessary, dose should be adjusted at intervals of no longer than 96 hours using a patch of the next strength or using 2 patches of the same strength (applied at same time to avoid confusion). Max. 2 patches can be used at any one time. For breakthrough pain, consider 200–400 micrograms buprenorphine sublingually

**Important:** it may take approx. 30 hours for the plasma-buprenorphine concentration to decrease by 50% after patch is removed

**Long duration of action** In view of the long duration of action, patients who have severe side-effects should be monitored for up to 30 hours after removing patch

**CODEINE PHOSPHATE**

**Indications** mild to moderate pain; diarrhoea (section 1.4.2); cough suppression (section 3.9.1)

**Cautions** see notes above; also cardiac arrhythmias; acute abdomen; gallstones

**Variation in metabolism** The capacity to metabolise codeine can vary considerably and lead to either reduced therapeutic effect or marked increase in side-effects

**Contra-indications** see notes above

**Side-effects** see notes above; also abdominal pain, anorexia, seizures, malaise, hypothermia, and muscle fasciculation; pancreatitis also reported

**Dose**

- **By mouth**, 30–60 mg every 4 hours when necessary, to a max. of 240 mg daily; CHILD 1–12 years, 3 mg/kg daily in divided doses
- **By intramuscular injection**, 30–60 mg every 4 hours when necessary
4 Central nervous system

**Dihydrocodeine (Non-proprietary)**

**Tablets** *(DF)*, dihydrocodeine tartrate 30 mg. Net price 28 = £1.34. Label: 2, 21

**Dental prescribing on NHS** Dihydrocodeine Tablets 30 mg may be prescribed

**Oral solution** *(DF)*, dihydrocodeine tartrate 10 mg/5 mL. Net price 150 mL = £3.08. Label: 2, 21

**Injection** *(DF)*, dihydrocodeine tartrate 50 mg/mL. Net price 1 mL amp = £2.29

**DF 118 Forte** *(Mirtindal)* *(DF)*

**Tablets**, dihydrocodeine tartrate 40 mg. Net price 100-tab pack = £11.51. Label: 2, 21

**Dose** ADULT and CHILD over 12 years, severe pain, 40–80 mg 3 times daily; max. 240 mg daily

**Modified release**

**DHC Continus** *(Napp)* *(DF)*

**Tablets**, m/r, dihydrocodeine tartrate 60 mg. Net price 56-tab pack = £5.50; 90 mg, 56-tab pack = £8.66; 120 mg, 56-tab pack = £11.57. Label: 2, 25

**Dose** ADULT and CHILD over 12 years, chronic severe pain, 60–120 mg every 12 hours

**Note** Dihydrocodeine is an ingredient of some compound analgesic preparations, section 4.7.1

**DIOPANONE HYDROCHLORIDE**

**(Heroin Hydrochloride)**

**Indications** see under Dose; acute pulmonary oedema

**Cautions** see notes above; also severe diarrhoea; toxic psychosis, CNS depression; severe cor pulmonale

**Contra-indications** see notes above; also pancreatitis; severe cor pulmonale

**Side-effects** see notes above; also anorexia, taste disturbance; syncope; asthenia, raised intracranial pressure; myocardial infarction also reported

**Dose**

- Acute pain, by subcutaneous or intramuscular injection, 5 mg repeated every 4 hours if necessary (up to 10 mg for heavier well-muscled patients); by slow intravenous injection, quarter to half corresponding intramuscular dose
- Myocardial infarction, by slow intravenous injection (1 mg/minute), 5 mg followed by a further 2.5–5 mg if necessary; elderly or frail patients, reduce dose by half
- Acute pulmonary oedema, by slow intravenous injection (1 mg/minute) 2.5–5 mg
- Chronic pain, by mouth or by subcutaneous or intramuscular injection, 5–10 mg regularly every 4 hours; dose may be increased according to needs; intramuscular dose should be approx. half corresponding oral dose, and approx. one third corresponding oral morphine dose—see also Prescribing in Palliative Care, p. 15; by subcutaneous infusion (using syringe driver), see Prescribing in Palliative Care, p. 18

**Diamorphine (Non-proprietary)** *(DF)*

**Tablets**, diamorphine hydrochloride 10 mg. Net price 100-tab pack = £12.92. Label: 2

**Injection**, powder for reconstitution, diamorphine hydrochloride. Net price 5-mg amp = £2.69, 10-mg amp = £3.37, 30-mg amp = £3.60, 100-mg amp = £9.92, 500-mg amp = £43.44

**DIHYDROCODEINE TARTRATE**

**Indications** moderate to severe pain

**Cautions** see notes above; also diabetes mellitus; phaeochromocytoma

**Contra-indications** see notes above

**Side-effects** see notes above; also psychositis, restlessness, raised intracranial pressure

**Dose**

- See preparation below

**Diconal** *(Amdipharm)* *(DF)*

**Tablets**, pink, scored, dipipanone hydrochloride 10 mg, cyclazine hydrochloride 30 mg. Net price 50-tab pack = £8.70. Label: 2

**Dose** acute pain, 1 tablet gradually increased to 3 tablets every 6 hours; CHILD not recommended

**Caution** Not recommended in palliative care, see Nausea and Vomiting, p. 18

**FENTANYL**

**Indications** see under preparations; parenteral indications (section 15.1.4.3)

**Cautions** see notes above; also diabetes mellitus, impaired consciousness, cerebral tumour; iontophoretic transdermal system, impaired hearing, chest or abdominal surgery, remove before magnetic resonance imaging (MRI), cardioversion or diathermy

**Fever or external heat** Monitor patients using patches for increased side-effects if fever present (increased absorption possible); avoid exposing application site to external heat (may also increase absorption)

**Transdermal fentanyl** Risk of fatal respiratory depression, particularly in patients not previously treated with a strong opioid analgesic; manufacturer recommends use only in opioid tolerant patients

**Contra-indications** see notes above

**Side-effects** see notes above; also abdominal pain, anorexia, dyspepsia, dysphagia, mouth ulceration, taste disturbance, dry mouth; vasodilatation; apnoea; anxiety; myoclonus; less commonly flatulence, diarrhoea, laryngospasm, dysphonia, hypoventilation, depersonalisation, dysarthria, amnesia, incoordin-
Fentanyl

Dose

- See under preparations
- Conversion (from oral morphine to transdermal fentanyl) see Prescribing in Palliative Care, p. 16

Tablets

Abstral® (ProStrakan) ▼ TC

Fentanyl (as citrate) 100 micrograms, net price 3 = £18.85; 30 micrograms/hour for 72 hours), 5 = £50.32; ‘75’ patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £70.15; ‘100’ patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £88.32. Label: 2

Dose

- breakthrough dose for each pain episode); adjust dose according to
- chronic cancer pain, initially 200 micrograms (over 15 minutes)
- ADULT over 18 years, initially 100 micrograms repeated if necessary after 15–30 minutes; adjust dose according to
- dose units for each pain episode); adjust dose according to
- seizures; shock, astyole, pyrexia, ataxia, and muscle
- fentanyl (as citrate) 100 micrograms, net price 4.7.2 Opioid analgesics 237

Actiq
Abstral

£49.99, 30-tab pack = £149.70; 400 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70: 300 micrograms, 10-tab pack = £49.99, 30-tab pack = £149.70: 600 micrograms, 30-tab pack = £149.70. Label: 2, 26

Note

- may take up to 25 hours for the plasma-fentanyl concentration to decrease by 50%—replacement opioid therapy should be initiated at a low dose and increased gradually.

Long duration of action

- in view of the long duration of action, patients who have had severe side-effects should be monitored for up to 24 hours after patch removal

Durogesic DTrans® (Janssen-Cilag) ▼ TC

Patches, self-adhesive, transparent, fentanyl, ‘12’ patch (releasing approx. 12 micrograms/hour for 72 hours), net price 5 = £18.85; ‘25’ patch (releasing approx. 25 micrograms/hour for 72 hours), 5 = £26.94; ‘50’ patch (releasing approx. 50 micrograms/hour for 72 hours), 5 = £50.32; ‘75’ patch (releasing approx. 75 micrograms/hour for 72 hours), 5 = £70.15; ‘100’ patch (releasing approx. 100 micrograms/hour for 72 hours), 5 = £88.32. Label: 2

Dose

- chronic intractable pain, apply to dry, non-irritated, non-
- rash, erythema, and itching reported
- dermatitis, and itching reported

Patches

Prescriptions

- to avoid confusion)—consider additional or alternative

Fentanyl

Dose

- severe chronic pain, apply to dry, non-irritated, non-
- and itching reported

Dose adjustment

- in view of the long duration of action, patients who have had severe side-effects should be monitored for up to 24 hours after patch removal

Iontophoretic transdermal system

IONSYS® is a needle-free patient-controlled device that consists of an electronic controller and 2 hydrogel reservoirs, one of which contains fentanyl.

IONSYS® (Janssen-Cilag) ▼ TC

Iontophoretic transdermal system, self-adhesive, fentanyl 40 micrograms/dose, net price 1 unit (80 doses) = £62.00 (hosp. only). Label: 2

Dose

- acute moderate to severe post-

Note

- Titrate analgesic requirement before starting treatment with IONSYS®. Patient and healthcare professional should be familiar with IONSYS® operating system (consult product literature)
**4 Central nervous system**

**Indications**
- Severe pain in cancer

**Cautions**
- See notes above; also paralytic ileus, seizures, asthena, agitation, and myoclonus

**Contra-indications**
- See notes above; also myocardial infarction, severe cor pulmonale

**Side-effects**
- See notes above; also pancreatitis, cardiac arrhythmias, severe cor pulmonale

**METHADONE HYDROCHLORIDE**

**Indications**
- Severe pain, see notes above; cough in terminal disease (section 3.9.1); adjunct in treatment of opioid dependence (section 4.10)

**Cautions**
- See notes above; also history of cardiac conduction abnormalities, family history of sudden death (ECG monitoring recommended; see also QT Interval Prolongation, below)

**Contra-indications**
- See notes above; also phaeochromocytoma

**Side-effects**
- See notes above; also QT interval prolongation, torsade de pointes, hypothermia, restlessness, raised intracranial pressure, dysmenorrhoea, dry eyes, and hyperprolactinaemia

**Dose**
- **By mouth or by subcutaneous or intramuscular injection**
  - 5–10 mg every 6–8 hours, adjusted according to response; on prolonged use not to be given more frequently than every 12 hours; **CHILD** not recommended

**Methadone (Non-proprietary)**

- **Tablets**
  - Methadone hydrochloride 5 mg. Net price 50 = £2.97. Label: 2

- **Injection**
  - Methadone hydrochloride, 10 mg/mL, net price 1-mL amp = 93p; 2-mL amp = £1.61; 3.5-mL amp = £1.98; 5-mL amp = £2.14

**Linclus**

- Section 3.9.1

**Oral solution and oral concentrate**

- Section 4.10

**MORPHINE SALTS**

**Indications**
- See notes above and under Dose; acute diarrhoea (section 1.4.2); cough in terminal care (section 3.9.1)

**Cautions**
- See notes above; also pancreatitis, cardiac arrhythmias, severe cor pulmonale

**Contra-indications**
- See notes above; also delayed gastric emptying, acute abdomen; heart failure secondary to chronic lung disease; phaeochromocytoma

**Side-effects**
- See notes above; also paralytic ileus, abdominal pain, anorexia, dyspepsia, exacerbation of pancreatitis, taste disturbance, hypertension, hypothermia, syncope, bronchospasm, inhibition of cough reflex, restlessness, seizures, paraesthesia, asthenia, malaise, disorientation, excitation, agitation, delirium, raised intracranial pressure, amenorrhoea, myoclonus, muscle fasciculation, and rhabdomyolysis

**Dose**
- The patient should be closely monitored for pain relief as well as for side-effects especially respiratory depression. See also notes above.

- **Acute pain, by subcutaneous injection (not suitable for oedematous patients) or by intramuscular injection**, initially 10 mg (ELDERLY or frail 5 mg) every 4 hours (or more frequently during titration), adjusted according to response; **NEONATE** initially 100 micrograms/kg every 6 hours, adjusted according to response; **CHILD** 1–6 months initially 100–200 micrograms/kg every 6 hours, adjusted according to response; **CHILD** 6 months–2 years
initially 100–200 micrograms/kg every 4 hours, adjusted according to response; CHILD 2–12 years initially 200 micrograms/kg every 4 hours, adjusted according to response; CHILD 12–18 years initially 2.5–10 mg every 4 hours, adjusted according to response

By slow intravenous injection, initially 2.5 mg (reduce dose in ELDERLY or frail) every 4 hours (or more frequently during titration), adjusted according to response; NEONATE initially 40–100 micrograms/kg every 6 hours, adjusted according to response; CHILD 1–6 months initially 100–200 micrograms/kg every 6 hours, adjusted according to response; CHILD 6 months–12 years initially 100–200 micrograms/kg every 4 hours, adjusted according to response

• Premedication, by subcutaneous or intramuscular injection, up to 10 mg 60–90 minutes before operation; CHILD, by intramuscular injection, 150 micrograms/kg

• Patient controlled analgesia (PCA), consult hospital protocols

• Myocardial infarction, by slow intravenous injection (2 mg/minute), 10 mg followed by a further 5–10 mg if necessary; ELDERLY or frail patients, reduce dose by half

• Acute pulmonary oedema, by slow intravenous injection (2 mg/minute) 5–10 mg; ELDERLY or frail patients, reduce dose by half

• Chronic pain, by mouth or by subcutaneous injection (not suitable for oedematous patients) or by intramuscular injection, initially 5–20 mg every 4 hours, adjusted according to response; see also Prescribing in Palliative Care, p. 15

By rectum, initially 15–30 mg every 4 hours, adjusted according to response

Note The doses stated above refer equally to morphine hydrochloride and sulphate

Oral solutions

Note For advice on transfer from oral solutions of morphine to modified-release preparations of morphine, see Prescribing in Palliative Care, p. 15

Morphine Oral Solutions

Oral solutions of morphine can be prescribed by writing the formula: Morphine hydrochloride 5 mg Chloroform water to 5 mL

Note The proportion of morphine hydrochloride may be altered when specified by the prescriber; if above 15 mg per 5 mL, the solution becomes a controlled drug. For example prescribing see Controlled Drugs and Drug Dependence, p. 7. It is usual to adjust the strength so that the dose volume is 5 or 10 mL.

Oramorph® (Boehringer Ingelheim) Oramorph® oral solution (PML), morphine sulphate 10 mg/5 mL. Net price 100-mL pack = £1.87; 300-mL pack = £5.21; 500-mL pack = £7.86. Label: 2

Oramorph® concentrated oral solution (BM), sugar-free, morphine sulphate 100 mg/5 mL. Net price 30-mL pack = £5.24; 120-mL pack = £19.57 (both with calibrated dropper). Label: 2

Tablets

Sevedrol® (Napp) Tablets, f/c, scored, morphine sulphate 10 mg (blue), net price 56-tab pack = £5.61; 20 mg (pink), 56-tab pack = £11.21; 50 mg (pale green), 56-tab pack = £28.02. Label: 2

Modiﬁed-release 12-hourly oral preparations

Morphgesic® SR (Amdipharm) Tablets, m/r, f/c, morphine sulphate 10 mg (buff), net price 60-tab pack = £4.09; 30 mg (violet), 60-tab pack = £9.81; 60 mg (orange), 60-tab pack = £19.15; 100 mg (grey), 60-tab pack = £30.30. Label: 2, 25

Dose every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Note Prescriptions must also specify ‘tablets’ (i.e. Morphgesic SR tablets)

MST Continus® (Napp) Tablets, m/r, f/c, morphine sulphate 5 mg (white), net price 60-tab pack = £3.29; 10 mg (brown), 60-tab pack = £5.48; 15 mg (green), 60-tab pack = £9.61; 30 mg (purple), 60-tab pack = £13.17; 60 mg (orange), 60-tab pack = £25.69; 100 mg (grey), 60-tab pack = £40.66; 200 mg (green), 60-tab pack = £81.34. Label: 2, 25

Suspension (= sachet of granules to mix with water), m/r, pink, morphine sulphate 20 mg/sachet, net price 30-sachet pack = £24.58; 30 mg/sachet, 30-sachet pack = £25.54; 60 mg/sachet, 30-sachet pack = £51.09; 100 mg/sachet, 30-sachet pack = £85.15; 200 mg/sachet pack, 30-sachet pack = £170.30. Label: 2, 13

Dose every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Note Prescriptions must also specify ‘tablets’ or ‘suspension’ (i.e. ‘MST Continus tablets’ or ‘MST Continus suspension’)

Zomorph® (Link) Capsules, m/r, morphine sulphate 10 mg (yellow/clear enclosing pale yellow pellets), net price 60-cap pack = £4.08; 30 mg (pink/clear enclosing pale yellow pellets), 60-cap pack = £9.77; 60 mg (orange/clear enclosing pale yellow pellets), 60-cap pack = £19.06; 100 mg (white/clear enclosing pale yellow pellets), 60-cap pack = £30.18; 200 mg (clear enclosing pale yellow pellets), 60-cap pack = £60.35. Label: 2, counselling, see below

Dose every 12 hours, dose adjusted according to daily morphine requirements; for further advice on determining doses, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Note Prescriptions must also specify ‘capsules’ (i.e. ‘Zomorph capsules’)

Modiﬁed-release 24-hourly oral preparations

MXL® (Napp) Capsules, m/r, morphine sulphate 30 mg (light blue), net price 28-cap pack = £10.91; 60 mg (brown), 28-cap pack = £14.95; 90 mg (pink), 28-cap pack = £22.04; 120 mg (green), 28-cap pack = £29.15; 150 mg (blue), 28-cap pack = £36.43; 200 mg (red/brown), 28-cap pack = £46.15. Label: 2, counselling, see below

Dose every 24 hours, dose adjusted according to daily morphine requirements; for further advice on determining dose, see Prescribing in Palliative Care, p. 15; dosage requirements should be reviewed if the brand is altered

Counselling Swallow whole or open capsule and sprinkle contents on soft food

Note Prescriptions must also specify ‘capsules’ (i.e. ‘MXL capsules’)
4 Central nervous system

---

**Suppositories**

**Morphine** (Non-proprietary)

Suppositories, morphine hydrochloride or sulphate

10 mg, net price 12 = £8.69; 15 mg, 12 = £7.50; 20 mg, 12 = £33.22; 30 mg, 12 = £10.90. Label: 2

Available from Aurum, Martindale

Note Both the strength of the suppositories and the morphine salt contained in them must be specified by the prescriber

---

**Injections**

**Morphine Sulphate** (Non-proprietary)

Injection, morphine sulphate 10, 15, 20, and 30 mg/mL, net price 1- and 2-mL amp (all) = £72p–£1.40; 10 mg/mL, 1-mL prefilled syringe = £5.00

Intravenous infusion, morphine sulphate 1 mg/mL, net price 50 mL vial = £5.00; 2 mg/mL, 50-mL vial = £5.89

Minijet® Morphine Sulphate (UCB Pharma)

Injection, morphine sulphate 1 mg/mL, net price 10-mL disposable syringe = £7.58

---

**Injection with antiemetic**

Caution In myocardial infarction cyclizine may aggravate severe heart failure and counteract the haemodynamic benefits of opioids, section 4.6. Not recommended in palliative care, see Nausea and Vomiting, p. 17

---

**Cyclimorph®** (Amidpharm)

Cyclimorph-10® Injection, morphine tartrate 10 mg, cyclazine tartrate 50 mg/mL. Net price 1-mL amp = £1.34

Dose ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more often than every 4 hours; max. 3 doses in any 24-hour period

Cyclimorph-15® Injection, morphine tartrate 15 mg, cyclazine tartrate 50 mg/mL. Net price 1-mL amp = £1.39

Dose ADULT and CHILD over 12 years, moderate to severe pain (short-term use only) by subcutaneous, intramuscular, or intravenous injection, 1 mL, repeated not more often than every 4 hours; max. 3 doses in any 24-hour period

---

**OXYCODONE HYDROCHLORIDE**

**Indications** moderate to severe pain in patients with cancer; postoperative pain; severe pain

**Caution** see notes above; also toxic psychosis; pancreatitis

**Contra-indications** see notes above; also acute abdomen; delayed gastric emptying; chronic constipation; cor pulmonale; acute porphyria (section 9.8.2)

**Side-effects** see notes above; also diarrhoea, abdominal pain, anorexia, dyspepsia; bronchospasm, dysphonia, impaired cough reflex; asthma, anxiety, chills; muscle fasciculation; less commonly paralytic ileus, gastritis, flatulence, dyspepsia, taste disturbance, belching, hiccups, vasodilatation, supraventricular tachycardia, syncope, amenoria, hypoesthesia, restlessless, seizures, pyrexia, amenorrhoea, hypotonia, paraesthesia, disorders of taste, agitation, speech disorder, tremor, and dry skin

**Dose**

- By mouth, initially 5 mg every 4–6 hours, increased if necessary according to severity of pain, usual max. 400 mg daily, but some patients may require higher doses; CHILD under 18 years, see BNF for Children

- By slow intravenous injection, 1–10 mg every 4 hours when necessary; CHILD under 18 years, not recommended

- By intravenous infusion, initially 2 mg/hour, adjusted according to response; CHILD under 18 years not recommended

- By subcutaneous injection, initially 5 mg every 4 hours when necessary; CHILD under 18 years, not recommended

- By subcutaneous infusion, initially 7.5 mg/24 hours adjusted according to response; CHILD under 18 years, not recommended

- Patient controlled analgesia (PCA), consult hospital protocols

**Note** 2 mg oral oxycodone is approximately equivalent to 1 mg parenteral oxycodone

**OxyNorm®** (Napp)

**Capsules**, oxycodone hydrochloride 5 mg (orange/beige), net price 56-cap pack = £12.07; 10 mg (white/beige), 56-cap pack = £24.14; 20 mg (pink/beige), 56-cap pack = £48.27. Label: 2

**Liquid** (oral solution), sugar-free, oxycodone hydrochloride 5 mg/5 mL, net price 250 mL = £10.26. Label: 2

**Concentrate** (concentrated oral solution), sugar-free, oxycodone hydrochloride 10 mg/mL, net price 120 mL = £49.25. Label: 2

**Injection**, oxycodone hydrochloride 10 mg/mL, net price 1-mL amp = £1.60, 2-mL amp = £3.20

**Note** The Scottish Medicines Consortium has advised (October 2004) that OxyNorm injection is used only in patients with cancer who have difficulty in tolerating morphine or diamorphine

**Modified release**

**OxyContin®** (Napp)

**Tablets**, f/c, m/r, oxycodone hydrochloride 5 mg (blue), net price 28-tab pack = £13.23; 10 mg (white), 56-tab pack = £26.45; 20 mg (pink), 56-tab pack = £52.89; 40 mg (yellow), 56-tab pack = £105.80; 80 mg (green), 56-tab pack = £211.61. Label: 2

**Dose** initially 10 mg every 12 hours, increased if necessary according to severity of pain, usual max. 200 mg every 12 hours, but some patients may require higher doses; CHILD under 18 years, see BNF for Children

**PAPAVERETUM**

**Important** Do not confuse with papaverine (section 7.4.5)

A mixture of 253 parts of morphine hydrochloride, 23 parts of papaverine hydrochloride and 20 parts of codeine hydrochloride

The CSM has advised that to avoid confusion the figures of 7.7 mg/mL or 15.4 mg/mL should be used for prescribing purposes

**Indications** premedication; enhancement of anaesthesia (but see section 15.1.4.3); postoperative analgesia; severe chronic pain

**Caution** see notes above; supraventricular tachycardia

**Contra-indications** see notes above; heart failure secondary to chronic lung disease; phaeochromocytoma

**Side-effects** see notes above; also hypothermia

**Dose**

- By subcutaneous, intramuscular, or intravenous injection, 7.7–15.4 mg repeated every 4 hours if necessary (ELDERLY initially 7.7 mg); CHILD up to 1 month 115 micrograms/kg, 1–12 months 154 micro-
PENTAZOCINE

Indications moderate to severe pain, but see notes above

Cautions see notes above; also pancreatitis, arterial or pulmonary hypertension, cardiac arrhythmias, myocardial infarction, pheochromocytoma; effects only partially reversed by naloxone

Contra-indications see notes above; patients dependent on opioids (can precipitate withdrawal); heart failure secondary to chronic lung disease; acute porphyria (section 9.8.2)

Side-effects see notes above; also abdominal pain, hypertension, syncope, seizures, paraesthesia, tremor, raised intracranial pressure, disorientation, hypothermia, chills, blood disorders, myalgia, and toxic epidermal necrolysis

Dose
• By mouth, pentazocine hydrochloride 50 mg every 3–4 hours preferably after food (range 25–100 mg); max. 600 mg daily; CHILD 6–12 years 25 mg
• By subcutaneous, intramuscular, or intravenous injection, moderate pain, pentazocine 30 mg, severe pain 45–60 mg every 3–4 hours when necessary; CHILD over 1 year, by subcutaneous or intramuscular injection, up to 1 mg/kg, by intravenous injection up to 500 micrograms/kg
• By rectum in suppositories, pentazocine 50 mg up to 4 times daily; CHILD not recommended

Pentazocine (Non-proprietary) Capsules, pentazocine hydrochloride 50 mg. Net price 28-cap pack = £1.57. Label: 2, 21
Brands include Fortral

Tablets, pentazocine hydrochloride 25 mg. Net price 28-tab pack = £0.83. Label: 2, 21
Brands include Fortral

Injection, pentazocine 30 mg (as lactate)/mL. Net price 1-mL amp = £1.67; 2-mL amp = £3.21
Brands include Fortral

PETRIDINE HYDROCHLORIDE

Indications moderate to severe pain, obstetric analgesia; peri-operative analgesia

Cautions see notes above; not suitable for severe continuing pain; accumulation of metabolites may result in neurotoxicity; cardiac arrhythmias, severe cor pulmonale

Contra-indications see notes above; pheochromocytoma

Side-effects see notes above; also restlessness and hypothermia; convulsions reported in overdosage

Dose
• Acute pain, by mouth, 50–150 mg every 4 hours; CHILD 0.5–2 mg/kg
• By subcutaneous or intramuscular injection, 25–100 mg, repeated after 4 hours; CHILD, by intramuscular injection, 0.5–2 mg/kg
• By slow intravenous injection, 25–50 mg, repeated after 4 hours
• Obstetric analgesia, by subcutaneous or intramuscular injection, 50–100 mg, repeated 1–3 hours later if necessary; max. 400 mg in 24 hours
• Premedication, by intramuscular injection, 25–100 mg 1 hour before operation; CHILD 0.5–2 mg/kg
• Postoperative pain, by subcutaneous or intramuscular injection, 25–100 mg, every 2–3 hours if necessary; CHILD, by intramuscular injection, 0.5–2 mg/kg

Note In the postoperative period, the patient should be closely monitored for pain relief as well as for side-effects especially respiratory depression

Pethidine (Non-proprietary) Tablets, pethidine hydrochloride 50 mg, net price 20 = £2.07. Label: 2

Injection, pethidine hydrochloride 50 mg/mL, net price 1-mL amp = 53p, 2-mL amp = 56p; 10 mg/mL, 5-mL amp = £3.17, 10-mL amp = £2.18

Pamergan P100® (Martindale) Injection, pethidine hydrochloride 50 mg, promethazine hydrochloride 25 mg/mL. Net price 2-mL amp = £1.44

Dose by intramuscular injection, premedication, 2 mL 60–90 minutes before operation; CHILD 6–12 years 0.75 mL, 13–16 years 1 mL

Obstetric analgesia, 1–2 mL every 4 hours if necessary

Severe pain, 1–2 mL every 4–6 hours if necessary

Note Although usually given intramuscularly, may be given intravenously after dilution to at least 10 mL with water for injections

TRAMADOL HYDROCHLORIDE

Indications moderate to severe pain

Cautions see notes above; impaired consciousness; excessive bronchial secretions; not suitable as a substitute in opioid-dependent patients

General anaesthesia Not recommended for anaesthesia during potentially light planes of general anaesthesia (possibly increased intra-operative recall reported)

Contra-indications see notes above; uncontrolled epilepsy; acute porphyria (section 9.8.2)

Side-effects see notes above; also diarrhoea; fatigue; less commonly retching, gastritis, and flatulence; rarely anorexia, syncope, hypertension, bronchospasm, dysphoria, wheezing, seizures, paraesthesia, and muscle weakness; blood disorders also reported

Dose
• ADULT and CHILD over 12 years, by mouth, 50–100 mg not more often than every 4 hours; total of more than 400 mg daily not usually required
• ADULT and CHILD over 12 years, by intramuscular injection or by intravenous injection (over 2–3
4.7.3 Neuropathic pain

Neuropathic pain, which occurs as a result of damage to neural tissue, includes postherpetic neuralgia (see below), phantom limb pain, complex regional pain syndrome (reflex sympathetic dystrophy, causalgia) compression neuropathies, peripheral neuropathies (e.g. due to diabetes, haematological malignancies, rheumatoid arthritis, alcoholism, drug misuse), trauma, central pain (e.g. pain

---

**Tramadol Hydrochloride**

- **Capsules**, tramadol hydrochloride 50 mg, net price 30-cap pack = £1.15; 100-cap pack = £2.21. Label: 2
- **Brands** include **Tramake**
- **Injection**, tramadol hydrochloride 50 mg/mL. Net price 2-mL amp = £1.15

**Tramadol (Meda)**

- **Capsules**, tramadol hydrochloride 50 mg, net price 100-cap pack = £8.00. Label: 2
- **Orodispersible tablets** (**Zamadol Melt®**), tramadol hydrochloride 50 mg, net price 60-tab pack = £7.12. Label: 2, counselling, administration
- **Excipients** include aspartame (section 9.4.1)
- **Counselling** **Zamadol Melt** should be sucked and then swallowed. May also be dispersed in water
- **Injection**, tramadol hydrochloride 50 mg/mL. Net price 2-mL amp = £1.10

**Modified release**

**Dromadol SR** (**IVAX**)**

- **Tablets**, m/r, tramadol hydrochloride 100 mg (white), net price 60-tab pack = £12.78; 150 mg (beige), 60-tab pack = £19.17; 200 mg (orange), 60-tab pack = £25.56. Label: 2, 25
- **Dose** _ADULT and CHILD_ over 12 years, initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

**Larapam SR** (**Sandoz**)**

- **Tablets**, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.25; 150 mg, 60-tab pack = £27.35; 200 mg, 60-tab pack = £36.50. Label: 2, 25
- **Dose** _ADULT and CHILD_ over 12 years, initially 100 mg twice daily increased if necessary; usual max. 200 mg twice daily

**Mabron®** (**Morningside**)**

- **Tablets**, m/r, tramadol hydrochloride 100 mg, net price 60-tab pack = £18.26; 150 mg, 60-tab pack = £27.39; 200 mg, 60-tab pack = £36.52. Label: 2, 25
- **Dose** _ADULT and CHILD_ over 12 years, 100 mg twice daily increased if necessary; max. 200 mg twice daily

**Maxitram SR®** (**Trinity-Chiesi**)**

- **Capsules**, m/r, tramadol hydrochloride 50 mg (white), net price 60-cap pack = £6.48; 100 mg (yellow), 60-cap pack = £12.14; 150 mg (yellow), 60-cap pack = £18.21; 200 mg (yellow), 60-cap pack = £24.28. Label: 2, 25
- **Dose** _ADULT and CHILD_ over 12 years, 100–200 mg twice daily, total of more than 400 mg daily not usually required
following stroke, spinal cord injury and syringomyelia) and idiopathic neuropathy. The pain occurs in an area of sensory deficit and may be described as burning, shooting or scalding and is often accompanied by pain that is evoked by a non-noxious stimulus (allodynia).

Trigeminal neuralgia is also caused by dysfunction of neural tissue, but its management (see below) is distinct from other forms of neuropathic pain.

Neuropathic pain is generally managed with a tricyclic antidepressant and certain antiepileptic drugs. Neuropathic pain may respond only partially to opioid analgesics. Of the opioids, methadone, tramadol, and oxycodeone are probably the most effective for neuropathic pain and they may be considered when other measures fail. Nerve blocks, transcutaneous electrical nerve stimulation (TENS) and, in selected cases, central electrical stimulation may help. Many patients with chronic neuropathic pain require multidisciplinary management, including physiotherapy and psychological support.

Gabapentin (p. 252) and pregabalin (p. 253) are effective for the treatment of neuropathic pain. Amitriptyline (p. 208) is also prescribed frequently (unlicensed indication); nortriptyline (unlicensed indication) (p. 210) may be better tolerated than amitriptyline.

Capsaicin (section 10.3.2) is licensed for neuropathic pain (but the intense burning sensation during initial treatment may limit use). Ketamine (section 15.1.1), an NMDA antagonist, or lidocaine (lignocaine) by intravenous infusion may also be useful in some forms of neuropathic pain (both unlicensed indication; specialist use only).

A corticosteroid may help to relieve pressure in compression neuropathy and thereby reduce pain. The management of trigeminal neuralgia and postherpetic neuralgia are outlined below; for the management of neuropathic pain in palliative care see p. 16; for the management of diabetic neuropathy, see section 6.1.5.

**Trigeminal neuralgia**

Surgery may be the treatment of choice in many patients; a neurological assessment will identify those who stand to benefit. Carbamazepine (section 4.8.1) taken during the acute stages of trigeminal neuralgia, reduces the frequency and severity of attacks. It is very effective for the severe pain associated with trigeminal neuralgia and (less commonly) glossopharyngeal neuralgia. Blood counts and electrolytes should be monitored when high doses are given. Small doses should be used initially to reduce the incidence of side-effects e.g. dizziness. Oxcarbazepine [unlicensed indication] is an alternative to carbamazepine. Lamotrigine [unlicensed indication] and gabapentin are also used in trigeminal neuralgia. Some cases respond to phenytoin (section 4.8.1); the drug may be given by intravenous infusion (possibly as fosphenytoin) in a crisis (specialist use only).

**Postherpetic neuralgia**

Postherpetic neuralgia can follow acute herpes zoster infection (shingles), particularly in the elderly. If amitriptyline [unlicensed indication] fails to manage the pain adequately, gabapentin may improve control. A topical analgesic preparation containing capsaicin 0.075% (section 10.3.2) is licensed for use in postherpetic neuralgia. Application of topical local anaesthetic preparations such as lidocaine medicated plasters (section 15.2) may be helpful in some patients.

**Chronic facial pain**

Chronic oral and facial pain including persistent idiopathic facial pain (also termed ‘atypical facial pain’) and temporomandibular dysfunction (previously termed temporomandibular joint pain dysfunction syndrome) may call for prolonged use of analgesics or for other drugs. Tricyclic antidepressants (section 4.3.1) may be useful for facial pain [unlicensed indication], but are not on the Dental Practitioners’ List. Disorders of this type require specialist referral and psychological support to accompany drug treatment. Patients on long-term therapy need to be monitored both for progress and for side-effects.

**Central nervous system**

**4.7.4 Antimigraine drugs**

**4.7.4.1 Treatment of acute migraine**

**4.7.4.2 Prophylaxis of migraine**

**4.7.4.3 Cluster headache**

Treatment of a migraine attack should be guided by response to previous treatment and the severity of the attacks. A simple analgesic such as aspirin, paracetamol (preferably in a soluble or dispersible form) or a NSAID is often effective; concomitant antimetoc treatment may be required. If treatment with an analgesic is inadequate, an attack may be treated with a specific antimigraine compound such as a 5HT agonist (‘trip-tan’). Ergot alkaloids are rarely required now, oral and rectal preparations are associated with many side-effects and they should be avoided in cerebrovascular or cardiovascular disease.

Excessive use of acute treatments for migraine (opioid and non-opioid analgesics, 5HT agonists, and ergotamine) is associated with medication-overuse headache (analgesic-induced headache); therefore, increasing consumption of these medicines needs careful management.

**Analgesics**

Most migraine headaches respond to analgesics such as aspirin or paracetamol (section 4.7.1) but because peristalsis is often reduced during migraine attacks the medication may not be sufficiently well absorbed to be effective; dispersible or effervescent preparations are therefore preferred.

The NSAID tolfenamic acid is licensed specifically for the treatment of an acute attack of migraine; diclofenac potassium, flurbiprofen, ibuprofen, and naproxen sodium (section 10.1.1) are also licensed for use in migraine.
4.7.4 Antimigraine drugs

**ANALGESICS**

- **Aspirin**
  Section 4.7.1
- **Paracetamol**
  Section 4.7.1
- **Non-steroidal anti-inflammatory drugs (NSAIDs)**
  Section 10.1.1

**With antiemetics**

- **Migraleve** (McNeil)
  Tablets, all 1/2 c, pink tablets, buclizine hydrochloride 6.25 mg, paracetamol 500 mg, codeine phosphate 8 mg; yellow tablets, paracetamol 500 mg, codeine phosphate 8 mg. Yellow price 48-tab Migraleve (32 pink + 16 yellow) = £5.10; 48 pink (Migraleve Pink) = £5.56; 48 yellow (Migraleve Yellow) = £4.70. Label: 2, (Migraleve Pink), 17, 30

- **MigraMax** (Zeneus)
  Tablets, 12.5 mg, net price 3-tab pack = £9.07; 6-tab pack = £18.14; 9-tab pack = £27.20. Label: 3

- **Paramax** (Sanofi-Synthelabo)
  Tablets, scored, paracetamol 500 mg, metoclopramide hydrochloride 5 mg. Net price 42-tab pack = £8.03. Label: 17, 30

**TOLFENAMIC ACID**

**Indications** treatment of acute migraine

**Cautions** see NSAIDs, section 10.1.1

**Contra-indications** see NSAIDs, section 10.1.1

**Side-effects** see NSAIDs, section 10.1.1; also dysuria

**Dose**

- **ADULT** over 18 years, 200 mg at onset repeated once after 1–2 hours if necessary

- **Clotam Rapid** (Galen)
  Tablets, tolafenamic acid 200 mg. Net price 10-tab pack = £15.00. Label: 21

**5HT1 agonists**

A 5HT agonist is of considerable value in the treatment of an acute migraine attack. The 5HT agonists (‘triptans’) act on the 5HT (serotonin) 1B/1D receptors and they are therefore sometimes referred to as 5HT receptor agonists. A 5HT agonist may be used during the established headache phase of an attack and is the preferred treatment in those who fail to respond to conventional analgesics.

The 5HT agonists available for treating migraine are almotriptan, eletriptan, frovatriptan, naratriptan, rizatriptan, sumatriptan, and zolmitriptan. Sumatriptan is also of value in cluster headache (section 4.7.4.3).

**Cautions** 5HT agonists should be used with caution in conditions which predispose to coronary artery disease (pre-existing cardiac disease, see Contra-indications below); hepatic impairment (see Appendix 2); pregnancy (see Appendix 4) and breast-feeding (see Appendix 5). 5HT agonists are recommended as mono-therapy and should not be taken concurrently with other therapies for acute migraine; see also interactions: Appendix 1 (5HT agonists). Little information is available on the use of these drugs in the elderly (over 65 years).

**Contra-indications** 5HT agonists are contra-indicated in ischaemic heart disease, previous myocardial infarction, coronary vasospasm (including Prinzmetal’s angina), and uncontrolled or severe hypertension.

**Side-effects** Side-effects of the 5HT agonists include sensations of tingling, heat, heaviness, pressure, or tightness of any part of the body (including throat and chest—discontinue if intense, may be due to coronary vasoconstriction or to anaphylaxis; see also CSM advice under Sumatriptan); flushing, dizziness, feeling of weakness; fatigue; nausea and vomiting also reported.

**ALMOTRIPTAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT agonists above; sensitivity to sulphonamides; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); inter- actions: Appendix 1 (5HT agonists)

**Contra-indications** see under 5HT agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

**Side-effects** see under 5HT agonists above; also transient increase in blood pressure, drowsiness; less commonly diarrhoea, dyspepsia, dry mouth, chest pain, palpitation, paraesthesia, headache, myalgia, bone pain, tinnitus; very rarely myocardial infarction, and tachycardia

**Dose**

- 12.5 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 25 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

- **Almogran** (Organon)
  Tablets, 1/2 c, almogran (as hydrogen maleate) 12.5 mg, net price 3-tab pack = £9.07; 6-tab pack = £18.14; 9-tab pack = £27.20. Label: 3
**ELETRIPTAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT agonists above; renal impairment (avoid if severe—Appendix 3); interactions: Appendix 1 (5HT agonists)

**Contra-indications** see under 5HT agonists above; previous cerebrovascular accident or transient ischaemic attack; arrhythmias; heart failure; peripheral vascular disease; severe hepatic impairment

**Side-effects** see under 5HT agonists above; also abdominal pain, dry mouth, dyspepsia; tachycardia, palpitation; drowsiness, headache; pharyngitis, rhinitis, chills; myasthenia, myalgia; sweating; less commonly diarrhoea, glossitis, thirst, anorexia, taste disturbance; dyspnoea, yawning, oedema, agitation, confusion, euphoria, depression, insomnia, depersonalisation, tremor, dysarthria, stupor, movement disorders, hypertonia, urinary frequency, arthralgia, photophobia, visual disturbances, tinnitus, rash, and pruritus; rarely constipation, oesophagitis, bradyarrhythmias, asthma, syncope, lymphadenopathy, and menorrhagia; ischaemic colitis and hypertension also reported

**Dose**

- **ADULT** over 18 years, 40 mg repeated after 2 hours if migraine recurs (patient not responding to initial dose should not take second dose for same attack); increase to 80 mg for subsequent attacks if 40-mg dose inadequate; max. 80 mg in 24 hours

*Relpax* (Pfizer) ▼

Tablets, f/c, orange, eletriptan (as hydrobromide)

20 mg, net price 6-tab pack = £22.50; 40 mg, 6-tab pack = £22.50. Label: 3

**NARATRIPTAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT agonists above; sensitivity to sulphonamides; renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3); interactions: Appendix 1 (5HT agonists)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see under 5HT agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

**Side-effects** see under 5HT agonists above; also less commonly bradyarrhythmias, tachycardia, palpitation, and visual disturbance; rarely ischaemic colitis

**Dose**

- 2.5 mg, repeated after at least 4 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 5 mg in 24 hours; **CHILD** and **ADOLESCENT** under 18 years not recommended

*Naramig*® (GSK)

Tablets, f/c, green, naratriptan (as hydrochloride)

2.5 mg, net price 6-tab pack = £24.55, 12-tab pack = £49.10. Label: 3

**RIZATRIPTAN**

**Indications** treatment of acute migraine

**Cautions** see under 5HT agonists above; renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3); interactions: Appendix 1 (5HT agonists)

**Driving** Drowsiness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** see under 5HT agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease

**Side-effects** see under 5HT agonists above; drowsiness, palpitation, tachycardia, dry mouth, diarrhoea, dyspepsia, thirst, pharyngeal discomfort, dyspnoea, headache, paraesthesia, decreased alertness, insomnia, tremor, ataxia, nervousness, vertigo, confusion, myalgia and muscle weakness, sweating, urticaria, pruritus, blurred vision; rarely syncope, hypertension; hypersensitivity reactions (including rash, angioedema, and toxic epidermal necrolysis) and taste disturbance reported

**Dose**

- 10 mg as soon as possible after onset repeated after 2 hours if migraine recurs (patient not responding should not take second dose for same attack); max. 20 mg in 24 hours; **CHILD** and **ADOLESCENT** under 18 years not recommended

*Maxalt*® (MSD)

Tablets, pink, rizatriptan (as benzoate) 5 mg, net price 6-tab pack = £26.74; 10 mg, 3-tab pack = £13.37, 6-tab pack = £26.74. Label: 3

Oral lyophilisate (*Maxalt*® Melt Wafers), rizatriptan (as benzoate) 10 mg, net price 3-wafer pack = £13.37.
4 Central nervous system

6-wafer pack = £26.74. Label: 3, counselling, administration. Counselling Melt wafers should be placed on the tongue and allowed to dissolve. Excipients include aspartame equivalent to phenylalanine 2.1 mg (section 9.4.1).

SUMATRIPTAN

Indications treatment of acute migraine; cluster headache (subcutaneous injection only)

Cautions see under 5HT agonists above; history of seizures; renal impairment; sensitivity to sulphonamides; interactions: Appendix 1 (5HT agonists)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving)

Contra-indications see under 5HT agonists above; previous cerebrovascular accident or transient ischaemic attack; peripheral vascular disease; moderate and severe hypertension

Side-effects see under 5HT agonists above; also drowsiness, transient increase in blood pressure; very rarely ischaemic colitis, hypotension, bradycardia or tachycardia, palpitation, arrhythmias, myocardial infarction, Raynaud's syndrome, seizures, tremor, dystonia, nystagmus, and visual disturbances; erythema at injection site; nasal irritation and epistaxis with nasal spray

CSM advice Following reports of chest pain and tightness (coronary vasospastic/vasoconstrictive) CSM has emphasised that sumatriptan should not be used in ischaemic heart disease or Prinzmetal's angina, and that use with ergotamine should be avoided (see also Cautions).

Dose

- By mouth, 50 mg (some patients may require 100 mg); dose may be repeated after at least 2 hours if migraine recurs; max. 300 mg in 24 hours; CHILD and ADOLESCENT under 18 years, see BNF for Children

- By subcutaneous injection using auto-injector, 6 mg; dose may be repeated once after at least 1 hour if migraine recurs; max. 12 mg in 24 hours; CHILD and ADOLESCENT under 18 years not recommended

Important Not for intravenous injection which may cause coronary vasospasm and angina

- Intranasally, 10–20 mg (ADOLESCENT 12–17 years) into one nostril; dose may be repeated once after at least 2 hours if migraine recurs; max. 40 mg (ADOLESCENT 12–17 years 20 mg) in 24 hours

Note Patient not responding to initial dose should not take second dose for same attack

1 Sumatriptan (Non-proprietary) (Astrazeneca)

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £9.09; 100 mg, 6-tab pack = £13.77. Label: 3, 10, patient information leaflet

1 Sumatriptan 50 mg tablets can be sold to the public to treat previously diagnosed migraine; max. daily dose 100 mg

Imigran® (GSK) (Astrazeneca)

Tablets, sumatriptan (as succinate) 50 mg, net price 6-tab pack = £27.62, 12-tab pack = £52.48; 100 mg, 6-tab pack = £44.64, 12-tab pack = £89.28. Label: 3, 10, patient information leaflet

Injection, sumatriptan (as succinate) 12 mg/mL (= 6/0.5 mL syringe), net price, treatment pack (2 x 0.5 mL prefilled syringes and auto-injector) = £44.19; refill pack 2 x 0.5 mL prefilled cartridges = £42.05. Label: 3, 10, patient information leaflet

Nasal spray, sumatriptan 10 mg/0.1 mL actuation, net price 2 unit-dose spray device = £12.28; 20 mg/0.1 mL actuation, 2 unit-dose spray device = £12.28, 6 unit-dose spray device = £36.83. Label: 3, 10, patient information leaflet

Imigran® Radis (GSK)

Tablets, f/c, sumatriptan (as succinate) 50 mg (pink), net price 6-tab pack = £24.87, 12-tab pack = £49.77; 100 mg (white), 6-tab pack = £44.64, 12-tab pack = £89.28. Label: 3, 10, patient information leaflet

ZOLMITRIPTAN

Indications treatment of acute migraine

Cautions see under 5HT agonists above; should not be taken within 12 hours of any other 5HT agonist; interactions: Appendix 1 (5HT agonists)

Contra-indications see under 5HT agonists above; Wolff-Parkinson-White syndrome or arrhythmias associated with accessory cardiac conduction pathways; previous cerebrovascular accident or transient ischaemic attack

Side-effects see under 5HT agonists above; also dry mouth, drowsiness, paraesthesia, myalgia, muscle weakness; rarely palpitation, tachycardia, angioedema, headache, urticaria; very rarely abdominal pain, gastro-intestinal and splenic infarction, ischaemic colitis, angina, myocardial infarction, polyuria, transient increase in blood pressure; with nasal spray, taste disturbance and nasal discomfort

Dose

- By mouth, ADOLESCENT over 18 years, 2.5 mg repeated after not less than 2 hours if migraine persists or recurs (increase to 5 mg for subsequent attacks in patients not achieving satisfactory relief with 2.5-mg dose); max. 10 mg in 24 hours

- Intranasally, ADOLESCENT over 18 years, 5 mg (1 spray) into one nostril as soon as possible after onset repeated after not less than 2 hours if migraine persists or recurs; max. 10 mg in 24 hours

Zomig® (AstraZeneca)

Tablets, f/c, yellow, zolmitriptan 2.5 mg, net price 6-tab pack = £24.00, 12-tab pack = £48.00

Ordispersible tablets (Zomig Rapimelt®), zolmitriptan 2.5 mg, net price 6-tab pack = £24.00; 5 mg, 6-tab pack = £26.16 Counselling, administration

Counselling Zomig Rapimelt should be placed on the tongue, allowed to disperse and swallowed. Excipients include aspartame equivalent to phenylalanine 2.81 mg/tablet (section 9.4.1)

Nasal spray, zolmitriptan 5 mg/0.1 mL unit-dose spray device, net price 6 unit-dose sprays = £40.50

Ergotalkaloids

The value of ergotamine for migraine is limited by difficulties in absorption and by its side-effects, particularly nausea, vomiting, abdominal pain, and muscular cramps; it is best avoided. The recommended doses of ergotamine preparations should not be exceeded and treatment should not be repeated at intervals of less than 4 days.

To avoid habituation the frequency of administration of ergotamine should be limited to no more than twice a month. It should never be prescribed prophylactically but in the management of cluster headache a low dose (e.g. ergotamine 1 mg at night for 6 nights in 7) is
Antiemetics (section 4.6), such as metoclopramide or domperidone, or phenothiazine and antihistamine antiemetics, relieve the nausea associated with migraine attacks. Antiemetics may be given by intramuscular injection or rectally if vomiting is a problem. Metoclopramide and domperidone have added the advantage of promoting gastric emptying and normal peristalsis; a single dose should be given at the onset of symptoms. Oral analgesic preparations containing metoclopramide are a convenient alternative (important: for warnings relating to extrapyramidal effects of metoclopramide particularly in children and young adults, see p. 222).

### ERGOTAMINE TARTRATE

**Indications** treatment of acute migraine and migraine variants unresponsive to analgesics

**Cautions** risk of peripheral vasospasm (see below); elderly; dependence (see Ergot Alkaloids above); cardiac disease; anaemia; interaction: Appendix 1 (ergot alkaloids)

**Peripheral vasospasm** Warn patient to stop treatment immediately if numbness or tingling of extremities develops and to contact doctor.

**Contra-indications** peripheral vascular disease, coronary heart disease, obliterator vascular disease and Raynaud’s syndrome, temporal arteritis, hepatic impairment (Appendix 2), renal impairment (Appendix 3), sepsis, severe or inadequately controlled hypertension, hyperthyroidism, pregnancy (Appendix 4), breast-feeding (Appendix 3), acute porphyria (section 9.8.2)

**Side-effects** abdominal pain, nausea, vomiting; dizzeness; less commonly diarrhoea, pain and weakness in extremities, cyanosis, peripheral vasoconstriction, paraesthesia, and hypoesthesia; rarely intestinal ischaemia, arrhythmias, increased blood pressure, dyspnoea, ergotism (including absence of pulse and numbness in extremities), myalgia, rash, and urticaria; very rarely myocardial ischaemia, myocardial infarction, heart-valve fibrosis, and gangrene; constipation, dry mouth, cerebral ischaemia, thrombosis, drowsiness, sleep disturbances, tremor, seizures, extrapyramidal effects, anxiety, depression, confusion, hallucinations, renal artery spasm, urinary retention, blood disorders, blurred vision, and arthralgia also reported; with suppositories rectal and anal ulcers on prolonged use

**Dose**

- See under preparations below

**Cafergot® (Alliance)**

<table>

<tbody>
<tr>
<td>Dose: 1 tablet at onset, followed after 30 minutes by ½–1 tablet, repeated every 30 minutes if necessary; max. 3 tablets in 24 hours, 4 tablets per attack, 6 tablets in one week (but see also notes above), CHILD not recommended</td>
</tr>
</tbody>
</table>

**ANTIEMETICS**

**Indications** prevention of vascular headache including classical migraine, common migraine, and cluster headache

**PIZOTIFEN**

**Indications** prevention of vascular headache including classical migraine, common migraine, and cluster headache

**4.7.4 Prophylaxis of migraine**

Where migraine attacks are frequent, possible provoking factors such as stress, irregular life-style (e.g. lack of sleep), or chemical triggers (e.g. alcohol and nitrates) should be sought; combined oral contraceptives may also provoke migraine, see section 7.3.1 for advice.

Preventive treatment for migraine should be considered for patients who:

- suffer at least two attacks a month;
- suffer an increasing frequency of headaches;
- suffer significant disability despite suitable treatment for migraine attacks;
- cannot take suitable treatment for migraine attacks.

Prophylaxis is also necessary in some rare migraine subtypes and those at risk of migraineous infarction.

The beta-blockers propranolol, metoprolol, nadolol, and timolol (section 2.4) are all effective. Propranolol is the most commonly used.

Pizotifen is an antihistamine and serotonin antagonist structurally related to the tricyclic antidepressants. It affords good prophylaxis but may cause weight gain. To avoid undue drowsiness treatment may be started at a low dose and gradually increased.

**Sodium valproate** (section 4.8.1) may be effective for migraine prophylaxis [unlicensed indication] in a starting dose of 300 mg twice daily, increased if necessary to 1.2 g daily in divided doses. **Valproic acid** (as semisodium valproate) (section 4.2.3) is similarly effective [unlicensed indication] in a starting dose of 250 mg twice daily, increased if necessary to 1 g daily in divided doses.

**Topiramate** (section 4.8.1) is effective for migraine prophylaxis. Treatment should be supervised by a specialist.

Tricyclic antidepressants (section 4.3.1) (e.g. amitriptyline) are also used for preventing migraine [unlicensed indication].

Cyproheptadine (section 3.4.1), an antihistamine with serotonin-antagonist and calcium channel-blocking properties, may also be tried in refractory cases.

Clonidine (Dixari®) is not recommended and may aggravate depression or produce insomnia. Methysergide, a semi-synthetic ergot alkaloid, has dangerous side-effects (retroperitoneal fibrosis and fibrosis of the heart valves and pleura); important: it should only be administered under hospital supervision.
Central nervous system

Cautions urinary retention; susceptibility to angle-closure glaucoma; renal impairment; pregnancy; breast-feeding (Appendix 5); interactions: Appendix 1 (pizotifen)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Side-effects antimuscarinic effects (very rarely angle-closure glaucoma), drowsiness, increased appetite and weight gain; occasionally nausea, dizziness, rarely anxiety, aggression, and depression; CNS stimulation may occur in children

Dose

- Initially 500 micrograms at night increased gradually to usual dose of 1.5 mg at night or in 3 divided doses; may be further increased up to max. daily dose 4.5 mg (but rarely necessary), max. single dose 3 mg; CHILD over 2 years, up to 1.5 mg daily in divided doses; max. single dose at night 1 mg

Pizotifen (Non-proprietary) [AU]
Tablets, pizotifen (as hydrogen maleate), 500 micrograms, net price 28-tab pack = £1.37; 1.5 mg, 28-tab pack = £2.75. Label: 2

Sanomigran® (Novartis) [AU]
Tablets, both ivory-yellow, s/c, pizotifen (as hydrogen maleate), 500 micrograms, net price 60-tab pack = £2.57; 1.5 mg, 28-tab pack = £4.28. Label: 2

Elixir, pizotifen (as hydrogen maleate) 250 micrograms/5 mL, net price 300 mL = £4.51. Label: 2

Contra-indications renal, hepatic, pulmonary, and cardiovascular disease, severe hypertension, collagen disease, cellulitis, urinary-tract disorders, cachectic or septic conditions, pregnancy, breast-feeding

Side-effects nausea, vomiting, heartburn, abdominal discomfort, drowsiness, and dizziness occur frequently in initial treatment; mental and behavioural disturbances, insomnia, oedema, weight gain, rashes, loss of scalp hair, cramps, arterial spasm (including coronary artery spasm with angina and possible myocardial infarction), paraesthesias of extremities, postural hypotension, and tachycardia also occur; retroperitoneal and other abnormal fibrotic reactions may occur on prolonged administration, requiring immediate withdrawal of treatment

Dose

- Initially 1 mg at bedtime, increased gradually over about 2 weeks to 1–2 mg 3 times daily with food (see notes above); CHILD not recommended

- Diarrhoea associated with carcinoid syndrome, usual range, 12–20 mg daily (hospital supervision); CHILD not recommended

Deseril® (Alliance) [AU]
Tablets, s/c, methysergide (as maleate) 1 mg, net price 60-tab pack = £13.46. Label: 2, 21

4.8 Antiepileptic drugs

4.8.1 Control of epilepsy

4.8.2 Drugs used in status epilepticus

4.8.3 Febrile convulsions

4.7.4.3 Cluster headache

Cluster headache rarely responds to standard analgesics. Sumatriptan given by subcutaneous injection is the drug of choice for the treatment of cluster headache. Alternatively, 100% oxygen at a rate of 7–12 litres/minute is useful in aborting an attack.

Prophylaxis of cluster headache is considered if the attacks are frequent, or last over 3 weeks, or if the attacks cannot be treated effectively. Verapamil or lithium [both unlicensed use] are used for prophylaxis. Ergotamine, used on an intermittent basis is an alternative for patients with short bouts, but it should not be used for prolonged periods. Methysergide is effective but must be used with extreme caution (section 4.7.4.2) and only if other drugs cannot be used or if they are not effective.

4.8 Antiepileptic drugs

The object of treatment is to prevent the occurrence of seizures by maintaining an effective dose of one or more antiepileptic drugs. Careful adjustment of doses is necessary, starting with low doses and increasing gradually until seizures are controlled or there are significant adverse effects.

When choosing an antiepileptic drug, the seizure type, concomitant medication, co-morbidity, age, and sex should be taken into account. For women of child-bearing age, see Pregnancy and Breast-feeding, p. 250.
The dose frequency is often determined by the plasma-drug half-life, and should be kept as low as possible to encourage adherence with the prescribed regimen. Most antiepileptics, when used in the usual dosage, may be given twice daily. Lamotrigine, phenobarbital, and phenytoin, which have long half-lives, can be given once daily at bedtime. However, with large doses, some antiepileptics may need to be given more frequently to avoid adverse effects associated with high peak plasma-drug concentration. Young children metabolise antiepileptics more rapidly than adults and therefore require more frequent doses and a higher dose in proportion to their body-weight.

Interaction	Interactions	Interactions between antiepileptic drugs

Phenobarbital or Primidone

Often lowers plasma concentration of phenytoin

Oxcarbazepine

Sometimes lowers plasma concentration of carbamazepine (but may raise concentration of an active metabolite of carbamazepine)

Phenytoin

Often lowers plasma concentration of clonazepam, carbamazepine, lamotrigine, and of phenytoin (but may also raise phenytoin concentration), tiagabine, valproate, and zonisamide

Levetiracetam

No interactions with levetiracetam reported

Valproate

Sometimes raises plasma concentration of an active metabolite of oxcarbazepine

Pregabalin

No interactions with pregabalin reported

Somewhat raises plasma concentration of phenytoin

Topiramate

Sometimes raises plasma concentration of phenytoin

Somewhat raises plasma concentration of an active metabolite of oxcarbazepine

Rufinamide

Sometimes raises plasma concentration of phenytoin

Sometimes lowers plasma concentration of phenobarbital

Vigabatrin

Often lowers plasma concentration of phenytoin

Sometimes lowers plasma concentration of phenobarbital, and primidone

For other important interactions see Appendix 1; for advice on hormonal contraception and enzyme-inducing drugs (including antiepileptics), see section 7.3.1 and section 7.3.2.

Withdrawal

Antiepileptic drugs should be withdrawn under specialist supervision. Abrupt withdrawal, particularly of the barbiturates and benzodiazepines, should be avoided because this may precipitate severe rebound seizures. Reduction in dosage should be gradual and, in the case of barbiturates, withdrawal of the drug may take months.

The decision to withdraw antiepileptic drugs from a seizure-free patient, and its timing, is often difficult and depends on individual circumstances. Even in patients who have been seizure-free for several years, there is a significant risk of seizure recurrence on drug withdrawal.

In patients receiving several antiepileptic drugs, only one drug should be withdrawn at a time.
Central nervous system

**Driving**  Patients suffering from epilepsy may drive a motor vehicle (but not a heavy goods or public service vehicle) provided that they have had a seizure-free period of one year or, if subject to attacks only while asleep, have established a 3-year period of asleep attacks without awake attacks. Patients affected by drowsiness should not drive or operate machinery.

Guidance issued by the Drivers Medical Unit of the Driver and Vehicle Licensing Agency (DVLA) recommends that patients should be advised not to drive during withdrawal of antiepileptic drugs, or for 6 months afterwards (see also Drugs and Driving under General Guidance, p. 3).

**Pregnancy and breast-feeding** There is an increased risk of teratogenicity associated with the use of antiepileptic drugs (reduced if treatment is limited to a single drug). In view of the increased risk of neural tube and other defects associated, in particular, with carbamazepine, lamotrigine, oxcarbazepine, phenytoin, and valproate, women taking antiepileptic drugs who may become pregnant should be informed of the possible consequences. Those who wish to become pregnant should be referred to an appropriate specialist for advice. Women who become pregnant should be counselled and offered antenatal screening (alpha-fetoprotein measurement and a second trimester ultrasound scan).

To counteract the risk of neural tube defects, adequate folate supplements are advised for women before and during pregnancy (section 9.1.2).

The concentration of antiepileptic drugs in the blood can change during pregnancy, particularly in the later stages. The dose of antiepileptic drugs should be monitored carefully during pregnancy and after birth, and adjustments made on a clinical basis.

Routine injection of vitamin K (section 9.6.6) at birth effectively counteracts any antiepileptic-associated risk of neonatal haemorrhage.

Breast-feeding is acceptable with all antiepileptic drugs, taken in normal doses, with the possible exception of the barbiturates, and also some of the more recently introduced ones, see Appendix 5.

**Partial seizures with or without secondary generalisation**

Carbamazepine, lamotrigine, oxcarbazepine, and sodium valproate are the drugs of choice for partial (focal) seizures; second-line drugs include clobazam, gabapentin, levetiracetam, pregabalin, tiagabine, topiramate, and zonisamide.

**Generalised seizures**

**Tonic-clonic seizures (grand mal)** The drugs of choice for tonic-clonic seizures are carbamazepine, lamotrigine, and sodium valproate. Clobazam, levetiracetam, oxcarbazepine, and topiramate are second-line drugs.

**Absence seizures (petit mal)** Ethosuximide and sodium valproate are the drugs of choice in typical absence seizures; alternatives include clonazepam and lamotrigine. Sodium valproate is also highly effective in treating the generalised tonic-clonic seizures which can co-exist with absence seizures in idiopathic primary generalised epilepsy.

**Myoclonic seizures** Myoclonic seizures (myoclonic jerks) occur in a variety of syndromes, and response to treatment varies considerably. Sodium valproate is the drug of choice; clonazepam and levetiracetam can also be used. Alternatives include lamotrigine and topiramate, but lamotrigine may occasionally exacerbate myoclonic seizures. For reference to the adjunctive use of piracetam, see section 4.9.3.

Sodium valproate and levetiracetam are effective in treating the generalised tonic-clonic seizures that co-exist with myoclonic seizures in idiopathic generalised epilepsy.

**Atypical absence, tonic, and tonic seizures** Atypical absence, tonic, and tonic seizures are usually seen in childhood, in specific epilepsy syndromes, or associated with cerebral damage or mental retardation. They may respond poorly to the traditional drugs. Sodium valproate, lamotrigine, and clonazepam can be tried. Second-line drugs that are occasionally helpful include clobazam, ethosuximide, levetiracetam, and topiramate.

**Carbamazepine and oxcarbazepine**

Carbamazepine is a drug of choice for simple and complex partial seizures and for tonic-clonic seizures secondary to a focal discharge. It is essential to initiate carbamazepine therapy at a low dose and build this up slowly with increments of 100–200 mg every two weeks. Reversible blurring of vision, dizziness, and unsteadiness are dose-related, and may be dose-limiting. These side-effects may be reduced by altering the timing of medication; use of modified-release tablets also significantly lessens the incidence of dose-related side-effects.

Oxcarbazepine is licensed for the treatment of partial seizures with or without secondarily generalised tonic-clonic seizures. Oxcarbazepine induces hepatic enzymes to a lesser extent than carbamazepine.

---

**CARBAMAZEPINE**

**Indications** partial and secondary generalised tonic-clonic seizures; primary generalised tonic-clonic seizures; trigeminal neuralgia; prophylaxis of bipolar disorder unresponsive to lithium

**Cautions** hepatic impairment (Appendix 2) or renal impairment; cardiac disease (see also Contra-indications); skin reactions (see also Blood, hepatic or skin disorders below and under Side-effects); test for HLA-B*1502 allele in individuals of Han Chinese or Thai origin—risk of Stevens-Johnson syndrome in presence of HLA-B*1502 allele; history of haematological reactions to other drugs; manufacturer recommends blood counts and hepatic and renal function tests (but evidence of practical value unsatisfactory); may exacerbate absence and myoclonic seizures; susceptibility to angle-closure glaucoma; pregnancy (important: see above and Appendix 4 (neural tube...
Carbamazepine (Non-proprietary) Tablets, carbamazepine 100 mg, net price 45-tab pack = £2.43; 200 mg, 45-tab pack = £4.50; 400 mg, 56-tab pack = £5.90. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Chewtabs, orange, carbamazepine 100 mg, net price 56-tab pack = £3.72; 200 mg, 56-tab pack = £6.92. Label: 3, 8, 21, 24, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Suppositories, carbamazepine 125 mg, net price 5 = £9.45; 250 mg, 5 = £12.60. Label: 3, 8, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy, for short-term use (max. 7 days) when oral therapy temporarily not possible, consider equivalent in therapeutic effect to tablets of 100 mg but final adjustment should always depend on clinical response (plasma concentration monitoring recommended); max. rectum 1 g daily in 4 divided doses

Modified release

Carbagene SR (Generics) Tablets, m/r, f/c, both scored, carbamazepine 200 mg, net price 56-tab pack = £4.88; 400 mg, 56-tab pack = £9.63. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy (ADULT and CHILD over 5 years), as above, trigeminal neuralgia, as above; total daily dose given in 1–2 divided doses; bipolar disorder, as above

Tegretol® Retard (Novartis) Tablets, both scored, carbamazepine 200 mg (beige-orange), net price 56-tab pack = £5.52; 400 mg (brown-orange), 56-tab pack = £10.86. Label: 3, 8, 25, counselling, blood, hepatic or skin disorder symptoms (see above), driving (see notes above)

Dose epilepsy (ADULT and CHILD over 5 years), as above; trigeminal neuralgia, as above; total daily dose given in 2 divided doses

OXCARBAZEPINE

Indications monotherapy and adjunctive treatment of partial seizures with or without secondarily generalised tonic-clonic seizures; trigeminal neuralgia [unlicenced indication] (section 4.7.3)

Cautions hypersensitivity to carbamazepine; avoid abrupt withdrawal; hyponatraemia (monitor plasma-sodium concentration in patients at risk), heart failure (monitor body-weight), cardiac conduction disorders; avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 250 and Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1

Blood, hepatic or skin disorders Patients or their carers should be told to recognise signs of blood, liver, or skin disorders, and advised to seek immediate medical attention if symptoms such as lethargy, confusion, muscular twitching, fever, sore throat, rash, blistering, mouth ulcers, bruising, or bleeding develop

Side-effects nausea, vomiting, constipation, diarrhoea, abdominal pain; dizziness, headache, drowsiness, agitation, amnesia, astaxia, ataxia, confusion,
impaired concentration, depression, tremor; hypo-
natraemia; acne, alopecia, rash,ystagmus, visual
disorders including diplopia; less commonly urticaria,
leucopenia; very rarely hepatitis, pancreatitis, arrhyth-
thmias, hypersensitivity reactions, thrombocytopenia,
systemic lupus erythematosus, Stevens-Johnson
syndrome, and toxic epidermal necrolysis

**Dose**

- Initially 300 mg twice daily increased according to
  response in steps of up to 600 mg daily at weekly
  intervals; usual dose range 0.6–2.4 g daily in divided
doses; CHILD 6–18 years, 8–10 mg/kg daily in 2
  divided doses increased according to response in
  steps of up to 10 mg/kg daily at weekly intervals (in
  adjunctive therapy, maintenance dose approx. 30 mg/
  kg daily); max. 46 mg/kg daily in divided doses

**Note** In adjunctive therapy, the dose of concomitant anti-
epileptics may need to be reduced when using high doses of
oxcarbazepine

**Oxcarbazepine (Non-proprietary)**

**Tablets**

- oxcarbazepine 150 mg, net price 50-tab pack
  = £10.00; 300 mg, 50-tab pack = £19.93; 600 mg 50-
tab pack = £39.48. Label: 3, 8, counselling, blood,
  hepatic, or skin disorders (see above), driving (see
  notes above)

**Oral suspension**, sugar-free, oxcarbazepine 300 mg/
5 mL, net price 250 mL (with oral syringe) = £40.00.
Label: 3, 8, counselling, blood, hepatic or skin dis-
orders (see above), driving (see notes above)

**Excipients** include propylene glycol (see Excipients, p. 2)

**ETHOSUXIMIDE**

**Ethosuximide** is used in typical absence seizures; it
may also be used in atypical absence seizures. Ethosux-
imide is rarely used for myoclonic or tonic seizures.

**ETHOSUXIMIDE**

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; hepatic impair-
ment; renal impairment; pregnancy (see p. 250 and
Appendix 4); breast-feeding (Appendix 5); avoid in
acute porphyria (section 9.8.2); interactions: Appen-
dix 1 (ethosuximide)

**Blood disorders** Patients or their carers should be told how
to recognise signs of blood disorders, and advised to seek
immediate medical attention if symptoms such as fever, sore
throat, mouth ulcers, bruising, or bleeding develop

**Side-effects** gastrointestinal disturbances (including
nausea, vomiting, diarrhoea, abdominal pain, ano-
exia, weight loss); less frequently headache, fatigue,
drowsiness, dizziness, hiccups, ataxia, mild euphoria,
irritability, aggression, impaired concentration; rarely
tongue swelling, sleep disturbances, night terrors,
depression, psychosis, photophobia, dyskinesia,
increased libido, vaginal bleeding, myopia, gingival
hypertrophy, and rash; also reported, hyperactivity,
increase in seizure frequency, blood disorders such as
leucopenia, agranulocytosis, pancytopenia, and
 aplastic anaemia (blood counts required if features of
infection), systemic lupus erythematosus, and Stev-
ens-Johnson syndrome

**Dose**

- **ADULT** and **CHILD** over 6 years, initially 500 mg daily,
increased by 250 mg at intervals of 4–7 days to usual
dose of 1–1.5 g daily; occasionally up to 2 g daily may
be needed; **CHILD** up to 6 years initially 250 mg daily,
increased gradually to usual dose of 20 mg/kg daily;
max. 1 g daily

**Ethosuximide (Non-proprietary)**

**Capsules**

- ethosuximide 250 mg, net price 56-cap
  pack = £38.23. Label: 8, counselling, blood disorders (see
  above), driving (see notes above)

**Emeside® (Chemidex)**

**Syrup**

- black currant, ethosuximide 250 mg/5 mL, net
  price 200-mL pack = £6.60. Label: 8, counselling,
  blood disorders (see above), driving (see notes above)

**Zarontin® (Pfizer)**

**Syrup**

- yellow, ethosuximide 250 mg/5 mL, net price
  200-mL pack = £4.48. Label: 8, counselling, blood
  disorders (see above), driving (see notes above)

**Gabapentin and pregabalin**

Gabapentin and pregabalin are used for the treatment of
partial seizures with or without secondary general-
isation. They are also licensed for the treatment of
neuropathic pain (p. 242). Pregabalin is licensed for the
treatment of generalised anxiety disorder (p. 207).

**GABAPENTIN**

**Indications** monotherapy and adjunctive treatment of
partial seizures with or without secondary general-
isation; peripheral neuropathic pain (section 4.7.3)

**Cautions** avoid abrupt withdrawal (may cause anxiety,
insomnia, nausea, pain, and sweating—taper off over
at least 1 week); elderly; renal impairment (Appendix
3); diabetes mellitus; false positive readings with some
urinary protein tests; pregnancy (see p. 250 and
Appendix 4); breast-feeding (see p. 250 and Appendix
5); interactions: Appendix 1 (gabapentin)

**Side-effects** diarrhoea, dry mouth, dyspepsia, nausea,
vomiting, constipation, abdominal pain, flatulence,
appetite changes, gingivitis, weight gain; hyper-
tension, vasodilation, oedema; dyspnoea, cough,
rhinitis; confusion, depression, hostility, sleep distur-
bances, headache, dizziness, anxiety, amnesia, ataxia,
dysarthria, ataxia, tinnitus, acute renal failure, Stevens-
Johnson syndrome, and toxic epidermal necrolysis

**Dose**

- **Epilepsy.** 300 mg on day 1, then 300 mg twice daily on
day 2, then 300 mg 3 times daily on day 3 or initially
300 mg 3 times daily on day 1; then increased
according to response in steps of 300 mg daily (in 3
divided doses) every 2–3 days; usual dose 0.9–3.6 g
daily in 3 divided doses; **CHILD** 2–6 years see **BNF for
Children**; **CHILD** 6–12 years (adjunctive therapy only)
10–15 mg/kg daily initially, then increased according
to response over 3 days to usual maintenance dose
25–35 mg/kg daily in 3 divided doses; max. 50 mg/kg
daily in 3 divided doses
- Neuropathic pain, ADULT over 18 years, 300 mg on
day 1, then 300 mg twice daily on day 2, then 300 mg 3
times daily (approx. every 8 hours) on day 3 or initially
300 mg 3 times daily on day 1, then increased
according to response in steps of 300 mg daily (in 3
divided doses) every 2–3 days to max. 3.6 g daily

**Gabapentin** (Non-proprietary)

**Capsules**, gabapentin 100 mg, net price 100-cap pack = £5.78; 300 mg, 100-cap pack = £8.96; 400 mg, 100-
cap pack = £9.24. Label: 3, 5, 8, counselling, driving
(see notes above)

**Tablets**, gabapentin 600 mg, net price 100-tab pack =
£106.00; 800 mg, 100-tab pack = £83.38. Label: 3, 5, 8,
counselling, driving (see notes above)

**Neurontin** (Pfizer)

**Capsules**, gabapentin 100 mg (white), net price 100-
cap pack = £22.86; 300 mg (yellow), 100-cap pack =
£53.00; 400 mg (orange), 100-cap pack = £61.33.
Label: 3, 5, 8, counselling, driving (see notes above)

**Tablets**, f/c, gabapentin 600 mg, net price 100-tab
pack = £106.00; 800 mg, 100-tab pack = £122.66.
Label: 3, 5, 8, counselling, driving (see notes above)

**PREGABALIN**

**Indications** peripheral and central neuropathic pain;
adjunctive therapy for partial seizures with or without
secondary generalisation; generalised anxiety disor-
der

**Cautions** avoid abrupt withdrawal (taper over at least
1 week); severe congestive heart failure; renal
impairment (Appendix 3); pregnancy (Appendix 4)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** dry mouth, constipation, nausea, vomit-
ing, flatulence; oedema; dizziness, drowsiness, irrit-
ability, attention disturbance, disturbances in muscle
control and movement, memory impairment,
paraesthesia, euphoria, confusion, fatigue, appetite
changes, weight gain; changes in sexual function;
visual disturbances and ocular disorders (including
blurred vision, diplopia, eye strain and eye irritation);
less commonly abdominal distension, increased sali-
vation, gastro-oesophageal reflux disease, taste dis-
turbance, thirst, hot flushes, tachycardia, syncope,
dysphonia, chest tightness, nasal dryness, stupor,
depersonalisation, depression, insomnia, abnormal
dreams, hallucinations, agitation, mood swings, panic
attacks, asthenia, speech disorder; dysuria, urinary
incontinence, thrombocytopenia, joint swelling,
muscle cramp, myalgia, arthralgia, sweating, and rash;
rarely ascites, dysphagia, pancreatitis, hypotension,
hypertension, cold extremities, first-degree AV block,
arrrhythmia, bradycardia, nasopharyngitis, cough,
epistaxis, rhinitis, parosmia, pyrexia, rashes, disinhibi-
tion, weight loss, hypoglycaemia or hyperglycaemia,
renal failure, menstrual disturbances, breast pain,
breast discharge, breast hypertrophy, neutropenia,
rhabdomyolysis, hyperacusis, hypokalaemia, and leu-
cytosis; diarrhoea, congestive heart failure, angio-
edema, loss of consciousness, headache, Stevens-
Johnson syndrome, and pruritus also reported

**Dose**

- Neuropathic pain, ADULT over 18 years, initially 150 mg
daily in 2–3 divided doses, increased if necessary after
3–7 days to 300 mg daily in 2–3 divided doses, increased
further if necessary after 7 days to max. 600 mg daily in 2–3
divided doses
- Epilepsy, ADULT over 18 years, initially 25 mg twice
daily, increased at 7-day intervals in steps of 50 mg
daily to 300 mg daily in 2–3 divided doses, increased
further if necessary after 7 days to max. 600 mg daily
in 2–3 divided doses
- Generalised anxiety disorder, ADULT over 18 years,
initially 150 mg daily in 2–3 divided doses, increased if
necessary at 7-day intervals in steps of 150 mg daily;
max. 600 mg daily in 2–3 divided doses

**Note** Pregabalin doses in BNF may differ from those in product
literature

**Lyrica** (Pfizer)

**Capsules**, pregabalin 25 mg (white), net price 56-cap
pack = £64.40, 84-cap pack = £96.60; 50 mg (white),
84-cap pack = £96.60; 75 mg (white/orange), 56-cap
pack = £64.40; 100 mg (orange), 84-cap pack =
£96.60; 150 mg (white), 56-cap pack = £64.40; 200 mg
(oranger), 84-cap pack = £96.60; 225 mg (white/or-
gange), 56-cap pack = £64.40; 300 mg (white/or-
gange), 56-cap pack = £64.40. Label: 3, 8, counsel-
lng, driving (see notes above)

**Note** The Scottish Medicines Consortium has advised (July
2007) that Lyrica is not recommended for the treatment of
central neuropathic pain

**Lacosamide**

Lacosamide is licensed for adjunctive treatment of
partial seizures with or without secondary generalisation.

**Vimpat** (UCB Pharma)

**Tablets**, f/c, lacosamide 50 mg (pink), net price 14-tab
pack = £9.01; 100 mg (yellow), 14-tab pack = £18.02,
56-tab pack = £72.08; 150 mg (pink), 14-tab pack =
£27.03, 56-tab pack = £108.12; 200 mg (blue), 56-tab
pack = £96.60; 225 mg (white/orange), 56-tab pack =
£144.16. Label: 8, counselling, driving (see notes above)

**Note** Pregabalin doses in BNF may differ from those in product
literature

**Indications** see notes above

**Cautions** conduction problems, severe cardiac disease
(increased risk of PR-interval prolongation), elderly,
hepatic impairment (Appendix 2), renal impairment
(Appendix 3); pregnancy (p. 250 and Appendix 4);
breast-feeding (see p. 250 and Appendix 5); interac-
tions: Appendix 1 (lacosamide)

**Side-effects** nausea, vomiting, flatulence, constipa-
tion; dizziness, headache, depression, diplopia, nys-
tagmus, impaired coordination, impaired memory,
cognitive disorder, drowsiness, tremor, asthenia, fati-
gue; pruritus; less commonly PR-interval prolongation

**Dose**

- By intravenous infusion over 15–60 minutes (for up
to 5 days) or by mouth, ADULT and CHILD over 16
years, initially 50 mg twice daily, increased weekly by
50 mg twice daily to max. 200 mg twice daily

**Vimpat** (UCB Pharma)

**Tablets**, f/c, lacosamide 50 mg (pink), net price 14-tab
pack = £9.01; 100 mg (yellow), 14-tab pack = £18.02,
56-tab pack = £72.08; 150 mg (pink), 14-tab pack =
£27.03, 56-tab pack = £108.12; 200 mg (blue), 56-tab
pack = £96.60. Label: 8, counselling, driving (see notes above)

**Syrup**, lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Electrolytes** Na 0.4 mmol/5 mL

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)

**Excipients** include aspartame (section 9.4.1)

**Syrup** lacosamide 15 mg/mL, net price 200 mL =
£38.61. Label: 8, counselling, driving (see notes above)
Lamotrigine

Lamotrigine is an antiepileptic for partial seizures and primary and secondarily generalised tonic-clonic seizures. Lamotrigine may cause serious skin rash especially in children; dose recommendations should be adhered to closely.

Lamotrigine is used either as sole treatment or as an adjunct to treatment with other antiepileptic drugs. Valproate increases plasma-lamotrigine concentration whereas the enzyme inducing antiepileptics reduce it; care is therefore required in choosing the appropriate initial dose and subsequent titration. Where the potential for interaction is not known, treatment should be initiated with lower doses such as those used with valproate.

LAMOTRIGINE

**Indications** monotherapy and adjunctive treatment of partial seizures and primary and secondarily generalised tonic-clonic seizures; seizures associated with Lennox-Gastaut syndrome; trigeminal neuralgia (unlicensed indication) (section 4.7.3)

**Cautions** closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop; avoid abrupt withdrawal (taper off over 2 weeks or longer) unless serious skin reaction occurs; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 250 and Appendix 4); breast-feeding (Appendix 5); interactions: see p. 249 and Appendix 1 (lamotrigine)

**Blood disorders** The CSM has advised prescribers to be alert for symptoms and signs suggestive of bone-marrow failure such as anaemia, bruising, or infection. Aplastic anaemia, bone-marrow depression and pancytopenia have been associated rarely with lamotrigine.

**Side-effects** rash (see Skin Reactions, below); hypersensitivity syndrome (possibly including rash, fever, lymphadenopathy, hepatic dysfunction, blood disorders, disseminated intravascular coagulation and multi-organ dysfunction); nausea, vomiting, diarrhoea, hepatic dysfunction; headache, fatigue, dizziness, sleep disturbances, tremor, movement disorders, agitation, confusion, hallucinations, occasional increase in seizure frequency; blood disorders (including leucopenia, thrombocytopenia, pancytopenia—see Blood Disorders, above); arthralgia; lupus erythematosus-like effect; photosensitivity; rash (erythema multiforme, toxic epidermal necrolysis); Stevens-Johnson syndrome and toxic epidermal necrolysis (rarely with fatalities) have developed especially in children; most rashes occur in the first 8 weeks. Rash is sometimes associated with hypersensitivity syndrome (see Side-effects, above) and is more common in patients with history of allergy or rash from other antiepileptic drugs. Consider withdrawal if rash or signs of hypersensitivity syndrome develop. The CSM has advised that factors associated with increased risk of serious skin reactions include concomitant use of valproate, initial lamotrigine dosing higher than recommended, and more rapid dose escalation than recommended.

**Counselling** Warn patients to see their doctor immediately if rash or signs or symptoms of hypersensitivity syndrome develop

**Dose** Important Do not confuse the different combinations; see also notes below

**Note** Dose titration should be repeated if restarting after an interval of more than 5 days

- Monotherapy, **ADULT** and **CHILD** over 12 years, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 50–100 mg daily every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses (up to 500 mg daily has been required)

- Adjunctive therapy with valproate, initially 25 mg on alternate days for 14 days then 25 mg once daily for further 14 days, thereafter increased by max. 25–50 mg daily every 7–14 days; usual maintenance, 100–200 mg daily in 1–2 divided doses; **CHILD** 2–12 years initially 150 micrograms/kg once daily for 14 days (those weighing under 13 kg may receive 2 mg on alternate days for first 14 days) then 300 micrograms/kg once daily for further 14 days, thereafter increased by max. 300 micrograms/kg daily every 7–14 days; usual maintenance 1–5 mg/kg daily in 1–2 divided doses (max. single dose 100 mg)

- Adjunctive therapy (with enzyme inducing drugs) **without valproate**, initially 50 mg once daily for 14 days then 50 mg twice daily for further 14 days, thereafter increased by max. 100 mg daily every 7–14 days; usual maintenance 200–400 mg daily in 2 divided doses (up to 700 mg daily has been required); **CHILD** 2–12 years initially 600 micrograms/kg daily in 2 divided doses for 14 days then 1.2 mg/kg daily in 2 divided doses for further 14 days, thereafter increased by max. 1.2 mg/kg daily every 7–14 days; usual maintenance 5–15 mg/kg daily in 2 divided doses (max. single dose 200 mg)

- Adjunctive therapy with oxcarbazepine, initially 25 mg once daily for 14 days, increased to 50 mg once daily for further 14 days, then increased by max. 50–100 mg daily every 7–14 days; usual maintenance 100–200 mg daily in 1–2 divided doses; **CHILD** 2–12 years initially 300 micrograms/kg daily in 1–2 divided doses for 14 days then 600 micrograms/kg daily in 1–2 divided doses for further 14 days, thereafter increased by max. 600 micrograms/kg daily every 7–14 days; usual maintenance 1–10 mg/kg daily in 1–2 divided doses; max. 200 mg daily

**Lamotrigine** (Non-proprietary)  
**Tablets**, lamotrigine 25 mg, net price 56-tab pack = £3.45; 50 mg, 56-tab pack = £4.13; 100 mg, 56-tab pack = £5.45; 200 mg, 30-tab pack = £27.53, 56-tab pack = £9.36. Label: 8, counselling, driving (see notes above), skin reactions (see above)

**Dispersible tablets**, lamotrigine 5 mg, net price 28-tab pack = £2.87; 25 mg, 56-tab pack = £3.87; 100 mg, 56-tab pack = £7.70. Label: 8, 13, counselling, driving (see notes above), skin reactions (see above)

**Lamictal®** (GSK)  
**Tablets**, yellow, lamotrigine 25 mg, net price 21-tab pack (Valproate Add-on therapy ’Starter Pack’ = £7.65, 42-tab pack (’Monotherapy’ Starter Pack) = £15.30, 56-tab pack = £20.41; 50 mg, 42-tab pack (’Non-valproate Add-on therapy’ Starter Pack) = £26.02, 56-tab pack = £34.70; 100 mg, 56-tab pack = £59.86; 200 mg, 56-tab pack = £101.76. Label: 8, counselling, driving (see notes above), skin reactions (above)

**Dispersible tablets**, chewable, lamotrigine 2 mg, net price 30-tab pack = £8.71; 5 mg, 28-tab pack = £8.14; 25 mg, 56-tab pack = £20.41; 100 mg, 56-tab pack = £59.86. Label: 8, 13, counselling, driving (see notes above), skin reactions (above)
Levetiracetam

Levetiracetam is licensed for monotherapy and adjunctive treatment of partial seizures with or without secondary generalisation, and for adjunctive therapy of myoclonic seizures and primarily generalised tonic-clonic seizures.

**LEVETIRACETAM**

**Indications** see notes above

**Cautions** avoid abrupt withdrawal; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see p. 250 and Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (levetiracetam)

**Side-effects** nausea, vomiting, dyspepsia, diarrhoea, abdominal pain, anorexia, weight changes; cough; drowsiness, asthenia, anemia, ataxia, seizures, dizziness, headache, tremor, hyperkinesia, depression, emotional lability, insomnia, anxiety, impaired attention, aggression, irritability; thrombocytopenia; myalgia; visual disturbances; pruritus, rash; also reported pancreatitis, hepatic dysfunction, confusion, psychosis, hallucinations, suicidal ideation, paraesthesia, leucopenia, pancytopenia, and alopecia

**Dose**

- Monotherapy of partial seizures with or without secondary generalisation, by mouth or by intravenous infusion, **ADULT** and **CHILD** over 16 years, initially 250 mg twice daily increased according to response in steps of 250 mg twice daily every 2 weeks; max. 1.5 g twice daily
- Adjunctive therapy of partial seizures with or without secondary generalisation, myoclonic seizures, and primarily generalised tonic-clonic seizures, by mouth or by intravenous infusion, **ADULT** and **CHILD** over 12 years, body-weight over 50 kg, initially 500 mg twice daily, adjusted in steps of 500 mg twice daily every 2 to 4 weeks; max. 1.5 g twice daily; **CHILD** 4–18 years (12–18 years for myoclonic and tonic-clonic seizures), body-weight under 50 kg, initially 10 mg/kg twice daily, adjusted in steps not exceeding 10 mg/kg twice daily every 2 weeks; max. 30 mg/kg twice daily

**Keppra** (UCB Pharma) (R)

- **Tablets**, f/c, levetiracetam 250 mg (blue), net price 60-tab pack = £29.70; 500 mg (yellow), 60-tab pack = £52.30; 750 mg (orange) 60-tab pack = £89.10; 1 g (white), 60-tab pack = £101.10. **Label**: 8
- **Oral solution**, sugar-free, levetiracetam 100 mg/mL, net price 300 mL = £71.00. **Label**: 8
- **Concentrate for intravenous infusion**, levetiracetam 100 mg/mL. For dilution before use. **Net price** 5-mL vial = £13.50
- **Electrolytes**: Na < 0.5 mmol/vial

Phenobarbital and other barbiturates

Phenobarbital (phenobarbitone) is effective for tonic-clonic and partial seizures but may be sedative in adults and cause behavioural disturbances and hyperkinesia in children. It may be tried for atypical absence, atonic, and tonic seizures. Rebound seizures may be a problem on withdrawal. Monitoring plasma concentrations is less useful than with other drugs because tolerance occurs.

Primidone is largely converted to phenobarbital and this is probably responsible for its antiepileptic action. A small starting dose of primidone (125 mg) is essential, and the drug should be introduced over several weeks.

**PHENOBARBITAL**

(Phenobarbitone)

**Indications** all forms of epilepsy except absence seizures; status epilepticus (section 4.8.2)

**Cautions** see notes above; elderly; debilitated; children; respiratory depression (avoid if severe); avoid abrupt withdrawal (dependence with prolonged use); history of drug or alcohol abuse; avoid in acute porphyria (section 9.8.2); hepatic impairment (avoid if severe—Appendix 2); renal impairment; pregnancy (see p. 250 and Appendix 4); breast-feeding (see p. 250 and Appendix 5); **interactions**: see p. 249 and Appendix 1 (barbiturates)

**Side-effects** hepatatitis, cholestasis; hypotension; respiratory depression; behavioural disturbances, nystagmus, irritability, drowsiness, lethargy, depression, ataxia, paradoxical excitement, hallucinations, impaired memory and cognition, hyperactivity particularly in the elderly and in children; osteomalacia; megaloblastic anaemia (may be treated with folic acid); agranulocytosis, thrombocytopenia; allergic skin reactions; very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis; **overdosage**: see Emergency Treatment of Poisoning. p. 28

**Dose**

- By mouth, 60–180 mg at night; **CHILD** 5–8 mg/kg daily

**Note** For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect. Plasma-phenobarbital concentration for optimum response 15–40 mg/litre (60–180 micromol/litre)

**Phenobarbital** (Non-proprietary) (C)

- **Tablets**, phenobarbital 15 mg, net price 28-tab pack = 88p; 30 mg, 28-tab pack = 59p; 60 mg, 28-tab pack = 69p. **Label**: 2, 8, counselling, driving (see notes above)
- **Elixir**, phenobarbital 15 mg/5 mL in a suitable flavoured vehicle, containing alcohol 38%, net price 100 mL = 77p. **Label**: 2, 8, counselling, driving (see notes above)

**Note** Some hospitals supply alcohol-free formulations of varying phenobarbital strengths

**Injection**

Section 4.8.2

**PRIMIDONE**

**Indications** all forms of epilepsy except absence seizures; essential tremor (also section 4.9.3)

**Cautions** see under Phenobarbital; **interactions**: see p. 249 and Appendix 1 (primidone)

**Side-effects** see under Phenobarbital; also nausea and visual disturbances; less commonly vomiting, headache, and dizziness; rarely arthralgia

**Dose**

- Epilepsy, **ADULT** and **CHILD** over 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days to 500 mg daily in 2 divided doses, then increased according to response by 250 mg every 3 days to usual maintenance 0.75–1.5 g daily in 2 divided doses; **CHILD** under 9 years, initially 125 mg daily at bedtime, increased by 125 mg every 3 days according to
response; usual maintenance, CHILD under 2 years, 250–500 mg daily in 2 divided doses; 2–5 years, 500–750 mg daily in 2 divided doses; 5–9 years 0.75–1 g daily in 2 divided doses

• Essential tremor, initially 62.5 mg daily increased gradually over 2–3 weeks according to response; max. 750 mg daily

Note Monitor plasma concentrations of derived phenobarbital; optimum range as for phenobarbital. Primidone doses in BNF may differ from those in product literature

Mysoline® (Acornus) Tablets, scored, primidone 250 mg, net price 100-tab pack = £12.60. Label: 2, 8, counselling, driving (see notes above)

Phenytoin

Phenytoin is effective in tonic-clonic and partial seizures. It has a narrow therapeutic index and the relationship between dose and plasma concentration is non-linear; small dosage increases in some patients may produce large rises in plasma concentrations with acute toxic side-effects. Monitoring of plasma concentration greatly assists dosage adjustment. A few missed doses or a small change in drug absorption may result in a marked change in plasma concentration. Phenytoin may cause coarse facies, acne, hirsutism, and gingival hyperplasia and so may be particularly undesirable in adolescent patients.

When only parenteral administration is possible, fosphenytoin (section 4.8.2), a pro-drug of phenytoin, may be convenient to give. Whereas phenytoin can be given intravenously only, fosphenytoin may also be given by intramuscular injection.

PHENYTOIN

Indications all forms of epilepsy except absence seizures; status epilepticus (section 4.8.2); trigeminal neuralgia if carbamazepine inappropriate (see also section 4.7.3)

Caution avoid abrupt withdrawal; manufacturer recommends blood counts (but evidence of practical value unsatisfactory); avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); pregnancy (important: see notes above and Appendix 4); breast-feeding (see notes above and Appendix 5); interactions: see p. 249 and Appendix 1 (phenytoin)

Blood or skin disorders Patients or their carers should be told how to recognise signs of blood or skin disorders, and advised to seek immediate medical attention if symptoms such as fever, sore throat, rash, mouth ulcers, bruising, or bleeding develop. Leucopenia which is severe, progressive, or associated with clinical symptoms requires withdrawal (if necessary under cover of suitable alternative)

Side-effects nausea, vomiting, constipation, insomnia, transient nervousness, tremor, paraesthesia, diarrhoea, headache, anorexia; gingival hypertrophy and tenderness; rash (discontinue; if mild re-introduce cautiously but discontinue immediately if recurrence), acne, hirsutism, coarse facies; rarely hepatotoxicity, peripheral neuropathy, dyskinesia, lymphadenopathy, osteomalacia, blood disorders (including megaloblastic anaemia (may be treated with folic acid), leucopenia, thrombocytopenia, and aplastic anaemia), polyarteritis nodosa, lupus erythematosus, Stevens-Johnson syndrome, and toxic epidermal necrolysis; also reported pneumonitis and interstitial nephritis; with excessive dosage nyctagmus, diplopia, slurred speech, ataxia, confusion, and hyperglycaemia

Dose

• By mouth, initially 3–4 mg/kg daily or 150–300 mg daily (as a single dose or in 2 divided doses) increased gradually as necessary (with plasma-phenytoin concentration monitoring); usual dose 200–500 mg daily (exceptionally, higher doses may be used); CHILD initially 5 mg/kg daily in 2 divided doses, usual dose range 4–8 mg/kg daily (max. 300 mg daily)

Note Plasma concentration for optimum response 10–20 mg/litre (40–80 micromol/litre)

Counselling Take preferably with or after food

Phenytoin (Non-proprietary) Tablets, coated, phenytoin sodium 100 mg, net price 28-tab pack = £30.00. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note On the basis of single dose tests there are no clinically relevant differences in bioavailability between available phenytoin sodium tablets and capsules but there may be a pharmacokinetic basis for maintaining the same brand of phenytoin in some patients

Epanutin® (Pfizer) Capsules, phenytoin sodium 25 mg (white/purple), net price 28-cap pack = 66p; 50 mg (white/pink), 28-cap pack = 67p; 100 mg (white/orange), 84-cap pack = £2.83; 300 mg (white/green), 28-cap pack = £2.83. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Infatabs® (= chewable tablets), yellow, scored, phenytoin 50 mg, net price 112 = £7.38. Label: 8, 24, counselling, blood or skin disorder symptoms (see above), driving (see notes above)

Note Contain phenytoin 50 mg (as against phenytoin sodium) therefore care is needed on changing to capsules or tablets containing phenytoin sodium

Suspension, red, phenytoin 30 mg/5 mL, net price 500 mL = £4.27. Label: 8, counselling, administration, blood or skin disorder symptoms (see above), driving (see notes above)

Note Suspension of phenytoin 90 mg in 15 mL may be considered to be approximately equivalent in therapeutic effect to capsules or tablets containing phenytoin sodium 100 mg, but nevertheless care is needed in making changes

Rufinamide

Rufinamide is licenced for the adjunctive treatment of seizures in Lennox-Gastaut syndrome.

The Scottish Medicines Consortium (p. 3) has advised (October 2008) that rufinamide (Inovelon) is accepted for restricted use within NHS Scotland as adjunctive therapy in the treatment of seizures associated with Lennox-Gastaut syndrome in patients four years and above. It is restricted for use when alternative traditional antiepileptic drugs are unsatisfactory.

RUFINAMIDE

Indications adjunctive treatment of seizures in Lennox-Gastaut syndrome

Caution closely monitor and consider withdrawal if rash, fever, or other signs of hypersensitivity syndrome develop; avoid abrupt withdrawal; hepatic
Topiramate

**Topiramate** can be given alone or as adjunctive treatment in generalised tonic-clonic seizures or partial seizures with or without secondary generalisation. It can be used as adjunctive treatment for seizures associated with Lennox-Gastaut syndrome. Topiramate is also licensed for prophylaxis of migraine (section 4.7.4.2).

### Tiagabine

Tiagabine is used as adjunctive treatment for partial seizures, with or without secondary generalisation.

#### Tiagabine

**Indications**

- adjunctive treatment for partial seizures with or without secondary generalisation not satisfactorily controlled with other antiepileptics

**Cautions**

- avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment; pregnancy (see notes above and Appendix 4); interactions: see p. 249 and Appendix 1 (tiagabine)

**Driving**

- May impair performance of skilled tasks (e.g. driving)

**Side-effects**

- diaphoresis; dizziness, tiredness, nervousness, tremor, impaired concentration, emotional lability, speech impairment; rarely confusion, depression, drowsiness, psychosis, non-convulsive status epilepticus, bruising, and visual disturbances; leucopenia also reported

**Dose**

- Adjunctive therapy, **ADULT** and **CHILD** over 12 years, with enzyme-inducing drugs, 5 mg twice daily for 1 week, then increased at weekly intervals in steps of 5–10 mg daily; usual maintenance dose 30–45 mg daily (doses above 30 mg given in 3 divided doses); in patients receiving non-enzyme-inducing drugs, initial maintenance dose 15–30 mg daily

### Gabitril® (Cephalon) [tbr]

**Tablets, 1/c, tiagabine (as hydrochloride) 5 mg, net price 100-tab pack = £43.37; 10 mg, 100-tab pack = £86.74; 15 mg, 100-tab pack = £130.11. Label: 21**

---

**TOPIRAMATE**

**Indications**

- monotherapy and adjunctive treatment of generalised tonic-clonic seizures or partial seizures with or without secondary generalisation; adjunctive treatment of seizures in Lennox-Gastaut syndrome; migraine prophylaxis (under specialist supervision)

**Cautions**

- avoid abrupt withdrawal; ensure adequate hydration (especially if predisposition to nephrolithiasis or in strenuous activity or warm environment); avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (see notes above and Appendix 4); interactions: see p. 249 and Appendix 1 (topiramate)

**CSM advice**

- Topiramate has been associated with acute myopia with secondary angle-closure glaucoma, typically occurring within 1 month of starting treatment. Choroidal effusions resulting in anterior displacement of the lens and iris have also been reported. The CSM advises that if raised intra-ocular pressure occurs:
  - seek specialist ophthalmological advice;
  - use appropriate measures to reduce intra-ocular pressure;
  - stop topiramate as rapidly as feasible

**Contra-indications**

- breast-feeding (Appendix 5)

**Side-effects**

- nausea, vomiting, constipation, diarrhoea, abdominal pain, weight loss, anorexia; rhinitis, epistaxis; dizziness, headache, drowsiness, insomnia, anxiety, fatigue, increase in seizure frequency, impaired coordination, hyperactivity, tremor, gait disturbances; influenza-like symptoms; oligomenorrhea; back pain; nystagmus, diplopia, blurred vision; rash and acne; hypersensitivity syndrome (possibly including rash, fever, lymphadenopathy, hepatic dysfunction, haematuria, and multiorgan dysfunction) also reported

**Hypersensitivity syndrome**

- Serious hypersensitivity syndrome (see Side-effects) has developed, especially in children and upon initiation of therapy; consider withdrawal if rash or signs of hypersensitivity syndrome develop

**Counselling**

- Warn patients to seek immediate medical attention if signs or symptoms of hypersensitivity develop

**Dose**

- **ADULT** and **CHILD** over 4 years body-weight over 30 kg, initially 200 mg twice daily increased according to response in steps of 200 mg twice daily at intervals of not less than 2 days; body-weight 30–50 kg max. 900 mg twice daily; body-weight 50–70 kg max. 1.2 g twice daily; body-weight over 70 kg max. 1.6 g twice daily; **CHILD** over 4 years body-weight less than 30 kg, initially 100 mg twice daily increased according to response in steps of 100 mg twice daily at intervals of not less than 2 days; max. 500 mg twice daily (max. 300 mg twice daily if adjunctive therapy with valproate)

**Inovelon®** (Eisai) ▼ [tbr]

**Tablets, pink, 1/c, scored, rufinamide 100 mg, net price 10-tab pack = £8.58; 200 mg, 60-tab pack = £51.48; 400 mg, 60-tab pack = £85.80. Label: 21, counselling, driving (see notes above), hypersensitivity syndrome (see above)

**Intra-ocular pressure occurs:**

- iris have also been reported. The CSM advises that if raised intra-ocular pressure occurs:
  - seek specialist ophthalmological advice;
  - use appropriate measures to reduce intra-ocular pressure;
  - stop topiramate as rapidly as feasible

---

**4.8.1 Control of epilepsy**

**257**

---

**Central nervous system**
intervals of 1–2 weeks taken in 2 divided doses; recommended dose range 5–9 mg/kg daily in 2 divided doses; max. 15 mg/kg daily

- Migraine prophylaxis ADULT and CHILD over 16 years, initially 25 mg daily at night for 1 week then increased in steps of 25 mg daily at intervals of 1 week; usual dose 50–100 mg daily in 2 divided doses

Note If patient cannot tolerate titration regimens recommended above then smaller steps or longer interval between steps may be used

**Topamax** (Janssen-Cilag) ▼ (NM)

**Tablets**, e/c, topiramate 25 mg, net price 60-tab pack = £20.48; 50 mg (light yellow), 60-tab pack = £33.64; 100 mg (yellow), 60-tab pack = £60.26; 200 mg (salmon), 60-tab pack = £117.02. Label: 3, 8, counselling, driving (see notes above)

**Sprinkle capsules**, topiramate 15 mg, net price 60-cap pack = £15.70; 25 mg, 60-cap pack = £23.55; 50 mg, 60-cap pack = £38.69. Label: 3, 8, counselling, administration, driving (see notes above)

**Counselling** Swallow whole or open capsule and sprinkle contents on soft food

**Valproate**

**Sodium valproate** is effective in controlling tonic-clonic seizures, particularly in primary generalised epilepsy. It is a drug of choice in primary generalised epilepsy, generalised absences and myoclonic seizures, and can be tried in atypical absence, atonic, and tonic seizures. It is a drug of choice in primary generalised epilepsy, generalised absences and myoclonic seizures, and can be tried in atypical absence, atonic, and tonic seizures.

Valproate concentrations are not a useful index of efficacy, therefore routine monitoring is unhelpful.

Liver toxicity Liver dysfunction (including fatal hepatic failure) has occurred in association with valproate (especially in children under 3 years and in those with metabolic or degenerative disorders, organic brain disease or severe seizure disorders associated with mental retardation) usually in first 6 months and usually involving multiple antiepileptic therapy. Raised liver enzymes during valproate treatment are usually transient but patients should be reassessed clinically and liver function (including prothrombin time) monitored until return to normal—discontinue if abnormality prolonged prothrombin time (particular in association with other relevant abnormalities).

**Blood or hepatic disorders** Patients or their carers should be told how to recognise signs and symptoms of blood or liver disorders and advised to seek immediate medical attention if symptoms develop

Pancreatitis Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek immediate medical attention if symptoms such as abdominal pain, nausea and vomiting develop; discontinue if pancreatitis is diagnosed

**Contra-indications** active liver disease, family history of severe hepatic dysfunction; acute porphyria (section 9.8.2)

**Side-effects** nausea, gastric irritation, diarrhoea; weight gain; hyperammonaemia, thrombocytopenia; transient hair loss (regrowth may be curvy); less frequently increased alertness, aggression, hyperactivity, behavioural disturbances, ataxia, tremor, and vasculitis; rarely hepatic dysfunction (see under Cautions); withdrawal treatment immediately if persistent vomiting and abdominal pain, anorexia, jaundice, oedema, malaise, drowsiness, or loss of seizure control; lethargy, drowsiness, confusion, stupor, hallucinations, menstrual disturbances, anaemia, leucopenia, pancytopenia, hearing loss, and rash; very rarely pancreatitis (see under Cautions), peripheral oedema, increase in bleeding time, extrapyramidal symptoms, dementia, encephalopathy, coma, gynaecomastia, Fanconi’s syndrome, hirsutism, acne, enuresis, hypnornatremia, toxic epidermal necrolysis, and Stevens-Johnson syndrome

**Dose**

- By mouth, initially 600 mg daily in 2 divided doses, preferably after food, increased by 200 mg daily every 3 days to max. 2.5 g daily, usual maintenance dose 1–2 g daily (20–30 mg/kg daily); CHILD body-weight up to 20 kg, initially 20 mg/kg daily in divided doses, may be increased provided plasma concentration monitored (dose above 40 mg/kg daily also monitor clinical chemistry and haematological parameters); CHILD under 12 years body-weight up to 20 kg, initially 400 mg daily in divided doses increased according to response (usual range 20–30 mg/kg daily); max. 35 mg/kg daily

- By intravenous injection (over 3–5 minutes) or by intravenous infusion, continuation of valproate treatment, same as current dose by oral route Initiation of valproate therapy, by intravenous injection (over 3–5 minutes), 400–800 mg (up to 10 mg/kg) followed by intravenous infusion up to max. 2.5 g daily; CHILD under 12 years, usually 20–30 mg/kg daily, may be increased provided plasma concentration monitored (dose above 40 mg/kg daily also monitor clinical chemistry and haematological parameters)

**Oral**

**Sodium Valproate** (Non proprietary) ▼

**Tablets** (crushable), scored, sodium valproate 100 mg, net price 100-tab pack = £4.67. Label: 8, counselling, blood or hepatic disorder symptoms (see above), driving (see notes above)

**Tablets**, e/c, sodium valproate 200 mg, net price 100-tab pack = £5.71; 500 mg, 100-tab pack = £12.15. Label: 5, 8, 25, counselling, blood or hepatic disorder symptoms (see above), driving (see notes above)

**Brands include** Orlept

**Oral solution**, sodium valproate 200 mg/5 mL, net price 300 mL = £8.20. Label: 8, counselling, blood or hepatic disorder symptoms (see above), driving (see notes above)

**Brands include** Orlept sugar-free

**Epilim** (Sanofi-Synthelabo) ▼

**Tablets** (crushable), scored, sodium valproate 100 mg, net price 100 = £4.67. Label: 8, counselling,
blood or hepatic disorder symptoms (see above),
driving (see notes above)

Tablets, both e/c, lilac, sodium valproate 200 mg, net
price 100 = £7.70; 500 mg, 100 = £19.25. Label: 5, 8,
25, counselling, blood or hepatic disorder symptoms
(see above), driving (see notes above)

Liquid, red, sugar-free, sodium valproate 200 mg/5
mL, net price 300-mL pack = £7.78. Label: 8,
counselling, blood or hepatic disorder symptoms (see
above), driving (see notes above)

Syrup, red, sodium valproate 200 mg/5 mL, net price
300-mL pack = £7.78. Label: 8, counselling, blood
or hepatic disorder symptoms (see above), driving (see
notes above)

### Modified release

**Epilim Chrono** (Sanofi-Synthelabo) (£)

Tablets, m/r, lilac, sodium valproate 200 mg (as sodium
valproate and valproic acid), net price 100-tab pack
= £9.71; 300 mg, 100-tab pack = £14.56; 500 mg,
100-tab pack = £24.25. Label: 8, 25, counselling, blood
or hepatic disorder symptoms (see above), driving
(see notes above)

Dose ADULT and CHILD over 20 kg, as above, total daily dose
given in 1–2 divided doses

**Epilim Chronosphere** (Sanofi-Aventis) (£)

Granules, m/r, sodium valproate 50 mg (as sodium
valproate, and valproic acid), net price 30-sachet pack
= £30.00; 100 mg, 30-sachet pack = £30.00; 250 mg,
30-sachet pack = £30.00; 500 mg, 30-sachet pack =
£30.00; 750 mg, 30-sachet pack = £30.00. Label: 8,
counselling, administration, blood or hepatic disorder
symptoms (see above), driving (see notes above)

Dose ADULT and CHILD, as above, total daily dose given in 1–2
divided doses

Counselling Granules may be mixed with cold food or drink and
swallowed immediately without chewing

**Episenta** (Beacon) (£)

Capsules, m/r, sodium valproate 150 mg, net price
100-cap pack = £5.70; 300 mg, 100-cap pack = £10.90.
Label: 8, 25, counselling, administration, blood or
hepatic disorder symptoms (see above), driving (see
notes above)

Dose ADULT and CHILD, as above, total daily dose given in 1–2
divided doses

Counselling Contents of capsule may be mixed with cold food or
drink and swallowed immediately without chewing

Granules, m/r, sodium valproate 500 mg, net price
100-sachet pack = £18.00; 1 g, 100-sachet pack =
£35.50. Label: 8, 25, counselling, administration,
blood or hepatic disorder symptoms (see above),
driving (see notes above)

Dose ADULT and CHILD, as above, total daily dose given in 1–2
divided doses

Counselling Granules may be mixed with cold food or drink and
swallowed immediately without chewing

### Parenteral

**Epilim** Intravenous (Sanofi-Synthelabo) (£)

Injection, powder for reconstitution, sodium val-
proate, net price 400-mg vial (with 4-mL amp water
for injections) = £11.58

**Episenta** (Beacon) (£)

Injection, sodium valproate 100 mg/mL, net price 3-
ml amp = £7.00, 10-mL amp = £23.33

### Valproic acid

**Convulex** (Pharmacia) (£)

Capsules, e/c, valproic acid 150 mg, net price 100-
cap pack = £3.68; 300 mg, 100-cap pack = £7.35;
500 mg, 100-cap pack = £12.25. Label: 8, 25, coun-
selling, blood or hepatic disorder symptoms (see
above), driving (see notes above)

Dose ADULT and CHILD as for sodium valproate, total daily dose
given in 2–4 divided doses

Equivalence to sodium valproate Manufacturer advises that Con-
vulex has a 1:1 dose relationship with products containing sodium
valproate, but nevertheless care is needed in making changes.

**Depakote** (Sanofi-Synthelabo) (£)

Section 4.2.3 (bipolar disorder)

---

### Vigabatrin

**Indications** initiated and supervised by appropriate
specialist, adjunctive treatment of partial seizures
with or without secondary generalisation not satis-
factory controlled with other antiepileptics; mono-
therapy for management of infantile spasms (West's
syndrome)

About one-third of patients treated with vigabatril have
suffered visual field defects; counselling and careful
monitoring for this side-effect are required (see also
Visual Field Defects under Cautions below). Vigabatrin
has prominent behavioural side-effects in some patients.

### Vigabatrin

**Indications** initiated and supervised by appropriate
specialist, adjunctive treatment of partial seizures
with or without secondary generalisation not satis-
factory controlled with other antiepileptics; mono-
therapy for management of infantile spasms (West's
syndrome)

**Cautions** renal impairment (Appendix 3); elderly;
clo-
sely monitor neurological function; avoid sudden
withdrawal (taper off over 2–4 weeks); history of
psychosis, depression or behavioural problems;
pregnancy (see p. 250 and Appendix 4) and breast-
feeding (Appendix 5); absence seizures (may be exa-
cerated); interactions: see p. 249 and Appendix 1
(vigabatrin)

**Visual field defects** Vigabatrin is associated with visual
field defects. The CSM has advised that onset of symptoms
varies from 1 month to several years after starting. In most
cases, visual field defects have persisted despite discontin-
uation. Product literature advises visual field testing before
treatment and at 6-month intervals; a procedure for testing
visual fields in those with a developmental age of less than 9
years is available from the manufacturers. Patients should be
warned to report any new visual symptoms that develop and
those with symptoms should be referred for an urgent
ophthalmological opinion. Gradual withdrawal of vigabatrin
should be considered.

**Contra-indications** visual field defects

**Side-effects** nausea, abdominal pain; oedema; drow-
siness (rarely encephalopathic symptoms including
marked sedation, stupor, and confusion with non-
specific slow wave EEG—reduce dose or withdraw),
fatigue, excitement, and agitation (especially in chil-
dren), dizziness, headache, nervousness, depression,
agression, paranoia, impaired concentration, mem-
ory disturbances, tremor, paraesthesia, weight gain;
visual field defects (see also under Cautions), blurred
vision, nystagmus, diplopia; less commonly ataxia,
sychosis, mania, and rash; occasional increase in
seizure frequency (especially if myoclonic); rarely suicidal ideation and retinal disorders (including peripheral retinal neuropathy); very rarely hepatitis, optic neuritis and optic atrophy; also reported, decrease in liver enzymes and speech disorder

Dose

- With current antiepileptic therapy, initially 1 g daily in single or 2 divided doses then increased according to response in steps of 500 mg at weekly intervals; usual range 2–3 g daily (max. 3 g daily); CHILD initially 40 mg/kg daily in single or 2 divided doses then adjusted according to body-weight 10–15 kg, 0.5–1 g daily; body-weight 15–30 kg, 1–1.5 g daily; body-weight 30–50 kg, 1.5–3 g daily; body-weight over 50 kg, 2–3 g daily
- Infantile spasms (West's syndrome), monotherapy, 50 mg/kg daily, adjusted according to response over 7 days; up to 150 mg/kg daily used with good tolerability

Sabril® (Aventis Pharma)

Tablets, 1/2, scored, vigabatrin 500 mg, net price 100-tab pack = £30.84. Label: 3, 8, counselling, driving (see notes above)

Powder, sugar-free, vigabatrin 500 mg/sachet. Net price 50-sachet pack = £17.08. Label: 3, 8, 15, counselling, driving (see notes above)

Note The contents of a sachet should be dissolved in water or a soft drink immediately before taking

Zonisamide

Zonisamide can be used as adjunctive treatment for refractory partial seizures with or without secondary generalisation.

ZONISAMIDE

Indications adjunctive therapy for refractory partial seizures with or without secondary generalisation

Cautions elderly; ensure adequate hydration (especially if predisposition to nephrolithiasis or in strenuous activity or warm environment); concomitant use of drugs that increase risk of hyperthermia or nephrolithiasis; avoid abrupt withdrawal; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: see p. 249 and Appendix 1 (zonisamide)

Contra-indications hypersensitivity to sulphonamides; breast-feeding (Appendix 5)

Side-effects nausea, diarrhoea, abdominal pain, anorexia, weight loss; drowsiness, dizziness, confusion, agitation, irritability, depression, ataxia, speech disorder, impaired memory and attention, pyrexia; diplopia; rash (consider withdrawal); less commonly vomiting, cholelithiasis, cholecytitis, aggression, suicidal ideation, convulsions, psychosis, urinary calcilus, hypokalaemia; very rarely hepatitis, pancreatitis, dysphonia, hallucinations, insomnia, amnesia, coma, myasthenic syndrome, neuroleptic malignant syndrome, heat stroke, hydrenephrosis, renal impairment, metabolic acidosis, blood disorders, rhabdomyolysis, impaired sweating, pruritus, and Stevens-Johnson syndrome

Dose

- ADULT over 18 years, initially 50 mg daily in 2 divided doses, increased after 7 days to 100 mg daily in 2 divided doses; then increase if necessary by 100 mg every 7 days; usual maintenance 300–500 mg daily in 1–2 divided doses

Zonegran® (Eisai)

Capsules, zonisamide 25 mg (white), net price 14-cap pack = £8.82; 50 mg (white/grey), 56-cap pack = £47.04; 100 mg (white/red), 56-cap pack = £62.72. Label: 3

Benzodiazepines

Clonazepam is occasionally used in tonic-clonic or partial seizures, but its sedative side-effects may be prominent. Clobazam may be used as adjunctive therapy in the treatment of epilepsy (section 4.1.2), but the effectiveness of these and other benzodiazepines may wane considerably after weeks or months of continuous therapy.

CLOBAZAM

Indications adjunct in epilepsy; anxiety (short-term use)

Cautions see under Diazepam (section 4.1.2)

Contra-indications see under Diazepam (section 4.1.2)

Side-effects see under Diazepam (section 4.1.2)

Dose

- Epilepsy, 20–30 mg daily; max. 60 mg daily; CHILD over 3 years, not more than half adult dose
- Anxiety, 20–30 mg daily in divided doses or as a single dose at bedtime, increased in severe anxiety (in hospital patients) to a max. of 60 mg daily in divided doses; ELDERLY (or debilitated) 10–20 mg daily

Clobazam (Non-proprietary)

Tablets, clobazam 10 mg. Net price 30-tab pack = £9.74. Label: 2 or 19, 8, counselling, driving (see notes above)

Brands include Frisium

1. except for epilepsy and endorsed ‘SLS’

CLONAZEPAM

Indications all forms of epilepsy; myoclonus; status epilepticus (section 4.8.2)

Cautions see notes above; elderly and debilitated, respiratory disease, spinal or cerebellar ataxia; history of alcohol or drug abuse, depression or suicidal ideation; avoid sudden withdrawal; myasthenia gravis (avoid if unstable); acute porphyria (section 9.8.2); hepatic impairment (avoid if severe; Appendix 2); renal impairment; pregnancy (see notes above and Appendix 4); breast-feeding (see notes above and Appendix 5); interactions: Appendix 1 (anxiolytics and hypnotics)

Driving Drowsiness may affect performance of skilled tasks (e.g. driving); effects of alcohol enhanced

Contra-indications respiratory depression; acute pulmonary insufficiency; sleep apnoea syndrome; marked neuromuscular respiratory weakness including unstable myasthenia gravis

Side-effects drowsiness, fatigue, dizziness, muscle hypotonia, co-ordination disturbances; also poor concentration, restlessness, confusion, amnesia, dependence, and withdrawal; salivary or bronchial hypersecretion in infants and small children; rarely gastro-intestinal symptoms, respiratory depression,
headache, paradoxical effects including aggression, anxiety, sexual dysfunction, urinary incontinence, urticaria, pruritus, reversible hair loss, skin pigmentation changes; dysarthria, and visual disturbances on long-term treatment; blood disorders reported; over-dosage: see Emergency Treatment of Poisoning, p. 32

Dose

- 1 mg (ELDERLY 500 micrograms) initially at night for 4 nights, increased according to response over 2–4 weeks to usual maintenance dose of 4–8 mg usually at night (may be given in 3–4 divided doses if necessary); CHILD up to 1 year, initially 250 micrograms increased as above to usual maintenance dose of 0.5–1 mg, 1–5 years, initially 250 micrograms increased as above to 1–3 mg, 5–12 years, initially 500 micrograms increased as above to 3–6 mg

Note Clonazepam doses in BNF may differ from those in product literature

Rivotril® (Roche) (NH)

Tablets, both scored, clonazepam 500 micrograms (beige), net price 100 = £3.92; 2 mg (white), 100 = £5.23. Label: 2, 8, counselling, driving (see notes above)

Injection, section 4.8.2

Other drugs

Acetazolamide (section 11.6), a carbonic anhydrase inhibitor, has a specific role in treating epilepsy associated with menstruation. It can also be used with other antiepileptics for tonic-clonic and partial seizures. It is occasionally helpful in atypical absence, atomic, and tonic seizures.

Piracetam (section 4.9.3) is used as adjunctive treatment for cortical myoclonus.

4.8.2 Drugs used in status epilepticus

Immediate measures to manage status epilepticus include positioning the patient to avoid injury, supporting respiration including the provision of oxygen, maintaining blood pressure, and the correction of any hypoglycaemia. Parenteral thiamine should be considered if alcohol abuse is suspected; pyridoxine (section 9.6.2) should be given if the status epilepticus is caused by pyridoxine deficiency.

Major status epilepticus should be treated urgently with intravenous lorazepam, repeated once after 10 minutes if seizures recur. Intravenous diazepam is effective but it is associated with a high risk of thrombophlebitis (reduced by using an emulsion formulation). Absorption of diazepam from intramuscular injection or from suppositories is too slow for treatment of status epilepticus. Clonazepam can also be used as an alternative.

Where facilities for resuscitation are not immediately available, diazepam can be administered as a rectal solution or midazolam [unlicensed use] can be given into the buccal cavity.

Phenytoin sodium may be given by slow intravenous injection, with ECG monitoring, followed by the maintenance dosage. Intramuscular use of phenytoin is not recommended (absorption is slow and erratic).

Alternatively, fosphenytoin, a pro-drug of phenytoin, can be given more rapidly and when given intravenously causes fewer injection-site reactions than phenytoin. Intravenous administration requires ECG monitoring. Although it can also be given intramuscularly, absorption is too slow by this route for treatment of status epilepticus. Doses of fosphenytoin should be expressed in terms of phenytoin sodium.

Paraldehyde also remains a valuable drug. Given rectally it causes little respiratory depression and is therefore useful where facilities for resuscitation are poor.

For advice on the management of epileptic seizures in dental practice, see p. 22.

Non-convulsive status epilepticus

The urgency to treat non-convulsive status epilepticus depends upon the severity of the patient’s condition. If there is incomplete loss of awareness, usual oral antiepileptic therapy should be continued or restarted. Patients who fail to respond to oral antiepileptic therapy or have complete lack of awareness can be treated in the same way as for convulsive status epilepticus, although anaesthesia is rarely needed.

CLONAZEPAM

Indications status epilepticus; other forms of epilepsy, and myoclonus (section 4.8.1)

Cautions see section 4.8.1; facilities for reversing respiratory depression with mechanical ventilation must be at hand (but see also notes above)

Intravenous infusion Intravenous infusion of clonazepam is potentially hazardous (especially if prolonged), calling for close and constant observation and best carried out in specialist centres with intensive care facilities. Prolonged infusion may lead to accumulation and delay recovery

Contra-indications see section 4.8.1; avoid injections containing benzyl alcohol in neonates (see under preparations below)

Side-effects see section 4.8.1; hypotension and apnoea

Dose

- By intravenous injection into a large vein (over at least 2 minutes) or by intravenous infusion, 1 mg, repeated if necessary; CHILD all ages, 500 micrograms

Rivotril® (Roche) (NH)

Injection, clonazepam 1 mg/mL in solvent, for dilution with 1 mL water for injections immediately before
4 Central nervous system

4.8.2 Drugs used in status epilepticus

**FOSPHENYTOIN SODIUM**

**Note** Fosphenytoin is a pro-drug of phenytoin.

**Indications** status epilepticus; seizures associated with neurosurgery or head injury; when phenytoin by mouth not possible

**Cautions** see Phenytoin Sodium; liver impairment

**Contra-indications** see section 4.1.2

**Side-effects** see section 4.1.2; hypotension and apnoea

**Dose**

- Status epilepticus, by intravenous infusion (at a rate of 100–150 mg(PE)/minute), initially 20 mg(PE)/kg then by intravenous infusion (at a rate of 50–100 mg(PE)/minute), 4–5 mg(PE)/kg daily in 1–2 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration
- CHILD 5 years and over, by intravenous infusion (at a rate of 2–3 mg(PE)/kg/minute), initially 20 mg(PE)/kg then by intravenous infusion (at a rate of 1–2 mg(PE)/kg/minute), 4–5 mg(PE)/kg daily in 1–4 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration
- Prophylaxis or treatment of seizures associated with neurosurgery or head injury, by intramuscular injection or by intravenous infusion (at a rate of 50–100 mg(PE)/minute), initially 10–15 mg(PE)/kg then by intramuscular injection or by intravenous infusion (at a rate of 50–100 mg(PE)/minute), 4–5 mg(PE)/kg daily (in 1–2 divided doses), dose adjusted according to response and trough plasma-phenytoin concentration
- CHILD 5 years and over, by intravenous infusion (at a rate of 1–2 mg(PE)/kg/minute), initially 10–15 mg(PE)/kg then 4–5 mg(PE)/kg daily in 1–4 divided doses, dose adjusted according to response and trough plasma-phenytoin concentration
- Temporary substitution for oral phenytoin, by intramuscular injection or by intravenous infusion (at a rate of 50–100 mg(PE)/minute), same dose and dosing frequency as oral phenytoin therapy; CHILD 5 years and over, by intravenous infusion (at a rate of 1–2 mg(PE)/kg/minute), same dose and dosing frequency as oral phenytoin therapy

**Note** ELDERLY consider 10–25% reduction in dose or infusion rate

**Note** Fosphenytoin sodium doses in BNF may differ from those in product literature

**Pro-Epanutin® (Pfizer)**

**Injection**, fosphenytoin sodium 75 mg/mL (equivalent to phenytoin sodium 50 mg/mL), net price 10-mL vial = £40.00

Electrolytes phosphate 3.7 micromol/mg fosphenytoin sodium (phosphate 5.6 micromol/mg phenytoin sodium)

**LORAZEPAM**

**Indications** status epilepticus; other indications (section 4.1.2)

**Cautions** see section 4.1.2

**Contra-indications** see under Diazepam (section 4.1.2)

**Side-effects** see under Diazepam (section 4.1.2)

**Dose**

- By slow intravenous injection (into large vein), 4 mg repeated once after 10 minutes if necessary; CHILD under 12 years 100 micrograms/kg (max. 4 mg) repeated once after 10 minutes if necessary

**Preparations**

Section 4.1.2
**MIDAZOLAM**

**Indications** status epilepticus [unlicensed indication]; other indications (section 15.1.4)

**Cautions** section 15.1.4

**Contra-indications** section 15.1.4

**Side-effects** section 15.1.4

**Dose**

- By buccal administration, *ADULT* and *CHILD* over 10 years, 10 mg repeated once if necessary; *CHILD* up to 6 months, 300 micrograms/kg (max. 2.5 mg); 6 months–1 year, 2.5 mg; 1–5 years, 5 mg; 5–10 years, 7.5 mg

**Note** Midazolam injection solution may be given by buccal administration

**Midazolam** (Non-proprietary) [EB]

Buccal liquid, midazolam 10 mg/mL

'Special order' [unlicensed] product; brands include Epistatus

**Injection**

Section 15.1.4

---

**PARALDEHYDE**

**Indications** status epilepticus

**Cautions** bronchopulmonary disease, hepatic impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5); *interactions:* Appendix 1 (paraldehyde)

**Contra-indications** gastric disorders; rectal administration in colitis

**Side-effects** rashes; rectal irritation after enema

**Dose**

- By rectum, *ADULT* and *CHILD* over 12 years, 20 mL; *CHILD* up to 3 months 0.5 mL, 3–6 months 1 mL, 6–12 months 1.5 mL, 1–2 years 2 mL, 2–5 years 3–4 mL, 6–12 years 5–10 mL

**Administration** Administer as an enema containing 1 part paraldehyde diluted with 9 parts physiological saline (some centres mix paraldehyde with an equal volume of arachis (peanut) oil instead)

**Note** Do not use paraldehyde if it has a brownish colour or an odour of acetic acid. Avoid contact with rubber and plastics.

**Paraldehyde** (Non-proprietary) [P]

**Injection**, sterile paraldehyde, net price 5-mL amp = £9.49

---

**PHENOBARBITAL SODIUM**

(Phenobarbitone sodium)

**Indications** status epilepticus; other forms of epilepsy except absence seizures (section 4.8.1)

**Cautions** see under Phenobarbital (section 4.8.1)

**Side-effects** see under Phenobarbital (section 4.8.1)

**Dose**

- Status epilepticus, by intravenous injection (dilute injection 1 in 10 with water for injections), 10 mg/kg at a rate of not more than 100 mg/minute; max. 1 g

**Note** For therapeutic purposes phenobarbital and phenobarbital sodium may be considered equivalent in effect

**Phenobarbital** (Non-proprietary) [P]

**Injection**, phenobarbital sodium 200 mg/mL, net price 1-mL amp = £2.00

**Excipients** include propylene glycol 90% (see Excipients, p. 2)

**Note** Must be diluted before intravenous administration (see under Dose)

**Oral preparations**

Section 4.8.1

---

**PHENYTOIN SODIUM**

**Indications** status epilepticus; seizures in neurosurgery; arrhythmias, but now obsolete (section 2.3.2)

**Cautions** hypotension and heart failure; resuscitation facilities must be available; injection solutions alkaline (irritant to tissues); see also p. 256; *interactions:* see p. 249 and Appendix 1 (phenytoin)

**Contra-indications** sinus bradycardia, sino-atrial block, and second- and third-degree heart block; Stokes-Adams syndrome; acute porphyria (section 9.8.2)

**Side-effects** intravenous injection may cause cardiovascular and CNS depression (particularly if injection too rapid) with arrhythmias, hypotension, and cardiovascular collapse; alterations in respiratory function (including respiratory arrest); injection site reactions; see also p. 256

**Dose**

- By slow intravenous injection or infusion (with blood pressure and ECG monitoring), status epilepticus, 18 mg/kg at a rate not exceeding 50 mg per minute, as a loading dose (see also notes above); maintenance doses of about 100 mg should be given thereafter at intervals of every 6–8 hours, monitored by measurement of plasma concentrations; rate and dose reduced according to weight; *CHILD* 18 mg/kg as a loading dose (NEONATE 15–20 mg/kg at rate of 1–3 mg/kg/minute)

**Side-effects**

- Ventricular arrhythmias (but use now obsolete), by intravenous injection via caval catheter, 3.5–5 mg/kg at a rate not exceeding 50 mg/minute, with blood pressure and ECG monitoring; repeated once if necessary

**Note** To avoid local venous irritation each injection or infusion should be preceded and followed by an injection of sterile physiological saline through the same needle or catheter

- By intramuscular injection, not recommended (see notes above)

**Note** Phenytoin sodium doses in BNF may differ from those in product literature

**Phenytoin** (Non-proprietary) [PM]

**Injection**, phenytoin sodium 50 mg/mL with propylene glycol 40% and alcohol 10% in water for injections, net price 5-mL amp = £3.40

**Epanutin® Ready-Mixed Parenteral** (Pfizer) [PM]

**Injection**, phenytoin sodium 50 mg/mL with propylene glycol 40% and alcohol 10% in water for injections, net price 5-mL amp = £4.88

**Electrolytes** 1.1 mmol Na per 5 mL ampoule

**Oral preparations**

Section 4.8.1

---

**4.8.3 Febrile convulsions**

Brief febrile convulsions need no specific treatment; antipyretic medication, e.g., *paracetamol* (section 4.7.1) is commonly used to reduce fever and prevent further convulsions but evidence to support this practice is lacking. *Prolonged febrile convulsions* (those lasting 15 minutes or longer), *recurrent convulsions,* or those occurring in a child at known risk must be treated more actively, as there is the possibility of resulting brain damage. *Diazepam* is the drug of choice given either by slow intravenous injection or preferably rectally in solution (section 4.8.2). The rectal route is preferred as
In idiopathic Parkinson’s disease, the progressive degeneration of pigmented neurones in the substantia nigra leads to a deficiency of the neurotransmitter dopamine. The resulting neurochemical imbalance in the basal ganglia causes the characteristic signs and symptoms of the illness. Drug therapy does not prevent disease progression, but it improves most patients’ quality of life.

Patients with suspected Parkinson’s disease should be referred to a specialist to confirm the diagnosis; the diagnosis should be reviewed every 6–12 months.

Features resembling those of Parkinson’s disease can occur in diseases such as progressive supranuclear palsy and multiple system atrophy, but they do not normally show a sustained response to the drugs used in the treatment of idiopathic Parkinson’s disease.

When initiating treatment, patients should be advised about its limitations and possible side-effects. About 5–10% of patients with Parkinson’s disease respond poorly to treatment.

Treatment is usually not started until symptoms cause significant disruption of daily activities. Therapy with two or more antiparkinsonian drugs may be necessary as the disease progresses. Most patients eventually require levodopa and subsequently develop motor complications.

Antiparkinsonian drug therapy should never be stopped abruptly as this carries a small risk of neuroleptic malignant syndrome.

Elderly Antiparkinsonian drugs can cause confusion in the elderly. It is particularly important to initiate treatment with low doses and to increase the dose gradually.

4.9 Drugs used in parkinsonism and related disorders

4.9.1 Dopaminergic drugs used in parkinsonism

Dopamine receptor agonists

The dopamine receptor agonists, bromocriptine, cabergoline, pergolide, pramipexole, ropinirole, and rotigotine have a direct action on dopamine receptors. The treatment of new patients is often started with dopamine receptor agonists. They are also used with levodopa in more advanced disease. Rotigotine is licensed for use as monotherapy in early-stage Parkinson’s disease.

When used alone, dopamine receptor agonists cause fewer motor complications in long-term treatment compared with levodopa treatment but the overall motor performance improves slightly less. The dopamine receptor agonists are associated with more neuropsychiatric side-effects than levodopa. The ergot-derived dopamine receptor agonists, bromocriptine, cabergoline, and pergolide, have been associated with fibrotic reactions (see notes below). Patients should be monitored for signs of cardiac fibrosis, using ECG before and at regular intervals during treatment with cabergoline or pergolide. In most cases, non-ergot-derived dopamine agonists are preferred over ergot-derived dopamine agonists.

Dopamine receptor agonists can cause excessive daytime sleepiness and sudden onset of sleep, see Sudden Onset of Sleep, p. 268.

Hypotensive reactions can occur in some patients taking dopamine agonists; these can be particularly problematic during the first few days of treatment and care should be exercised when driving or operating machinery.

Doses of dopamine receptor agonists should be increased slowly according to response and tolerability. Treatment with dopamine receptor agonists should not be withdrawn abruptly.

Fibrotic reactions

The CSM (updated by MHRA/CHM July and October 2008) has advised that ergot-derived dopamine receptor agonists, bromocriptine, cabergoline, lisuride [discontinued], and pergolide, have been associated with pulmonary, retroperitoneal, and pericardial fibrotic reactions. Exclude cardiac valvulopathy with echocardiography before starting treatment with these ergot derivatives for Parkinson’s disease or chronic endocrine disorders (excludes suppression of lactation); it may also be appropriate to measure the erythrocyte sedimentation rate and serum creatinine and to obtain a chest X-ray. Patients should be monitored for dyspnoea, persistent cough, chest pain, cardiac failure, and abdominal pain or tenderness. If long-term treatment is expected, then lung-function tests may also be helpful. Patients taking cabergoline or pergolide should be regularly monitored for cardiac fibrosis by echocardiography (within 3–6 months of initiating treatment and subsequently at 6–12 month intervals).

Apomorphine is a potent dopamine agonist that is sometimes helpful in advanced disease for patients due to lack of satisfactory absorption is achieved within minutes and administration is much easier. Suppositories are not suitable because absorption is too slow.

Intermittent prophylaxis (i.e. the anticonvulsant administered at the onset of fever) is possible in only a small proportion of children. Again diazepam is the treatment of choice, orally or rectally.

Long-term anticonvulsant prophylaxis for febrile convulsions is rarely indicated. Anticonvulsant treatment needs to be considered only for children at risk from prolonged or complex febrile convulsions, including those whose first seizure occurred at under 14 months or who have neurological abnormalities or who have had previous prolonged or focal convulsions.

4.9.2 Antimuscarinic drugs used in parkinsonism

4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders
experiencing unpredictable ‘off’ periods with levodopa treatment. Apomorphine is highly emetogenic; patients must receive domperidone for at least 2 days before starting treatment. Specialist supervision is advisable throughout apomorphine treatment.

**APOMORPHINE HYDROCHLORIDE**

**Indications** refractory motor fluctuations in Parkinson’s disease (“off” episodes) inadequately controlled by levodopa with dopa-decarboxylase inhibitor or other dopaminergics (for capable and motivated patients under specialist supervision)

**Cautions** see notes above; pulmonary or cardiovascular disease, history of postural hypotension (special care on initiation); neuropsychiatric problems or dementia; hepatic, haemopoietic, renal, and cardiovascular monitoring; on administration with levodopa test initially and every 6 months for haemolytic anaemia (development calls for specialist haematological care with dose reduction and possible discontinuation); renal impairment; pregnancy; interactions: Appendix 1 (apomorphine)

**Contra-indications** respiratory depression, hypersensitivity to opioids; not suitable if ‘on’ response to levodopa marred by severe dyskinesia, hypotonia or psychiatric effects; hepatic impairment; breast-feeding; not for intravenous administration

**Side-effects** nausea, vomiting (see below under Dose); drowsiness (including sudden onset of sleep), confusion, hallucinations, injection-site reactions (including nodule formation and ulceration)—change injection sites in rotation; less commonly postural hypotension, breathing difficulties, dykinesias during ‘on’ periods (may require discontinuation), haemolytic anaemia with levodopa (see Cautions), and rash; rarely eosinophilia; pathological gambling, increased libido, and hypersexuality also reported

**Dose**

- **By subcutaneous injection**, usual range (after initiation as below) 3–30 mg daily in divided doses; subcutaneous infusion may be preferable in those requiring division of injections into more than 10 doses daily; max. single dose 10 mg; CHILD and ADOLESCENT under 18 years not recommended

- **By continuous subcutaneous infusion** (those requiring division into more than 10 injections daily) initially 1 mg/hour daily increased according to response (not more often than every 4 hours) in max. steps of 500 micrograms/hour, to usual rate of 1–4 mg/hour (14–60 micrograms/kg/hour); change infusion site every 12 hours and give during waking hours only (24-hour infusions not advised unless severe night-time symptoms)—intermittent bolus boosts also usually needed; CHILD and ADOLESCENT under 18 years not recommended

**Note** Total daily dose by either route (or combined routes) max. 100 mg

**Requirements for initiation** Hospital admission and at least 2 days of pretreatment with domperidone for nausea and vomiting, after at least 3 days withhold existing antiparkinsonian medication overnight to provoke ‘off’ episode, determine threshold dose, re-establish other antiparkinsonian drugs, determine effective apomorphine regimen, teach to administer by subcutaneous injection into lower abdomen or outer thigh at first sign of ‘off’ episode, discharge from hospital, monitor frequently and adjust dosage regimen as appropriate (domperidone may normally be withdrawn over several weeks or longer)—for full details of initiation requirements, consult product literature

**Injection** apomorphine hydrochloride 10 mg/mL, net price 2-mL amp = £7.59, 5-mL amp = £14.62

**Excipients** include sulphites

**Injection (APO-go® Pen)**, apomorphine hydrochloride 10 mg/mL, net price 3-mL pen injector = £24.78

**Excipients** include sulphites

**Injection (APO-go® PFS)**, apomorphine hydrochloride 5 mg/mL, net price 10-mL prefilled syringe = £14.62

**Excipients** include sulphites

**BROMOCRIPTINE**

**Indications** parkinsonism (but not drug-induced extrapyramidal symptoms); endocrine disorders (section 6.7.1)

**Cautions** see section 6.7.1 and notes above

**Contra-indications** section 6.7.1

**Side-effects** section 6.7.1

**Dose**

- **First week** 1–1.25 mg at night, second week 2–2.5 mg at night, third week 2.5 mg twice daily, fourth week 2.5 mg 3 times daily then increasing by 2.5 mg every 3–4 days according to response to a usual range of 10–30 mg daily; taken with food

**Preparations** Section 6.7.1

**CABERGOLINE**

**Indications** alone or as adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson’s disease where dopamine receptor agonists other than ergot derivative not appropriate; endocrine disorders (section 6.7.1)

**Cautions** see section 6.7.1 and notes above

**Contra-indications** section 6.7.1

**Side-effects** section 6.7.1

**Dose**

- **Initially** 1 mg daily, increased by increments of 0.5–1 mg at 7 or 14 day intervals; usual range 2–3 mg daily

**Note** Concurrent dose of levodopa may be decreased gradually while dose of cabergoline is increased

**Cabergoline** (Non-proprietary) Tablets, scored, cabergoline 1 mg, net price 20-tab pack = £52.97; 2 mg, 20-tab pack = £63.78. Label: 21, counselling, hypotensive reactions, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**Cabaser®** (Pharmacia) Tablets, scored, cabergoline 1 mg, net price 20-tab pack = £83.00; 2 mg, 20-tab pack = £83.00. Label: 21, counselling, hypotensive reactions, driving, see notes above

**Note** Dispense in original container (contains desiccant)

**PERGOLIDE**

**Indications** alone or as adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson’s disease where dopamine receptor agonists other than ergot derivative not appropriate

**Cautions** see notes above; arrhythmias or underlying cardiac disease; history of confusion, psychosis, or...
hallucinations, dyskinesia (may exacerbate); acute porphyria (section 9.8.2); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (pergolide)

Contra-indications
history of fibrotic disorders; cardiac valvulopathy (exclude before treatment, see Fibrotic Reactions, p. 264)

Side-effects
see notes above; also nausea, vomiting, dyspepsia, abdominal pain; dysphonia, rhinitis; hallucinations, dyskinesia, drowsiness (including sudden onset of sleep); diplopia; also reported constipation, diarrhoea, tachycardia, atrial premature contractions, palpitation, hypotension, syncope, Raynaud's phenomenon, cardiac valvulopathy, pericarditis, pericardial effusion, pleuritis, pleural effusion, pleural fibrosis, insomnia, confusion, dizziness, pathological gambling, neuroleptic malignant syndrome, fever, increased libido, hypersexuality, and rash

Dose
- Monotherapy, 50 micrograms at night on day 1, then 50 micrograms twice daily on days 2–4, then increased by 100–250 micrograms daily every 3–4 days to 1.5 mg daily in 3 divided doses at day 28; after day 30, further increases every 3–4 days of up to 250 micrograms daily; usual maintenance dose 2.1–2.5 mg daily; max. 3 mg daily
- Adjunctive therapy with levodopa, 50 micrograms daily for 2 days, increased gradually by 100–150 micrograms every 3 days over next 12 days, usually given in 3 divided doses; further increases of 250 micrograms every 3 days; max. 3 mg daily; during pergolide titration levodopa dose may be reduced cautiously

Pergolide (Non-proprietary)
Tablets, pergolide (as mesilate) 50 micrograms, net price 100-tab pack = £13.80; 250 micrograms, 100-tab pack = £11.27; 1 mg, 100-tab pack = £28.96. Counselling, hypotensive reactions, driving, see notes above

Celance® (Lilly)
Tablets, all scored, pergolide (as mesilate) 50 micrograms (ivory), net price 100-tab pack = £32.44; 250 micrograms (green), 100-tab pack = £48.92; 1 mg (pink), 100-tab pack = £176.58. Counselling, hypotensive reactions, driving, see notes above

Pramipexole
Indications Parkinson's disease, used alone or as an adjunct to levodopa with a dopa-decarboxylase inhibitor; moderate to severe restless legs syndrome
Caution see notes above; psychotic disorders; ophthalmological testing recommended (risk of visual disorders); severe cardiovascular disease; renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (pramipexole)

Contra-indications
breast-feeding (Appendix 5)

Side-effects
see notes above; also nausea, constipation; postural hypotension, hypotension, headache, confusion, drowsiness (including sudden onset of sleep), fatigue, insomnia, dizziness, hallucinations (mostly visual), dyskinesia, peripheral oedema; hyperkinesia, delusions, abnormal dreams, paradoxical worsening of restless legs syndrome, and behavioural changes including pathological gambling, binge eating, hypersexuality, and changes in libido also reported

Dose
Important Doses and strengths are stated in terms of pramipexole (base); equivalent strengths in terms of pramipexole dihydrochloride monohydrate (salt) are as follows: 88 micrograms base = 125 micrograms salt; 180 micrograms base = 250 micrograms salt; 350 micrograms base = 500 micrograms salt; 700 micrograms base = 1 mg salt
- Parkinson's disease, initially 88 micrograms 3 times daily, dose doubled every 5–7 days if tolerated to 350 micrograms 3 times daily; further increased if necessary by 180 micrograms 3 times daily at weekly intervals; max. 3.3 mg daily in 3 divided doses
Note During pramipexole dose titration and maintenance, levodopa dose may be reduced
- Restless legs syndrome, initially 88 micrograms once daily 2–3 hours before bedtime, dose doubled every 4–7 days if necessary to 350 micrograms daily; max. 540 micrograms daily; CHILD under 18 years not recommended

Mirapexin® (Boehringer Ingelheim)
Tablets, pramipexole (as hydrochloride) 88 micrograms, net price 100-tab pack = £9.55; 180 micrograms (scored), 30-tab pack = £19.10, 100-tab pack = £63.67; 350 micrograms (scored), 30-tab pack = £38.20, 100-tab pack = £127.34; 700 micrograms (scored), 30-tab pack = £76.40, 100-tab pack = £254.69. Counselling, hypotensive reactions, driving, see notes above

Ropinirole
Indications Parkinson's disease, either used alone or as an adjunct to levodopa with a dopa-decarboxylase inhibitor; moderate to severe restless legs syndrome
Caution see notes above; severe cardiovascular disease, major psychotic disorders; hepatic impairment (Appendix 2); renal impairment (Appendix 3); interactions: Appendix 1 (ropinirole)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5)

Side-effects
see notes above; also nausea, vomiting, abdominal pain, dyspepsia, constipation; syncope, peripheral oedema; drowsiness (including sudden onset of sleep, see p. 268), dizziness, nervousness, fatigue, dyskinesia, hallucinations, confusion; less commonly psychosis, pathological gambling, hypersexuality, and increased libido; very rarely hepatic disorders; also reported paradoxical worsening of restless legs syndrome

Dose
- See under preparations

Adartrel® (GSK)
Tablets, 1.5 mg, ropinirole (as hydrochloride) 250 micrograms (white), net price 12-tab pack = £3.94; 500 micrograms (yellow), 28-tab pack = £15.75, 84-tab pack = £47.26; 2 mg (pink), 28-tab pack = £31.51, 84-tab pack = £94.53. Label: 21, counselling, driving, see notes above

Dose restless legs syndrome, initially 250 micrograms at night for 2 days, increased if tolerated to 500 micrograms at night for 3 days and then to 1 mg at night for 7 days; further increased at weekly intervals in steps of 250 micrograms daily according to response; usual dose 2 mg once at night; max. 4 mg once daily; CHILD under 18 years not recommended
Note Repeat dose titration if restarting after interval of more than a few days

The Scottish Medicines Consortium has advised (June 2006) that Adartrel should be restricted for use in patients with a baseline score of 24 points or more on the International Restless Legs Scale
Requip® (GSK) 

Tablets, f/c, ropinirole (as hydrochloride) 1 mg (green), net price 84-tab pack = £47.26; 2 mg (pink), 84-tab pack = £94.53; 5 mg (blue), 84-tab pack = £163.27; 28-day starter pack of 42 × 250-microgram (white) tablets, 42 × 500-microgram (yellow) tablets, and 21 × 1-mg (green) tablets = £40.10; 28-day follow-on pack of 42 × 500-microgram (yellow) tablets, 42 × 1-mg (green) tablets, and 63 × 2-mg (pink) tablets = £74.40. Label: 21, counselling, driving, see notes above

Dose Parkinson’s disease, initially 750 micrograms daily in 3 divided doses, increased by increments of 750 micrograms at weekly intervals to 3 mg daily; further increased by increments of up to 3 mg at weekly intervals according to response, usual range 9–16 mg daily (but higher doses may be required if used with levodopa); max. 24 mg daily

Note When administered as adjunct to levodopa, concurrent dose of levodopa may be reduced by approx. 20%, ropinirole doses in the BNF may differ from those in product literature

Modified release

Requip® XL (GSK) ▼ (FW)

Tablets, m/f, f/c, ropinirole (as hydrochloride) 2 mg (pink), net price 28-tab pack = £31.36; 4 mg (brown), 28-tab pack = £62.72; 8 mg (red), 28-tab pack = £105.28. Label: 25, counselling, driving, see notes above

Dose stable Parkinson’s disease in patients transferring from ropinirole immediate-release tablets, initially Requip XL once daily substituted for total daily dose equivalent of ropinirole immediate-release tablets; if control not maintained after switching, in patients receiving less than 8 mg once daily, increase in steps of 2 mg at intervals of at least 1 week to 8 mg once daily according to response, in patients receiving 8 mg once daily or more, increase in steps of 2 mg at intervals of at least 2 weeks according to response; max. 24 mg once daily

Note When administered as adjunct to levodopa, concurrent dose of levodopa may be reduced

ROTIGOTINE

Indications Parkinson’s disease, either used alone or as an adjunct to levodopa with dopa-decarboxylase inhibitor

Cautions see notes above; ophthalmic testing recommended; avoid exposure of patch to heat; hepatic impairment (Appendix 2); interactions: Appendix 1 (rotigotine)

Contra-indications pregnancy (Appendix 4); breast-feeding (Appendix 5); remove patch (aluminium-containing) before magnetic resonance imaging or cardioversion

Side-effects nausea, vomiting, constipation, dry mouth, diarrhoea, dyspepsia, weight changes; postural hypotension, peripheral oedema; confusion, drowsiness (including sudden onset of sleep), sleep disorders, dizziness, headache, dyskinesia, asthenia, hallucinations; hyperhidrosis, rash (including local reactions to patch), and pruritus; less commonly abdominal pain, anorexia, taste disturbance, palpitation, tachycardia, hypotension, hypertension, atrial fibrillation, syncope, dyspnoea, cough, hiccup, tremor, psychosis, pathological gambling, anxiety, impaired attention, dystonia, paraesthesia, impaired memory, erectile dysfunction, increased libido, arthralgia, and visual disturbances; rarely convulsions and loss of consciousness

Dose

• Monotherapy, apply ‘2 mg/24 hours’ patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for 14 days); increased in steps of 2 mg/24 hours at weekly intervals if required; max. 8 mg/24 hours

• Adjunctive therapy with levodopa, apply ‘4 mg/24 hours’ patch to dry, non-irritated skin on torso, thigh, or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same site for 14 days); increased in steps of 2 mg/24 hours at weekly intervals if required; max. 16 mg/24 hours

Neupro® (UCB Pharma) ▼ (FW)

Tablets, self-adhesive, beige, rotigotine 2 mg/24 hours, net price 28 = £77.24; 4 mg/24 hours, 28 = £117.71; 6 mg/24 hours, 28 = £142.79; 8 mg/24 hours, 28 = £142.79; 28-day starter pack of 7 × 2 mg/24 hours, 7 × 4 mg/24 hours, 7 × 6 mg/24 hours, and 7 × 8 mg/24 hours patches = £142.79. Counselling, hypotensive reactions, driving, see notes above

Note The Scottish Medicines Consortium has advised that Neupro is accepted as monotherapy for the treatment of early-stage idiopathic Parkinson’s disease (June 2007) and for restricted use for the treatment of advanced Parkinson’s disease in combination with levodopa where the transdermal route would facilitate treatment (July 2007)

Lеводопа

Lеводопа, the amino-acid precursor of dopamine, acts by replenishing depleted striatal dopamine; it is given with an extracerebral dopa-decarboxylase inhibitor that reduces the peripheral conversion of levodopa to dopamine, thereby limiting side-effects such as nausea, vomiting and cardiovascular effects. Additionally, effective brain-dopamine concentrations can be achieved with lower doses of levodopa. The extracerebral dopa-decarboxylase inhibitors used with levodopa are benzserazide (in co-beneldopa) and carbidopa (in co-careldopa). Levodopa, in combination with a dopa-decarboxylase inhibitor, is useful in the elderly or frail, in patients with other significant illnesses, and in those with more severe symptoms. It is effective and well tolerated in the majority of patients. Levodopa therapy should be initiated at a low dose and increased in small steps; the final dose should be as low as possible. Intervals between doses should be chosen to suit the needs of the individual patient. Note When co-careldopa is used, the total daily dose of carbidopa should be at least 70 mg. A lower dose may not achieve full inhibition of extracerebral dopa-decarboxylase, with a resultant increase in side-effects.

Nausea and vomiting with co-beneldopa or co-careldopa are rarely dose-limiting but domperidone (section 4.6) may be useful in controlling these effects. Levodopa treatment is associated with the development of potentially troublesome motor complications including response fluctuations and dyskinasias. Response fluctuations are characterised by large variations in motor performance, with normal function during the ‘on’ period, and weakness and restricted mobility during the ‘off’ period. ‘End-of-dose’ deterioration also occurs, where the duration of benefit after each dose becomes progressively shorter. Modified-release preparations
may help with ‘end-of-dose’ deterioration or nocturnal immobility and rigidity. Motor complications are particularly problematic in young patients treated with levodopa.

**Cautions** Levodopa should be used with caution in severe cardiovascular or pulmonary disease, psychiatric illness (avoid if severe), endocrine disorders (including hyperthyroidism, Cushing’s syndrome, diabetes mellitus, osteomalacia, and pheochromocytoma), and in those with a history of convulsions, malignant melanoma, or peptic ulcer. Levodopa should be used with caution in open-angle glaucoma and patients susceptible to angle-closure glaucoma, and in hepatic or renal impairment. Patients should be advised to avoid abrupt withdrawal (risk of neuroleptic malignant syndrome and rhabdomyolysis), and to be aware of the potential for excessive drowsiness and sudden onset of sleep (see Sudden Onset of Sleep, below). Levodopa should be used with caution in pregnancy (Appendix 4); **interactions:** Appendix 1 (levodopa).

**Contra-indications** Levodopa should be avoided in breast-feeding (Appendix 5).

**Side-effects** Side-effects of levodopa include nausea, vomiting, taste disturbances, dry mouth, anorexia, arrhythmias, postural hypotension, syncope, drowsiness (including sudden onset of sleep), fatigue, dementia, psychoses, hallucinations, confusion, euphoria, abnormal dreams, insomnia, depression (very rarely with suicidal ideation), anxiety, dizziness, dystonia, dyskinesia, and chorea.

Less commonly weight loss or gain, constipation, diarrhoea, hypersalivation, dysphagia, flatulence, hypertension, chest pain, oedema, hoarseness, ataxia, increased hand tremor, malaise, muscle cramps, and reddish discoloration of the urine and other body fluids may occur. Rare side-effects include abdominal pain, gastro-intestinal bleeding, dyspepsia, phlebitis, dyspnkea, agitation, paraesthesia, bruxism, trismus, hiccup, neuroleptic malignant syndrome (associated with abrupt withdrawal), convulsions, reduced mental acuity, disorientation, headache, urinary retention, urinary incontinence, priapism, activation of malignant melanoma, leucopenia, haemolytic and non-haemolytic anaemia, thrombocytopenia, agranulocytosis, blurred vision, blepharospasm, diplopia, activation of Horner’s syndrome, pupil dilatation, oculogyric crisis, angioedema, rash, urticaria, pruritus, flushing, alopecia, exanthema, Henoch-Schönlein purpura, and increased sweating. Very rarely angle-closure glaucoma may occur; pathological gambling, increased libido, hypersexuality, and false positive tests for urinary ketones have also been reported.

**CO-BENELDOPA**

A mixture of benserazide hydrochloride and levodopa in mass proportions corresponding to 1 part of benserazide and 4 parts of levodopa

**Indications** parkinsonism (but not drug-induced extrapyramidal symptoms), see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**

- See preparations

**Madopar** (Roche) (pH)

Capsules 62.5, blue/pink, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg). Net price 100-cap pack = £6.20. Label: 14, counselling, driving, see notes above

Capsules 125, blue/pink, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg). Net price 100-cap pack = £8.64. Label: 14, counselling, driving, see notes above

Capsules 250, blue/caramel, co-beneldopa 50/200 (benserazide 50 mg (as hydrochloride), levodopa 200 mg). Net price 100-cap pack = £14.73. Label: 14, counselling, driving, see notes above

**Dispersible tablets** 62.5, scored, co-beneldopa 12.5/50 (benserazide 12.5 mg (as hydrochloride), levodopa 50 mg). Net price 100-tab pack = £7.37. Label: 14, counselling, administration, see below, driving, see notes above

**Dispersible tablets** 125, scored, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride) levodopa 100 mg). Net price 100-tab pack = £13.06. Label: 14, counselling, administration, see below, driving, see notes above

**Note** The tablets can be dispersed in water or orange squash (not orange juice) or swallowed whole

**Dose** expressed as levodopa, initially 50 mg 3–4 times daily (100 mg 3 times daily in advanced disease), increased by 100 mg daily once or twice weekly according to response; usual maintenance dose 400–600 mg daily in divided doses; **ELDERLY** initially 50 mg once or twice daily; increased by 50 mg daily every 3–4 days according to response

**Note** When transferring from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued 12 hours before (although interval can be shorter)

**Modified release**

**Madopar CR** (Roche) (pH)

Capsules 125, m/r, dark green/light blue, co-beneldopa 25/100 (benserazide 25 mg (as hydrochloride), levodopa 100 mg). Net price 100-cap pack = £15.96. Label: 5, 14, 25, counselling, driving, see notes above

**Dose** Patients not taking levodopa/dopa-decarboxylase inhibitor therapy, initially 1 capsule 3 times daily (max. initial dose 6 capsules daily)

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, initially 1 capsule substituted for every 100 mg of levodopa and given at same dosage frequency, increased every 2–3 days according to response; average increase of 50% needed over previous levodopa dose and titration may take up to 4 weeks

Supplementary dose of immediate-release Madopar may be needed with first morning dose; if response still poor to total daily dose of Madopar CR plus Madopar corresponding to 1.2 g levodopa, consider alternative therapy

---

**Sudden onset of sleep**

Excessive daytime sleepiness and sudden onset of sleep can occur with co-careldopa, co-beneldopa, and dopamine receptor agonists.

Patients starting treatment with these drugs should be warned of the possibility of these effects and of the need to exercise caution when driving or operating machinery.

Patients who have suffered excessive sedation or sudden onset of sleep, should refrain from driving or operating machines until those effects have stopped recurring.
CO-CARELDOPA
A mixture of carbidopa and levodopa; the proportions are expressed in the form $x/y$ where $x$ and $y$ are the strengths in milligrams of carbidopa and levodopa respectively.

**Indications** parkinsonism (but not drug-induced extrapyramidal symptoms), see notes above

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- Expressed as levodopa, initially 100 mg (with carbidopa 25 mg) 3 times daily, increased by 50–100 mg (with carbidopa 12.5–25 mg) daily or on alternate days according to response, up to 800 mg (with carbidopa 200 mg) daily in divided doses
- Alternatively, initially 50–100 mg (with carbidopa 10–12.5 mg) 3–4 times daily, increased by 50–100 mg daily or on alternate days according to response, up to 800 mg (with carbidopa 80–100 mg) daily in divided doses
- Alternatively, initially 125 mg (with carbidopa 12.5 mg, as ½ tablet of co-careldopa 25/250) 1–2 times daily, increased by 125 mg (with carbidopa 12.5 mg) daily or on alternate days according to response

**Note** At least 70 mg carbidopa daily is necessary to achieve full inhibition of peripheral dopa-decarboxylase. When transferring patients from another levodopa/dopa-decarboxylase inhibitor preparation, the previous preparation should be discontinued at least 12 hours before

**Co-careldopa** (Non-proprietary)

**Tablets**
- co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £23.07. Label: 14, counselling, driving, see notes above
- co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 100-tab pack = £20.97. Label: 14, counselling, driving, see notes above
- co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 100-tab pack = £32.23. Label: 14, counselling, driving, see notes above

**Sinemet®** (Bristol-Myers Squibb)

**Sinemet-62.5 tablets**
- yellow, scored, co-careldopa 12.5/50 (carbidopa 12.5 mg (anhydrous), levodopa 50 mg), net price 90-tab pack = £6.54. Label: 14, counselling, driving, see notes above

**Sinemet-110 tablets**
- blue, scored, co-careldopa 10/100 (carbidopa 10 mg (anhydrous), levodopa 100 mg), net price 90-tab pack = £6.84. Label: 14, counselling, driving, see notes above

**Sinemet-Plus tablets**
- yellow, scored, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 90-tab pack = £10.05. Label: 14, counselling, driving, see notes above

**Sinemet-275 tablets**
- blue, scored, co-careldopa 25/250 (carbidopa 25 mg (anhydrous), levodopa 250 mg), net price 90-tab pack = £14.28. Label: 14, counselling, driving, see notes above

**For use with enteral tube**

**Duodopa®** (Solvay)

Intestinal gel, co-careldopa 5/20 (carbidopa 5mg as monohydrate, levodopa 20mg/mL, net price 100 mL cassette (for use with Duodopa® portable pump) = £77.00. Label: 14, counselling, driving, see notes above

**Dose** Severe Parkinson’s disease inadequately controlled by other preparations, consult product literature

**Modified release**

**Caramet® CR** (Teva)

**Tablets**
- m/r, orange-brown, co-careldopa 25/100 (carbidopa 25 mg (as monohydrate), levodopa 100 mg), net price 60-tab pack = £11.47; co-careldopa 50/200 (carbidopa 50 mg (as monohydrate), levodopa 200 mg), 60-tab pack = £11.47. Label: 14, 25, counselling, driving, see notes above

**Dose** Patients not receiving levodopa/dopa-decarboxylase inhibitor preparations, expressed as levodopa, initially 100–200 mg twice daily (at least 6 hours between doses); dose adjusted according to response at intervals of at least 2 days

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, 1 tablet twice daily at least 12 hours before first dose of Caramet CR, substitute Caramet CR to provide a similar amount of levodopa daily and extend dosing interval by 30–50%; dose then adjusted according to response at intervals of at least 2 days

**Half Sinemet® CR** (Bristol-Myers Squibb)

**Tablets**
- m/r, pink, co-careldopa 25/100 (carbidopa 25 mg (anhydrous), levodopa 100 mg), net price 60-tab pack = £12.07. Label: 14, 25, counselling, driving, see notes above

**Dose** For fine adjustment of Sinemet CR dose (see below)

**Sinemet® CR** (Bristol-Myers Squibb)

**Tablets**
- m/r, peach, scored, co-careldopa 50/200 (carbidopa 50 mg (anhydrous), levodopa 200 mg), net price 60-tab pack = £12.07. Label: 14, 25, counselling, driving, see notes above

**Dose** Patients not receiving levodopa/dopa-decarboxylase inhibitor therapy, initially, 1 Sinemet CR tablet twice daily; both dose and interval then adjusted according to response at intervals of not less than 3 days

Patients transferring from immediate-release levodopa/dopa-decarboxylase inhibitor preparations, 1 Sinemet CR tablet twice daily can be substituted for a daily dose of levodopa 300–400 mg in immediate-release Sinemet tablets (substitute Sinemet CR to provide approx. 10% more levodopa per day and extend dosing interval by 30–50%), dose and interval then adjusted according to response at intervals of not less than 3 days

**With entacapone**

**Note** For Parkinson’s disease and end-of-dose motor fluctuations not adequately controlled with levodopa and dopa-decarboxylase inhibitor treatment

**Stalevo®** (Orion)

**Stalevo 50 mg/12.5 mg/200 mg tablets**
- f/c, brown, levodopa 50 mg, carbidopa 12.5 mg, entacapone 200 mg, net price 30-tab pack = £21.72, 100-tab pack = £72.40. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron-containing preparations at the same time of day

**Stalevo 100 mg/25 mg/200 mg tablets**
- f/c, brown, levodopa 100 mg, carbidopa 25 mg, entacapone 200 mg, net price 30-tab pack = £21.72, 100-tab pack = £72.40. Label: 14 (urine reddish-brown), 25, counselling, driving, see notes above, avoid iron-containing preparations at the same time of day

**Stalevo 150 mg/37.5 mg/200 mg tablets**
- f/c, brown, levodopa 150 mg, carbidopa 37.5 mg, entacapone 200 mg, net price 30-tab pack = £21.72, 100-tab
Monoamine-oxidase-B inhibitors

Rasagiline, a monoamine-oxidase-B inhibitor, is licensed for the management of Parkinson’s disease used alone or as an adjunct to levodopa for ‘end-of-dose’ fluctuations.

Selegiline is a monoamine-oxidase-B inhibitor used in conjunction with levodopa to reduce ‘end-of-dose’ deterioration in advanced Parkinson’s disease. Early treatment with selegiline alone can delay the need for levodopa therapy. When combined with levodopa, selegiline should be avoided or used with great caution in postural hypotension.

**RASAGILINE**

**Indications** Parkinson’s disease, used alone or as an adjunct to levodopa with dopa-decarboxylase inhibitor

**Cautions** avoid abrupt withdrawal; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breastfeeding (Appendix 5); interactions: Appendix 1 (rasagiline)

**Side-effects** dry mouth, dyspepsia, constipation; angina; headache, depression, anorexia, weight loss, abdominal dreams, vertigo, hallucinations; influenza-like symptoms; urinary urgency; leucopenia; arthralgia; conjunctivitis; rash; less commonly myocardial infarction, and cerebrovascular accident

**Dose**
- 1 mg daily

Azilect® (Teva)

Tablets, rasagiline (as mesilate) 1 mg, net price 28-tab pack = £70.72

**SELEGILINE HYDROCHLORIDE**

**Indications** Parkinson’s disease, used alone or as an adjunct to levodopa with dopa-decarboxylase inhibitor

**Cautions** avoid abrupt withdrawal; gastric and duodenal ulceration (avoid in active ulceration), uncontrolled hypertension, arrhythmias, angina, psychosis, side-effects of levodopa may be increased, concurrent levodopa dosage can be reduced by 10–20%; interactions: Appendix 1 (selegiline)

**Contra-indications** pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Side-effects** nausea, constipation, diarrhoea, dry mouth; postural hypotension; dyskinesia, vertigo, sleeping disorders, confusion, hallucinations; arthralgia, myalgia; mouth ulcers with oral lyophilisate; rarely arrhythmias, agitation, headache, micturition difficulties, skin reactions; also reported chest pain

**Dose**
- 10 mg in the morning, or 5 mg at breakfast and midday; ELDERLY see below

**Elderly** To avoid initial confusion and agitation, it may be appropriate to start treatment with a dose of 2.5 mg daily, particularly in the elderly

Selegiline Hydrochloride (Non-proprietary)

Tablets, selegiline hydrochloride 5 mg, net price 56-tab pack = £4.99; 10 mg, 30-tab pack = £8.21

**Elderyl®** (Orion)

Tablets, both scored, selegiline hydrochloride 5 mg, net price 60-tab pack = £10.35; 10 mg, 30-tab pack = £10.10

**Oral liquid** selegiline hydrochloride 10 mg/5 mL, net price 200 mL = £18.72

**Oral lyophilisate**

Zelapar® (Cephalon)

Oral lyophilisates (= freeze-dried tablets), yellow, selegiline hydrochloride 1.25 mg, net price 30-tab pack = £59.95. Counselling, administration Excerpts include apartame (section 9.4.1)

**Dose** initially 1.25 mg daily before breakfast

Counselling Tablets should be placed on the tongue and allowed to dissolve. Advise patient not to drink, rinse, or wash mouth out for 5 minutes after taking the tablet

**Note** Patients receiving 10 mg conventional selegiline hydrochloride tablets can be switched to Zelapar 1.25 mg

Catechol-O-methyltransferase inhibitors

Entacapone and tolcapone prevent the peripheral breakdown of levodopa, by inhibiting catechol-O-methyltransferase, allowing more levodopa to reach the brain. They are licensed for use as an adjunct to co-beneldopa or co-careldopa for patients with Parkinson’s disease who experience ‘end-of-dose’ deterioration and cannot be stabilised on these combinations. Due to the risk of hepatotoxicity, tolcapone should be prescribed under specialist supervision only, when other catechol-O-methyltransferase inhibitors combined with co-beneldopa or co-careldopa are ineffective.

**ENTACAPONE**

**Indications** adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson’s disease and ‘end-of-dose’ motor fluctuations

**Cautions** avoid abrupt withdrawal; concurrent levodopa dose may need to be reduced by about 10–30%; interactions: Appendix 1 (entacapone)

**Contra-indications** pregnancy (Appendix 4); breastfeeding (Appendix 5); hepatic impairment; phaeochromocytoma; history of neuroleptic malignant syndrome or non-traumatic rhabdomyolysis

**Side-effects** nausea, vomiting, abdominal pain, constipation, diarrhoea, urine may be coloured reddish-brown, dry mouth; confusion, dizziness, abnormal dreams, fatigue, insomnia, dystonia, dyskinesia, hallucinations; increased sweating; rarely hepatic dysfunction and rash; very rarely anorexia, weight loss, agitation, and urticaria; also reported colitis, neuroleptic malignant syndrome, rhabdomyolysis, and skin, hair, and nail discoloration
Dose
- 200 mg with each dose of levodopa with dopa-decarboxylase inhibitor; max. 2 g daily

Comtess® (Orion) (cf)
Tablets, f/c, brown/orange, entacapone 200 mg, net price 30-tab pack = £18.00. 100-tab pack = £60.00. Label: 14, (urine reddish-brown), counselling, driving, see notes above, avoid iron-containing products at the same time of day

TOLCAPONE

Indications  adjunct to levodopa with dopa-decarboxylase inhibitor in Parkinson’s disease and ‘end-of-dose’ motor fluctuations if another inhibitor of peripheral catechol-O-methyltransferase inappropriate (under specialist supervision)

Cautions  avoid abrupt withdrawal; most patients receiving more than 600 mg levodopa daily require reduction of levodopa dose by about 30%; renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (tolcapone)

Hepatotoxicity  Potentially life-threatening hepatotoxicity including fulminating hepatitis reported rarely, usually in females and during the first 6 months, but late-onset liver injury has also been reported; test liver function before treatment, and monitor every 2 weeks for first year, every 4 weeks for next 6 months and every 8 weeks thereafter (restart monitoring schedule if dose increased); discontinue if abnormal liver function tests or symptoms of liver disorder (counselling, see below); do not re-introduce tolcapone once discontinued

Counselling  Patients should be told how to recognise signs of liver disorder and advised to seek immediate medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, dark urine, or pruritus develop

Contra-indications  hepatic impairment or raised liver enzymes (see Hepatotoxicity above), severe neuroleptic malignant syndrome, rhabdomyolysis, or hyperthermia; breast-feeding (Appendix 5)

Side-effects  diarrhoea, constipation, dyspepsia, abdominal pain, nausea, vomiting, anorexia, xerostomia, hepatotoxicity (see above); chest pain; confusion, dystonia, dyskinesia, drowsiness, headache, dizziness, sleep disturbances, excessive dreaming, hallucinations; syncope; urine discoloration, sweating; neuroleptic malignant syndrome and rhabdomyolysis reported on dose reduction or withdrawal

Dose
- 100 mg 3 times daily, leave 6 hours between each dose; max. 200 mg 3 times daily in exceptional circumstances; first daily dose should be taken at the same time as levodopa with dopa-decarboxylase inhibitor

Note  Continue beyond 3 weeks only if substantial improvement

Tasmar® (Valeant) (cf)
Tablets, f/c, yellow, tolcapone 100 mg, net price 100-tab pack = £95.20. Label: 14, 25

Amantadine

Amantadine  is a weak dopamine agonist with modest antiparkinsonian effects. It improves mild bradykinetic disabilities as well as tremor and rigidity. It may also be useful for dyskinesias in more advanced disease. Tolerance to its effects may develop and confusion and hallucinations may occasionally occur. Withdrawal of amantadine should be gradual irrespective of the patient’s response to treatment.

AMANTADINE HYDROCHLORIDE

Indications  Parkinson’s disease (but not drug-induced extrapyramidal symptoms); antiviral (section 5.3.4)

Cautions  hepatic impairment; renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3), congestive heart disease (may exacerbate oedema), confused or hallucinatory states, elderly; avoid abrupt withdrawal in Parkinson’s disease; interactions: Appendix 1 (amantadine)

Driving  May affect performance of skilled tasks (e.g. driving)

Contra-indications  epilepsy; history of gastric ulceration; pregnancy (Appendix 4), breast-feeding (Appendix 5)

Side-effects  anorexia, nausea, nervousness, inability to concentrate, insomnia, dizziness, convulsions, hallucinations or feelings of detachment, blurred vision, gastrointestinal disturbances, livedo reticularis and peripheral oedema; rarely leucopenia, rashes

Dose
- Parkinson’s disease, 100 mg daily increased after one week to 100 mg twice daily, usually in conjunction with other treatment; some patients may require higher doses, max. 400 mg daily; elderly 65 years and over, 100 mg daily adjusted according to response
- Post-herpetic neuralgia, 100 mg twice daily for 14 days, continued for a further 14 days if necessary

Symmetrel® (Alliance) (cf)
Capsules, red-brown, amantadine hydrochloride 100 mg. Net price 56-cap pack = £16.88. Counselling, driving

Syrup, amantadine hydrochloride 50 mg/5 mL. Net price 150-mL pack = £5.55. Counselling, driving

Lysovir® (Alliance) (cf)
See p. 350

4.9.2 Antimuscarinic drugs used in parkinsonism

Antimuscarinic drugs exert their antiparkinsonian action by reducing the effects of the relative central cholinergic excess that occurs as a result of dopamine deficiency. Antimuscarinic drugs can be useful in drug-induced parkinsonism, but they are generally not used in idiopathic Parkinson’s disease because they are less effective than dopaminergic drugs and they are associated with cognitive impairment.

The antimuscarinic drugs orphenadrine, procyclidine, and trihexyphenidyl (benzhexol), reduce the symptoms of parkinsonism induced by antipsychotic drugs, but there is no justification for giving them routinely in the absence of parkinsonian side-effects. Tardive dyskinesia is not improved by antimuscarinic drugs and may be made worse.

In idiopathic Parkinson’s disease, antimuscarinic drugs reduce tremor and rigidity but they have little effect on bradykinesia. They may be useful in reducing sialorrhoea.
No important differences exist between the antimuscarinic drugs, but some patients tolerate one better than another.

Procyclidine may be given parenterally and it is effective emergency treatment for acute drug-induced dystonic reactions.

**Cautions**
Antimuscarinics should be used with caution in cardiovascular disease, hypertension, psychotic disorders, prostatic hypertrophy, pyrexia, in those susceptible to angle-closure glaucoma, and in the elderly. Antimuscarinics should not be withdrawn abruptly in patients receiving long-term treatment. Antimuscarinics are liable to abuse. They should also be used with caution in hepatic impairment, renal impairment, pregnancy (Appendix 4), and breast-feeding (Appendix 5).

**Interactions:** Appendix 1 (Antimuscarinics)

**Driving**
May affect performance of skilled tasks (e.g. driving)

**Contra-indications**
Antimuscarinics should be avoided in gastro-intestinal obstruction and myasthenia gravis.

**Side-effects**
Side-effects of antimuscarinics include constipation, dry mouth, nausea, vomiting, tachycardia, dizziness, confusion, euphoria, hallucinations, impaired memory, anxiety, restlessness, urinary retention, blurred vision, and rash. Angle-closure glaucoma may occur very rarely.

**ORPHENADRINE HYDROCHLORIDE**

**Indications**
parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

**Cautions**
see notes above

**Contra-indications**
see notes above; also acute porphyria (section 9.8.2)

**Side-effects**
see notes above; less commonly: insomnia and impaired coordination

**Dose**
- Initially 150 mg daily in divided doses, increased gradually in steps of 50 mg every 2–3 days according to response; usual dose range 150–300 mg daily in divided doses; max. 400 mg daily; ELDERLY preferably lower end of range

**Orphenadrine Hydrochloride (Non-proprietary)**

Tablets, orphenadrine hydrochloride 50 mg, net price 20 = £11.13. Counselling, driving

Oral solution, orphenadrine hydrochloride 50 mg/5 mL, net price 200 mL = £9.47. Counselling, driving

**Biorphen®** (Alliance)

Liquid, sugar-free, orphenadrine hydrochloride 25 mg/5 mL, net price 200 mL = £7.07. Counselling, driving

**Disipal®** (Astellas)

Tablets, yellow, s/c, orphenadrine hydrochloride 50 mg, net price 20 = 69p. Counselling, driving

Excipients include tartarazine

**TRIHEXYPHENIDYL HYDROCHLORIDE**

(Benzhexol hydrochloride)

**Indications**
parkinsonism; drug-induced extrapyramidal symptoms (but not tardive dyskinesia, see notes above)

**Cautions**
see notes above

**Contra-indications**
see notes above

**Side-effects**
see notes above

**Dose**
- 1 mg daily, increased gradually; usual maintenance dose 5–15 mg daily in 3–4 divided doses (max. 20 mg daily); ELDERLY preferably lower end of range

**Trihexyphenidyl (Non-proprietary)**

Tablets, trihexyphenidyl hydrochloride 2 mg, net price 84-tab pack = £24.63; 5 mg, 100-tab pack = £14.36. Counselling, with or after food, driving

**Broflex®** (Alliance)

Syrup, pink, black currant, trihexyphenidyl hydrochloride 5 mg/5 mL, net price 200 mL = £6.20. Counselling, driving
4.9.3 Drugs used in essential tremor, chorea, tics, and related disorders

Tetrabenazine is mainly used to control movement disorders in Huntington’s chorea and related disorders. It may act by depleting nerve endings of dopamine. It has useful action in only a proportion of patients and its use may be limited by the development of depression.

Haloperidol may be useful in improving motor tics and symptoms of Tourette syndrome and related choreas.

Piracetam is used as an adjunctive treatment for myoclonus. Propranolol is given in a dosage of 40 mg 2 or 3 times daily, increased if necessary; 80 to 160 mg daily is usually required for maintenance.

Piracetam is used as an adjunctive treatment for myoclonus of cortical origin.

Riluzole is used to extend life in patients with motor neurone disease who have amyotrophic lateral sclerosis.

Riluzole for motor neurone disease (January 2001)

Riluzole is recommended for treating the amyotrophic lateral sclerosis (ALS) form of motor neurone disease (MND). Treatment should be initiated by a specialist in MND but it can then be supervised under a shared-care arrangement involving the general practitioner.

HALOPERIDOL

Indications motor tics, adjunctive treatment in choreas and Tourette syndrome; other indications, section 4.2.1

Cautions section 4.2.1

Contra-indications section 4.2.1

Side-effects section 4.2.1

Dose

- By mouth, 0.5–1.5 mg 3 times daily adjusted according to the response; 10 mg daily or more may occasionally be necessary in Tourette syndrome; CHILD 5–12 years, Tourette syndrome, 12.5–25 microgram/kg twice daily, adjusted according to response up to max. 10 mg daily

Preparations

Section 4.2.1

PIRACETAM

Indications adjunctive treatment of cortical myoclonus

Cautions avoid abrupt withdrawal; elderly; haemostasis, major surgery, or severe haemorrhage; renal impairment (avoid if creatinine clearance less than 20 mL/minute; Appendix 3)

Contra-indications cerebral haemorrhage; hepatic impairment; pregnancy; breast-feeding

Side-effects weight gain, nervousness, hyperkinesia; less commonly drowsiness, depression, asthma; also reported abdominal pain, nausea, vomiting, diarrhoea, headache, anxiety, confusion, hallucination, vertigo, ataxia, insomnia, and rash

Dose

- Initially 7.2 g daily in 2–3 divided doses, increased according to response by 4.8 g daily every 3–4 days to max. 20 g daily (subsequently, attempts should be made to reduce dose of concurrent therapy); CHILD under 16 years not recommended

Oral solution Follow the oral solution with a glass of water (or soft drink) to reduce bitter taste.

Nootropil® (UCB Pharma) Tablets, f/c, scored, piracetam 800 mg, net price 90-tab pack = £14.69; 1.2 g, 60-tab pack = £13.71. Label: 3

Oral solution, piracetam, 333.3 mg/mL, net price 300-mL pack = £20.39. Label: 3

RILUZOLE

Indications to extend life in patients with amyotrophic lateral sclerosis, initiated by specialists experienced in the management of motor neurone disease

Cautions history of abnormal hepatic function (consult product literature for details)

Blood disorders Patients or their carers should be told how to recognise signs of neutropenia and advised to seek immediate medical attention if symptoms such as fever occur; white blood cell counts should be determined in febrile illness; neutropenia requires discontinuation of riluzole

Driving Dizziness or vertigo may affect performance of skilled tasks (e.g. driving)

Contra-indications hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breastfeeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea, abdominal pain; tachycardia; asthenia, headache, dizziness, drowsiness, oral paraesthesia; less commonly pan-creatitis and anaemia; rarely neutropenia; very rarely hepatitis

Dose

- 50 mg twice daily; CHILD not recommended

Rilutek® (Aventis Pharma) Tablets, f/c, riluzole 50 mg. Net price 56-tab pack = £242.39. Counselling, blood disorders, driving

TETRABENAZINE

Indications see under Dose

Cautions pregnancy (Appendix 4); avoid in breast-feeding; interactions: Appendix 1 (tetrabenazine)

Driving May affect performance of skilled tasks (e.g. driving)

Side-effects drowsiness, gastro-intestinal disturbances, depression, extrapyramidal dysfunction,
 hypotension; rarely parkinsonism; neuroleptic malignant syndrome reported

**Dose**

- Movement disorders due to Huntington’s chorea, hemiballismus, senile chorea, and related neurological conditions, initially 12.5 mg twice daily (elderly 12.5 mg daily) gradually increased to 12.5–25 mg 3 times daily; max. 200 mg daily
- Moderate to severe tardive dyskinesia, initially 12.5 mg daily, gradually increased according to response

**Side-effects**

- Increased electrophysiologic jitter in history of dysphagia or aspiration; neuroleptic malignant syndrome reported

**Cautions**

- Supervision.

**Botulinum toxin type A** should be used under specialist supervision. Botox® and Dysport® are licensed for the treatment of focal spasticity (including arm symptoms in conjunction with physiotherapy, dynamic equinus foot deformity caused by spasticity in ambulant paediatric cerebral palsy patients over 2 years of age, hand and wrist disability associated with stroke), blepharospasm, hemifacial spasm, and spasmodic torticollis. Botox® is also licensed for severe hyperhidrosis of the axillae.

Vistabel® is licensed for the temporary improvement of moderate to severe wrinkles between the eyebrows. Xeomin® is licensed for the treatment of blepharospasm and spasmodic torticollis.

**BOTULINUM TOXIN TYPE A**

**Indications** see notes above; preparations are not interchangeable and should be used under specialist supervision

**Cautions** history of dysphagia or aspiration; neurological disorders (can lead to increased sensitivity and exaggerated muscle weakness); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Specific cautions for blepharospasm or hemifacial spasm** Caution if risk of angle-closure glaucoma; reduced blinking can lead to corneal exposure, persistent epithelial defect and corneal ulceration (especially those with VIIth nerve disorders)—careful testing of corneal sensation in previously operated eyes, avoidance of injection in lower lid area to avoid ectropion, and vigorous treatment of epithelial defect needed

**Contra-indications** generalised disorders of muscle activity (e.g. myasthenia gravis)

**Side-effects** increased electrophysiologic jitter in some distant muscles; misplaced injections may paralyse nearby muscle groups and excessive doses may paralyse distant muscles; influenza-like symptoms; rarely arrhythmias, myocardial infarction, seizures, hypersensitivity reactions including rash, pruritus and anaphylaxis, antibody formation (substantial deterioration in response), and injection-site reactions; very rarely exaggerated muscle weakness, dysphagia, and aspiration (seek medical attention if swallowing, speech, or respiratory disorders)

**Specific side-effects for blepharospasm or hemifacial spasm** Ptosis; keratitis, lagophthalmos, dry eye, irritation, photophobia, lacrimation; facial oedema; less commonly dry mouth, facial weakness (including drooping), dizziness, tiredness, ectropion, entropion, diplopia, visual disturbances, conjunctivitis; rarely eyelid bruising and swelling (minimised by applying gentle pressure at injection site immediately after injection); very rarely angle-closure glaucoma, corneal ulceration

**Specific side-effects in paediatric cerebral palsy** Drowsiness, paraesthesia, urinary incontinence, myalgia

**Specific side-effects for temporary improvement of moderate to severe wrinkles between the eyebrows** Headache; ptosis; less commonly nausea, dry mouth, facial oedema, dizziness, asthenia, anxiety, paraesthesia, visual disturbances, blepharitis, photosensitivity reactions, and dry skin

**Specific side-effects in spasmodic torticollis** Dysphagia and pooling of saliva (occurs most frequently after injection into sternomastoid muscle), nausea, dry mouth, rhinitis, drowsiness, headache, dizziness, hypertonia, stiffness; less commonly dyspnoea, voice alteration, diaphoresis, and ptosis

**Specific side-effects in axillary hyperhidrosis** Non-axillary sweating; hot flushes; less commonly myalgia and joint pain

**Specific side-effects in focal upper-limb spasticity associated with stroke** Dysphagia; hypertonia; less commonly arthralgia and bursitis

**Dose**

- Consult product literature (important: specific to each individual preparation and not interchangeable)

**Botox® (Allergan)**

**Injection**, powder for reconstitution, botulinum toxin type A complex, net price 50-unit vial = £72.30, 100-unit vial = £128.93

**Dysport® (Ipsen)**

**Injection**, powder for reconstitution, botulinum toxin-haemagglutinin complex type A, net price 500-unit vial = £164.50

**Vistabel® (Allergan)**

**Injection**, powder for reconstitution, botulinum toxin type A, net price 50-unit vial = £85.00

**Xeomin® (Merz)**

**Injection**, powder for reconstitution, botulinum toxin type A, net price 100-unit vial = £119.90

**BOTULINUM TOXIN TYPE B**

**Indications** spasmodic torticollis (cervical dystonia)—specialist use only

**Cautions** history of dysphagia or aspiration; inadvertent injection into a blood vessel; tolerance may occur

**Contra-indications** neuromuscular or neuromuscular junctional disorders; pregnancy (Appendix 4) and breast-feeding (Appendix 5)

**Side-effects** increased electrophysiologic jitter in some distant muscles; dry mouth, dyspnea, worsening torticollis, neck pain, myasthenia, voice changes, taste disturbances; very rarely exaggerated muscle weakness, dysphagia, and aspiration (seek medical attention if swallowing, speech, or respiratory disorders)

**Dose**

- By intramuscular injection, initially 5000–10 000 units divided between 2–4 most affected muscles; adjust dose and frequency according to response; important: not interchangeable with other botulinum toxin preparations

**NeuroBloc® (Eisai)**

**Injection**, botulinum toxin type B 5000 units/mL, net price 0.5-mL vial = £111.20; 1-mL vial = £148.27; 2-mL vial = £197.69

**Note** May be diluted with sodium chloride 0.9%
This section includes drugs used in alcohol dependence, cigarette smoking, and opioid dependence.

The health departments of the UK have produced a report, *Drug Misuse and Dependence* which contains guidelines on clinical management.

*Drug Misuse and Dependence*. London, The Stationery Office, 1999 can be obtained from:
The Publications Centre
PO Box 276
London, SW8 5DT
Tel: (087) 0600 5522
Fax: (087) 0600 5533

or from The Stationery Office bookshops and through all good book sellers.

It is important to be aware that people who misuse drugs may be at risk not only from the intrinsic toxicity of the drug itself but also from the practice of injecting preparations intended for administration by mouth. Excipients used in the production of oral dose forms are usually insoluble and may lead to *obscure formation at the site of injection*, or even to *necrosis and gangrene*, moreover, deposits in the heart or lungs may lead to *cardiac or pulmonary toxicity*. Additional hazards include *infection* following the use of a dirty needle or an unsterilised diluent.

### Alcohol dependence

**Disulfiram** is used as an adjunct to the treatment of alcohol dependence. It gives rise to extremely unpleasant systemic reactions after the ingestion of even a small amount of alcohol because it leads to accumulation of acetaldehyde in the body. Reactions include flushing of the face, throbbing headache, palpitation, tachycardia, nausea, vomiting, and, with large doses of alcohol, arrhythmias, hypotension, and collapse. Small amounts of alcohol included in many oral medicines may be sufficient to precipitate a reaction (even toiletries and mouthwashes that contain alcohol should be avoided). It may be advisable for patients to carry a card warning of the danger of administration of alcohol.

Long-acting *benzodiazepines* (section 4.1) are used to attenuate withdrawal symptoms but they also have a dependence potential. To minimise the risk of dependence, administration should be for a limited period only (e.g. *chloridiazepoxide* 10–50 mg 4 times daily, gradually reducing over 7–14 days). Benzodiazepines should not be prescribed if the patient is likely to continue drinking alcohol.

**Clomethiazole** (*clormethiazole*) (section 4.1.1) should be used for the management of withdrawal in an *inpatient setting only*. It is associated with a risk of dependence and should not be prescribed if the patient is likely to continue drinking alcohol.

**Acamprosate**, in combination with counselling, may be helpful in maintaining abstinence in alcohol-dependent patients. It should be initiated as soon as possible after abstinence has been achieved and should be maintained if the patient relapses. Continued alcohol abuse, however, negates the therapeutic benefit of acamprosate.

### Acamprosate Calcium

**Indications** maintenance of abstinence in alcohol dependence

**Cautions** continued alcohol abuse (risk of treatment failure)

**Contra-indications** severe hepatic impairment; renal impairment (avoid if serum creatinine greater than 120 micromol/litre; Appendix 3); pregnancy; breast-feeding

**Side-effects** diarrhoea, nausea, vomiting, abdominal pain; fluctuation in libido; pruritus, maculopapular rash; rarely bullous skin reactions

**Dose**

- **ADULT** 18–65 years, body-weight 60 kg and over, 666 mg 3 times daily; body-weight less than 60 kg, 666 mg at breakfast, 333 mg at midday and 333 mg at night

**Treatment course** Treatment should be initiated as soon as possible after alcohol withdrawal period and maintained if patient relapses; recommended treatment period 1 year

**Campral EC®** (Merck) $\xrightarrow{\text{c}}$

Tablet, 625 mg, acamprosate calcium 333 mg. net price 168-tab pack = £28.92. Label: 21, 25

| Electrolytes | Ca 0.8 mmol/tablet |

**DISULFIRAM**

**Indications** adjunct in the treatment of chronic alcohol dependence (under specialist supervision)

**Cautions** ensure that alcohol not consumed for at least 24 hours before initiating treatment; see also notes above; alcohol challenge not recommended on routine basis (if considered essential—specialist units only with resuscitation facilities); hepatic or renal impairment, respiratory disease, diabetes mellitus, epilepsy; interactions: Appendix 1 (disulfiram)

**Alcohol reaction** Patients should be warned of unpredictable and occasionally severe nature of disulfiram-alcohol interactions. Reactions can occur within 10 minutes and last several hours (may require intensive supportive therapy—oxygen should be available). Patients should not ingest alcohol at all and should be warned of possible presence of alcohol in liquid medicines, remedies, tonics, foods and even in toiletries (alcohol should also be avoided for at least 1 week after stopping)

**Contra-indications** cardiac failure, coronary artery disease, history of cerebrovascular accident, hypertension, psychosis, severe personality disorder, suicide risk, pregnancy (Appendix 4), breast-feeding (Appendix 5)

**Side-effects** initially drowsiness and fatigue; nausea, vomiting, halitosis, reduced libido; rarely psychotic reactions (depression, paranoia, schizophrenia, mania), allergic dermatitis, peripheral neuritis, hepatic cell damage

**Dose**

- 800 mg as a single dose on first day, reducing over 5 days to 100–200 mg daily; should not be continued for longer than 6 months without review; **CHILD** not recommended

**Antabuse®** (Actavis) $\xrightarrow{\text{c}}$

Cigarette smoking

Smoking cessation interventions are a cost-effective way of reducing ill health and prolonging life. Smokers should be advised to stop and offered help if interested in doing so, with follow-up when appropriate.

When possible, smokers should have access to a smoking cessation clinic for behavioural support. Nicotine replacement therapy and bupropion are effective aids to smoking cessation for those smoking more than 10 cigarettes a day. Bupropion has been used as an antidepressant but its mode of action in smoking cessation is not clear and may involve an effect on noradrenaline and dopamine neurotransmission. Varenicline is a selective nicotine receptor partial agonist used as an aid for smoking cessation. Nicotine replacement therapy is regarded as the pharmacological treatment of choice in the management of smoking cessation.

Cigarette smoking should stop completely before starting nicotine replacement therapy. If complete smoking cessation is not possible some nicotine preparations are licensed for use as part of a programme to reduce smoking before stopping completely; the smoking cessation regimen can be followed during a quit attempt.

BSM advice (bupropion)
The BSM has issued a reminder that bupropion is contra-indicated in patients with a history of seizures or of eating disorders, a CNS tumour, or who are experiencing acute symptoms of alcohol or benzodiazepine withdrawal. Bupropion should not be prescribed to patients with other risk factors for seizures unless the potential benefit of smoking cessation clearly outweighs the risk. Factors that increase the risk of seizures include concomitant administration of drugs that can lower the seizure threshold (e.g. antidepresants, antimalarials [such as mefloquine and chloroquine], antipsychotics, quinolones, sedating antihistamines, systemic corticosteroids, theophylline, tramadol), alcohol abuse, history of head trauma, diabetes, and use of stimulants and anorectics.

**BUPROPION HYDROCHLORIDE**

**(Amfebutamone hydrochloride)**

**Indications** see notes above

**Cautions** elderly; predisposition to seizures (see BSM advice above); measure blood pressure before and during treatment (monitor weekly if used with nicotine products); hepatic impairment (Appendix 2), renal impairment (Appendix 3); interactions: Appendix 1 (bupropion)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see BSM advice above; history of bipolar disorder; pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Side-effects** dry mouth, gastrointestinal disturbances, taste disturbance, insomnia (reduced by avoiding dose at bedtime), tremor, impaired concentration, headache, dizziness, depression, agitation, anxiety; fever; rash, pruritus, sweating; less commonly chest pain, tachycardia, hypertension, flushing, confusion, tinnitus, asthma, and visual disturbances; rarely jaundice, hepatitis, palpitation, postural hypotension, hallucinations, depersonalisation, seizures, dystonia, ataxia, abnormal dreams, memory impairment, paraesthesia, blood-glucose disturbances, urinary retention, urinary frequency, Stevens-Johnson syndrome, and exacerbation of psoriasis; very rarely delusions, and aggression

**Dose**

- **ADULT** over 18 years, start 1–2 weeks before target stop date, initially 150 mg daily for 6 days then 150 mg twice daily (max. single dose 150 mg, max. daily dose 300 mg; minimum 8 hours between doses); period of treatment 7–9 weeks; discontinue if abstinence not achieved at 7 weeks; consider max. 150 mg daily in patients with risk factors for seizures (see BSM advice above); **ELDERLY** max. 150 mg daily

**Zyban®** (GSK) Tablets, m/r, f/c, bupropion hydrochloride 150 mg, net price 60-tab pack = £39.85. Label: 25, counselling, driving, see above

**NICOTINE**

**Indications** see notes above

**Cautions** severe or unstable cardiovascular disease (including hospitalisation for severe arrhythmias, recent myocardial infarction, or recent cerebrovasc-
ular accident)—initiate under medical supervision; uncontrolled hyperthyroidism; diabetes mellitus (monitor blood-glucose concentration closely when initiating treatment); phaeochromocytoma; oral preparations, oesophagitis, gastritis, peptic ulcers; patches, skin disorders (patches should not be placed on broken skin); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Note Most warnings under Cautions also apply to continuation of cigarette smoking

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, dyspepsia); headache, dizziness; influenza-like symptoms; dry mouth; rash; less frequently palpitation; rarely atrial fibrillation; with nasal spray, sneezing, epistaxis, watering eyes, ear sensations; with lozenges, thirst, paraesthesia of mouth, taste disturbances; with patches, skin reactions (discontinue if severe)—vasculitis also reported, blood pressure disturbances; with spray, palpitation; less frequently sweating, sneezing, epistaxis, watering eyes, ear sensations; with nicotine inhalator, hiccups, throat irritation

**Dose**
- See under preparations, below

**Nicopass** (Fabre)

**Lozenges**, sugar-free, fresh mint- or liquorice mint-flavoured, nicotine (as resinate complex) 1.5 mg, net price pack of 12 = £1.68; pack of 36 = £4.18, pack of 96 = £8.94. Label: 24

Excipients include aspartame (section 9.4.1)

**Dose** smoking cessation, **ADULT** over 18 years (not heavily dependent on nicotine), initially suck 1 lozenge when urge to smoke occurs (max. 20 lozenges daily), withdraw gradually after 3 months, max. period of treatment should not exceed 6 months; review treatment if abstinence not achieved within 3 months; **CHILD** 12–18 years, treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 9 months; **CHILD** 12–18 years, treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

**Note** Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

**Patches**, self-adhesive, beige, nicotine, ‘5 mg’ patch (releasing approx. 5 mg/16 hours), net price 7 = £9.07; ‘10 mg’ patch (releasing approx. 10 mg/16 hours), 7 = £9.07; ‘15 mg’ patch (releasing approx. 15 mg/16 hours), 2 = £2.85, 7 = £9.07

**Dose** smoking cessation, **ADULT** and **CHILD** over 12 years, apply in waking hours on non-hairy skin on hip, chest or upper arm, removing after approx. 16 hours, usually when retiring to bed, site next patch on different area (avoid using same area on consecutive days); initially ‘15-mg’ patch for 16 hours daily for 8 weeks then if abstinence achieved ‘10-mg’ patch for 16 hours daily for 2 weeks then ‘5-mg’ patch for 16 hours daily for 6 weeks, stop altogether at end of next 2 weeks; review treatment if abstinence not achieved within 3 months—further courses may be given if considered beneficial

**Nicopatch** (Fabre)

**Patches**, self-adhesive, nicotine ‘7 mg’ patch (releasing approx. 7 mg/24 hours), net price 7 = £8.95; ‘14 mg’ patch (releasing approx. 14 mg/24 hours), 7 = £8.95; ‘21 mg’ patch (releasing approx. 21 mg/24 hours), 7 = £8.95

**Dose** smoking cessation, **ADULT** over 18 years, apply to dry, non-hairy skin site, removing after 24 hours and site replacement patch on a different area (avoid using same area for 24 hours); individuals smoking less than 20 cigarettes daily, initially ‘14-mg’ or ‘21-mg’ patch daily (depending on severity of withdrawal symptoms); individuals smoking 20 or more cigarettes daily, initially ‘21-mg’ patch daily, reducing dose every 3–4 weeks. review treatment if abstinence not achieved within 3 months; max. period of treatment should not exceed 6 months

**Note** Children under 18 years should consult a healthcare professional before starting a smoking-reduction regimen

**Nicorette** (Pharmacia)

**Microtab** (sublingual), nicotine (as a cyclodextrin complex) 2 mg, net price starter pack of 2 x 15-tablet discs with dispenser = £9.99; refill pack of 7 x 15-tablet discs = £11.12. Label: 26

**Dose** smoking cessation, individuals smoking 20 cigarettes or less daily, sublingually, 2 mg each hour; for patients who fail to stop smoking or have significant withdrawal symptoms, consider increasing to 4 mg each hour; individuals smoking more than 20 cigarettes daily, sublingually, 4 mg each hour, max. 80 mg daily. treatment continued for at least 3 months followed by a gradual reduction in dose, review treatment if abstinence not achieved within 9 months; **CHILD** 12–18 years, treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

**Chewing gum**, sugar-free, nicotine (as resin) 2 mg, net price pack of 15 = £1.71, pack of 30 = £3.25, pack of 105 = £8.89; 4 mg, net price pack of 15 = £2.11, pack of 30 = £3.99, pack of 105 = £10.83

**Note** Also available in mint, freshfruit, and freshmint flavours

**Dose** smoking cessation, individuals smoking 20 cigarettes or less daily, initially chew one 2-mg piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes when urge to smoke occurs; individuals smoking more than 20 cigarettes daily or needing more than 15 pieces of 2-mg gum daily should use the 4-mg strength gum (releasing approx. 15 pieces of 4-mg strength gum daily, withdraw gradually after 3 months; review treatment if abstinence not achieved within 9 months; **CHILD** 12–18 years, treatment continued for up to 8 weeks followed by gradual reduction over 4 weeks; review treatment if abstinence not achieved within 3 months

Smoking reduction, chew 1 piece when urge to smoke occurs between smoking episodes; reduce smoking within 6 weeks and attempt smoking cessation within 6 months, review treatment if abstinence not achieved within 9 months

**Note** Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

**Patches** (Novartis Consumer Health)

**Chewing gum**, sugar-free, nicotine (as polacrilm complex) 2 mg, net price pack of 12 = £1.71, pack of 24 = £3.01, pack of 96 = £8.26, pack of 204 = £14.23; 4 mg, net price pack of 12 = £1.70, pack of 24 = £3.30, pack of 96 = £10.26

**Note** Also available in fruit, liquorice and mint flavours

**Dose** smoking cessation, individuals smoking 20 cigarettes or less daily, initially chew one 2-mg piece slowly (chew gum until taste becomes strong, then rest gum between cheek and gum, when taste fades start chewing again) for approx. 30 minutes, when urge to smoke occurs; individuals smoking more than 20 cigarettes daily should use the 4-mg strength, max. 60 mg daily; withdraw gradually after 3 months, max. period of treatment should not exceed 6 months; **CHILD** 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

**Mint lozenge**, sugar-free, nicotine (as bitartrate) 1 mg, net price pack of 12 = £1.71, pack of 36 = £4.27, pack...
of 96 = £9.12; 2 mg, net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 36 = £5.12, pack of 72 = £9.97. Contains 0.65 mmol Na+/lozenge. Label: 24

**NiQuitin®** (GSK Consumer Healthcare)

**Chewing gum**, sugar-free, mint-flavoured, nicotine 2 mg (white), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55; 4 mg (yellow), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55

**Dose** smoking cessation, initial use: smoking cessation, individuals smoking 30 cigarettes or less daily, initially suck one 1-mg lozenge every 1–2 hours, when urge to smoke occurs; individuals smoking more than 30 cigarettes daily should use the 2-mg strength; max. 30 mg/day, withdraw gradually after 3 months; max. period of treatment should not usually exceed 6 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

**Lozenges**, sugar-free, nicotine (as polacrilex) 2 mg, net price pack of 36 = £5.12, pack of 72 = £9.97; 4 mg, pack of 36 = £5.12, pack of 72 = £9.97. Contains 0.65 mmol Na+/lozenge. Label: 24

**Excipients** include aspartame (section 9.4.1)

**Dose** smoking cessation, initial use: smoking cessation, individuals smoking 30 cigarettes or less daily, initially suck one 1-mg lozenge every 1–2 hours, when urge to smoke occurs; individuals smoking more than 30 cigarettes daily should use the 2-mg strength; max. 30 mg/day, withdraw gradually after 3 months; max. period of treatment should not usually exceed 6 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

**TTS Patches**, self-adhesive, all yellowish-ochre, nicotine, '10' patch (releasing approx. 7 mg/24 hours), net price 7 = £9.12, '20' patch (releasing approx. 14 mg/24 hours), net price 2 = £2.57, 7 = £9.40; '30' patch (releasing approx. 21 mg/24 hours), net price 2 = £2.85, 7 = £9.97, 21 = £24.51

**Dose** smoking cessation, ADULT and CHILD over 12 years, apply to dry, non-hairy skin on trunk or upper arm, removing after 24 hours and siting replacement patch on a different area (avoid using the same area for several days); individuals smoking less than 20 cigarettes daily, initially '20' patch daily, individuals smoking 20 or more cigarettes daily, initially '30' patch daily, withdraw gradually, reducing dose every 3–4 weeks; review treatment if abstinence not achieved within 3 months

**NiQuitin®** (GSK Consumer Healthcare)

Chewing gum, sugar-free, mint-flavoured, nicotine 2 mg (white), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55; 4 mg (yellow), net price pack of 12 = £1.71, pack of 24 = £2.85, pack of 96 = £8.55

**Dose** smoking cessation, initial use: smoking cessation, individuals smoking 30 cigarettes or less daily, initially suck one 1-mg lozenge every 30 minutes, when urge to smoke occurs; max. 15 pieces daily; withdraw gradually after 3 months; review treatment if abstinence not achieved within 9 months; CHILD 12–18 years, withdraw gradually and review treatment if abstinence not achieved within 3 months

Smoking reduction, chew 1 piece when urge to smoke occurs between smoking episodes (max. 15 pieces daily); reduce smoking within 6 weeks and attempt cessation within 6 months; review treatment if abstinence not achieved within 3 months

**Note** Children under 18 years should consult a healthcare professional before starting smoking-reduction regimen

Temporary abstinence, chew 1 piece when urge to smoke occurs between smoking episodes (max. 15 pieces daily); review treatment if abstinence not achieved after 6 months; review treatment if abstinence not achieved within 3 months

Smoking reduction, chew 1 piece when urge to smoke occurs between smoking episodes (max. 15 pieces daily); reduce smoking within 6 weeks and attempt cessation within 6 months; review treatment if abstinence not achieved within 3 months

Temporary abstinence, chew 1 piece when urge to smoke occurs between smoking episodes (max. 15 pieces daily); review treatment if abstinence not achieved after 6 months; review treatment if abstinence not achieved within 3 months

VARENCLINE

**Indications** see notes above

**Cautions** risk of relapse, irritability, depression, and insomnia on discontinuation (consider dose tapering on completion of 12-week course); history of psychiatric illness (may exacerbate underlying illness including depression); renal impairment (Appendix 3); breast-feeding (Appendix 5)

**MHRA/CHM advice**

**Suicidal behaviour and varencline**

Suicidal thoughts and behaviour have been reported in patients taking varencline. Patients should be advised to discontinue treatment and seek prompt medical advice if they develop depression or suicidal thoughts.

Patients with a history of psychiatric illness should be monitored closely while taking varencline.

**Contra-indications** pregnancy (Appendix 4)

**Side-effects** gastro-intestinal disturbances, appetite changes, dry mouth, taste disturbance; headache, drowsiness, dizziness, sleep disorders, abnormal dreams; less common, thirst, weight gain, apthous stomatitis, gingival pain, chest pain, hypertension, tachycardia, atrial fibrillation, palpitation, panic attack, abnormal thinking, mood swings, dysarthria, asthenia, tremor, inco-ordination, hypertonia, restlessness, hypoesthesia, impaired temperature regulation, menorrhagia, vaginal discharge, sexual dysfunction, dysuria, arthralgia, muscle spasm, visual disturbances, eye pain, lacrimation, tinnitus, acne, sweating, rash, and pruritus; myocardiad infarction, depression, and suicidal ideation (see MHRA/CHM advice above) also reported

**Dose**

- ADULT over 18 years, start 1–2 weeks before target stop date, initially 500 micrograms once daily for 3 days, increased to 500 micrograms twice daily for 4 days, then 1 mg twice daily for 11 weeks (reduce to 500 micrograms twice daily if not tolerated); 12-week course can be repeated in abstinent individuals to reduce risk of relapse

**Champix®** (Pfizer) ▼

**Tablets**, 1/2, varencline (as tartrate) 500 micrograms (white), net price 56-tab pack = £54.60; 1 mg (blue) 28-tab pack = £27.30, 56-tab pack = £54.60; starter pack of 11 × 500-microgram tabs with 14 × 1-mg tabs = £27.30. Label: 3

**Opioid dependence**

The management of opioid dependence requires medical, social, and psychological treatment; access to a multidisciplinary team is valuable. Treatment with opioid substitutes or with naltrexone is best initiated under the supervision of an appropriately qualified physician.
Methadone, an opioid agonist, can be substituted for opioids such as diamorphine, preventing the onset of withdrawal symptoms; it is itself addictive and should only be prescribed for those who are physically dependent on opioids. It is administered in a single daily dose usually as methadone oral solution 1 mg/mL. The dose is adjusted according to the degree of dependence.

**Buprenorphine** is an opioid partial agonist. Because of its abuse and dependence potential it should be prescribed only for those who are already physically dependent on opioids. It can be used as substitution therapy for patients with moderate opioid dependence. In patients dependent on high doses of opioids, buprenorphine may precipitate withdrawal due to its partial antagonist properties; in these patients, the daily opioid dose should be reduced gradually before initiating therapy with buprenorphine.

**Naltrexone**, an opioid antagonist, blocks the action of opioids and precipitates withdrawal symptoms in opioid-dependent subjects. Because the euphoric action of opioid agonists is blocked by naltrexone it is given to former addicts as an aid to prevent relapse.

Lofoxdine is used for the alleviation of symptoms in individuals whose opioid use is well controlled and are undergoing opioid withdrawal. Like clonidine it is an alpha-adrenergic agonist and appears to act centrally to produce a reduction in sympathetic tone, but reduction in blood pressure is less marked.

### Methadone and buprenorphine for the management of opioid dependence (January 2007)

Oral methadone and buprenorphine are recommended for maintenance therapy in the management of opioid dependence. Patients should be committed to a supportive care programme including a flexible dosing regimen administered under supervision for at least 3 months, until compliance is assured. Selection of methadone or buprenorphine should be made on a case-by-case basis, but methadone should be prescribed if both drugs are equally suitable.

### Naltrexone for the management of opioid dependence (January 2007)

Naltrexone is recommended for the prevention of relapse in detoxified formerly opioid-dependent patients who are motivated to remain in a supportive care abstention programme. Naltrexone should be administered under supervision and its effectiveness in preventing opioid misuse reviewed regularly.

### Dose

- **By sublingual administration**, initially, 0.8–4 mg as a single daily dose, adjusted according to response; max. 32 mg daily; withdraw gradually; **CHILD** under 16 years not recommended

**Note** In patients who have not undergone opioid withdrawal, buprenorphine should be given at least 6 hours after last use of opioid or when signs of withdrawal appear.

In patients receiving methadone, dose of methadone should be reduced to max. 30 mg daily before starting buprenorphine.

**Buprenorphine** (Non-proprietary)

- **Tablets** (sublingual), buprenorphine (as hydrochloride) 400 micrograms, net price 7-tab pack = £1.57; 2 mg, 7-tab pack = £6.59; 8 mg, 7-tab pack = £19.76. Label: 2, 26

**Subutex** (Scherer-Plough)

- **Tablets** (sublingual), buprenorphine (as hydrochloride) 400 micrograms, net price 7-tab pack = £1.60; 2 mg, 7-tab pack = £6.72; 8 mg, 7-tab pack = £20.16. Label: 2, 26

**With naloxone**

**Suboxone** (Scherer-Plough) ▼

- **Suboxone 2 mg/500 micrograms tablets** (sublingual), buprenorphine (as hydrochloride) 2 mg, naloxone (as hydrochloride) 500 micrograms, net price 28-tab pack = £26.88. Label: 2, 26

- **Suboxone 8mg/2mg tablets** (sublingual), buprenorphine (as hydrochloride) 8 mg, naloxone (as hydrochloride) 2 mg, net price 28-tab pack = £80.64. Label: 2, 26

**Note** In patients who have not undergone opioid withdrawal, **Suboxone** should be given when signs of withdrawal appear, at least 6 hours after last use of opioid. In patients receiving methadone, dose of methadone should be reduced to max. 30 mg daily before starting **Suboxone**; first dose of **Suboxone** should be given when signs of withdrawal appear, at least 24 hours after last dose of methadone.

**Note** The Scottish Medicines Consortium has advised (February 2007) that **Suboxone** should be restricted for use in patients in whom methadone is not suitable.

### LOFOXIDINE HYDROCHLORIDE

**Indications** management of symptoms of opioid withdrawal

**Cautions** severe coronary insufficiency, recent myocardial infarction, cerebrovascular disease, marked bradycardia (monitor pulse rate); history of QT prolongation, concomitant administration of drugs that prolong QT interval; withdraw gradually over 2–4 days (or longer) to minimise risk of rebound hypertension and associated symptoms; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (lofoxdine)

**Side-effects** dry mucus membranes, hypotension, bradycardia, rebound hypertension on withdrawal, drowsiness

**Dose**

- Initially, 800 micrograms daily in divided doses, increased as necessary in steps of 400–800 micrograms daily to max. 2.4 mg daily in divided doses; max. single dose 800 micrograms; recommended duration of treatment 7–10 days if no opioid use (but

### BUPRENORPHINE

**Indications** adjunct in the treatment of opioid dependence; premedication, peri-operative analgesia, analgesia in other situations (section 4.7.2)

**Cautions** see section 4.7.2 and notes above; effects only partially reversed by naloxone

**Contra-indications** see section 4.7.2; breast-feeding (Appendix 5)

**Side-effects** see section 4.7.2
4.11 Drugs for dementia

Acetylcholinesterase inhibiting drugs are used in the treatment of Alzheimer’s disease, specifically for mild to moderate disease. Rivastigmine is also licensed for mild to moderate dementia associated with Parkinson’s disease. The evidence to support the use of these drugs relates to their cognitive enhancement.

Treatment with drugs for dementia should be initiated and supervised only by a specialist experienced in the management of dementia.

Benefit is assessed by repeating the cognitive assessment at around 3 months. Such assessment cannot demonstrate how the disease may have progressed in the absence of treatment but it can give a good guide to response. Up to half the patients given these drugs will show a slower rate of cognitive decline. Drugs for dementia should be discontinued in those thought not to be responding. Many specialists repeat the cognitive assessment 4 to 6 weeks after discontinuation to assess deterioration; if significant deterioration occurs during this short period, consideration should be given to restarting therapy.

Donepezil is a reversible inhibitor of acetylcholinesterase. Galantamine is a reversible inhibitor of acetylcholinesterase and it also has nicotinic receptor agonist properties. Rivastigmine is a reversible non-competitive inhibitor of acetylcholinesterases; it is also licensed...
for treating mild to moderate dementia in Parkinson’s disease.

Acetylcholinesterase inhibitors can cause unwanted dose-related cholinergic effects and should be started at a low dose and the dose increased according to response and tolerability.

**Memantine** is a NMDA-receptor antagonist that affects glutamate transmission; it is licensed for treating moderate to severe Alzheimer’s disease.

### NICE guidance

**Donepezil, galantamine, rivastigmine, and memantine for Alzheimer’s disease** (September 2007)

Donepezil, galantamine, and rivastigmine are recommended for the adjunctive treatment of moderate Alzheimer's disease in those whose mini mental-state examination (MMSE) score is 10–20 points under the following conditions:

- Alzheimer’s disease must be diagnosed in a specialist clinic; the clinic should also assess cognitive, global, and behavioural functioning, activities of daily living, and the likelihood of compliance with treatment;
- treatment should be initiated by specialists but can be continued by general practitioners under a shared-care protocol;
- the carers’ views of the condition should be sought before and during drug treatment;
- the patient should be assessed every 6 months and drug treatment should normally continue only if the MMSE score remains at or above 10 points and if treatment is considered to have a worthwhile effect on the global, functional, and behavioural condition.

Patients receiving acetylcholinesterase inhibitors for mild Alzheimer’s disease can continue treatment until they, their carers, or their specialist consider it appropriate to stop.

Healthcare professionals should not rely solely on the MMSE score to assess the severity of Alzheimer’s disease when the patient has learning or other disabilities, or other communication difficulties.

NICE does not recommend memantine for moderately severe to severe Alzheimer’s disease except as part of well designed clinical studies; patients already receiving memantine can continue treatment until they, their carers, or their specialist consider it appropriate to stop.

### Donepezil Hydrochloride

**Indications** mild to moderate dementia in Alzheimer’s disease

**Cautions** sick sinus syndrome or other supraventricular conduction abnormalities; hepatic impairment (Appendix 2); pregnancy (Appendix 4); **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** renal impairment (avoid if creatinine clearance less than 9 mL/minute; Appendix 3); breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, dyspepsia; syncope; rinitis; sleep disturbances, dizziness, confusion, depression, headache, fatique, anorexia, tremor; fever; weight loss; less commonly arrhythmias, palpitation, myocardial infarction, cerebrovascular disease, paraesthesia, tinnitus, and leg cramps; rarely bradycardia, seizures, hallucinations, agitation, aggression, dehydration, hypokalaemia, and rash; very rarely gastrointestinal bleeding, dysphagia, hypotension, exacerbation of Parkinson’s disease, and sweating

**Dose**

- Initially 4 mg twice daily for 4 weeks increased to 8 mg twice daily for 4 weeks; maintenance 8–12 mg twice daily

**Reminyl®** (Shire)

**Tablets**

- all f/c, galantamine (as hydrobromide) 8 mg (pink), net price 56-tab pack = £68.32; 12 mg (orange-brown), 56-tab pack = £84.00. Label: 3, 21

**Oral solution**

- galantamine (as hydrobromide) 4 mg/mL, net price 100 mL with pipette = £120.00. Label: 3, 21

**Modified release**

**Reminyl® XL** (Shire)

**Capsules**

- m/r, galantamine (as hydrobromide) 8 mg (white), net price 28-cap pack = £54.60; 16 mg (pink), 28-cap pack = £68.32; 24 mg (beige), 28-cap pack = £84.00. Label: 3, 21, 25

**Dose** initially 8 mg once daily for 4 weeks increased to 16 mg once daily for 4 weeks; maintenance 16–24 mg daily

GALANTAMINE

**Indications** mild to moderate dementia in Alzheimer’s disease

**Cautions** cardiac disease (including sick sinus syndrome or other supraventricular conduction abnormalities, unstable angina, congestive heart failure); electrolyte disturbances; susceptibility to peptic ulcers; asthma, chronic obstructive pulmonary disease, pulmonary infection; avoid in urinary retention and gastro-intestinal obstruction; hepatic impairment (Appendix 2)—avoid if severe; pregnancy (Appendix 4); **interactions:** Appendix 1 (parasympathomimetics)

**Contra-indications** renal impairment (avoid if creatinine clearance less than 9 mL/minute; Appendix 3); breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain, dyspepsia; syncope; rinitis; sleep disturbances, dizziness, confusion, depression, headache, fatigue, anorexia, tremor; fever; weight loss; less commonly arrhythmias, palpitation, myocardial infarction, cerebrovascular disease, paraesthesia, tinnitus, and leg cramps; rarely bradycardia, seizures, hallucinations, agitation, aggression, dehydration, hypokalaemia, and rash; very rarely gastrointestinal bleeding, dysphagia, hypotension, exacerbation of Parkinson’s disease, and sweating

**Dose**

- Initially 5 mg once daily at bedtime, increased if necessary after one month to max. 10 mg daily

**Aricept®** (Pfizer, Eisai)

**Tablets**

- donepezil hydrochloride 5 mg (white), net price 28-tab pack = £63.54; 10 mg (yellow), 28-tab pack = £89.06.

**Aricept Evess®** (Pfizer, Eisai)

**Orodispersible tablets**

- donepezil hydrochloride 5 mg (white), net price 28-tab pack = £63.54; 10 mg (yellow), 28-tab pack = £89.06. Counselling, administration

**Counselling** Aricept Evess should be placed on the tongue, allowed to disperse, and swallowed
MEMANTINE HYDROCHLORIDE

**Indications**  moderate to severe dementia in Alzheimer's disease

**Cautions**  history of convulsions; renal impairment (avoid if creatinine clearance less than 5 mL/minute; Appendix 3); pregnancy (Appendix 4); Interactions: Appendix 1 (memantine)

**Contra-indications**  breast-feeding

**Side-effects**  constipation; hypertension; headache, dizziness, drowsiness; less commonly vomiting, thrombosis, confusion, fatigue, hallucinations, and abnormal gait; very rarely seizures; pancreatitis, psychosis, depression, and suicidal ideation also reported

**Dose**
- Initially 5 mg once daily, increased in steps of 5 mg at weekly intervals; max. 20 mg daily

**Ebixa**<sup>®</sup> (Lundbeck)

**Tablets**, f/c, scored, memantine hydrochloride 10 mg, net price 28-tab pack = £34.50, 56-tab pack = £69.01, 112-tab pack = £138.01; 20 mg, 28-tab pack = £69.01; treatment initiation pack, 7 <sup>5/10</sup> <sup>mg</sup>, 7 <sup>10</sup> <sup>mg</sup>, 7 <sup>15</sup> <sup>mg</sup>, and 7 <sup>20</sup> <sup>mg</sup> = £43.13

**Oral drops**, memantine hydrochloride 10 mg/g, net price 50 g = £61.61, 100 g = £123.23

Note 5 mg = 10 drops of memantine hydrochloride oral drops

Note The Scottish Medicines Consortium has advised (January 2004) that Ebixa is not recommended for the treatment of Alzheimer’s disease

RIVASTIGMINE

**Indications**  mild to moderate dementia in Alzheimer's disease or in Parkinson’s disease

**Cautions**  gastric or duodenal ulcers (or susceptibility to ulcers); monitor body-weight; sick sinus syndrome, conduction abnormalities; history of asthma or chronic obstructive pulmonary disease; history of seizures; bladder outflow obstruction; hepatic impairment (avoid if severe—Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); Interactions: Appendix 1 (parasympathomimetics)

**Contra-indications**  breast-feeding (Appendix 5)

**Side-effects**  nausea, vomiting, diarrhoea, dyspepsia, anorexia, abdominal pain; dizziness, headache, drowsiness, tremor, asthma, malaise, agitation, confusion; sweating; weight loss; less commonly gastric or duodenal ulceration, bradycardia, syncope, depression, insomnia, rarely angina pectoris, seizures; very rarely gastro-intestinal haemorrhage, pancreatitis, cardiac arrhythmias, hypertension, hallucinations, extrapyramidal symptoms (including worsening of Parkinson's disease), and rash; with patches application-site reactions

Note Gastro-intestinal side-effects more common in women

**Dose**
- See under preparations below

**Exelon**<sup>®</sup> (Novartis)

**Capsules**, rivastigmine (as hydrogen tartrate) 1.5 mg (yellow), net price 28-cap pack = £39.12, 56-cap pack = £78.25; 3 mg (orange), 28-cap pack = £39.12, 56-cap pack = £78.25; 4.5 mg (red), 28-cap pack = £39.12, 56-cap pack = £78.25; 6 mg (red/orange), 28-cap pack = £39.12, 56-cap pack = £78.25. Label: 21, 25

Oral solution, rivastigmine (as hydrogen tartrate) 2 mg/mL, net price 120 mL (with oral syringe) = £116.64. Label: 21

**Dose**  initially 1.5 mg twice daily, increased in steps of 1.5 mg twice daily at intervals of at least 2 weeks according to response and tolerance; usual range 3–6 mg twice daily; max. 6 mg twice daily

**Patches**, self-adhesive, beige, rivastigmine 4.6 mg/24 hours, net price 30 = £83.84; 9.5 mg/24 hours, 30 = £83.84

**Dose**  initially apply 4.6 mg/24 hours patch to clean, dry, non-hairy, non-irritated skin on back, upper arm, or chest, removing after 24 hours and siting a replacement patch on a different area (avoid using the same area for 14 days); if well tolerated increase to 9.5 mg/24 hours patch daily after no less than 4 weeks; if patch not applied for more than several days, treatment should be restarted with 4.6 mg/24 hours patch

Note When switching a patient from oral to transdermal therapy, patients taking 3-6 mg daily should be prescribed the 4.6 mg/24 hours patch; patients taking 9 mg daily who do not tolerate the dose well should be prescribed the 4.6 mg/24 hours patch, while those taking 9 mg daily who tolerate the dose well should be prescribed the 9.5 mg/24 hours patch; patients taking 12 mg daily should be prescribed the 9.5 mg/24 hours patch. The first patch should be applied on the day following the last oral dose

Note The Scottish Medicines Consortium has advised (October 2007) that Exelon patches should be restricted for use in patients with moderately severe Alzheimer’s disease under the conditions of the NICE guidance (September 2007) and when a transdermal patch is an appropriate choice of formulation
5 Infections

5.1 Antibacterial drugs

5.1.1 Penicillins

5.1.1.1 Benzylpenicillin and phenoxy-methylpenicillin

5.1.1.2 Penicillinase-resistant penicillins

5.1.1.3 Broad-spectrum penicillins

5.1.1.4 Antipseudomonal penicillins

5.1.1.5 Mecillinams

5.1.2 Cephalosporins, carbapenems, and other beta-lactams

5.1.2.1 Cephalosporins

5.1.2.2 Carbapenems

5.1.2.3 Other beta-lactam antibiotics

5.1.3 Tetracyclines

5.1.4 Aminoglycosides

5.1.5 Macrolides

5.1.6 Clindamycin

5.1.7 Some other antibacterials

5.1.8 Sulphonamides and trimethoprim

5.1.9 Antituberculosis drugs

5.1.10 Antileprotic drugs

5.1.11 Metronidazole and tinidazole

5.1.12 Quinolones

5.1.13 Urinary-tract infections

5.2 Antifungal drugs

5.3 Antiviral drugs

5.3.1 HIV infection

5.3.2 Herpesvirus infections

5.3.2.1 Herpes simplex and varicella-zoster infection

5.3.2.2 Cytomegalovirus infection

5.3.3 Viral hepatitis

5.3.4 Influenza

5.3.5 Respiratory syncytial virus

5.4 Antiprotozoal drugs

5.4.1 Antimalarials

5.4.2 Amoebicides

5.4.3 Trichomonacides

5.4.4 Antigiardial drugs

5.4.5 Leishmaniacides

5.4.6 Trypanocides

5.4.7 Drugs for toxoplasmosis

5.4.8 Drugs for pneumocystis pneumonia

5.5 Anthelmintics

5.5.1 Drugs for threadworms

5.5.2 Ascaricides

5.5.3 Drugs for tapeworm infections

5.5.4 Drugs for hookworms

5.5.5 Schistosomicides

5.5.6 Filaricides

5.5.7 Drugs for cutaneous larva migrans

5.5.8 Drugs for strongyloidiasis

This chapter also includes advice on the drug management of the following:
- anthrax, p. 323
- Clostridium difficile infection, p. 285
- Lyme disease, p. 293
- MRSA infections, p. 292
- oral infections, p. 284, p. 287, p. 327

5 Notifiable diseases

Doctors must notify the Proper Officer of the local authority (usually the consultant in communicable disease control) when attending a patient suspected of suffering from any of the diseases listed below; a form is available from the Proper Officer.

- Anthrax
- Ophthalmia neonatorum
- Cholera
- Paratyphoid fever
- Diphtheria
- Plague
- Dysentery (amoebic or bacillary)
- Poliomyelitis, acute
- Encephalitis, acute
- Rabies
- Food poisoning
- Relapsing fever
- Haemorrhagic fever (viral)
- Rubella
- Hepatitis, viral
- Scarlet fever
- Leptospirosis
- Smallpox
- Leprosy
- Tetanus
- Malaria
- Tuberculosis
- Measles
- Typhoid fever
- Meningitis
- Typhus
- Meningococcal septicaemia (without meningitis)
- Yellow fever
- Whooping cough
- Measles
- Mumps

Note: It is good practice for doctors to also inform the consultant in communicable disease control of instances of other infections (e.g. psittacosis) where there could be a public health risk.

5.1 Antibacterial drugs

Choice of a suitable drug  Before selecting an antibacterial the clinician must first consider two factors—the patient and the known or likely causative organism. Factors related to the patient which must be considered include history of allergy, renal and hepatic function, susceptibility to infection (i.e. whether immunocompromised), ability to tolerate drugs by mouth, severity of illness, ethnic origin, age, whether taking other medication and, if female, whether pregnant, breast-feeding or taking an oral contraceptive.

The known or likely organism and its antibacterial sensitivity in association with the above factors, will suggest one or more antibacterials, the final choice depending on the microbiological, pharmacological, and toxicological properties.

An example of a rational approach to the selection of an antibacterial is treatment of a urinary-tract infection in a patient complaining of nausea and symptoms of a urinary-tract infection in early pregnancy. The organism is reported as being resistant to ampicillin but sensitive to nitrofurantoin (can cause nausea), gentamicin (can be given only by injection and best avoided in pregnancy), tetracycline (causes dental discoloration) and trimethoprim (folic acid antagonist therefore theoretical teratogenic risk), and cefalexin. The safest antibiotics in pregnancy are the penicillins and cephalosporins; therefore, cefalexin is reported as being resistant to ampicillin but sensitive to these antibiotics that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Antibacterial policies  Local policies often limit the antibacterials that may be used to achieve reasonable economy consistent with adequate cover, and to reduce the development of resistant organisms. A policy may indicate a range of drugs for general use, and permit other drugs only on the advice of the microbiologist or physician responsible for the control of infectious diseases.

Before starting therapy  The following precepts should be considered before starting:

- Viral infections should not be treated with antibacterials. However, antibacterials are occasionally helpful in controlling secondary bacterial infection (e.g. acute necrotising ulcerative gingivitis secondary to herpes simplex infection);
- Samples should be taken for culture and sensitivity testing; ‘blind’ antibacterial prescribing for unexplained pyrexia usually leads to further difficulty in establishing the diagnosis;
- Knowledge of prevalent organisms and their current sensitivity is of great help in choosing an antibacterial before bacteriological confirmation is available. Generally, narrow-spectrum antibacterials are preferred to broad-spectrum antibacterials unless there is a clear clinical indication (e.g. life-threatening sepsis);
- The dose of an antibacterial varies according to a number of factors including age, weight, hepatic function, renal function, and severity of infection.

The prescribing of the so-called ‘standard’ dose in serious infections may result in failure of treatment or even death of the patient; therefore it is important to prescribe a dose appropriate to the condition. An inadequate dose may also increase the likelihood of antibacterial resistance. On the other hand, for an antibacterial with a narrow margin between the toxic and therapeutic dose (e.g. an aminoglycoside) it is also important to avoid an excessive dose and the concentration of the drug in the plasma may need to be monitored;

- The route of administration of an antibacterial often depends on the severity of the infection. Life-threatening infections require intravenous therapy. Antibacterials that are well absorbed may be given by mouth even for some serious infections. Parenteral administration is also appropriate when the oral route cannot be used (e.g. because of vomiting) or if absorption is inadequate. Whenever possible, painful intramuscular injections should be avoided in children;

- Duration of therapy depends on the nature of the infection and the response to treatment. Courses should not be unduly prolonged because they encourage resistance, they may lead to side-effects and they are costly. However, in certain infections such as tuberculosis or chronic osteomyelitis it is necessary to treat for prolonged periods. Conversely, a single dose of an antibacterial may cure uncomplicated urinary-tract infections.

Oral bacterial infections  Antibacterial drugs should only be prescribed for the treatment of oral infections on the basis of defined need. They may be used in conjunction with (but not as an alternative to) other appropriate measures, such as providing drainage or extracting a tooth.

The ‘blind’ prescribing of an antibacterial for unexplained pyrexia, cervical lymphadenopathy, or facial swelling can lead to difficulty in establishing the diagnosis. In severe oral infections, a sample should always be taken for bacteriology.

Oral infections which may require antibacterial treatment include acute periapical or periodontal abscess, cellulitis, acute sinusitis, severe pericoronitis, localised osteitis, acute necrotising ulcerative gingivitis, and destruactive forms of chronic periodontal disease. Most of these infections are readily resolved by the early establishment of drainage and removal of the cause (typically an infected necrotic pulp). Antibacterials may be indicated if treatment has to be delayed and they are essential in immunocompromised patients or in those with conditions such as diabetes or Paget’s disease.

 Certain rarer infections including bacterial sialadenitis, osteomyelitis, actinomycosis, and infections involving faccial spaces such as Ludwig’s angina, require antibiotics and specialist hospital care.

Antibacterial drugs may also be useful after dental surgery in some cases of spreading infection. Infection may spread to involve local lymph nodes, to fascial spaces (where it can cause airway obstruction), or into the bloodstream (where it can lead to cavernous sinus thrombosis and other serious complications). Extension of an infection can also lead to maxillary sinusitis; osteomyelitis is a complication, which usually arises when host resistance is reduced.

If the oral infection fails to respond to antibacterial treatment within 48 hours the antibacterial should be...
changed, preferably on the basis of bacteriological investigation. Failure to respond may also suggest an incorrect diagnosis, lack of essential additional measures (such as drainage), poor host resistance, or poor patient compliance.

Combination of a penicillin (or erythromycin) with metronidazole may sometimes be helpful for the treatment of severe oral infections or oral infections that have not responded to initial antibacterial treatment.

See also Penicillins (section 5.1.1), Cephalosporins (section 5.1.2), Tetracyclines (section 5.1.3), Macrolides (section 5.1.5), Clindamycin (section 5.1.6), Metronidazole (section 5.1.11), Fusidic acid (section 13.10.1.2).

Superinfection In general, broad-spectrum antibacterial drugs such as the cephalosporins are more likely to be associated with adverse reactions related to the selection of resistant organisms e.g. fungal infections or antibiotic-associated colitis (pseudomembranous colitis); other problems associated with superinfection include vaginitis and pruritus ani.

Therapy Suggested treatment is shown in table 1. When the pathogen has been isolated treatment may be changed to a more appropriate antibacterial if necessary. If no bacterium is cultured the antibacterial can be continued or stopped on clinical grounds. Infections for which prophylaxis is useful are listed in table 2.

</table>

### Gastro-intestinal system

**Gastro-enteritis**
- Antibacterial not usually indicated
  - Frequently self-limiting and may not be bacterial

**Campylobacter enteritis**
- Ciprofloxacin or erythromycin
  - Frequently self-limiting; treat severe infection

**Invasive salmonellosis**
- Ciprofloxacin or cefotaxime
  - Includes severe infections which may be invasive

**Shigellosis**
- Ciprofloxacin or azithromycin (unlicensed indication)
  - Amoxicillin or trimethoprim can be used if organism sensitive.
  - Antibacterial not indicated for mild cases

**Typhoid fever**
- Ciprofloxacin or cefotaxime
  - Infections from Indian subcontinent, Middle-East, and South-East Asia may be multiple-antibacterial-resistant and sensitivity should be tested; azithromycin (unlicensed indication) may be an option in mild or moderate disease caused by multiple antibiotic-resistant organisms

**Clostridium difficile infection**
- Oral metronidazole or oral vancomycin
  - Treat for 7–10 days. Use vancomycin for severe infection or in patients intolerant of metronidazole. Give metronidazole by intravenous infusion if oral treatment inappropriate

**Biliary-tract infection**
- Ciprofloxacin or gentamicin or a cephalosporin

**Peritonitis**
- A cephalosporin (or gentamicin) + metronidazole (or clindamycin)

**Peritoneal dialysis-associated peritonitis**
- Either vancomycin<sup>1</sup> + cefazidine added to dialysis fluid or vancomycin added to dialysis fluid + ciprofloxacin by mouth
  - Treat for 14 days or longer

### Cardiovascular system

**Endocarditis: initial ‘blind’ therapy**
- Fluvoxacinil (or benzylpenicillin if symptoms less severe) + gentamicin
  - Substitute fluvoxacinil (or benzylpenicillin) with vancomycin + rifampicin if cardiac prostheses present, or if penicillin-allergic, or if meticillin-resistant *Staphylococcus aureus* suspected

**Endocarditis caused by staphylococci**
- Fluvoxacinil (or vancomycin + rifampicin if penicillin-allergic or if meticillin-resistant *Staphylococcus aureus*)
  - Treat for at least 4 weeks; treat prosthetic valve endocarditis for at least 6 weeks and if using fluvoxacinil add rifampicin for at least 2 weeks

**Endocarditis caused by streptococci**
- Benzylpenicillin (or vancomycin<sup>1</sup> if penicillin-allergic or highly penicillin-resistant) + gentamicin
  - Treat endocarditis caused by fully sensitive streptococci with benzylpenicillin or vancomycin alone for 4 weeks or (if no intracardial abscess or infected emboli) with benzylpenicillin + gentamicin for 2 weeks. Treat more resistant organisms for 4–6 weeks (stopping gentamicin after 2 weeks for organisms moderately sensitive to penicillin); if aminoglycoside cannot be used and if streptococci moderately sensitive to penicillin, treat with benzylpenicillin alone for 4 weeks. Treat prosthetic valve endocarditis for at least 6 weeks (stopping gentamicin after 2 weeks if organisms fully sensitive to penicillin)

**Endocarditis caused by enterococci**
- (e.g. *Enterococcus faecalis*)
  - Amoxicillin<sup>2</sup> (or vancomycin<sup>1</sup> if penicillin-allergic or penicillin-resistant) + gentamicin
    - Treat for at least 4 weeks (at least 6 weeks for prosthetic valve endocarditis); if gentamicin-resistant, substitute gentamicin with streptomycin

**Endocarditis caused by haemophilus, actinobacillus, cardiobacterium, eikenella, and kingella species (‘HACEK’ organisms)**
- Amoxicillin<sup>2</sup> (or ceftriaxone if amoxicillin-resistant) + low-dose gentamicin
  - Treat for 4 weeks (6 weeks for prosthetic valve endocarditis); stop gentamicin after 2 weeks

### Respiratory system

**Haemophilus influenzae epiglotitis**
- Cefotaxime or chloramphenicol
  - Give intravenously

**Exacerbations of chronic bronchitis**
- Amoxicillin<sup>2</sup> or tetracycline (or erythromycin<sup>3</sup>)
  - Some pneumococci and *Haemophilus influenzae* strains tetracycline-resistant; approx. 20% *H. influenzae* strains amoxicillin-resistant

**Uncomplicated community-acquired pneumonia**
- Amoxicillin<sup>2</sup> (or benzylpenicillin if previously healthy chest or erythromycin<sup>1</sup> if penicillin-allergic)
  - Add fluvoxacinil if staphylococci suspected, e.g. in influenza or measles (or vancomycin<sup>1</sup> if meticillin-resistant *Staphylococcus aureus*) suspected; treat for 7 days (14–21 days for infections caused by staphylococci); pneumococci with decreased penicillin sensitivity being isolated but not yet common in UK; add erythromycin<sup>1</sup> if atypical pathogens suspected

---

<sup>1</sup> Where vancomycin is suggested teicoplanin may be used.

<sup>2</sup> Where amoxicillin is suggested ampicillin may be used.

<sup>3</sup> Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
Severe community-acquired pneumonia of unknown aetiology
Cefuroxime (or cefotaxime) + erythromycin
Add flucloxacillin if staphylococci suspected (or vancomycin if meticillin-resistant Staphylococcus aureus suspected); treat for 10 days (14–21 days if staphylococci, legionella, or Gram-negative enteric bacilli suspected)

Pneumonia possibly caused by atypical pathogens
Erythromycin
Severe Legionella infections may require addition of rifampicin; tetracycline is an alternative for chlamydial and mycoplasma infections; treat for at least 14 days (14–21 days for legionella)

Hospital-acquired pneumonia
A broad-spectrum cephalosporin (e.g. cefotaxime or ceftazidime) or an antipseudomonal penicillin or another antipseudomonal beta-lactam or a quinolone (e.g. ciprofloxacin)
An aminoglycoside may be added in severe illness

Central nervous system
Meningitis: initial empirical therapy
- Transfer patient urgently to hospital
- If bacterial meningitis and especially if meningococcal disease suspected, general practitioners should give benzylpenicillin (see p. 291 for dose) before urgent transfer to hospital; cefotaxime (section 5.1.2) may be an alternative in penicillin allergy; chloramphenicol (section 5.1.7) may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins
- Consider adjunctive treatment with dexamethasone (particularly if pneumococcal meningitis suspected in adults; section 6.3.2) starting before or with first dose of antibacterial; avoid dexamethasone in septic shock, meningococcal septicaemia, or if immunocompromised, or in meningitis following surgery

Meningitis caused by meningococci
Benzylenicillin or cefotaxime
Treat for at least 5 days; substitute chloramphenicol if history of immediate hypersensitivity reaction to penicillin or to cephalosporins. To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

Meningitis caused by pneumococci
Cefotaxime
Treat for 10–14 days; substitute benzylpenicillin if organism penicillin-sensitive; if organism highly penicillin- and cephalosporin-resistant, add vancomycin and if necessary rifampicin. Consider adjunctive treatment with dexamethasone (section 6.3.2) starting before or with first dose of antibacterial (but may reduce penetration of vancomycin into cerebrospinal fluid)

Meningitis caused by *Haemophilus influenzae*
Cefotaxime
Treat for at least 10 days; substitute chloramphenicol if history of immediate hypersensitivity reaction to penicillin or to cephalosporins, or if organism resistant to cefotaxime. Consider adjunctive treatment with dexamethasone (section 6.3.2) starting before or with first dose of antibacterial. For *H. influenzae* type b give rifampicin for 4 days before hospital discharge (see Table 2, section 5.1)

Meningitis caused by *Listeria*
Amoxicillin + gentamicin
Treat for 10–14 days

Urinary tract
Acute pyelonephritis
A broad-spectrum cephalosporin or a quinolone
Treat for 10–14 days; longer treatment may be necessary in complicated pyelonephritis

1. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
2. Where vancomycin is suggested teicoplanin may be used.
3. Where amoxicillin is suggested ampicillin may be used.

Acute prostatitis
A quinolone or trimethoprim
Treat for 28 days; in severe infection, start treatment with a high dose broad-spectrum cephalosporin (e.g. cefuroxime or cefotaxime) + gentamicin
‘Lower’ urinary-tract infection
Trimethoprim or nitrofurantoin or amoxicillin or oral cephalosporin
Treat for 7 days but a short course (e.g. 3 days) is usually adequate for uncomplicated urinary-tract infections in women. See also section 5.1.13

Genital system
Syphilis
Benzathine benzylpenicillin [unlicensed] or doxycycline or erythromycin
Treat early syphilis (infection of less than 2 years) with benzathine benzylpenicillin as a single dose (repeat dose after 7 days for women in the third trimester of pregnancy) or with doxycycline or erythromycin for 14 days. Treat late latent syphilis (asymptomatic infection of more than 2 years) with doxycycline for 28 days or with benzathine benzylpenicillin once weekly for 2 weeks. Treat asymptomatic contacts of patients with infectious syphilis with doxycycline for 14 days. Contact tracing recommended.

Uncomplicated gonorrhoea
Cefixime [unlicensed indication] or ciprofloxacin
Single-dose treatment in uncomplicated infection. Choice depends on locality where infection acquired. Pharyngeal infection requires treatment with ceftriaxone. Use ciprofloxacin only if organism sensitive. Contact-tracing recommended; remember chlamydia

Uncomplicated genital chlamydial infection, non-gonococcal urethritis and non-specific genital infection
Doxycycline or azithromycin
Treat with doxycycline for 7 days or with azithromycin as a single dose; alternatively, treat with erythromycin for 14 days. Contact tracing recommended

Pelvic inflammatory disease
Doxycycline + metronidazole + i/m ceftriaxone or ofloxacin + metronidazole
Treat for at least 14 days (use i/m ceftriaxone as a single dose). In severely ill patients initial treatment with doxycycline + i/v ceftriaxone (as a single dose) + i/v metronidazole, then switch to oral treatment with doxycycline + metronidazole to complete 14 days’ treatment. Contact tracing recommended

Bacterial vaginosis
Oral or topical metronidazole or topical clindamycin
Oral treatment for 5–7 days (or with high-dose metronidazole as a single dose); topical treatment for 5 days (7 days with clindamycin)

Blood
Community-acquired septicaemia
A broad-spectrum antipseudomonal penicillin (e.g. *Tazocin®, Timentin®*) or a broad-spectrum cephalosporin (e.g. cefazidime, cefotaxime)
Add aminoglycoside if pseudomonas suspected, or if severe sepsis, or if patient recently discharged from hospital. Add vancomycin if meticillin-resistant *Staphylococcus aureus* suspected. Add metronidazole to broad-spectrum cephalosporin if anaerobic infection suspected

Hospital-acquired septicaemia
A broad-spectrum antipseudomonal beta-lactam antibacterial (e.g. *Tazocin®, Timentin®, cefazidime, imipenem (with cilastatin as Primaxin®) or meropenem)
Add aminoglycoside if pseudomonas suspected, or if multiple-resistant organisms suspected, or if severe sepsis. Add vancomycin if meticillin-resistant *Staphylococcus aureus* suspected. Add metronidazole to broad-spectrum cephalosporin if anaerobic infection suspected
Septicaemia related to vascular catheter
Vancomycin
Add an aminoglycoside + a broad-spectrum antipseudo-
monal beta-lactam if Gram-negative sepsis suspected, especially in the immunocompromised. Consider removing vascular catheter, particularly if infection caused by *Staphy-
lococcus aureus*, pseudomonas, or candida

Meningococcal septicaemia
Benzylenicillin or cefotaxime
If meningococcal disease suspected, general practitioners advised to give a single dose of benzylenicillin (see p. 291 for dose) before urgent transfer to hospital; cefotaxime (sees 1.2) may be an alternative in penicillin allergy; chloramphenicol may be used if history of immediate hypersensitivity reaction to penicillin or to cephalosporins. To eliminate nasopharyngeal carriage give rifampicin for 2 days (see Table 2, section 5.1)

Musculoskeletal system
Osteomyelitis
Flucloxacillin or clindamycin if penicillin-allergic (or vancomycin if resistant *Staphylococcus epidermidis* or meticillin-resistant *Staph. aureus*). Treat acute infection for 4–6 weeks and chronic infection for at least 12 weeks. Combine vancomycin with either fusidic acid or rifampicin if protheses present or if life-threatening condition

Septic arthritis
Flucloxacillin or clindamycin if penicillin-allergic (or vancomycin if resistant *Staphylococcus epidermidis* or meticillin-resistant *Staph. aureus*) (of cefotaxime if gono-
coccal arthritis or Gram-negative infection) Treat usually for 6 weeks (longer if infection complicated or if prothesis present; treat for 2 weeks if gonococcal infection). Combine vancomycin with either fusidic acid or rifampicin if protheses present or if life-threatening condition

Skin
Impetigo
Topical fusidic acid (or mupirocin if meticillin-resistant *Staphylococcus aureus*); oral flucloxacillin or erythromycin if widespread Traditional treatment for 7 days usually adequate; max. duration of topical treatment 10 days; seek local microbiology advice before using topical treatment in hospital; oral treatment for 7 days; add phosphomycillin to flucloxacillin if streptococcal infection suspected

Erysipelas
Phenoxymethylpenicillin (or erythromycin if penicillin-allergic) Treat for at least 7 days; add flucloxacillin to phenox-
ymethylpenicillin if staphylococcus suspected; substitute benzylpenicillin for phenoxymethylpenicillin if parenteral treatment required

Cellulitis
Benzylenicillin + flucloxacillin (or erythromycin alone if penicillin-allergic) Substitute phenoxymethylpenicillin for benzylpenicillin if oral treatment appropriate. Discontinue flucloxacillin if streptococcal infection confirmed. Substitute treatment with broad-spectrum antibacterials if Gram-negative bacteria or anaerobes suspected

Animal and human bites
Co-amoxiclav alone (or doxycycline + metronidazole if penicillin-allergic)

Acne
See section 13.6

---

5.1 Antibacterial drugs

**Sinusitis**

*Amoxicillin* or *doxycycline* or *erythromycin*

Antibacterial should usually be used only for persistent symptoms and purulent discharge lasting at least 7 days or if severe symptoms. Also, consider antibacterial for those at high risk of serious complications (e.g. in immunosuppres-
sion, cystic fibrosis). Treat for 7 days

**Otitis externa**

Flucloxacillin (or erythromycin if penicillin-allergic) Consider systemic antibacterial if spreading cellulitis or patient systemically unwell. Use ciprofloxacin (or an ami-
oglycoside) if pseudomonas suspected. For topical pre-
parations see section 12.1.1

**Otitis media**

*Amoxicillin* (or *erythromycin* if penicillin-allergic)

Many infections caused by viruses. Most uncomplicated cases resolve without antibacterial treatment. In children without systemic features, antibacterial treatment may be started after 72 hours if no improvement. Consider earlier treatment if deterioration, if systemically unwell, if at high risk of serious complications (e.g. in immunosuppression, cystic fibrosis). If mastoiditis present, or in children under 2 years of age with bilateral otitis media. Treat for 5 days (longer if severely ill); initial parenteral therapy in severe infections; consider co-amoxiclav or ceftriaxone if no improvement after 24–48 hours

---

1. Where vancomycin is suggested teicoplanin may be used.
2. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.
3. Where amoxicillin is suggested ampicillin may be used.
### Table 2. Summary of antibacterial prophylaxis

#### Prevention of recurrence of rheumatic fever

Phenoxyemethylenicillin 250 mg twice daily or sulfadiazine 1 g daily (500 mg daily for patients under 30 kg)

#### Prevention of secondary case of invasive group A streptococcal infection

Phenoxyemethylenicillin 250–500 mg every 6 hours for 10 days; CHILD under 1 year 62.5 mg every 6 hours, 1–5 years 125 mg every 6 hours, 6–12 years 250 mg every 6 hours

Patients who are penicillin allergic, either erythromycin ADULT and CHILD over 8 years, 250–500 mg every 6 hours for 10 days; CHILD under 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours or azithromycin [unlicensed indication] 500 mg once daily for 5 days; CHILD over 6 months, 12 mg/kg (max. 500 mg) once daily

#### Prevention of secondary case of meningococcal meningitis

Rifampicin 600 mg every 12 hours for 2 days; CHILD 10 mg/kg (under 1 year, 5 mg/kg) every 12 hours for 2 days

or ciprofloxacin [unlicensed indication] 500 mg as a single dose; CHILD 2–5 years 125 mg; 5–12 years 250 mg

or i/m ceftriaxone [unlicensed indication] 250 mg as a single dose; CHILD under 12 years 125 mg

#### Prevention of secondary case of Haemophilus influenzae type b disease

Rifampicin 600 mg once daily for 4 days (regimen of choice for adults); CHILD 1–3 months 10 mg/kg once daily for 4 days, over 3 months 20 mg/kg once daily for 4 days (max. 600 mg daily)

#### Prevention of secondary case of diphtheria in non-immune patient

Erythromycin 500 mg every 6 hours for 7 days; CHILD up to 2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours

Treat for further 10 days if nasopharyngeal swabs positive after first 7 days’ treatment

---

1. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory).

2. For details of those who should receive chemoprophylaxis contact a consultant in communicable disease control (or a consultant in infectious diseases or the local Health Protection Agency Laboratory). Unless there has been direct exposure of the mouth or nose to infectious droplets from a patient with meningococcal disease who has received less than 24 hours of antibacterial treatment, healthcare workers do not generally require chemoprophylaxis.

3. Where erythromycin is suggested another macrolide (e.g. azithromycin or clarithromycin) may be used.

4. For details of those who should receive chemoprophylaxis contact the lead clinician for local tuberculosis services (or a consultant in communicable disease control). See also section 5.1.9, for advice on immunocompromised patients and on prevention of tuberculosis.

5. Additional intra-operative or postoperative doses of antibiotic may be given for prolonged procedures or if there is major blood loss.

6. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
Resections of colon and rectum for carcinoma, and resections in inflammatory bowel disease, and appendectomy

Single dose$^1$ of i/v gentamicin + i/v metronidazole$^2$ or i/v cefuroxime + i/v metronidazole$^2$ or i/v co-amoxiclav alone

Endoscopic retrograde cholangiopancreatography

Single dose of i/v gentamicin or oral or i/v ciprofloxacin

Prophylaxis particularly recommended if bile stasis, pancreatic pseudocyst, previous cholangitis or neutropenia

Prevention of infection in orthopaedic surgery

Joint replacement including hip and knee and management of fractures

Single dose$^1$ of i/v cefuroxime or i/v fluocxacillin

Substitute i/v vancomycin if history of allergy to penicillins or to cephalosporins or if high risk of meticillin-resistant Staphylococcus aureus; use cefuroxime + metronidazole for complex open fractures with extensive soft-tissue damage; prophylaxis continued for 24 hours in open fractures (longer if complex open fractures)

Prevention of infection in urological procedures

Transrectal prostate biopsy

Single dose$^1$ of oral ciprofloxacin + oral metronidazole or i/v gentamicin + i/v metronidazole$^2$

Transurethral resection of prostate

Single dose$^1$ of oral ciprofloxacin or i/v gentamicin or i/v cefuroxime

Prevention of infection in obstetric and gynaecological surgery

Caesarean section

Single dose$^1$ of i/v cefuroxime

Administer immediately after umbilical cord is clamped; substitute i/v clindamycin if history of allergy to penicillins or cephalosporins

Hysterectomy

Single dose$^1$ of i/v cefuroxime + i/v metronidazole$^2$ or i/v gentamicin + i/v metronidazole$^2$ or i/v co-amoxiclav alone

Termination of pregnancy

Single dose$^1$ of oral metronidazole

If genital chlamydial infection cannot be ruled out, give doxycycline (section 5.1.3) postoperatively

Prevention of infection in vascular surgery

Reconstructive arterial surgery of abdomen, pelvis or legs

Single dose$^1$ of i/v cefuroxime or i/v ciprofloxacin

Add i/v metronidazole for patients at risk from anaerobic infections including those with diabetes, gangrene, or undergoing amputation; add i/v vancomycin if high risk of meticillin-resistant Staphylococcus aureus

NICE guidance

Antimicrobial prophylaxis against infective endocarditis in adults and children undergoing interventional procedures (March 2008)

Antibacterial prophylaxis and chlorhexidine mouthwash are not recommended for the prevention of endocarditis in patients undergoing dental procedures.

Antibacterial prophylaxis is not recommended for the prevention of endocarditis in patients undergoing procedures of the:

- upper and lower respiratory tract (including ear, nose, and throat procedures and bronchoscopy);
- genito-urinary tract (including urological, gynaecological, and obstetric procedures);
- upper and lower gastro-intestinal tract.

Whilst these procedures can cause bacteraemia, there is no clear association with the development of infective endocarditis. Prophylaxis may expose patients to the adverse effects of antimicrobials when the evidence of benefit has not been proven.

Any infection in patients at risk of endocarditis should be investigated promptly and treated appropriately to reduce the risk of endocarditis.

If patients at risk of endocarditis are undergoing a gastro-intestinal or genito-urinary tract procedure at a site where infection is suspected, they should receive appropriate antibacterial therapy that includes cover against organisms that cause endocarditis.

Patients at risk of endocarditis should be:

- advised to maintain good oral hygiene;
- told how to recognise signs of infective endocarditis, and advised when to seek expert advice.

Dermatological procedures

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who undergo dermatological procedures do not require antibacterial prophylaxis against endocarditis.

1. Additional intra-operative or postoperative doses of antibacterial may be given for prolonged procedures or if there is major blood loss.
2. Metronidazole may alternatively be given by suppository but to allow adequate absorption, it should be given 2 hours before surgery.
3. Patients at risk of endocarditis include those with valve replacement, acquired valvular heart disease with stenosis or regurgitation, structural congenital heart disease (including surgically corrected or palliated structural conditions, but excluding isolated atrial septal defect, fully repaired ventricular septal defect, fully repaired patent ductus arteriosus, and closure devices considered to be endothelialised), hypertrophic cardiomyopathy, or a previous episode of infective endocarditis.
4. The British Association of Dermatologists Therapy Guidelines and Audit Subcommittee advise that such dermatological procedures include skin biopsies and excision of moles or of malignant lesions.
Joint protheses and dental treatment

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients with prosthetic joint implants (including total hip replacements) do not require antibiotic prophylaxis for dental treatment. The Working Party considers that it is unacceptable to expose patients to the adverse effects of antibiotics when there is no evidence that such prophylaxis is of any benefit, but that those who develop any intercurrent infection require prompt treatment with antibiotics to which the infecting organisms are sensitive. The Working Party has commented that joint infections have rarely been shown to follow dental procedures and are even more rarely caused by oral streptococci.

Immunosuppression and indwelling intraperitoneal catheters

Advice of a Working Party of the British Society for Antimicrobial Chemotherapy is that patients who are immunosuppressed (including transplant patients) and patients with indwelling intraperitoneal catheters do not require antibiotic prophylaxis for dental treatment provided there is no other indication for prophylaxis. The Working Party has commented that there is little evidence that dental treatment is followed by infection in immunosuppressed and immunodeficient patients nor is there evidence that dental treatment is followed by infection in patients with indwelling intraperitoneal catheters.

Penicillins

The penicillins are bactericidal and act by interfering with bacterial cell wall synthesis. They diffuse well into body tissues and fluids, but penetration into the cerebrospinal fluid is poor except when the meninges are inflamed. They are excreted in the urine in therapeutic concentrations.

Hypersensitivity reactions

The most important side-effect of the penicillins is hypersensitivity which causes rashes and anaphylaxis and can be fatal. Allergic reactions to penicillins occur in 1–10% of exposed individuals; anaphylactic reactions occur in fewer than 0.05% of treated patients. Patients with a history of atopic allergy (e.g. asthma, eczema, hay fever) are at a higher risk of anaphylactic reactions to penicillins. Individuals with a history of anaphylaxis, urticaria, or rash immediately after penicillin administration are at risk of immediate hypersensitivity to a penicillin; these individuals should not receive a penicillin. Patients who are allergic to one penicillin will be allergic to all because the hypersensitivity is related to the basic penicillin structure. As patients with a history of immediate hypersensitivity to penicillins may also react to the cephalosporins and other beta-lactam antibiotics, they should not receive these antibiotics; aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients and can be used with caution. If a penicillin (or another beta-lactam antibiotic) is essential in an individual with immediate hypersensitivity to penicillin then specialist advice should be sought on hypersensitivity testing or using a beta-lactam antibiotic with a different structure to the penicillin that caused the hypersensitivity (see also p. 297).

Individuals with a history of a minor rash (i.e. non-confluent, non-pruritic rash restricted to a small area of the body) or a rash that occurs more than 72 hours after penicillin administration are probably not allergic to penicillin and in these individuals a penicillin should not be withheld unnecessarily for serious infections; the possibility of an allergic reaction should, however, be borne in mind. Other beta-lactam antibiotics (including cephalosporins) can be used in these patients.

A rare but serious toxic effect of the penicillins is encephalopathy due to cerebral irritation. This may result from excessively high doses or in patients with severe renal failure. The penicillins should not be given by intrathecal injection because they can cause encephalopathy which may be fatal.

Another problem relating to high doses of penicillin, or normal doses given to patients with renal failure, is the accumulation of electrolyte since most injectable penicillins contain either sodium or potassium.

Diarrhoea frequently occurs during oral penicillin therapy. It is most common with broad-spectrum penicillins, which can also cause antibiotic-associated colitis.

Benzylpenicillin and phenoxymethylpenicillin

Benzylpenicillin sodium (Penicillin G) remains an important and useful antibiotic but is inactivated by bacterial beta-lactamases. It is effective for many streptococcal (including pneumococcal), gonococcal, and meningococcal infections and also for anthrax (section 5.1.12), diphtheria, gas-gangrene, leptospirosis, and treatment of Lyme disease (section 5.1.1.3). Pneumococci, meningococci, and gonococci which have decreased sensitivity to penicillin have been isolated; benzylpenicillin is no longer the drug of first choice for pneumococcal meningitis. Although benzylpenicillin is effective in the treatment of tetanus, metronidazole (section 5.1.11) is preferred. Benzylpenicillin is inactivated by gastric acid and absorption from the gut is low; therefore it is best given by injection.

Benzathine benzylpenicillin (available on a named-patient basis from specialist importing companies, see p. 939) is used for the treatment of early syphilis and late latent syphilis; it is given by intramuscular injection.

Phenoxymethylpenicillin (Penicillin V) has a similar antibacterial spectrum to benzylpenicillin, but is less active. It is gastric acid-stable, so is suitable for oral administration. It should not be used for serious infec-
tions because absorption can be unpredictable and plasma concentrations variable. It is indicated principally for respiratory-tract infections in children, for streptococcal tonsillitis, and for continuing treatment after one or more injections of benzylpenicillin when clinical response has begun. It should not be used for meningococcal or gonococcal infections. Phenoxymethylpenicillin is used for prophylaxis against streptococcal infections following rheumatic fever and against pneumococcal infections following splenectomy or in sickle-cell disease.

**Oral infections**  Phenoxymethylpenicillin is effective for dental alveolar abscess.

---

### BENZYLPCNILLIN SODIUM
(Penicillin G)

**Indications**  throat infections, otitis media, endocarditis, meningococcal disease, pneumonia, cellulitis (Table 1, section 5.1); anthrax; prophylaxis in limb amputation (Table 2, section 5.1); see also notes above

**Cautions**  history of allergy; false-positive urinary glucose (if tested for reducing substances); renal impairment (Appendix 3); **interactions:** Appendix 1 (penicillins)

**Contra-indications**  penicillin hypersensitivity

**Side-effects**  hypersensitivity reactions including urticaria, fever, joint pains, rashes, angioedema, anaphylaxis, serum sickness-like reaction; rarely CNS toxicity including convulsions (especially with high doses or in severe renal impairment), interstitial nephritis, haemolytic anaemia, leucopenia, thrombocytopenia, and coagulation disorders; also reported diarrhoea (including antibiotic-associated colitis)

**Dose**
- **By intramuscular or by slow intravenous injection** or by infusion, 2.4–4.8 g daily in 4 divided doses, increased if necessary in more serious infections (single doses over 1.2 g intravenous route only; see also below); **PRETERM NEONATE** and **NEONATE** under 1 week, 50 mg/kg daily in 2 divided doses; **NEONATE** 1–4 weeks, 75 mg/kg daily in 3 divided doses; **CHILD** 1 month–12 years, 100 mg/kg daily in 4 divided doses; **INFANT** A 1–9 years, 150 mg/kg daily in 4 divided doses; **INFANT** B 1–9 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections; 6–12 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections; 6–12 years, 250 mg every 6 hours, increased up to 12.5 mg/kg every 6 hours in severe infections

**Note**  Phenoxymethylpenicillin doses in the BNF may differ from those in product literature

---

### PHENOXYMETHYLPENICILLIN
(Penicillin V)

**Indications**  oral infections (see notes above); tonsillitis, otitis media, erysipelas, cellulitis; group A streptococcal infection, rheumatic fever and pneumococcal infection prophylaxis (Table 2, section 5.1)

**Cautions**  see under Benzylpenicillin

**Contra-indications**  see under Benzylpenicillin

**Side-effects**  see under Benzylpenicillin

**Dose**
- **By intrathecal injection, not recommended**

**Note**  Benzylpenicillin doses in BNF may differ from those in product literature

---

### 5.1.1.2 Penicillinase-resistant penicillins

Most staphylococci are now resistant to benzylpenicillin because they produce penicillinases. **Flucloxacillin**, however, is not inactivated by these enzymes and is thus effective in infections caused by penicillin-resistant staphylococci, which is the sole indication for its use. Flucloxacillin is acid-stable and can, therefore, be given by mouth as well as by injection. Flucloxacillin is well absorbed from the gut. For CSM warning on hepatic disorders see under Flucloxacillin.

**Temocillin** is active against Gram-negative bacteria and is stable against a wide range of beta-lactamases. It should be reserved for the treatment of infections caused by beta-lactamase-producing strains of Gram-negative bacteria, including those resistant to third-generation cephalosporins. Temocillin is not active against *Pseudomonas aeruginosa* or *Acinetobacter spp.*
MRSA  Infection from *Staphylococcus aureus* strains resistant to meticillin [now discontinued] (meticillin-resistant *Staph. aureus*, MRSA) and to flucloxacillin can be difficult to manage. Treatment is guided by the sensitivity of the infecting strain.

Rifampicin (section 5.1.9) or sodium fusidate (section 5.1.7) should not be used alone because resistance may develop rapidly. A tetracycline alone or a combination of rifampicin and sodium fusidate can be used for skin and soft-tissue infections caused by MRSA; clindamycin alone is an alternative. A glycopeptide (e.g. vancomycin, section 5.1.7) can be used for severe skin and soft-tissue infections involving Gram-negative organisms, it can be used for mixed skin and soft-tissue infections only when other treatments are not available; linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. A combination of a glycopeptide and sodium fusidate or a glycopeptide and rifampicin can be considered for skin and soft-tissue infections that have failed to respond to a single antibacterial.

The combination of the streptogramin antibiotics quinupristin and dalfopristin (section 5.1.7) should be reserved for skin and soft-tissue infections that have not responded to other antibacterials or for patients who cannot tolerate other antibacterials. Tigecycline (section 5.1.3) and daptomycin (section 5.1.7) are licensed for the treatment of complicated skin and soft-tissue infections involving MRSA.

A tetracycline or clindamycin can be used for bronchiectasis caused by MRSA. A glycopeptide can be used for pneumonia associated with MRSA; if a glycopeptide is unsuitable, linezolid (section 5.1.7) can be used on expert advice. Linezolid must be given with other antibacterials if the infection also involves Gram-negative organisms. Quinupristin and dalfopristin should be reserved for hospital-acquired pneumonia that has not responded to other antibacterials or for patients who cannot tolerate other antibacterials.

A tetracycline can be used for urinary-tract infections caused by MRSA; trimethoprim or nitrofurantoin are alternatives. A glycopeptide can be used for urinary-tract infections that are severe or resistant to other antibacterials.

A glycopeptide can be used for septicaemia associated with MRSA.

For the management of endocarditis, osteomyelitis, or septic arthritis associated with MRSA, see Table 1, section 5.1.

Prophylaxis with vancomycin or teicoplanin (alone or in combination with another antibacterial active against other pathogens) is appropriate for patients undergoing surgery if:

- there is a history of MRSA colonisation or infection without documented eradication;
- there is a risk that the patient’s MRSA carriage has recurred;
- the patient comes from an area with a high prevalence of MRSA.

For eradication of nasal carriage of MRSA, see section 12.2.3.

---

**FLUCLOXACILLIN**

**Indications** infections due to beta-lactamase-producing *Staphylococi* including *Staphylococcus aureus*; acute and chronic osteomyelitis, including *Staphylococcus aureus* osteomyelitis; and acute and chronic skin and soft-tissue infections due to beta-lactamase-producing *Staphylococci*.

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1)

**Side-effects** see under Benzylpenicillin (section 5.1.1.1): also gastrointestinal disturbances; very rarely hepatitis and cholestatic jaundice (see also CSM advice above)

**Dose**

- **By mouth**, 250–500 mg every 6 hours, at least 30 minutes before food; **CHILD** under 2 years quarter adult dose; 2–10 years half adult dose
- **By intramuscular injection**, 250–500 mg every 6 hours; **CHILD** under 2 years quarter adult dose; 2–10 years half adult dose
- **By slow intravenous injection or by intravenous infusion**, 0.25–2 g every 6 hours; **CHILD** under 2 years quarter adult dose; 2–10 years half adult dose
- Endocarditis (in combination with another antibacterial, see Table 1, section 5.1), body-weight under 85 kg, 8 g daily in 4 divided doses; body-weight over 85 kg, 12 g daily in 6 divided doses
- Osteomyelitis (see Table 1, section 5.1), up to 8 g daily in 3–4 divided doses
- Surgical prophylaxis, by slow intravenous injection or by intravenous infusion, 1–2 g at induction; up to 4 further doses of 500 mg may be given every 6 hours by mouth, or by intramuscular injection, or by slow intravenous injection or by intravenous infusion for high risk procedures

**Note** Flucloxacillin doses in BNF may differ from those in product literature

**Flucloxacillin** (Non-proprietary) [Flucloxacillin]

**Capsules**, flucloxacillin (as sodium salt) 250 mg, net price £2.38; 500 mg, net price £4.30. Label: 9, 23

Brands include *Fluclox*, *Fluclox*, *Ladroxin*, *Ladroxin*

**Oral solution** (= elixir or syrup), flucloxacillin (as sodium salt) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £2.97; 250 mg/5 mL, 100 mL = £8.84. Label: 9, 23

Brands include *Ladroxin*, *Ladroxin*

**Injection**, powder for reconstitution, flucloxacillin (as sodium salt). Net price 250-mg vial = £1.23; 500-mg vial = £2.45; 1-g vial = £4.90

**CSM advice (hepatic disorders)**

CSM has advised that very rarely cholestatic jaundice and hepatitis may occur up to several weeks after treatment with flucloxacillin has been stopped. Administration for more than 2 weeks and increasing age are risk factors. CSM has reminded that:

- flucloxacillin should not be used in patients with a history of hepatic dysfunction associated with flucloxacillin;
- flucloxacillin should be used with caution in patients with hepatic impairment;
- careful enquiry should be made about hypersensitivity reactions to beta-lactam antibacterials.
Fluxapen® (GSK) Furn.
Suspension (= syrup), flucoxacin (as magnesium salt) for reconstitution with water, 125 mg/5 mL. net price 100 mL = £3.25; 250 mg/5 mL, 100 mL = £6.48. Label: 9, 23

TEMOCILLIN

Indications septicaemia, urinary-tract infections, lower respiratory-tract infections caused by susceptible Gram-negative bacteria

Cautions see under Benzylpenicillin (section 5.1.1.1); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

Contra-indications see under Benzylpenicillin (section 5.1.1.1)

Side-effects see under Benzylpenicillin (section 5.1.1.1)

Dose

- By intramuscular injection or by intravenous infusion over 3–4 minutes, or by intravenous infusion
- ADULT and CHILD over 12 years (body-weight over 45 kg), 1–2 g every 12 hours
- Uncomplicated urinary-tract infections, ADULT and CHILD over 12 years (body-weight over 45 kg), 1 g daily as a single daily dose or in divided doses

Negaban® (Euromedica) Furn.
Injection, powder for reconstitution, temocillin (as sodium salt), net price 1-g vial = £25.45
Electrolytes Na 4.35 mmol/g

5.1.1.3 Broad-spectrum penicillins

Ampicillin is active against certain Gram-positive and Gram-negative organisms but is inactivated by penicillinas inclu

ing those produced by Staphylococcus aureus and by common Gram-negative bacilli such as Escherichia coli. Almost all staphylococci, approx. 60% of E. coli strains and approx. 20% of Haemophilus influenzae strains are now resistant. The likelihood of resistance should therefore be considered before using ampicillin for the ‘blind’ treatment of infections; in particular, it should not be used for hospital patients without checking sensitivity.

Ampicillin is well excreted in the bile and urine. It is principally indicated for the treatment of exacerbations of chronic bronchitis and middle ear infections, both of which may be due to Streptococcus pneumoniae and H. influenzae, and for urinary-tract infections (section 5.1.13).

Ampicillin can be given by mouth but less than half the dose is absorbed, and absorption is further decreased by the presence of food in the stomach. Amoxicillin may also be used for the treatment of Lyme disease [not licensed], see below.

Co-amoxiclav consists of amoxicillin with the beta-lactamase inhibitor clavulanic acid. Clavulanic acid itself has no significant antibacterial activity but, by inactivating beta-lactamases, it makes the combination active against beta-lactamase-producing bacteria that are resistant to amoxicillin. These include resistant strains of Staph. aureus, E. coli, and H. influenzae, as well as many Bacteroides and Klebsiella spp. Co-amoxiclav should be reserved for infections likely, or known, to be caused by amoxicillin-resistant beta-lactamase-producing strains; for CSM warning on cholestatic jaundice see under Co-amoxiclav.

A combination of ampicillin with flucoxacin (as co-fluampicil) is available to treat infections involving either streptococci or staphylococci (e.g. cellulitis).

Lyme disease Lyme disease should generally be treated by those experienced in its management. Doxycycline (p. 304), amoxicillin [unlicensed indication] or cefuroxime axetil are the antibacterials of choice for early Lyme disease or Lyme arthritis. If these antibacterials are contra-indicated, a macrolide (e.g. erythromycin) can be used for early Lyme disease. Intravenous administration of ceftriaxone, cefotaxime (p. 297), or benzylpenicillin (p. 291) is recommended for Lyme disease associated with cardiac or neurological complications. The duration of treatment is usually 2–4 weeks; Lyme arthritis may require further treatment.

Oral infections Amoxicillin or ampicillin are as effective as phenoxymethylpenicillin (section 5.1.1.1) but they are better absorbed; however, they may encourage emergence of resistant organisms. Like phenoxymethylpenicillin, amoxicillin and ampicillin are ineffective against bacteria that produce beta-lactamases. Amoxicillin may be useful for short-course oral regimens. Co-amoxiclav is active against beta-lactamase-producing bacteria that are resistant to amoxicillin. Co-amoxiclav may be used for severe dental infection with spreading cellulitis or dental infection not responding to first-line antibacterial treatment.

AMOXICILLIN

(Amoxyccillin)

Indications see under Ampicillin; oral infections (see notes above); also endocarditis treatment (Table 1, section 5.1); anthrax (section 5.1.12); adjunct in listerial meningitis (Table 1, section 5.1); Helicobacter pylori eradication (section 1.3)

Cautions see under Ampicillin; maintain adequate hydration with high doses (particularly during parenteral therapy)

Contra-indications see under Ampicillin

Side-effects see under Ampicillin

Dose

- By mouth, 250 mg every 8 hours, doubled in severe infections; CHILD up to 10 years, 125 mg every 8 hours, doubled in severe infections
- Otitis media, 1 g every 8 hours; CHILD 40 mg/kg daily in 3 divided doses (max. 3 g daily)
- Pneumonia, 0.5–1 g every 8 hours
- Anthrax (treatment and post-exposure prophylaxis—see also section 5.1.12), 500 mg every 8 hours; CHILD body-weight under 20 kg, 80 mg/kg daily in 3 divided doses, body-weight over 20 kg, adult dose
5.1.1 Penicillins

- **Short-course oral therapy**
  Dental abscess, 3 g repeated after 8 hours
  Urinary-tract infections, 3 g repeated after 10–12 hours

- **By intramuscular injection**
  500 mg every 8 hours; **CHILD**, 50–100 mg/kg daily in divided doses

- **By intravenous injection or infusion**
  500 mg every 8 hours increased to 1 g every 6 hours in severe infections; **CHILD**, 50–100 mg/kg daily in divided doses

- Listerial meningitis (in combination with another antibiotic if necessary, see Table 1, section 5.1), **by intravenous infusion**, 2 g every 4 hours for 10–14 days

- Endocarditis (in combination with another antibiotic if necessary, see Table 1, section 5.1), **by intravenous infusion**, 2 g every 6 hours, increased to 2 g every 4 hours e.g. in enterococcal endocarditis or if amoxicillin used alone

**Note** Amoxicillin doses in BNF may differ from those in product literature

### Amoxicillin (Non-proprietary)

**Capsules**
- amoxicillin (as trihydrate) 250 mg, net price 21 = £1.14; 500 mg, 21 = £1.56. Label: 9
- Brands include Amix, Amoram, Amoxident, Galenamox, Rimoxallin

**Oral suspension**
- amoxicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.37; 250 mg/5 mL, 100 mL = £1.54. Label: 9
- **Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription
- Brands include Amoram, Galenamox, Rimoxallin

**Sachets**
- sugar-free, amoxicillin (as trihydrate) 3 g/sachet, net price 2-sachet pack = £5.56, 14-sachet pack = £31.94. Label: 9, 13

**Injection**
- powder for reconstitution, amoxicillin (as sodium salt), net price 250-mg vial = 32p; 500-mg vial = 66p; 1-g vial = £1.16

**Dental prescribing on NHS**
- Amoxicillin Sachets may be prescribed. Amoxicillin Sachets may be prescribed as Amoxicillin Oral Powder

### Amoxicillin Capsules and Oral Suspension

**Brands include**
- Amix, Amoram, Amoxident, Galenamox, Rimoxallin

**Note** Amoxicillin doses in BNF may differ from those in product literature

### Amoxicillin (Non-proprietary)

**Capsules**
- amoxicillin 250 mg, net price 28 = £3.88; 500 mg, 28 = £19.68. Label: 9, 23
- Brands include Rimoxallin

**Oral suspension**
- amoxicillin 125 mg/5 mL when reconstituted with water, net price 100 mL = £3.38; 250 mg/5 mL, 100 mL = £6.61. Label: 9, 23
- Brands include Rimoxallin

**Injection**
- powder for reconstitution, amoxicillin (as sodium salt), net price 500-mg vial = £7.83

**Dental prescribing on NHS**
- Amoxicillin Capsules and Oral Suspension may be prescribed

### Penbritin® (Chemidex)

**Capsules**
- grey/red, ampicillin (as trihydrate) 250 mg, net price 28-cap pack = £2.10; 500 mg, 28-cap pack = £5.28. Label: 9, 23

**Syrup**
- apricot-caramel- and peppermint-flavoured, ampicillin (as trihydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £3.78; 250 mg/5 mL, 100 mL = £7.39. Label: 9, 23

**Exciptients**
- include sucrose 6 g/5 mL

**With fluocxacillin**
- See Co-fluampicil

### CO-AMOXICLAV

A mixture of amoxicillin (as the trihydrate or as the sodium salt) and clavulanic acid (as potassium clavulanate); the proportions are expressed in the form x/y where x and y are the strengths in milligrams of amoxicillin and clavulanic acid respectively

### Indications
- infections due to beta-lactamase-producing strains (where amoxicillin alone not appropriate) including respiratory-tract infections, genito-urinary and abdominal infections, cellulitis, animal bites,
severe dental infection with spreading cellulitis or dental infection not responding to first-line anti-
bacterial

**Cautions** see under Ampicillin and notes above; also caution in hepatic impairment (monitor hepatic function), pregnancy; maintain adequate hydration with high doses (particularly during parenteral ther-

**Cholestatic jaundice** CSM has advised that cholestatic jaundice can occur either during or shortly after the use of co-amoxiclav. An epidemiological study has shown that the risk of acute liver toxicity was about 6 times greater with co-

**Contra-indications** penicillin hypersensitivity, history of co-amoxiclav-associated or penicillin-associated jaundice or hepatic dysfunction

**Side-effects** see under Ampicillin; hepatitis, chole-

**Dose**

- **By mouth**, expressed as amoxicillin, 250 mg every 8 hours, dose doubled in severe infections; CHILD see under preparations below (under 6 years **Augmentin** ‘125/31 SF’ suspension; 6–12 years **Augmentin** ‘250/62 SF’ suspension or for short-
term treatment with twice daily dosage in CHILD 2 months–12 years **Augmentin-Duo** 400/57 suspend-

Severe dental infections (but not generally first-line, see notes above), expressed as amoxicillin, 250 mg every 8 hours for 5 days

- **By intravenous injection** over 3–4 minutes or by intravenous infusion, expressed as amoxicillin, 1 g every 8 hours increased to 1 g every 6 hours in more serious infections; INFANTS up to 3 months 25 mg/kg every 8 hours (every 12 hours in the perinatal period and in premature infants); CHILD 3 months–12 years, 25 mg/kg every 8 hours increased to 25 mg/kg every 6 hours in more serious infections Surgical prophylaxis, expressed as amoxicillin, 1 g at induction; for high risk procedures (e.g. colorectal surgery) up to 2–3 further doses of 1 g may be given every 8 hours

**Co-amoxiclav** (Non-proprietary) Tablets, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £3.04. Label: 9 Dental prescribing on NHS Co-amoxiclav 250/125 Tablets may be prescribed Tablets, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £6.32. Label: 9 Oral suspension, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31.25 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £3.07. Label: 9 Oral suspension, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62.5 mg as potassium salt)/5 mL when reconstituted with water, net price 100 mL = £3.87. Label: 9 **Injection 500/100**, powder for reconstitution, co-

**Augmentin** (GSK) Tablets 375 mg, f/c, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt), net price 21-tab pack = £4.45. Label: 9 Tablets 625 mg, f/c, co-amoxiclav 500/125 (amoxicillin 500 mg as trihydrate, clavulanic acid 125 mg as potassium salt). Net price 21-tab pack = £8.49. Label: 9 **Dispersible tablets**, sugar-free, co-amoxiclav 250/125 (amoxicillin 250 mg as trihydrate, clavulanic acid 125 mg as potassium salt). Net price 21-tab pack = £10.22. Label: 9, 13 **Suspension ‘125/31 SF’**, sugar-free, co-amoxiclav 125/31 (amoxicillin 125 mg as trihydrate, clavulanic acid 31 mg as potassium salt)/5 mL when reconstituted with water. Net price 100 mL (raspberry-and orange-flavoured) = £4.25. Label: 9 Excipients include aspartame 12.5 mg/5 mL (section 9.4.1) **Dose** CHILD 1–6 years (10–18 kg) 5 mL every 8 hours or INFANT and CHILD up to 6 years 0.8 mL/kg daily in 3 divided doses; in severe infections dose increased to 1.6 mL/kg daily in 3 divided doses **Suspension ‘250/62 SF’**, sugar-free, co-amoxiclav 250/62 (amoxicillin 250 mg as trihydrate, clavulanic acid 62 mg as potassium salt)/5 mL when reconstituted with water. Net price 100 mL (raspberry-and orange-flavoured) = £5.97. Label: 9 Excipients include aspartame 12.5 mg/5 mL (section 9.4.1) **Dose** CHILD 6–12 years (18–40 kg) 5 mL every 8 hours or 0.6 mL/kg/day in 3 divided doses; in severe infections dose increased to 0.8 mL/kg/day in 3 divided doses **Injection 600 mg**, powder for reconstitution, co-

**Augmentin-Duo** (GSK) Tablets 400/57, sugar-free, strawberry-flavoured, co-amoxiclav 400/57 (amoxicillin 400 mg as trihydrate, clavulanic acid 57 mg as potassium salt)/ 5/mL when reconstituted with water. Net price 35 mL = £4.38, 70 mL = £6.15. Label: 9 Excipients include aspartame 12.5 mg/5 mL (section 9.4.1) **Dose** CHILD 2 months–2 years 0.15 mL/kg twice daily, 2–6 years (13–21 kg) 2.5 mL twice daily, 7–12 years (22–40 kg) 5 mL twice daily, doubled in severe infections

**CO-FLUAMPICIL** A mixture of equal parts by mass of flucloxacillin and ampicillin

**Indications** mixed infections involving beta-lacta-
mase-producing staphylococci
5 Infections

**Side-effects**

- By mouth, co-fluampicil, 250/250 every 6 hours, dose doubled in severe infections; CHILD under 10 years half adult dose, dose doubled in severe infections.
- By intramuscular or slow intravenous injection or by intravenous infusion, co-fluampicil 250/250 every 6 hours, dose doubled in severe infections; CHILD under 2 years quarter adult dose, 2–10 years half adult dose, dose doubled in severe infections.

**Co-fluampicil (Non-proprietary)**

- Capsules, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 20-cap pack = £14.43. Label: 9, 22.
- Capsules, black/turquoise, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as trihydrate), net price 20-cap pack = £4.00. Label: 9, 22.
- Syrup, co-fluampicil 125/125 (flucloxacillin 125 mg as magnesium salt, ampicillin 125 mg as trihydrate)/5 mL when reconstituted with water, net price 100 mL = £4.99. Label: 9, 22.

**Magnapen® (CP)**

- Capsules, 3.14 g/5 mL.
- Injection 500 mg, powder for reconstitution, co-fluampicil 250/250 (flucloxacillin 250 mg as sodium salt, ampicillin 250 mg as sodium salt), net price per vial = £1.33.

**Electrolytes**

- Na 1.3 mmol/vial.

---

**5.1.1 Penicillins**

**Contra-indications**

See under Ampicillin and Flucloxacillin.

**Dose**

- By intramuscular injection or slow intravenous injection or by intravenous infusion, ampicillin and flucloxacillin.

**Indications**

See preparations.

---

**5.1.4 Antipseudomonal penicillins**

The carboxypenicillin, ticarcillin, is principally indicated for serious infections caused by *Pseudomonas aeruginosa* although it also has activity against certain other Gram-negative bacilli including *Proteus* spp. and *Bacteroides fragilis*.

Ticarcillin is now available only in combination with clavulanic acid (section 5.1.1.3); the combination (*Timentin®*) is active against beta-lactamase-producing bacteria resistant to ticarcillin.

*Tazocin®* contains the ureidopenicillin *piperacillin* with the beta-lactamase inhibitor tazobactam. Piperacillin is more active than ticarcillin against *P. aeruginosa*. The spectrum of activity of *Tazocin®* is comparable to that of the carbapenems, imipenem and meropenem (section 5.1.2).

For pseudomonas septicaemias (especially in neutropenia or endocarditis) these antipseudomonal penicillins should be given with an aminoglycoside (e.g. gentamicin or endocarditis), these antipseudomonal penicillins should be given with an aminoglycoside (e.g. gentamicin or tobramycin) since they have a synergistic effect.

**Contra-indications**

See under Benzylpenicillin (section 5.1.1.1).

**Side-effects**

See under Benzylpenicillin (section 5.1.1.1); also nausea, vomiting, diarrhoea; *less commonly* stomatitis, dyspepsia, constipation, jaundice, hypotension, headache, insomnia, and injection-site reactions; *rarely* abdominal pain, hepatitis, oedema, fatigue, and eosinophilia; *very rarely* hypoglycaemia, hypokalaemia, pancytopenia, Stevens-Johnson syndrome, and toxic epidermal necrolysis.

**Dose**

- See preparations.

---

**5.1.5 Mecillinams**

Pivmecillinam has significant activity against many Gram-negative bacteria including *Escherichia coli*, klebsiella, enterobacter, and salmonellae. It is not active.
against *Pseudomonas aeruginosa* or enterococci. Pivmecillinam is hydrolysed to mecillinam, which is the active drug.

**PIVMECILLINAM HYDROCHLORIDE**

**Indications** see under Dose below

**Cautions** see under Benzylpenicillin (section 5.1.1.1); also liver and renal function tests required in long-term use; avoid in acute porphyria (section 9.8.2); pregnancy; **interactions**: Appendix 1 (penicillins)

**Contra-indications** see under Benzylpenicillin (section 5.1.1.1); also carotid insufficiency, oesophageal strictures, gastro-intestinal obstruction, infants under 3 months

**Side-effects** see under Benzylpenicillin (section 5.1.1.1); nausea, vomiting, dyspepsia; also reduced serum and total body carminite (especially with long-term or repeated use)

**Dose**

- Acute uncomplicated cystitis, **ADULT** and **CHILD** over 40 kg, initially 400 mg then 200 mg every 8 hours for 3 days
- Chronic or recurrent bacteriuria, **ADULT** and **CHILD** over 40 kg, 400 mg every 6–8 hours
- Urinary tract infections, **CHILD** under 40 kg, 20–40 mg/kg daily in 3–4 divided doses
- Salmonellosis, not recommended therefore no dose stated

**Counselling** Tablets should be swallowed whole with plenty of fluid during meals while sitting or standing

**Selexid®** (LEO) Tablets, I/c, pivmecillinam hydrochloride 200 mg, net price 10-pack tab £4.50. Label 9, 21, 27, counselling, posture (see Dose above)

### 5.1.2 Cephalosporins, carbapenems, and other beta-lactams

Antibiotics in this section include the cephalosporins, such as cefotaxime, ceftazidime, cefuroxime, cefalexin and cefradine, the monobactam, aztreonam, and the carbapenems, imipenem (a thienamycin derivative), meropenem, doripenem, and ertapenem.

#### 5.1.2.1 Cephalosporins

The cephalosporins are broad-spectrum antibiotics which are used for the treatment of septicaemia, pneumonia, meningitis, biliary-tract infections, peritonitis, and urinary-tract infections. The pharmacology of the cephalosporins is similar to that of the penicillins, excretion being principally renal. Cephalosporins penetrate the cerebrospinal fluid poorly unless the meninges are inflamed; cefotaxime is a suitable cephalosporin for infections of the CNS (e.g. meningitis).

The principal side-effect of the cephalosporins is hypersensitivity and about 0.5–6.5% of penicillin-sensitive patients will also be allergic to the cephalosporins. Patients with a history of immediate hypersensitivity to penicillin should not receive a cephalosporin. If a cephalosporin is essential in these patients because a suitable alternative antibacterial is not available, then cefixime, cefotaxime, ceftazidime, ceftriaxone, or cefuroxime can be used with caution; cefaclor, cefadroxil, cefalexin, and cefradine should be avoided.

Antibiotic-associated colitis may occur with the use of broad-spectrum cephalosporins.

Cefradine (cefdihidine) has generally been replaced by the newer cephalosporins.

Cefuroxime is a 'second generation' cephalosporin that is less susceptible than the earlier cephalosporins to inactivation by beta-lactamases. It is, therefore, active against certain bacteria which are resistant to the other drugs and has greater activity against *Haemophilus influenzae* and *Neisseria gonorrhoeae*.

Cefotaxime, ceftazidime and ceftriaxone are 'third generation' cephalosporins with greater activity than the 'second generation' cephalosporins against certain Gram-negative bacteria. However, they are less active than cefuroxime against Gram-positive bacteria, most notably *Staphylococcus aureus*. Their broad antibacterial spectrum may encourage superinfection with resistant bacteria or fungi.

Cefadroxil has good activity against pseudomonas. It is also active against other Gram-negative bacteria.

Ceftriaxone has a longer half-life and therefore needs to be given only once daily. Indications include serious infections such as septicemia, pneumonia, and meningitis. The calcium salt of ceftriaxone forms a precipitate in the gall bladder which may rarely cause symptoms but these usually resolve when the antibiotic is stopped.

**Orally active cephalosporins** The orally active 'first generation' cephalosporins, cefalexin (cephalexin), cefadroxil, and cefuroxime have a similar antimicrobial spectrum. They are useful for urinary-tract infections which do not respond to other drugs or which occur in pregnancy, respiratory-tract infections, otitis media, sinusitis, and skin and soft-tissue infections. Cefaclor has good activity against *H. influenzae*, but it is associated with protracted skin reactions especially in children. Cefadroxil has a long duration of action and can be given twice daily; it has poor activity against *H. influenzae*. Cefuroxime axetil, an ester of the 'second generation' cephalosporin cefuroxime, has the same antibacterial spectrum as the parent compound; it is poorly absorbed.

Cefixime has a longer duration of action than the other cephalosporins that are active by mouth. It is only licensed for acute infections.

Cefpodoxime proxetil is more active than the other oral cephalosporins against respiratory bacterial pathogens and it is licensed for upper and lower respiratory-tract infections.

For treatment of Lyme disease, see section 5.1.1.3.

**Oral infections** The cephalosporins offer little advantage over the penicillins in dental infections, often being less active against anaerobes. Infections due to oral streptococci (often termed viridans streptococci) which become resistant to penicillin are usually also resistant to cephalosporins. This is of importance in the case of patients who have had rheumatic fever and are on long-term penicillin therapy. Cefalexin and cefradine have been used in the treatment of oral infections.
**Indications** infections due to sensitive Gram-positive and Gram-negative bacteria, but see notes above

**Cautions** sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also notes above and p. 290); renal impairment (Appendix 3); pregnancy and breast-feeding (but appropriate to use); false positive urinary glucose (if tested for reducing substances) and false positive Coombs’ test; **interactions**: Appendix 1 (cephalosporins)

**Contra-indications** cephalosporin hypersensitivity

**Side-effects** diarrhoea and rarely antibiotic-associated colitis (CSM has warned both more likely with higher doses), nausea and vomiting, abdominal discomfort, headache; allergic reactions including rashes, pruritus, urticaria, serum sickness-like reactions with rashes, fever and arthralgia, and anaphylaxis; Stevens-Johnson syndrome, toxic epidermal necrolysis reported; disturbances in liver enzymes, transient hepatitis and cholestatic jaundice; other side-effects reported include eosinophilia and blood dyscrasias (including thrombocytopenia, leucopenia, agranulocytosis, aplastic anaemia and haemolytic anaemia); reversible interstitial nephritis, hyperactivity, nervousness, sleep disturbances, hallucinations, confusion, hyperpnoea, and dizziness

**Dose**
- 250 mg every 8 hours, doubled for severe infections; max. 4 g daily; **CHILD** over 1 month, 20 mg/kg daily in 3 divided doses, doubled for severe infections, max. 1 g/day; or 1 month–1 year, 62.5 mg every 8 hours; 1–5 years, 125 mg; over 5 years, 250 mg; doses doubled for severe infections

**Cefaclor** (Non-proprietary) (Flynn)

- **Capsules**, cefaclor (as monohydrate) 250 mg, net price 21-cap pack = £4.52; 500 mg, 50-cap pack = £23.88. **Label**: 9

- **Brands include** Keftid

- **Suspension**, cefaclor (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 60 mL = £1.63; 250 mg/5 mL, 60 mL = £3.24; 500 mg/5 mL, 60 mL = £4.85. **Label**: 9

**Distaclovor** (Flynn) (Non-proprietary)

- **Capsules**, cefadroxil (as monohydrate) 500 mg (violet/grey), net price 20 = £17.33. **Label**: 9

- **Suspension**, both pink, cefadroxil (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 100 mL = £8.33; 250 mg/5 mL, 100 mL = £9.33. **Label**: 9

**Note** Sugar-free versions are available and can be ordered by specifying ‘sugar-free’ on the prescription **Brands include** Keftid

**Distaclovor MR** (Flynn) (Non-proprietary)

- **Tablets**, m/r, both blue, cefadroxil (as monohydrate) 375 mg. Net price 14-tab pack = £6.93. **Label**: 9, 21, 25

**Dose**
- 375 mg every 12 hours with food, dose doubled for pneumonia

Lower urinary-tract infections, 375 mg every 12 hours with food

**CEFADROXIL**

**Indications** see under Cefaclor; see also notes above

**Cautions** see under Cefaclor

**Contra-indications** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- Patients over 40 kg, 0.5–1 g twice daily; skin, soft tissue, and simple urinary-tract infections, 1 g daily; **CHILD** under 1 year, 25 mg/kg daily in divided doses; 1–6 years, 250 mg twice daily; over 6 years, 500 mg twice daily

**Cefadroxil** (Non-proprietary) (Non-proprietary)

- **Capsules**, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £5.25. **Label**: 9

**Baxan** (Bristol-Myers Squibb) (Galen)

- **Capsules**, cefadroxil (as monohydrate) 500 mg, net price 20-cap pack = £5.64. **Label**: 9

**Suspension**, cefadroxil (as monohydrate) for reconstitution with water, 125 mg/5 mL, net price 60 mL = £1.63; 250 mg/5 mL, 60 mL = £3.24; 500 mg/5 mL, 60 mL = £4.85. **Label**: 9

**CEFALEXIN** (Cefalexin)

**Indications** see under Cefaclor

**Cautions** see under Cefaclor

**Contra-indications** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- 250 mg every 6 hours or 500 mg every 8–12 hours increased to 1–1.5 g every 6–8 hours for severe infections; **CHILD** 25 mg/kg daily in divided doses, doubled for severe infections, max. 100 mg/kg daily; or under 1 year 125 mg every 12 hours, 1–5 years 125 mg every 8 hours, 5–12 years 250 mg every 8 hours

**Prophylaxis of recurrent urinary-tract infection, ADULT 125 mg at night**

**Cefalexin** (Non-proprietary) (Wyn)

- **Capsules**, cefalexin 250 mg, net price 28-cap pack = £2.07; 500 mg, 21-cap pack = £2.61. **Label**: 9

**Tablets**, cefalexin 250 mg, net price 28-tab pack = £2.27; 500 mg, 21-tab pack = £2.84. **Label**: 9

**Oral suspension**, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.83; 250 mg/5 mL, 100 mL = £2.27. **Label**: 9

**Dental prescribing on NHS** Cefalexin Capsules, Tablets, and Oral Suspension may be prescribed

**Ceporex** (Galen) (Non-proprietary)

- **Capsules**, both caramel/grey, cefalexin 250 mg, net price 28-cap pack = £4.02; 500 mg, 28-cap pack = £7.85. **Label**: 9

**Tablets**, all pink, f/c, cefalexin 250 mg, net price 28-tab pack = £4.02; 500 mg, 28-tab pack = £7.85. **Label**: 9

**Syrup**, all orange, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £1.43; 250 mg/5 mL, 100 mL = £2.87; 500 mg/5 mL, 100 mL = £5.57. **Label**: 9

**Keflex** (Flynn) (Non-proprietary)

- **Capsules**, cefalexin 250 mg (green/white), net price 28-cap pack = £1.76; 500 mg (pale green/dark green), 21-cap pack = £2.66. **Label**: 9

**Tablets**, both peach, cefalexin 250 mg, net price 28-tab pack = £2.09; 500 mg (scored), 21-tab pack = £2.47. **Label**: 9
Suspension, cefalexin for reconstitution with water, 125 mg/5 mL, net price 100 mL = £8.89; 250 mg/5 mL, 100 mL = £11.51. Label: 9

### CEFIXIME

**Indications** see under Cefaclor (acute infections only); gonorrhoea; surgical prophylaxis

**Side-effects** see under Cefaclor

**Contra-indications** see under Cefaclor

**Dose**
- ADULT and CHILD over 10 years, 200–400 mg daily in 1–2 divided doses; CHILD over 6 months 8 mg/kg daily in 1–2 divided doses or 6 months–1 year 75 mg daily; 1–4 years 100 mg daily; 5–10 years 200 mg daily
- Gonorrhoea [unlicensed indication], 400 mg as a single dose

**Suprax®** (Rhône-Poulenc Rorer) (FMD)

Tablets, 1, 2, scored, cefixime 200 mg. Net price 7-tab pack = £15.23. Label: 9

Paediatric oral suspension, cefixime 100 mg/5 mL, when reconstituted with water, net price 50 mL (with double-ended spoon for measuring 3.75 mL or 5 mL since dilution not recommended) = £10.53, 100 mL = £18.91. Label: 9

### CEFOTAXIME

**Indications** see under Cefaclor; gonorrhoea; surgical prophylaxis: Haemophilus epiglottitis and meningitis (Table 1, section 5.1); see also notes above

**Cautions** see under Cefaclor

**Contra-indications** see under Cefaclor

**Side-effects** see under Cefaclor; rarely arrhythmias following rapid injection reported

**Dose**
- **By intramuscular** or **intravenous injection** or **by intravenous infusion**, 1 g every 12 hours increased in severe infections (e.g. meningitis) to 8 g daily in 4 divided doses; higher doses (up to 12 g daily in 3–4 divided doses) may be required; NEONATE 50 mg/kg daily in 2–4 divided doses increased to 150–200 mg/kg daily in severe infections; CHILD 100–150 mg/kg daily in 2–4 divided doses increased up to 200 mg/kg daily in very severe infections
- Gonorrhoea, 500 mg as a single dose

**Important** If bacterial meningitis and especially if meningococcal disease is suspected the patient should be transferred urgently to hospital. If benzylpenicillin cannot be given (e.g. because of an allergy), a single dose of cefotaxime may be given (if available) before urgent transfer to hospital. Suitable doses of cefotaxime by intravenous injection (or by intramuscular injection) are ADULT and CHILD over 12 years 1 g; CHILD under 12 years 50 mg/kg; chloramphenicol (section 5.1.7) may be used if there is a history of anaphylaxis to penicillins or cephalosporins

**Cefotaxime (Non-proprietary) (FMD)**

**Injection**, powder for reconstitution, cefotaxime (as sodium salt), net price 500-mg vial = £2.14; 1-g vial = £4.31; 2-g vial = £8.57

### CEPFodoxime

**Indications** see under Dose

**Cautions** see under Cefaclor

**Contra-indications** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- Upper respiratory-tract infections (but in pharyngitis and tonsillitis reserved for infections which are recurrent, chronic, or resistant to other antibacterials), 100 mg twice daily (200 mg twice daily in sinusitis); CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Lower respiratory-tract infections (including bronchitis and pneumonia), 100–200 mg twice daily; CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Skin and soft-tissue infections, 200 mg twice daily; CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Uncomplicated urinary-tract infections, 100 mg twice daily (200 mg twice daily in uncomplicated upper urinary-tract infections); CHILD 15 days–6 months 4 mg/kg every 12 hours, 6 months–2 years 40 mg every 12 hours, 3–8 years 80 mg every 12 hours, over 9 years 100 mg every 12 hours
- Uncomplicated gonorrhoea, 200 mg as a single dose

**Orelox®** (Hoechst Marion Roussel) (FMD)

Tablets, 1, 2, cefpodoxime 100 mg (as proxetil), net price 10-tab pack = £10.18. Label: 5, 9, 21

Oral suspension, cefpodoxime (as proxetil) for reconstitution with water, 40 mg/5 mL, net price 100 mL = £11.97. Label: 5, 9, 21

Excipients include aspartame (section 9.4.1)

### CEFRADINE

(Cephradine)

**Indications** see under Cefaclor; surgical prophylaxis

**Cautions** see under Cefaclor

**Contra-indications** see under Cefaclor

**Side-effects** see under Cefaclor

**Dose**
- By mouth, 250–500 mg every 6 hours or 0.5–1 g every 12 hours; up to 1 g every 6 hours in severe infections; CHILD, 25–50 mg/kg daily in 2–4 divided doses
- By deep intramuscular injection or by intravenous injection over 3–5 minutes or by intravenous infusion, 0.5–1 g every 6 hours, increased to 8 g daily in severe infections; CHILD 50–100 mg/kg daily in 4 divided doses
- Surgical prophylaxis, by deep intramuscular injection or by intravenous injection over 3–5 minutes, 1–2 g at induction

**Cefradine (Non-proprietary) (FMD)**

Capsules, cefradine 250 mg, net price 20-cap pack = £8.97; 500 mg, 20-cap pack = £8.49. Label: 9

Brands include Nicef

Dental prescribing on NHS Cefradine Capsules may be prescribed

**Velosef®** (Squibb) (FMD)

Capsules, cefradine 250 mg (orange/blue), net price 20-cap pack = £5.42; 500 mg (blue), 20-cap pack = £11.22. Label: 9
**CEFADROME**

**Indications** see under Cefaclor; see also notes above

**Cautions** see under Cefaclor and notes above; surgical prophylaxis; prophylaxis of meningococcal disease in children

**Side-effects** see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis

**Dose**
- By deep intramuscular injection, or by intravenous injection over at least 2–4 minutes, or by intravenous infusion, 1 g daily; 2–4 g daily in severe infections; intramuscular doses over 1 g divided between more than one site; single intravenous doses above 1 g by intravenous infusion only
- Neonate by intravenous infusion over 60 minutes, 20–50 mg/kg daily (max. 50 mg/kg daily) infant and child under 50 kg, by deep intramuscular injection, or by intravenous injection over 2–4 minutes, or by intravenous infusion, 20–50 mg/kg daily; up to 80 mg/kg daily in severe infections; doses of 50 mg/kg and over by intravenous infusion only; 50 kg and over, adult dose
- Endocarditis caused by haemophilus, actinobacillus, carbiodermium, eikenella, and kingella species ("HACEK organisms") (in combination with another antibacterial, see Table 1, section 5.1; [unlicensed indication]), by intravenous infusion, 2–4 g daily
- Early syphilis [unlicensed indication], by deep intramuscular injection, 500 mg daily for 10 days
- Uncomplicated gonorrhoea, by deep intramuscular injection, 250 mg as a single dose
- Surgical prophylaxis, by deep intramuscular injection or by intravenous injection over at least 2–4 minutes, 1 g at induction; colorectal surgery, by deep intramuscular injection or by intravenous infusion, 2 g at induction; intramuscular doses over 1 g divided between more than one site

**CEFTRIAZONE**

**Indications** see under Cefaclor and notes above; surgical prophylaxis; prophylaxis of meningococcal meningitis [unlicensed indication] (Table 2, section 5.1)

**Cautions** see under Cefaclor; severe renal impairment (Appendix 3); hepatic impairment if accompanied by renal impairment (Appendix 2); premature neonates; may displace bilirubin from serum albumin, administer over 60 minutes in neonates (see also Contra-indications); treatment longer than 14 days, renal failure, dehydration—risk of ceftriaxone precipitation in gall bladder

**Contra-indications** see under Cefaclor; neonates with jaundice, hypoalbuminaemia, acidosis or impaired bilirubin binding; concomitant treatment with calcium in children—risk of precipitation in urine and lungs of neonates (and possibly infants and older children)

**Side-effects** see under Cefaclor; calcium ceftriaxone precipitates in urine (particularly in very young, dehydrated or those who are immobilised) or in gall bladder—consider discontinuation if symptomatic; rarely prolongation of prothrombin time, pancreatitis

**Dose**
- By mouth (as cefuroxime axetil), 250 mg twice daily in most infections including mild to moderate lower respiratory tract infections (e.g. bronchitis); doubled for more severe lower respiratory tract infections or if pneumonia suspected
- Urinary tract infection, 125 mg twice daily, doubled in pyelonephritis
- Gonorrhoea, 1 g as a single dose
- Child over 3 months, 125 mg twice daily, if necessary doubled in child over 2 years with otitis media
- Lyme disease, adult and child over 12 years, 500 mg twice daily for 20 days
The carbapenems are beta-lactam antibacterials with a broad-spectrum of activity which includes many Gram-positive and Gram-negative bacteria, and anaerobes; imipenem, meropenem, and doripenem have good activity against Pseudomonas aeruginosa. The carbapenems are not active against meticillin-resistant Staphylococcus aureus and Enterococcus faecium.

Imipenem is partially inactivated in the kidney by enzymatic activity and is therefore administered in combination with cilastatin, a specific enzyme inhibitor, which blocks its renal metabolism. Meropenem, doripenem, and ertapenem are stable to the renal enzyme which inactivates imipenem and therefore can be given without cilastatin.

Side-effects of imipenem with cilastatin are similar to those of other beta-lactam antibiotics; neurotoxicity has been observed at very high dosage, in renal failure, or in patients with CNS disease. Ertapenem has been associated with seizures uncommonly. Meropenem has less seizure-inducing potential and can be used to treat central nervous system infection.

**DORIPENEM**

**Indications**
- hospital-acquired pneumonia; complicated intra-abdominal infections; complicated urinary-tract infections

**Cautions**
- sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 290); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (doripenem)

**Side-effects**
- nausea, diarrhoea; headache; phlebitis, pruritus, rash; less commonly antibiotic-associated colitis; also reported, neutropenia

**Dose**
- By intravenous infusion, ADULT over 18 years, 500 mg every 8 hours; max. duration of treatment 14 days

**Doribax®** (Janssen-Cilag) ►

**Intravenous infusion**, powder for reconstitution, doripenem (as monohydrate), net price 500-mg vial = £15.11

**ERTAPENEM**

**Indications**
- abdominal infections; acute gynaecological infections; community-acquired pneumonia; diabetic foot infections of the skin and soft-tissue; prophylaxis for colorectal surgery

**Cautions**
- sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 290); elderly, renal impairment (Appendix 3); CNS disorders—risk of seizures; pregnancy (Appendix 4); CNS disorders—risk of seizures; pregnancy (Appendix 4); interactions: Appendix 1 (ertapenem)

**Contra-indications**
- breast-feeding (Appendix 5)

**Side-effects**
- diarrhoea, nausea, vomiting, headache, injection-site reactions, rash, pruritus, raised platelet count; less commonly dry mouth, taste disturbances, dyspepsia, abdominal pain, anorexia, constipation, melena, antibiotic-associated colitis, bradycardia, hypotension, chest pain, oedema, pharyngeal discomfort, dyspnoea, dizziness, sleep disturbances, confusion, asthenia, seizures, vomiting, raised glucose, peptechiae; rarely dysphagia, cholestatics, liver disorder (including jaundice), arrhythmia, increase in blood pressure, syncope, nasal congestion, cough, wheezing, anxiety, depression, agitation, tremor, pelvic peritonitis, renal impairment, muscle cramp, scleral disorder, blood disorders (including neutropenia, thrombocytopenia, haemorrhage), hypoglycaemia, electrolyte disturbances; very rarely hallucinations
5.1.2 Cephalosporins, carbapenems, and other beta-lactams

**Dose**
- **By intravenous infusion**:
  - **ADULT and ADOLESCENT** over 13 years, 1 g once daily; **CHILD** 3 months–13 years, 15 mg/kg every 12 hours (max. 1 g daily)
  - Surgical prophylaxis, colostral surgery, **ADULT** over 18 years, 1 g completed within 1 hour before surgery

**Invanz** *(MSD)* *(Novartis)*
- **Intravenous infusion**, powder for reconstitution, ertapenem (as sodium salt), net price 1-g vial = £31.65

**IMIPENEM WITH CILASTATIN**

**Indications**
- aerobic and anaerobic Gram-positive and Gram-negative infections; surgical prophylaxis; hospital-acquired septicaemia (Table 1, section 5.1); not indicated for CNS infections

**Cautions**
- sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 290); renal impairment (Appendix 3); CNS disorders (e.g. epilepsy); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (imipenem with cilastatin)

**Side-effects**
- nausea, vomiting, diarrhoea (associated colitis reported), abdominal pain, disturbances in liver function tests; headache; thrombophlebitis; erythema, pain and induration, and thrombophlebitis

**Dose**
- **By intravenous infusion**, in terms of imipenem, 1–2 g daily (in 3–4 divided doses); less sensitive organisms, up to 50 mg/kg daily (max. 4 g daily) in 3–4 divided doses; **CHILD** 3 months and older, 60 mg/kg (up to max. of 2 g) daily in 4 divided doses; over 40 kg, adult dose
  - Surgical prophylaxis, 1 g at induction repeated after 3 hours, supplemented in high risk (e.g. colorectal) surgery by doses of 500 mg 8 and 16 hours after induction

**Primaxin** *(MSD)* *(Novartis)*
- **Intravenous infusion**, powder for reconstitution, imipenem (as monohydrate) 500 mg with cilastatin (as sodium salt) 500 mg, net price per vial = £12.00

**MEROPEM**

**Indications**
- aerobic and anaerobic Gram-positive and Gram-negative infections

**Cautions**
- sensitivity to beta-lactam antibacterials (avoid if history of immediate hypersensitivity reaction, see also p. 290); hepatic impairment (monitor liver function; Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (meropenem)

**Side-effects**
- nausea, vomiting, diarrhoea (antibiotic-associated colitis reported), abdominal pain, disturbances in liver function tests; headache; thrombocytopenia, positive Coombs’ test; rash, pruritus, injection-site reactions; less commonly eosinophilia, thrombocytopenia; rarely convulsions; also reported paraesthesia, leucopenia, haemolytic anaemia, reduction in partial thromboplastin time, Stevens-Johnson syndrome, and toxic epidermal necrolysis

**Dose**
- **By intravenous injection** over 5 minutes or by intravenous infusion, 500 mg every 8 hours, dose doubled in hospital-acquired pneumonia, peritonitis, septicaemia and infections in neutropenic patients; **CHILD** 3 months–12 years [not licensed for injection in neutropenia] 10–20 mg/kg every 8 hours, over 50 kg body weight adult dose
  - Meningitis, 2 g every 8 hours; **CHILD** 3 months–12 years 40 mg/kg every 8 hours, over 50 kg body weight adult dose
  - Exacerbations of chronic lower respiratory-tract infection in cystic fibrosis, up to 2 g every 8 hours; **CHILD** 4–18 years 25–40 mg/kg every 8 hours

**Meronem** *(AstraZeneca)* *(Novartis)*
- **Injection**, powder for reconstitution, meropenem (as trihydrate), net price 500-mg vial = £8.60; 1-g vial = £17.19

**AZTREONAM**

**Other beta-lactam antibiotics**

**Aztreonam** is a monocyclic beta-lactam (‘monobactam’) antibiotic with an antibacterial spectrum limited to Gram-negative aerobic bacteria including *Pseudomonas aeruginosa*, *Neisseria meningitidis*, and *Haemophilus influenzae*; it should not be used alone for ‘blind’ treatment since it is not active against Gram-positive organisms. Aztreonam is also effective against *Neisseria gonorrhoeae* (but not against concurrent chlamydial infection). Side-effects are similar to those of the other beta-lactams although aztreonam may be less likely to cause hypersensitivity in penicillin-sensitive patients.

**AZTREONAM**

**Indications**
- Gram-negative infections including *Pseudomonas aeruginosa*, *Haemophilus influenzae*, and *Neisseria meningitidis*

**Cautions**
- hypersensitivity to beta-lactam antibiotics; hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (aztreonam)

**Contra-indications**
- aztreonam hypersensitivity; pregnancy (Appendix 4)

**Side-effects**
- nausea, vomiting, diarrhoea, abdominal cramps; mouth ulcers, altered taste; jaundice and hepatitis; flushing; hypersensitivity reactions; blood disorders (including thrombocytopenia and neutropenia); rashes, injection-site reactions; rarely hypotension, seizures, asthenia, confusion, dizziness, headache, halitosis, and breast tenderness; very rarely antibiotic-associated colitis, gastro-intestinal bleeding, and toxic epidermal necrolysis

**Dose**
- **By deep intramuscular injection** or by intravenous injection over 3–5 minutes or by intravenous infusion, 1 g every 8 hours or 2 g every 12 hours; 2 g every 6–8 hours for severe infections (including systemic *Pseudomonas aeruginosa* and lung infec-
sections in cystic fibrosis); single doses over 1 g intravenously route only
Urinary-tract infections, 0.5–1 g every 8–12 hours
- CHILD over 1 week, by intravenous injection or infusion, 30 mg/kg every 6–8 hours increased in severe infections for child of 2 years or older to 50 mg/kg every 6–8 hours; max. 8 g daily
- Gonorrhoea, cystitis, by intramuscular injection, 1 g as a single dose

Azactam® (Squibb)® Injection, powder for reconstitution, aztreonam. Net price 500-mg vial = £5.00; 1-g vial = £9.98; 2-g vial = £19.98

5.13 Tetracyclines

The tetracyclines are broad-spectrum antibiotics whose value has decreased owing to increasing bacterial resistance. They remain, however, the treatment of choice for infections caused by chlamydia (trachoma, psittacosis, salpingitis, urethritis, and lymphogranuloma venereum), rickettsia (including Q-fever, brucella (doxycycline with either streptomycin or rifampicin), and the spirochaete, Borrelia burgdorferi (Lyme disease—see section 5.1.1.3). They are also used in respiratory and genitai mycoplasma infections, in acne, in destructive (refractory) periodontal disease, in exacerbations of chronic bronchitis (because of their activity against Haemophilus influenzae), and for leptospirosis in penicillin hypersensitivity (as an alternative to erythromycin).

For the role of tetracyclines in the management of meticillin-resistant Staphylococcus aureus (MRSA) infection, see p. 292.

Microbiologically, there is little to choose between the various tetracyclines, the only exception being minocycline which has a broader spectrum; it is active against Neisseria meningitidis and has been used for meningococcal prophylaxis but is no longer recommended because of side-effects including dizziness and vertigo (see section 5.1, table 2 for current recommendations). Compared to other tetracyclines, minocycline is associated with a greater risk of lupus-erythematosus-like syndrome. Minocycline sometimes causes irreversible pigmentation.

Oral infections In adults, tetracyclines can be effective against oral anaerobes but the development of resistance (especially by oral streptococci) has reduced their usefulness for the treatment of acute oral infections; they may still have a role in the treatment of destructive (refractory) forms of periodontal disease. Doxycycline has a longer duration of action than tetracycline or oxytetracycline and need only be given once daily; it is reported to be more active against anaerobes than some other tetracyclines.

For the use of doxycycline in the treatment of recurrent aphthous ulceration, oral herpes, or as an adjunct to gingival scaling and root planing for periodontitis, see section 12.3.1 and section 12.3.2.

Cautions Tetracyclines should be used with caution in patients with hepatic impairment (Appendix 2) or those receiving potentially hepatotoxic drugs. Tetracyclines may increase muscle weakness in patients with myasthenia gravis, and exacerbate systemic lupus erythematosus. Antacids, and aluminium, calcium, iron, magnesium and zinc salts decrease the absorption of tetracyclines; milk also reduces the absorption of demeclocycline, oxytetracycline, and tetracycline. Other interactions: Appendix 1 (tetracyclines).

Contra-indications Depression of tetracyclines in growing bone and teeth (by binding to calcium) causes staining and occasionally dental hypoplasia, and they should not be given to children under 12 years, or to pregnant (Appendix 4) or breast-feeding women (Appendix 5). However, doxycycline may be used in children for treatment and post-exposure prophylaxis of anthrax when an alternative antibacterial cannot be given [unlicensed indication]. With the exception of doxycycline and minocycline, the tetracyclines may exacerbate renal failure and should not be given to patients with kidney disease (Appendix 3). Tetracyclines should not be given to patients with acute porphyria (section 9.8.2)

Side-effects Side-effects of the tetracyclines include nausea, vomiting, diarrhoea (antibiotic-associated colitis reported occasionally), dysphagia, and oesophageal irritation. Other rare side-effects include hepatotoxicity, pancreatitis, blood disorders, photosensitivity (particularly with demeclocycline), and hypersensitivity reactions (including rash, exfoliative dermatitis, Stevens-Johnson syndrome, urticaria, angioedema, anaphylaxis, pericarditis). Headache and visual disturbances may indicate benign intracranial hypertension (discontinue treatment); bulging fontanelles have been reported in infants.

Tetracycline

Indications see notes above; acne vulgaris, rosacea (section 13.6)

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above; also acute renal failure, skin discoloration

Dose
- 250 mg every 6 hours, increased in severe infections to 500 mg every 6–8 hours
- Acne, see section 13.6.2
- Non-gonococcal urethritis, 500 mg every 6 hours for 7–14 days (21 days if failure or relapse after first course)

Counselling Tablets should be swallowed whole with plenty of fluid while sitting or standing

Tetracycline (Non-proprietary)® Tablets, coated, tetracycline hydrochloride 250 mg, net price 28-tab pack = £8.85. Label: 7, 9, 23, counselling, posture

Dental prescribing on NHS Tetracycline Tablets may be prescribed

DEMECLOCYCLINE HYDROCHLORIDE

Indications see notes above; also inappropriate secretion of antidiuretic hormone, section 6.5.2

Cautions see notes above, but photosensitivity more common (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above
Side-effects see notes above; also reversible nephrogenic diabetes insipidus, acute renal failure

Dose
- 150 mg every 6 hours or 300 mg every 12 hours

Ledermycin® (Goldshield) [PH]
Capsules, red, demeclocycline hydrochloride 150 mg, net price 28-cap pack = £13.73. Label: 7, 9, 11, 23

DOXYCYCLINE

Indications see notes above; chronic prostatitis; sinusitis, syphilis, pelvic inflammatory disease (Table 1, section 5.1); treatment and prophylaxis of anthrax [unlicensed indication]; malaria treatment and prophylaxis (section 5.4.1); recurrent aphthous ulceration, adjunct to gingival scaling and root planing for periodontitis (section 12.3.1); oral herpes simplex (section 12.3.2); rosacea [unlicensed indication], acne vulgaris (section 13.6)

Cautions see notes above, but may be used in renal impairment; alcohol dependence; photosensitivity reported (avoid exposure to sunlight or sun lamps)

Contra-indications see notes above

Side-effects see notes above; also anorexia, flushing, and tinnitus

Dose
- 200 mg on first day, then 100 mg daily; severe infections (including refractory urinary-tract infections), 200 mg daily
- Early syphilis, 100 mg twice daily for 14 days; late latent syphilis, 100 mg twice daily for 28 days; neutrophils, 200 mg twice daily for 28 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 100 mg twice daily for 7 days (14 days in pelvic inflammatory disease, see also Table 1, section 5.1)
- Anthrax (treatment or post-exposure prophylaxis; see also section 5.1.12), 100 mg twice daily; CHILD (only if alternative antibacterial cannot be given) [unlicensed dose] 5 mg/kg daily in 2 divided doses (max. 200 mg daily)

Counselling Capsules should be swallowed whole with plenty of fluid during meals while sitting or standing

Note Doxycycline doses in BNF may differ from those in product literature

Doxycycline (Non-proprietary) [PH]
Capsules, doxycycline (as hylate) 50 mg, net price 28-cap pack = £1.78, 100 mg, 8-cap pack = £1.15. Label: 6, 9, 11, 27, counselling, posture

Brands include Doylax

Dental prescribing on NHS Doxycycline Capsules 100 mg may be prescribed

Vibramycin® (Pfizer) [PH]
Capsules, doxycycline (as hylate) 50 mg (green/ivory), net price 28-cap pack = £7.74. Label: 6, 9, 11, 27, counselling, posture

Vibramycin-D® (Pfizer) [PH]
Dispersible tablets, yellow, scored, doxycycline 100 mg, net price 8-tab pack = £4.91. Label: 6, 9, 11, 13

LYMECYCLINE

Indications see notes above

Cautions see notes above

Contra-indications see notes above

Side-effects see notes above

Dose
- 408 mg every 12 hours, increased to 1.224–1.632 g daily in severe infections
- Acne, 408 mg daily for at least 8 weeks

Tetralysal 300® (Galderma) [PH]
Capsules, red/yellow, lymecycline 408 mg (= tetracycline 300 mg), net price 28-cap pack = £7.16, 56-cap pack = £14.26. Label: 6, 9

MINOCYCLINE

Indications see notes above; meningococcal carrier state; acne vulgaris (section 13.6.2)

Cautions see notes above, but may be used in renal impairment; if treatment continued for longer than 6 months, monitor every 3 months for hepatotoxicity, pigmentation and for systemic lupus erythematosus—discontinue if these develop or if pre-existing systemic lupus erythematosus worsens

Contra-indications see notes above

Side-effects see notes above; also dizziness and vertigo (more common in women); rarely anorexia, tinnitus, impaired hearing, hyperaesthesia, paraesthesia, acute renal failure, pigmentation (sometimes irreversible), and alopecia; very rarely systemic lupus erythematosus, discoloration of conjunctiva, tears, and sweat

Dose
- 100 mg twice daily
- Acne, see section 13.6.2 and under preparations, below

Prophylaxis of asymptomatic meningococcal carrier state (but no longer recommended, see notes above), 100 mg twice daily for 5 days usually followed by rifampicin

Counselling Tablets or capsules should be swallowed whole with plenty of fluid while sitting or standing

Minocycline (Non-proprietary) [PH]
Capsules, minocycline (as hydrochloride) 50 mg, net price 56-cap pack = £15.27; 100 mg, 28-cap pack = £13.09. Label: 6, 9, counselling, posture

Brands include Aknemin

Tablets, minocycline (as hydrochloride) 50 mg, net price 28-tab pack = £3.96, 100 mg, 28-tab pack = £8.43. Label: 6, 9, counselling, posture

Modified release

Acnamin® MR (Dexcel) [PH]
Capsules, m/r, buff/brown (enclosing pink and peach tablets), minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £21.14. Label: 6, 25

Dose acne, 1 capsule daily

Minocin MR® (Meda) [PH]
Capsules, m/r, orange/brown (enclosing yellow and white pellets), minocycline (as hydrochloride) 100 mg. Net price 56-cap pack = £21.14. Label: 6, 25

Dose acne, 1 capsule daily

Sebomin MR® (Actavis) [PH]
Capsules, m/r, orange, minocycline (as hydrochloride) 100 mg, net price 56-cap pack = £21.14. Label: 6, 25

Dose acne, 1 capsule daily
**OXYTETRACYCLINE**

**Indications** see notes above; acne vulgaris, rosacea (section 13.6)

**Cautions** see notes above

**Contra-indications** see notes above

**Side-effects** see notes above

**Dose**
- 250–500 mg every 6 hours
- Acne, see section 13.6.2

**Oxytetracycline (Non-proprietary)**

Tablets, coated, oxytetracycline dihydrate 250 mg, net price 28-tab pack = £1.00. Label: 7, 9, 23

Brands include Oxytetracycline, Tygacil. By intravenous infusion

Oxytetracycline Tablets may be prescribed

**Tigecycline**

Tigecycline is a glycylcycline antibacterial structurally related to the tetracyclines; side-effects similar to those of the tetracyclines can potentially occur. Tigecycline is active against Gram-positive and Gram-negative bacteria, including tetracycline-resistant organisms, and some anaerobes. It is also active against meticillin-resistant Staphylococcus aureus and vancomycin-resistant enterococci, but *Pseudomonas aeruginosa* and many strains of *Proteus spp* are resistant to tigecycline. Tigecycline should be reserved for the treatment of complicated skin and soft-tissue infections and complicated abdominal infections caused by multiple-antibacterial resistant organisms.

**TIGECYCLINE**

**Indications** complicated intra-abdominal infections; complicated skin and soft-tissue infections

**Cautions** cholestasis, hepatic impairment (Appendix 2); breast-feeding (Appendix 5); interactions: Appendix 1 (tigecycline)

**Contra-indications** hypersensitivity to tetracyclines; pregnancy (Appendix 4)

**Side-effects** see notes above; also nausea, vomiting, abdominal pain, dyspepsia, diarrhoea, anorexia, bilirubinaemia, dizziness, headache, prolonged prothrombin time, prolonged activated partial thromboplastin time, rash, pruritus, and injection-site reactions; less commonly pancreatitis and hypoproteinaemia; also reported, antibiotic-associated colitis and thrombocytopenia

**Dose**
- By intravenous infusion, ADULT over 18 years, initially 100 mg, then 50 mg every 12 hours for 5–14 days
- *Tygaci* (Wyeth) ▼

  Intravenous infusion, powder for reconstitution, tigecycline, net price 50-mg vial = £32.31

**5.1.4 Aminoglycosides**

These include amikacin, gentamicin, neomycin, streptomycin, and tobramycin. All are bactericidal and active against some Gram-positive and many Gram-negative organisms. Amikacin, gentamicin, and tobramycin are also active against *Pseudomonas aeruginosa*; streptomycin is active against *Mycobacterium tuberculosis* and is now almost entirely reserved for tuberculosis (section 5.1.9).

The aminoglycosides are not absorbed from the gut (although there is a risk of absorption in inflammatory bowel disease and liver failure) and must therefore be given by injection for systemic infections. Excretion is principally via the kidney and accumulation occurs in renal impairment.

Most side-effects of this group of antibiotics are dose-related therefore care must be taken with dosage and whenever possible treatment should not exceed 7 days. The important side-effects are ototoxicity, and nephrotoxicity; they occur most commonly in the elderly and in patients with renal failure.

If there is impairment of renal function (or high pre-dose serum concentrations) the interval between doses must be increased; if the renal impairment is severe the dose itself should be reduced as well.

Aminoglycosides may impair neuromuscular transmission and should not be given to patients with myasthenia gravis; large doses given during surgery have been responsible for a transient myasthenic syndrome in patients with normal neuromuscular function.

Aminoglycosides should preferably not be given with potentially ototoxic diuretics (e.g. furosemide (frusemide)); if concurrent use is unavoidable administration of the aminoglycoside and of the diuretic should be separated by as long a period as practicable.

**Once daily dosage** Once daily administration of aminoglycosides is more convenient, provides adequate serum concentrations, and in many cases has largely superseded multiple daily dose regimens (given in 2–3 divided doses during the 24 hours). Local guidelines on dosage and serum concentrations should be consulted. A once-daily, high-dose regimen of an aminoglycoside should be avoided in patients with endocarditis, extensive burns of more than 20% of the total body surface area, or creatinine clearance less than 20 mL/minute.

**Serum concentrations** Serum concentration monitoring avoids both excessive and subtherapeutic concentrations thus preventing toxicity and ensuring efficacy. In patients with normal renal function, aminoglycoside concentrations should be measured after 3 or 4 doses of a multiple daily dose regimen; patients with renal impairment may require earlier and more frequent measurement of aminoglycoside concentration.

For multiple daily dose regimens, blood samples should be taken approximately 1 hour after intramuscular or intravenous administration (‘peak’ concentration) and also just before the next dose (‘trough’ concentration). For once daily dose regimens, consult local guidelines on serum concentration monitoring.

Serum-aminoglycoside concentrations should be measured in all patients and must be determined in infants, in the elderly, in obesity, and in cystic fibrosis, or if high doses are being given, or if there is renal impairment.

**Endocarditis** Gentamicin is used in combination with other antibiotics for the treatment of bacterial endocarditis (Table 1, section 5.1). Serum-gentamicin concentration should be determined twice each week (more often in renal impairment). Streptomycin may be used
as an alternative in gentamicin-resistant enterococcal endocarditis.

Gentamicin is the aminoglycoside of choice in the UK and is used widely for the treatment of serious infections. It has a broad spectrum but is inactive against anaerobes and has poor activity against haemolytic streptococci and pneumococci. When used for the ‘blind’ therapy of undiagnosed serious infections it is usually given in conjunction with a penicillin or metronidazole (or both). Gentamicin is used together with another antibiotic for the treatment of endocarditis (see above and Table 1, section 5.1).

Loading and maintenance doses of gentamicin may be calculated on the basis of the patient’s weight and renal function (e.g. using a nomogram); adjustments are then made according to serum-gentamicin concentrations. High doses are occasionally indicated for serious infections, especially in the neonate, in the patient with cystic fibrosis, or in the immunocompromised patient. Whenever possible treatment should not exceed 7 days.

Amikacin is more stable than gentamicin to enzyme inactivation. Amikacin is used in the treatment of serious infections caused by gentamicin-resistant Gram-negative bacilli.

Tobramycin has similar activity to gentamicin. It is less active against certain other Gram-negative bacteria. Tobramycin may be administered by nebuliser on a cyclical basis (28 days of tobramycin followed by a 28-day tobramycin-free interval) for the treatment of chronic pulmonary Ps. aeruginosa infection in cystic fibrosis; however, resistance may develop and some patients do not respond to treatment.

Neomycin is too toxic for parenteral administration and can only be used for infections of the skin or mucous membranes or to reduce the bacterial population of the colon prior to bowel surgery or in hepatic failure. Oral administration may lead to malabsorption. Small amounts of neomycin may be absorbed from the gut colon prior to bowel surgery or in hepatic failure. Oral Neomycin can only be used for infections of the skin or mucous membranes. It is too toxic for parenteral administration and patients do not respond to treatment.

**Dose**

- Multiple daily dose regimen, by intramuscular or by slow intravenous injection over at least 3 minutes or by intravenous infusion, 3–5 mg/kg daily (in divided doses every 8 hours), see also notes above; 
  - **CHILD** under 18 years see **BNF for Children**
  - Endocarditis (in combination with other antibiotics, see Table 1, section 5.1). **ADULT** 1 mg/kg every 8 hours

- Once daily dose regimen (see notes above and also consult local guidelines), by intravenous infusion, initially 5-7 mg/kg, then adjust according to serum-gentamicin concentration

- **By intrathecal injection**, seek specialist advice, 1 mg daily (increased if necessary to 5 mg daily)

**Note** For multiple daily dose regimen, one-hour (‘peak’) serum concentration should be 5–10 mg/litre (3–5 mg/litre for endocarditis); pre-dose (‘trough’) concentration should be less than 2 mg/litre (less than 1 mg/litre for endocarditis). For once-daily dose regimen, consult local guidelines on monitoring serum-gentamicin concentration

Gentamicin (Non-proprietary) (aminoglycosides)

**Injection**, gentamicin (as sulphate), net price 40 mg/mL, 1-mL amp = £1.40, 2-mL amp = £1.54, 2-mL vial = £1.48

Paediatric injection, gentamicin (as sulphate) 10 mg/mL, net price 2-mL vial = £1.80

Intrathecal injection, gentamicin (as sulphate) 5 mg/mL, net price 1-mL amp = 74p

Cidomycin® (Sanofi-Aventis) (aminoglycosides)

**Injection**, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp or vial = £1.48

Gentamicin® (Amidpharm) (aminoglycosides)

**Injection**, gentamicin (as sulphate) 40 mg/mL. Net price 2-mL amp = £1.40

Isotonic Gentamicin Injection (Baxter) (aminoglycosides)

**Intravenous infusion**, gentamicin (as sulphate) 800 micrograms/mL in sodium chloride intravenous infusion 0.9%. Net price 100-mL (80-mg) Viaflex® bag = £1.61

Electrolytes Na 15.4 mmol/100-mL bag

**GENTAMICIN**

**Indications** septicaemia and neonatal sepsis; meningitis and other CNS infections; biliary-tract infection, acute pyelonephritis or prostatitis, endocarditis (see notes above); pneumonia in hospital patients, adjunct in listerial meningitis (Table 1, section 5.1); eye (section 11.3.1); ear (section 12.1.1)

**Cautions** pregnancy (Appendix 4), renal impairment, neonates, infants and elderly (adjust dose and monitor renal, auditory and vestibular function together with serum-gentamicin concentrations); avoid prolonged use; conditions characterised by muscular weakness; obesity (use ideal weight for height to calculate dose and monitor serum-gentamicin concentration closely); see also notes above; **interactions**: Appendix 1 (aminoglycosides)

**Contra-indications** myasthenia gravis

**Side-effects** vestibular and auditory damage, nephrotoxicity; rarely, hypomagnesaemia on prolonged therapy, antibiotic-associated colitis, stomatitis; also reported, nausea, vomiting, rash, blood disorders; see also notes above

**AMIKACIN**

**Indications** serious Gram-negative infections resistant to gentamicin

**Cautions** see under Gentamicin

**Contra-indications** see under Gentamicin

**Side-effects** see under Gentamicin

**Dose**

- By intramuscular or by slow intravenous injection or by infusion, 15 mg/kg daily in 2 divided doses, increased to 22.5 mg/kg daily in 3 divided doses in severe infections; max. 1.5 g daily for up to 10 days (max. cumulative dose 15 g); CHILD under 18 years see **BNF for Children**

**Note** One-hour (‘peak’) serum concentration should not exceed 30 mg/litre; pre-dose (‘trough’) concentration should be less than 10 mg/litre

> Amikacin (Non-proprietary) (Amdipharm) (proprietary)

**Injection**, amikacin (as sulphate) 250 mg/mL. Net price 2-mL vial = £10.14

Electrolytes Na 0.56 mmol/500-mg vial
**NEOMYCIN SULPHATE**

**Indications**  
bowel sterilisation before surgery, see also notes above

**Cautions**  
see under Gentamicin but too toxic for systemic use, see notes above

**Contra-indications**  
see under Gentamicin; intestinal obstruction; renal impairment (Appendix 3)

**Side-effects**  
see under Gentamicin but poorly absorbed on oral administration; increased salivation, stomatitis, impaired intestinal absorption with statorrhoea and diarrhoea

**Dose**  
- **By mouth**, pre-operative bowel sterilisation, 1 g every hour for 4 hours, then 1 g every 4 hours for 2–3 days
- Hepatic coma, up to 4 g daily in divided doses usually for 5–7 days

**Neomycin** (Non-proprietary)

**Tablets**, neomycin sulphate 500 mg. Net price 20 = £4.13

Brands include **Nivemycin**

---

**TOBRAMYCIN**

**Indications**  
see under Gentamicin and notes above

**Cautions**  
see under Gentamicin

**Specific cautions for inhaled treatment**  
Other inhaled drugs should be administered before tobramycin; monitor for bronchospasm with initial dose, measure peak flow before and after nebulisation—if bronchospasm occurs, repeat test using bronchodilator; monitor renal function before treatment and then annually; severe haemoptysis

**Contra-indications**  
see under Gentamicin

**Side-effects**  
see under Gentamicin; on inhalation, mouth ulcers, voice alteration, cough, bronchospasm (see Cautions)

**Dose**  
- **By intramuscular injection or by slow intravenous injection** or by intravenous infusion, 3 mg/kg daily in divided doses every 8 hours, see also notes above; in severe infections up to 5 mg/kg daily in divided doses every 6–8 hours (reduced to 3 mg/kg as soon as clinically indicated); **CHILD** under 18 years see BNF for Children
- **Urinary-tract infection**  
by intramuscular injection, 2–3 mg/kg daily as a single dose

**Note**  
One-hour (‘peak’) serum concentration should not exceed 10 mg/litre; pre-dose (‘trough’) concentration should be less than 2 mg/litre

**Tobramycin** (Non-proprietary)

**Injection**, tobramycin (as sulphate) 40 mg/mL, net price 1 mL (40-mg) vial = £4.00, 2-mL (80-mg) vial = £4.16, 6-mL (240-mg) vial = £19.20

**Tobi®** (Chiron)

**Nebuliser solution**, tobramycin 60 mg/mL, net price 56 × 5 mL (300-mg) unit = £1484.00

**Dose**  
chronic pulmonary *Pseudomonas aeruginosa* infection in cystic fibrosis patients, by inhalation of nebulised solution, **ADULT** and **CHILD** over 6 years, 300 mg every 12 hours for 28 days, courses repeated after 28-day interval
**Cautions** neonate under 2 weeks (risk of hypertrophic pyloric stenosis); predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); avoid in acute porphyria (section 9.8.2); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (not known to be harmful) and breastfeeding (only small amounts in milk); **Interactions:** Appendix 1 (macrolides)

**Side-effects** nausea, vomiting, abdominal discomfort, diarrhoea (antibiotic-associated colitis reported); less frequently urticaria, rashes and other allergic reactions; reversible hearing loss reported after large doses; choledochal jaundice, pancreatitis, cardiac effects (including chest pain and arrhythmias), myasthenia-like syndrome, Stevens-Johnson syndrome, and toxic epidermal necrolysis also reported

**Dose**
- By mouth, **ADULT** and **CHILD** over 8 years, 250–500 mg every 6 hours or 0.5–1 g every 12 hours (see notes above); up to 4 g daily in divided doses in severe infections; **NEONATE** 12.5 mg/kg every 6 hours; **CHILD** 1 month–2 years 125 mg every 6 hours, 2–8 years 250 mg every 6 hours, doses doubled for severe infections
- Early syphilis, 500 mg 4 times daily for 14 days
- Uncomplicated genital chlamydia, non-gonococcal urethritis, 500 mg twice daily for 14 days
- By intravenous infusion, **ADULT** and **CHILD** severe infections, 50 mg/kg/day by continuous infusion or in divided doses every 6 hours; mild infections (oral treatment not possible), 25 mg/kg daily; **NEONATE** see BNF for Children

**Erythromycin (Non-proprietary)**

- **Capsules**, enclosing e/c microgranules, erythromycin 250 mg, net price 28-cap pack = £5.95. Label: 5, 9, 25
- **Brands** include Tilsoryth
- **Tablets**, e/c, erythromycin 250 mg, net price 28 = £1.93. Label: 5, 9, 25
- **Dental prescribing on NHS** Erythromycin Tablets e/c may be prescribed

**Erythromycin Ethyl Succinate (Non-proprietary)**

- **Oral suspension**, erythromycin (as ethyl succinate) for reconstitution with water 125 mg/5 mL (Suspension PI SF), net price 140 mL = £3.18; 250 mg/5 mL, 140 mL = £6.20; 500 mg/5 mL (Suspension SF Forte), 140 mL = £10.99. Label: 9

**Erythroped® (Abbott)**

- **Suspension SF**, sugar-free, banana-flavoured, erythromycin (as ethyl succinate) for reconstitution with water, 125 mg/5 mL (Suspension PI SF), net price 140 mL = £3.18; 250 mg/5 mL, 140 mL = £6.20; 500 mg/5 mL (Suspension SF Forte), 140 mL = £10.99. Label: 9

**Erythroped A® (Abbott)**

- **Tablets**, yellow, f/c, erythromycin 500 mg (as ethyl succinate). Net price 28-tab pack = £10.78. Label: 9
- **Dental prescribing on NHS** May be prescribed as Erythromycin Ethyl Succinate Tablets

**AZITHROMYCIN**

**Indications** respiratory-tract infections; otitis media; skin and soft-tissue infections; uncomplicated genital chlamydial infections and non-gonococcal urethritis (Table 1, section 5.1); mild or moderate typhoid due to multiple-antibacterial-resistant organisms [unlicensed indication]; prophylaxis of group A streptococcal infection (Table 2, section 5.1)

**Cautions** see under Erythromycin: pregnancy (Appendix 4) and breast-feeding (Appendix 5); **Interactions:** Appendix 1 (macrolides)

**Contra-indications** severe hepatic impairment (Appendix 2)

**Side-effects** see under Erythromycin; also anorexia, dyspepsia, flatulence, dizziness, headache, drowsiness, convulsions, arthralgia, and disturbances in taste and smell; rarely constipation, hepatitis, hepatic failure, syncope, insomnia, agitation, anxiety, asthma, paraesthesia, hyperactivity, thrombocytopenia, haemolytic anaemia, interstitial nephritis, acute renal failure, photosensitivity, tooth and tongue discoloration

**Dose**
- 500 mg once daily for 3 days or 500 mg on first day then 250 mg once daily for 4 days; **CHILD** over 6 months 10 mg/kg once daily for 3 days; or body-weight 15–25 kg, 200 mg once daily for 3 days; body-weight 26–35 kg, 300 mg once daily for 3 days; body-weight 36–45 kg, 400 mg once daily for 3 days
- Uncomplicated genital chlamydial infections and non-gonococcal urethritis, 1 g as a single dose
- Typhoid [unlicensed indication], 500 mg once daily for 7 days

**Azithromycin (Non-proprietary)**

- **1 Tablets**, azithromycin (as monohydrate hemi-ethanolate) 250 mg, net price 4-tab pack = £9.05; 500 mg, 3-tab pack = £9.19. Label: 5, 9
- **Capsules**, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £8.77, 6-cap pack = £13.16. Label: 5, 9, 23
1. Azithromycin tablets can be sold to the public for the treatment of confirmed, asymptomatic *Chlamydia trachomatis* genital infection in those over 16 years of age, and for the epidemiological treatment of their sexual partners, subject to max. single dose of 1 g, max. daily dose 1 g, and a pack size of 1 g

**Zithromax® (Pfizer)**

- **Capsules**, azithromycin (as dihydrate) 250 mg, net price 4-cap pack = £8.95, 6-cap pack = £13.43. Label: 5, 9, 23
- **Oral suspension**, cherry/banana-flavoured, azithromycin (as dihydrate) 200 mg/5 mL when reconsti-
tuted with water. Net price 15–mL pack = £5.08, 22.5-
ML pack = £7.62, 30–mL pack = £13.80. Label: 5, 9

**Indications**

**Clarithromycin**

respiratory-tract infections, mild to mod-
erate skin and soft tissue infections, otitis media; Helicobacter pylori eradication (section 1.3)

**Caution**

see under Erythromycin; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (macrolides)

**Side-effects**

see under Erythromycin; also dyspepsia,
tooth and tongue discoloration, smell and taste distur-
bances, stomatitis, glossitis, and headache; less com-
monly hepatitis, arthralgia, and myalgia; rarely
tinnitus; very rarely pancreatitis, dizziness, insomnia,
nightmares, anxiety, confusion, psychosis, paraes-
thesia, convulsions, hyperglycaemia, renal failure,
leucopenia, and thrombocytopenia; on intravenous
infusion, local tenderness, phlebitis

**Dose**

- **By mouth,** 250 mg every 12 hours for 7 days,
increased in severe infections to 500 mg every 12 hours for up to 14 days; **CHILD** body-weight under
8 kg, 7.5 mg/kg twice daily; 8–11 kg (1–2 years),
62.5 mg twice daily; 12–19 kg (3–6 years), 125 mg
twice daily; 20–29 kg (7–9 years), 187.5 mg twice
daily; 30–40 kg (10–12 years), 250 mg twice daily

- **By intravenous infusion** into larger proximal vein,
500 mg twice daily; **CHILD** under 12 years see BNF for Children

**Clarithromycin** (Non-proprietary)

- **Tablets,** clarithromycin 250 mg, net price 14-tab pack
  = £3.55; 500 mg, 14-tab pack = £7.02. Label: 9

**Clarosip®** (Grunenthal)

- **Granules,** clarithromycin 125 mg/straw, net price 14-
  straw pack = £6.70; 187.5 mg/straw, 14-straw pack
  = £9.70; 250 mg/straw, 14-straw pack = £12.70.

- **Counselling** Place straw in cold or warm drink such as water,
carbonated drink, or tea (but not full fat milk, milk-shake,
or drink with solid particles) and sip drink through straw; several sips may be required to obtain full dose

**Klaricid®** (Abbott)

- **Tablets,** both yellow, f/c, clarithromycin 250 mg, net
  price 14-tab pack = £7.43; 500 mg, 14-tab pack =

**Paediatric suspension**

clarithromycin for reconsti-
tution with water 125 mg/5 mL, net price 70 mL =
£5.58, 100 mL = £9.60; 250 mg/5 mL 70 mL = £11.16.
Label: 9

- **Granules,** clarithromycin 250 mg/sachet, net price
  14-sachet pack = £11.68. Label: 9, 13

**Intravenous infusion**

powder for reconstitution,
clarithromycin. Net price 500-mg vial = £11.46

**Electrolytes**

Na < 0.5 mmol/500-mg vial

**Klaricid XL®** (Abbott)

- **Tablets,** m/r, yellow, clarithromycin 500 mg, net
  price 7-tab pack = £6.72, 14-tab pack = £13.23. Label: 9, 21,
  25

**Dose**

500 mg once daily (doubled in severe infections) for 7–14 days

**Telithromycin**

**Indications** see notes above

**Cautions** hepatic impairment (Appendix 2; see also
Hepatic Disorders below); renal impairment (Appendix
3); pregnancy (Appendix 4); coronary heart dis-
ease, ventricular arrhythmias, bradycardia, hypokal-
aemia, hypomagnesaemia—risk of QT interval
prolongation; concomitant administration of drugs
that prolong QT-interval; **interactions:** Appendix 1
(telithromycin)

**Hepatic disorders** Patients should be told how to recognise
signs of liver disorder, and advised to discontinue treatment and seek prompt medical attention if symptoms such as
anorexia, nausea, vomiting, abdominal pain, jaundice, or
dark urine develop

**Driving** Visual disturbances or transient loss of consciousness
may affect performance of skilled tasks (e.g. driving);
effects may occur after the first dose. Administration at
time may reduce these side-effects. Patients should be
advised not to drive or operate machinery if affected

**Contra-indications** myasthenia gravis; history of telith-
romycin-associated hepatitis or jaundice; prolonga-
tion of QT interval; congenital or family history of
QT interval prolongation (if not excluded by ECG);
breast-feeding (Appendix 5)

**Side-effects** diarrhoea, nausea, vomiting, flatulence,
abdominal pain, taste disturbances; dizziness, head-
ache; less commonly constipation, stomatitis, anorexia,
hepatitis, flushing, palpitations, drowsiness, insomnia,
nervousness, eosinophilia, blurred vision, rash, urti-
caria, and pruritus; rarely cholestatic jaundice, arrhy-
thmias, hypotension, transient loss of consciousness,
par aesthesia, and diplopia; very rarely antibiotic-
associated colitis, altered sense of smell, muscle
cramp, erythema multiforme; also reported pan-
creatitis

**Dose**

- 800 mg once daily for 5 days for sinusitis or exacer-
bation of chronic bronchitis or for 7–10 days in com-
 munity-acquired pneumonia; **CHILD** under 18 years
  safety and efficacy not established

- **Tonsillitis** or pharyngitis caused by Streptococcus pyo-
genesis, **ADULT** and **CHILD** over 12 years, 800 mg once
daily for 5 days

**Ketek** (Aventis Pharma)

- **Tablets,** orange, f/c, telithromycin 400 mg, net price
  10-tab pack = £19.31. Label: 9, counselling, driving,
  hepatic disorders

**Clindamycin**

Clindamycin is active against Gram-positive cocci,
including streptococci and penicillin-resistant staphy-
occci, and also against many anaerobes, especially Bac-
teroides fragilis. It is well concentrated in bone and
excreted in bile and urine.

Clindamycin is recommended for staphylococcal joint
and bone infections such as osteomyelitis, and intra-
abdominal sepsis; it is an alternative to macrolides for
erysipelas or cellulitis in penicillin-allergic patients.
Clindamycin can also be used for infections associated
with meticillin-resistant Staphylococcus aureus (MRSA)
in bronchiectasis, bone and joint infections, and skin and
soft-tissue infections.

Clindamycin has been associated with antibiotic-asso-
ciated colitis (section 1.5), which may be fatal; it is most
common in middle-aged and elderly women, especially following an operation. Although antibiotic-associated colitis can occur with most antibacterials, it occurs more frequently with clindamycin. Patients should therefore discontinue treatment immediately if diarrhoea develops.

**Oral infections** Clindamycin should not be used routinely for the treatment of oral infections because it may be no more effective than penicillins against anaerobes and there may be cross-resistance with erythromycin-resistant bacteria. Clindamycin can be used for the treatment of dentoalveolar abscess that has not responded to penicillin or to metronidazole.

### CLINDAMYCIN

**Indications** see notes above; staphylococcal bone and joint infections, peritonitis; *falciparum* malaria (section 5.4.1)

**Cautions** discontinue immediately if diarrhoea or colitis develops; monitor liver and renal function on prolonged therapy and in neonates and infants; pregnancy (Appendix 4); breast-feeding (Appendix 5); avoid rapid intravenous administration; avoid in acute porphyria (section 9.8.2); interactions: Appendix 1 (clindamycin)

**Contra-indications** diarrhoeal states; avoid injections containing benzyl alcohol in neonates (see under preparations below)

**Side-effects** diarrhoea (discontinue treatment), abdominal discomfort, oesophagitis, oesophageal ulcers, taste disturbances, nausea, vomiting, antibiotic-associated colitis; jaundice; leucopenia, eosinophilia, and thrombocytopenia reported; rash, pruritus, urticaria, anaphylactic reactions, Stevens-Johnson syndrome, toxic epidermal necrolysis, exfoliative and vesiculobullous dermatitis reported; pain, induration, and abscess after intramuscular injection; thrombophlebitis after intravenous injection

**Dose**
- **By mouth**, 150–300 mg every 6 hours; up to 450 mg every 6 hours in severe infections; **CHILD**, 3–6 mg/kg every 6 hours
- **Counselling** Patients should discontinue immediately and contact doctor if diarrhoea develops; capsules should be swallowed with a glass of water.
- **By deep intramuscular injection or by intravenous infusion**, 0.6–2.7 g daily (in 2–4 divided doses); life-threatening infection, up to 4.8 g daily; single doses above 600 mg by intravenous infusion only; single doses by intravenous infusion not to exceed 1.2 g; **CHILD** over 1 month, 15–40 mg/kg daily in 3–4 divided doses; severe infections; at least 300 mg daily regardless of weight

**Clindamycin** (Non-proprietary) [58]

**Injection**, clindamycin (as phosphate) 150 mg/mL, net price 2-mL amp = £6.20; 4-mL amp = £12.35

**Excipients** include benzyl alcohol (avoid in neonates, see Excipients, p. 4)

### Chloramphenicol

Chloramphenicol is a potent broad-spectrum antibiotic; however, it is associated with serious haematological side-effects when given systemically and should therefore be reserved for the treatment of life-threatening infections, particularly those caused by *Haemophilus influenzae*, and also for typhoid fever.

Chloramphenicol eye drops (section 11.3.1) and chloramphenicol ear drops (section 12.1.1) are also available.

### CHLORAMPHENICOL

**Indications** see notes above

**Cautions** avoid repeated courses and prolonged treatment; reduce doses in hepatic impairment (Appendix 2); renal impairment (Appendix 3); blood counts required before and periodically during treatment; monitor plasma-chloramphenicol concentration in neonates (see below); interactions: Appendix 1 (chloramphenicol)

**Contra-indications** pregnancy (Appendix 4); breastfeeding (Appendix 5), acute porphyria (section 9.8.2)

**Side-effects** blood disorders including reversible and irreversible aplastic anaemia (with reports of resulting leukaemia), peripheral neuritis, optic neuritis, headache, depression, urticaria, erythema multiforme, nausea, vomiting, diarrhoea, stomatitis, glossitis, dry mouth; nocturnal haemoglobinuria reported; grey syndrome (abdominal distension, pallid cyanosis, circulatory collapse) may follow excessive doses in neonates with immature hepatic metabolism

**Dose**
- **By mouth or by intravenous injection or infusion**, 50 mg/kg daily in 4 divided doses (exceptionally, can be doubled for severe infections such as septicaemia and meningitis, providing high doses reduced as soon as clinically indicated); **CHILD**, haemophilus epiglotitis and pyogenic meningitis, 50–100 mg/kg daily in divided doses (high dosages decreased as soon as clinically indicated); **NEONATE** under 2 weeks 25 mg/kg daily (in 4 divided doses); **INFANT** 2 weeks–1 year 50 mg/kg daily (in 4 divided doses)

**Note** Plasma concentration monitoring required in neonates and preferred in those under 4 years of age, in the elderly, and in hepatic impairment; recommended peak plasma concentration (approx. 1 hour after intravenous injection or infusion) 15–25 mg/litre; pre-dose (‘trough’) concentration should not exceed 15 mg/litre

**Chloramphenicol** (Non-proprietary) [78]

| Capsules, chloramphenicol 250 mg. Net price 60 = £377.00 |
Fusidic acid

Fusidic acid and its salts are narrow-spectrum antibiotics. The only indication for their use is in infections caused by penicillin-resistant staphylococci, especially osteomyelitis, as they are well concentrated in bone; they are also used for staphylococcal endocarditis. A second antistaphylococcal antibiotic is usually required to prevent emergence of resistance.

**SODIUM FUSIDATE**

**Indications** penicillin-resistant staphylococcal infection including osteomyelitis; staphylococcal endocarditis in combination with other antibacterials (Table 1, section 5.1)

**Cautions** monitor liver function with high doses, on prolonged therapy or in hepatic impairment (Appendix 2); elimination may be reduced in hepatic impairment or biliary disease or biliary obstruction; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (fusidic acid)

**Side-effects** nausea, vomiting, reversible jaundice, especially after high dosage or rapid infusion (withdrawal therapy if persistent); rarely hypersensitivity reactions, acute renal failure (usually with jaundice), blood disorders

**Dose**

- See under Preparations, below

**Sodium fusidate (LEO)**

*Intravenous infusion*, powder for reconstitution, sodium fusidate 500 mg (= fusidic acid 480 mg), with buffer; net price per vial (with diluent) = £70.04

*Electrolytes* Na 3.14 mmol/g

*Dose* as sodium fusidate, by intravenous infusion, ADULT over 50 kg, 500 mg 3 times daily; ADULT under 50 kg and CHILD, 6–7 mg/kg/3 times daily

**Fucidin® (LEO)**

*Tablets*, I/c, sodium fusidate 250 mg, net price 10-tab pack = £6.02. Label: 9

*Dose* as sodium fusidate, 500 mg every 8 hours, doubled for severe infections Skin infection, as sodium fusidate, 250 mg every 12 hours for 5–10 days

**Suspension**, off-white, banana- and orange-flavoured, fusidic acid 250 mg/5 mL., net price 50 mL = £6.73. Label: 9, 21

*Dose* as fusidic acid, ADULT 750 mg every 8 hours; CHILD up to 1 year 50 mg/kg/daily (in 3 divided doses), 1–5 years 250 mg every 8 hours, 5–12 years 500 mg every 8 hours

**Note** Fusidic acid is incompletely absorbed and doses recommended for suspension are proportionately higher than those for sodium fusidate tablets

**Vancomycin and teicoplanin**

The glycopeptide antibiotics vancomycin and teicoplanin have bactericidal activity against aerobic and anaerobic Gram-positive bacteria including multi-resistant staphylococci. However, there are reports of *Staphylococcus aureus* with reduced susceptibility to glycopeptides. There are increasing reports of glycopeptide-resistant enterococci. Vancomycin is used by the intravenous route in the treatment of endocarditis and other serious infections caused by Gram-positive cocci. It has a long duration of action and can therefore be given every 12 hours. Vancomycin (added to dialysis fluid) is also used in the treatment of peritonitis associated with peritoneal dialysis [unlicensed route] (Table 1 section 5.1).

Vancomycin given by mouth is effective in the treatment of *Clostridium difficile* infection (see also section 1.5); a dose of 125 mg every 6 hours for 7 to 10 days is considered adequate (higher dose may be considered if the infection fails to respond or if it is severe). Vancomycin should not be given by mouth for systemic infections since it is not significantly absorbed.

**Teicoplanin** is similar to vancomycin but has a significantly longer duration of action allowing once-daily administration. Unlike vancomycin, teicoplanin can be given by intramuscular as well as by intravenous injection; it is not given by mouth.

**VANCOMYCIN**

**Indications** see notes above

**Cautions** avoid rapid infusion (risk of anaphylactoid reactions, see Side-effects); rotate infusion sites; renal impairment (Appendix 3); elderly; avoid if history of deafness; all patients require plasma-vancomycin measurement (after 3 or 4 doses if renal function normal, earlier if renal impairment), blood counts, urinalysis, and renal function tests; monitor auditory function in elderly or if renal impairment; pregnancy (Appendix 4) and breast-feeding (Appendix 5); teicoplanin sensitivity; systemic absorption may follow oral administration especially in inflammatory bowel disorders or following multiple doses; interactions: Appendix 1 (vancomycin)

**Side-effects** after parenteral administration: nephrotoxicity including renal failure and interstitial nephritis; ototoxicity (discontinue if tinnitus occurs); blood disorders including neutropenia (usually after 1 week or cumulative dose of 25 g), rarely agranulocytosis and thrombocytopenia; nausea, chills, fever, eosinophilia, anaphylaxis, rashes (including exfoliative dermatitis, Stevens-Johnson syndrome, toxic epidermal necrolysis, and vasculitis); phlebitis (irritant to tissue); on rapid infusion, severe hypotension (including shock and cardiac arrest), wheezing, dyspnoea, urticaria, pruritus, flushing of the upper body (‘red man’ syndrome), pain and muscle spasm of back and chest

**Dose**

- By mouth, *Clostridium difficile* infection, 125 mg every 6 hours for 7–10 days, see notes above; CHILD 5 mg/kg every 6 hours, over 5 years, half adult dose

**Note** Oral paediatric dose is lower than that on product literature but is adequate

- By intravenous infusion, 1–1.5 g every 12 hours;
  - ELDERLY over 65 years, 500 mg every 12 hours or 1 g once daily; CHILD over 1 month, 15 mg/kg every 8 hours (max. 2 g daily)

**Note** Plasma concentration monitoring required (see Cautions above); pre-dose (‘trough’) concentration should be 10–15 mg/litre (15–20 mg/litre for less sensitive strains of meticillin-resistant *Staphylococcus aureus*); vancomycin doses in BNF may differ from those in product literature
Vancomycin (Non-proprietary) (HM)
Capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £132.47; 250 mg, 28-cap pack = £132.47. Label: 9
Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £85.05; 1-g vial = £16.11
Note Can be used to prepare solution for oral administration

Vancocin® (Flynn) (HM)
Matrigel capsules, vancomycin (as hydrochloride) 125 mg, net price 28-cap pack = £88.31. Label: 9
Injection, powder for reconstitution, vancomycin (as hydrochloride), for use as an infusion, net price 500-mg vial = £85.05; 1-g vial = £16.11
Note Can be used to prepare solution for oral administration

TEICOPLANIN

Indications potentially serious Gram-positive infections including endocarditis, dialysis-associated peritonitis, and serious infections due to Staphylococcus aureus; prophylaxis in orthopaedic surgery at risk of infection with Gram-positive organisms

Cautions vancomycin sensitivity; blood counts and liver and kidney function tests required; monitor plasma-teicoplanin concentration if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; monitor renal and auditory function during prolonged treatment in renal impairment (Appendix 3) or if other nephrotoxic or neurotoxic drugs given; pregnancy (Appendix 4) and breast-feeding; interactions: Appendix 1 (teicoplanin)

Side-effects nausea, vomiting, diarrhoea; rash, pruritus, fever, bronchospasm, rigors, urticaria, angioedema, anaphylaxis; dizziness, headache; blood disorders including eosinophilia, leucopenia, neutropenia, and thrombocytopenia; disturbances in liver enzymes, transient increase of serum creatinine, renal failure; tinnitus, mild hearing loss, and vestibular disturbances; muscle effects (see Cautions), arthritis, myalgia, muscle weakness, and myositis; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated during treatment (more frequently if creatine kinase elevated before treatment, or if receiving another drug known to cause myopathy (preferably not salicylates)); discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

Dose By intramuscular injection or by intravenous injection or infusion, initially 400 mg (for severe infections, by intravenous injection or infusion, initially 400 mg every 12 hours for 3 doses), then 200 mg once daily (400 mg once daily for severe infections); higher doses may be required in patients over 85 kg over 2 months or if other nephrotoxic or neurotoxic drugs given; monitor plasma-teicoplanin concentration if severe sepsis or burns, deep-seated staphylococcal infection (including bone and joint infection), endocarditis, renal impairment, in elderly, and in intravenous drug abusers; monitor renal and auditory function during prolonged treatment in renal impairment (Appendix 3) or if other nephrotoxic or neurotoxic drugs given; pregnancy (Appendix 4) and breast-feeding; interactions: Appendix 1 (teicoplanin)

Child over 2 months by intravenous injection or infusion, initially 10 mg/kg every 12 hours for 3 doses, subsequently 6 mg/kg once daily (severe infections or in neutropenia, 10 mg/kg once daily); subsequent doses can be given by intramuscular injection (but intravenous administration preferred in children); NEONATE by intravenous infusion, initially a single dose of 16 mg/kg, subsequently 8 mg/kg once daily

Streptococcal endocarditis, by intravenous injection or infusion, ADULT initially 6 mg/kg every 12 hours for 3 doses, then 6 mg/kg once daily

Enterococcal endocarditis, by intravenous injection or infusion, ADULT initially 10 mg/kg every 12 hours for 3 doses, then 10 mg/kg once daily

Orthopaedic surgery prophylaxis, by intravenous injection, 400 mg at induction of anaesthesia
Note Plasma-teicoplanin concentration is not measured routinely because a relationship between plasma concentration and toxicity has not been established. However, the plasma-teicoplanin concentration can be used to optimise treatment in some patients (see Cautions). Pre-dose (‘trough’) concentrations should be greater than 10 mg/litre (greater than 15–20 mg/litre in endocarditis) but less than 60 mg/litre

Targocid® (Aventis Pharma) (HM)
Injection, powder for reconstitution, teicoplanin, net price 200-mg vial (with diluent) = £17.58; 400-mg vial (with diluent) = £35.62
Electrolytes Na < 0.5 mmol/200- and 400-mg vial

Daptomycin

Daptomycin is a lipopeptide antibacterial with a spectrum of activity similar to vancomycin but its efficacy against enterococci has not been established. Daptomycin should be reserved for complicated skin and soft-tissue infections caused by resistant Gram-positive bacteria including meticillin-resistant Staphylococcus aureus (MRSA). It needs to be given with other antibacterials for mixed infections involving Gram-negative bacteria and some anaerobes.

The Scottish Medicines Consortium (p. 3) has advised (February 2008) that daptomycin (Cubicin®) is accepted for restricted use within NHS Scotland for the treatment of MRSA bacteraemia associated with right-sided endocarditis or with complicated skin and soft-tissue infections.

DAPTOMYCIN

Indications see under: Dose

Cautions interference with assay for prothrombin time and INR—take blood sample immediately before daptomycin dose; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (daptomycin)

Muscle effects Myalgia, muscle weakness, and myositis may occur uncommonly; rhabdomyolysis is very rare. Monitor creatine kinase before treatment and then weekly during treatment (more frequently if creatine kinase elevated more than 5 times upper limit of normal before treatment, or if receiving another drug known to cause myopathy (preferably not salicylates)); discontinue if unexplained muscular symptoms and creatine kinase elevated markedly

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, diarrhoea; headache; rash, injection-site reactions; less commonly constipation, abdominal pain, dyspepsia, anorexia, taste disturbance, jaundice, hypertension, hypotension, flushing, arrhythmias, anxiety, insomnia, dizziness, fatigue, paraesthesia, hyperglycaemia, vaginitis, renal failure, anaemia, eosinophilia, thrombocytopenia, electrolyte disturbances, muscle effects (see Cautions), arthralgia, glossitis, and pruritus; also reported syncope, wheezing, and peripheral neuropathy
Dose

- By intravenous infusion, complicated skin and soft-tissue infections caused by Gram-positive bacteria, **ADULT** over 18 years, 4 mg/kg once daily; increased to 6 mg/kg once daily if associated with *Staphylococcus aureus* bacteraemia

Right-sided endocarditis caused by *Staphylococcus aureus*, **ADULT** over 18 years, 6 mg/kg once daily

Cubicin® (Novartis) ▼ [iir]

Intravenous infusion, powder for reconstitution, daptomycin, net price 350-mg vial = £62.00; 500-mg vial = £88.57

**Linezolid**

Linezolid, an oxazolidinone antibacterial, is active against Gram-positive bacteria including meticillin-resistant *Staphylococcus aureus* (MRSA), and vanco-mycin-resistant enterococci. Resistance to linezolid can develop with prolonged treatment or if the dose is less than that recommended. Linezolid is an option if a glycopeptide, such as vancomycin, cannot be used to treat pneumonia or severe skin and soft-tissue infections caused by MRSA. Linezolid is not active against Gram-negative organisms and must be given with other antibacterials if the infection also involves Gram-negative organisms (the combination should be used for mixed skin and soft tissue infections only when other treatments are not available). A higher incidence of blood disorders and optic neuropathy have been reported in patients receiving linezolid for more than the maximum recommended duration of 28 days.

**Linezolid**

**Indications** pneumonia, complicated skin and soft-tissue infections caused by Gram-positive bacteria (initiated under expert supervision)

**Cautions** monitor full blood count (including platelet count) weekly (see also CSM Advice below); history of seizures; unless close observation and blood-pressure monitoring possible, avoid in uncontrolled hypertension, phaeochromocytoma, carcinoid tumour, thyrotoxicosis, bipolar depression, schizophrenia, or acute confusional states; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (MAOIs)

**CSM advice (blood disorders)** Haematopoietic disorders (including thrombocytopenia, anaemia, leucopenia, and pancytopenia) have been reported in patients receiving linezolid. It is recommended that full blood counts are monitored weekly. Close monitoring is recommended in patients who:

- receive treatment for more than 10–14 days;
- have pre-existing myelosuppression;
- are receiving drugs that may have adverse effects on haemoglobin, blood counts, or platelet function;
- have severe renal impairment.

If significant myelosuppression occurs, treatment should be stopped unless it is considered essential, in which case intensive monitoring of blood counts and appropriate management should be implemented.

**CHM advice (optic neuropathy)** Severe optic neuropathy may occur rarely, particularly if linezolid is used for longer than 28 days. The CHM recommends that:

- patients should be warned to report symptoms of visual impairment (including blurred vision, visual field defect, changes in visual acuity and colour vision) immediately;
- patients experiencing new visual symptoms (regardless of treatment duration) should be evaluated promptly, and referred to an ophthalmologist if necessary;
- visual function should be monitored regularly if treatment is required for longer than 28 days.

**Monoamine oxidase inhibition** Linezolid is a reversible, non-selective monoamine oxidase inhibitor (MAOI). Patients should avoid consuming large amounts of tyramine-rich foods (such as mature cheese, yeast extracts, undistilled alcoholic beverages, and fermented soya bean products). In addition, linezolid should not be given with another MAOI or within 2 weeks of stopping another MAOI. Unless close observation and blood-pressure monitoring is possible, avoid in those receiving SSRIs, 5HT agonists (‘triptans’), tricyclic antidepressants, sympathomimetics, dopamine agonists, buspirone, pethidine and possibly other opioid analgesics. For other interactions see Appendix 1 (MAOIs)

**Contra-indications** breast-feeding (Appendix 5); see also Monoamine oxidase inhibition above

**Side-effects** diarrhoea (antibiotic-associated colitis reported), nausia, vomiting, taste disturbances; headache; less commonly thirst, dry mouth, glossitis, stomatitis, tongue discoloration, abdominal pain, dyspepsia, gastritis, constipation, pancreatitis, hypertension, fever, fatigue, dizziness, insomnia, hypoaesthesia, paraesthesia, tinnitus, polyuria, anaemia, leucopenia, thrombocytopenia, eosinophilia, electrolyte disturbances, blurred vision, rash, pruritus, diaphoresis, and injection-site reactions; very rarely transient ischaemic attacks, renal failure, pancytopenia and Stevens-Johnson syndrome; also reported convulsions, lactic acidosis; peripheral and optic neuropathy reported on prolonged therapy (see also CHM advice above)

**Dose**

- By mouth, 600 mg every 12 hours usually for 10–14 days (max. duration of treatment 28 days); **CHILD** [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

- By intravenous infusion over 30–120 minutes, 600 mg every 12 hours; **CHILD** [unlicensed] 1 week–12 years, 10 mg/kg every 8 hours; 12–18 years, adult dose

**Zyvox®** (Pharmacia) ▼ [iir]

**Tablets**, 1/g, linezolid 600 mg, net price 10-tab pack = £450.00. **Label**: 9, 10; patient information leaflet

**Suspension**, yellow, linezolid 100 mg/5 mL when reconstituted with water, net price 150 mL (orange-flavoured) = £222.50. **Label**: 9, 10; patient information leaflet

**Excipients** include aspartame 20 mg/5 mL (section 9.4.1)

**Intravenous infusion**, linezolid 2 mg/mL, net price 300-mL **Excel** bag = £44.50

**Excipients** include Na 5 mmol/300-mL bag, glucose 13.71 g/300-mL bag

**Quinupristin and dalfopristin**

A combination of the streptogramin antibiotics, quinupristin and dalfopristin (as Synercid®) is licensed for infections due to Gram-positive bacteria. The combination should be reserved for treating infections which have failed to respond to other antibacterials (e.g.
5 Infections

Meticillin-resistant *Staphylococcus aureus*, MRSA or for patients who cannot be treated with other antibacterials. Quinupristin and dalfopristin are not active against *Enterococcus faecalis* and they need to be given in combination with other antibacterials for mixed infections which also involve Gram-negative organisms.

### Quinupristin with Dalfopristin

**A mixture of quinupristin and dalfopristin (both as mesilate salts) in the proportions 3 parts to 7 parts**

**Indications**: Serious Gram-positive infections where no alternative antibacterial is suitable including hospital-acquired pneumonia, skin and soft-tissue infections, infections due to vancomycin-resistant *Enterococcus faecium*.

**Cautions**: Cardiac arrest, hypotension, bronchospasm, convulsions, thrombosis, thrombocytopenia and pancreatitis.

**Contra-indications**: Myasthenia gravis, pregnancy, hematological disorders, impaired renal and hepatic function.

**Side-effects**: Nausea, vomiting, diarrhoea; headache, asthenia; anaemia, leucopenia, eosinophilia, raised plasma-bilirubin concentration; hepatic impairment (avoid if severe; Appendix 3); predisposition to cardiac arrhythmias (including congenital QT syndrome, concomitant use of drugs that prolong QT interval, cardiac hypertrophy, dilated cardiomyopathy, hypokalaemia, hypomagnesaemia, bradycardia).

**Interactions**: Appendix 1 (quinupristin with dalfopristin).

**Dose**

- **Note**: Expressed as a combination of quinupristin and dalfopristin (in a ratio of 3:7)
- **ADULT** over 18 years, by intravenous infusion into central vein, 7.5 mg/kg every 8 hours for 7 days in skin and soft-tissue infections; for 10 days in hospital-acquired pneumonia; duration of treatment in *E. faecium* infection depends on site of infection.

**Synercid**

- **Nordic**
  - **Intravenous infusion**: Powder for reconstitution, quinupristin (as mesilate) 150 mg, dalfopristin (as mesilate) 350 mg, net price 500-mg vial = £37.00
  - **Electrolytes Na** approx. 16 mmol/500-mg vial

**Polyoxymyxins**

The polyoxymyxin antibiotic, colistin, is active against Gram-negative organisms including *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Klebsiella pneumoniae*. It is not absorbed by mouth and thus needs to be given by injection for a systemic effect. Intravenous administration of colistin should be reserved for Gram-negative infections resistant to other antibacterials; its major adverse effects are dose-related neurotoxicity and nephrotoxicity.

Colistin is used by mouth in bowel sterilisation regimens in neutropenic patients (usually with nystatin); it is not recommended for gastro-intestinal infections. It is also given by inhalation of a nebulised solution as an adjunct to standard antibacterial therapy in patients with cystic fibrosis.

Both colistin and polymyxin B are included in some preparations for topical application.

### Colistin

**Indications**: See notes above.

**Cautions**: Renal impairment (Appendix 3); acute porphyria (section 9.8.2); risk of bronchospasm on inhalation—may be prevented or treated with a selective beta agonist; interactions: Appendix 1 (polymyxins).

**Contra-indications**: Myasthenia gravis; pregnancy (Appendix 4); breast-feeding (Appendix 5).

**Side-effects**: Neurotoxicity reported especially with excessive doses (including apnoea, perioral and peripheral paralysis, vertigo; rarely vasomotor instability, slurred speech, confusion, psychosis, visual disturbances); nephrotoxicity; hypersensitivity reactions including rash; injection-site reactions; inhalation may cause sore throat, sore mouth, cough, bronchospasm.

**Dose**

- **By mouth**: Bowel sterilisation, 1.5–3 million units every 8 hours.
- **By slow intravenous injection** into a totally implantable venous access device, or by intravenous infusion (but see notes above).
- **ADULT** and **CHILD** body-weight under 60 kg, 50 000–75 000 units/kg daily in 3 divided doses; body-weight over 60 kg, 1–2 million units every 8 hours.

**Note**: Plasma concentration monitoring required in neonates, renal impairment, and in cystic fibrosis; recommended ‘peak’ plasma-colistin concentration (approx. 30 minutes after intravenous injection or infusion) 10–15 mg/litre (125–200 units/mL).

- **By inhalation of nebulised solution**: **ADULT** and **CHILD** over 2 years, 1–2 million units every 12 hours; **CHILD** under 2 years, 0.5–1 million units every 12 hours.

**Colomycin® (Forest)**

- **Tablets**: Scored, colistin sulphate 1.5 million units. Net price 50 = £58.28
- **Syrup**: Colistin sulphate 250 000 units/5 mL when reconstituted with water. Net price 80 mL = £3.48

**Injection**: Powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium). Net price 500 000-unit vial = £1.14; 1 million-unit vial = £1.68; 2 million-unit vial = £3.09

**Electrolytes (before reconstitution)** Na < 0.5 mmol/500 000-unit, 1 million-unit, and 2 million-unit vial.

**Note**: Colomycin Injection (dissolved in physiological saline) may be used for nebulisation.

**Promixin® (Profile)**

- **Powder for nebuliser solution**: Colistimethate sodium (colistin sulphomethate sodium), net price 1 million-unit vial = £4.60
  - **Injection**: Powder for reconstitution, colistimethate sodium (colistin sulphomethate sodium), net price 1 million-unit vial = £2.30

**Electrolytes (before reconstitution)** Na < 0.5 mmol/1 million-unit vial.
### 5.1.8 Sulphonamides and trimethoprim

The importance of the sulphonamides has decreased as a result of increasing bacterial resistance and their replacement by antibacterials which are generally more active and less toxic.

Sulfamethoxazole (sulphamethoxazole) and trimethoprim are used in combination (as co-trimoxazole) because of their synergistic activity. However, co-trimoxazole is associated with rare but serious side-effects (e.g. Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis) especially in the elderly (see CSM recommendations below).

#### Trimethoprim

Can be used alone for urinary- and respiratory-tract infections and for prostatitis, shigellosis, and invasive salmonella infections. Trimethoprim has irritatory-tract infections and for prostatitis, shigellosis, and systemic lupus erythematosus; rhabdomyolysis reported in HIV-infected patients.

**Side-effects**

- nausea, diarrhoea; headache; hyperkalaemia; rash (very rarely including Stevens-Johnson syndrome and blood dyscrasias, notably bone marrow depression and agranulocytosis) especially in the elderly (see CSM recommendations above).
- acute porphyria (section 9.8.2)

**Contra-indications**

- ketoacidosis; young infants (except for prophylaxis of pneumocystis pneumonia); hepatic impairment (avoid if severe); predisposition to folate deficiency or hyperkalaemia; elderly (see CSM recommendations above); asthma; G6PD deficiency (section 9.1.5); avoid in infants under 6 weeks (except for treatment or prophylaxis of pneumocystis pneumonia); hepatic impairment (avoid if severe); renal impairment (avoid if creatinine clearance less than 15 mL/minute; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (trimethoprim, sulfamethoxazole)

**Co-trimoxazole should be limited to the role of drug of choice in Pneumocystis jiroveci (Pneumocystis carinii) pneumonia; it is also indicated for toxoplasmosis and nocardiosis. It should now only be considered for use in acute exacerbations of chronic bronchitis and infections of the urinary tract when there is good bacteriological evidence of sensitivity to co-trimoxazole and good reason to prefer this combination to a single antibacterial; similarly it should only be used in acute otitis media in children when there is good reason to prefer it.**

**Cautions**

- avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (trimethoprim, sulfamethoxazole)

**Indications**

see CSM recommendations above

**Dose**

- By mouth, 960 mg every 12 hours; CHILD, every 12 hours, 6 weeks–5 months, 120 mg; 6–18 months, 240 mg; 6–12 years, 480 mg
- By intravenous infusion, 960 mg every 12 hours increased to 1.44 g every 12 hours in severe infections; CHILD 36 mg/kg daily in 2 divided doses increased to 54 mg/kg daily in severe infections
- Treatment of Pneumocystis jiroveci (Pneumocystis carinii) infections (undertaken where facilities for appropriate monitoring available—consult microbiologist and product literature), by mouth or by intravenous infusion, ADULT and CHILD over 4 weeks, 120 mg/kg daily in 2–4 divided doses for 14 days
- Prophylaxis of Pneumocystis jiroveci (Pneumocystis carinii) infections, by mouth, 960 mg once daily (may be reduced to 480 mg once daily to improve tolerance) or 960 mg on alternate days (3 times a week) or 960 mg twice daily on alternate days (3 times a week); CHILD 6 weeks–5 months, 120 mg twice daily on 3 consecutive or alternate days per week or on 7 days per week; 6 months–5 years, 240 mg; 6–12 years, 480 mg

**Note**

480 mg of co-trimoxazole consists of sulfamethoxazole 400 mg and trimethoprim 80 mg

**Co-trimoxazole (Non-proprietary) (UK)**

**Sulfadiazine**

(Sulphadiazine)

**Indications**

prevention of rheumatic fever recurrence, toxoplasmosis [unlicensed]—see section 5.4.7

**Cautions**

see under Co-trimoxazole; renal impairment (avoid if severe; Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (sulphonamides)
5.1.9 Antituberculosis drugs

Tuberculosis is treated in two phases—an initial phase using 4 drugs and a continuation phase using 2 drugs in fully sensitive cases. Treatment requires specialised knowledge, particularly where the disease involves resistant organisms or non-respiratory organs.

The regimens given below are recommended for the treatment of tuberculosis in the UK; variations occur in other countries. Either the unsupervised regimen or the supervised regimen described below should be used; the two regimens should not be used concurrently.

Initial phase The concurrent use of 4 drugs during the initial phase is designed to reduce the bacterial population as rapidly as possible and to prevent the emergence of drug-resistant bacteria. The drugs are best given as combination preparations unless one of the components cannot be given because of resistance or intolerance.

The treatment of choice for the initial phase is the daily use of isoniazid, rifampicin, pyrazinamide and ethambutol. Treatment should be started without waiting for culture results if clinical features or histology results are consistent with tuberculosis; treatment should be continued even if initial culture results are negative. The initial phase drugs should be continued for 2 months. Where a positive culture for M. tuberculosis has been obtained, but susceptibility results are not available after 2 months, treatment with rifampicin, isoniazid, pyrazinamide and ethambutol should be continued until full susceptibility is confirmed, even if this is for longer than 2 months.

Streptomycin is rarely used in the UK but it may be used in the initial phase of treatment if resistance to isoniazid has been established before therapy is commenced.

Continuation phase After the initial phase, treatment is continued for a further 4 months with isoniazid and rifampicin (preferably given as a combination preparation). Longer treatment is necessary for meningitis, direct spinal cord involvement, and for resistant organisms which may also require modification of the regimen.

Unsupervised treatment The following regimen should be used for patients who are likely to take antituberculous drugs reliably without supervision. Patients who are unlikely to comply with daily administration of antituberculous drugs should be treated with the regimen described under Supervised Treatment.

Recommended dosage for standard unsupervised 6-month treatment

Rifater® [rifampicin, isoniazid, and pyrazinamide] (for 2-month initial phase only)

Adult under 40 kg 3 tablets daily, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, over 65 kg 6 tablets daily

Ethambutol (for 2-month initial phase only)

Adult and child 15 mg/kg daily

Rifinah® [rifampicin and isoniazid] (for 4-month continuation phase following initial treatment with Rifater®)

Adult under 50 kg 3 tablets daily of Rifinah -150, 50 kg and over, 2 tablets daily of Rifinah -300 or (if combination preparations not appropriate):

Isoniazid (for 2-month initial and 4-month continuation phases)

Adult 300 mg daily; child 5–10 mg/kg (max. 300 mg) daily

Rifampicin (for 2-month initial and 4-month continuation phases)

Adult under 50 kg 450 mg daily, 50 kg and over 600 mg daily; child 10 mg/kg (max. 600 mg) daily

Pyrazinamide (for 2-month initial phase only)

Adult under 50 kg 1.5 g daily, 50 kg and over 2 g daily; child 35 mg/kg daily

Ethambutol (for 2-month initial phase only)

Adult and child 15 mg/kg daily

Pregnancy and breast-feeding The standard regimen (above) may be used during pregnancy and breastfeeding. Streptomycin should not be given in pregnant.
**Children**  Children are given isoniazid, rifampicin, pyrazinamide, and ethambutol for the first 2 months followed by isoniazid and rifampicin during the next 4 months. However, care is needed in young children receiving ethambutol because of the difficulty in testing eyesight and in obtaining reports of visual symptoms (see below).

**Supervised treatment**  Drug administration needs to be **fully supervised** (directly observed therapy, DOT) in patients who cannot comply reliably with the treatment regimen. These patients are given isoniazid, rifampicin, pyrazinamide and ethambutol (or streptomycin) 3 times a week under supervision for the first 2 months followed by isoniazid and rifampicin 3 times a week for a further 4 months.

**Recommended dosage for intermittent supervised 6-month treatment**

**Isoniazid** (for 2-month initial and 4-month continuation phases)

- **ADULT AND CHILD** 15 mg/kg (max. 900 mg) 3 times a week

**Rifampicin** (for 2-month initial and 4-month continuation phases)

- **ADULT** 600–900 mg 3 times a week; **CHILD** 15 mg/kg (max. 900 mg) 3 times a week

**Pyrazinamide** (for 2-month initial phase only)

- **ADULT** under 50 kg 2 g 3 times a week; 50 kg and over 2.5 g 3 times a week; **CHILD** 50 mg/kg 3 times a week

**Ethambutol** (for 2-month initial phase only)

- **ADULT AND CHILD** 30 mg/kg 3 times a week

**Immunocompromised patients**

Multi-resistant *Mycobacterium tuberculosis* may be present in immunocompromised patients. The organism should always be cultured to confirm its type and drug sensitivity. Confirmed *M. tuberculosis* infection sensitive to first-line drugs should be treated with a standard 6-month regimen; after completing treatment, patients should be closely monitored. The regimen may need to be modified if infection is caused by resistant organisms, and specialist advice is needed.

Specialist advice should be sought about tuberculosis treatment or chemoprophylaxis in a HIV-positive individual; care is required in choosing the regimen and in avoiding potentially hazardous interactions. Starting antiretroviral treatment in the first 2 months of antituberculosis treatment increases the risk of immune reconstitution syndrome.

Infection may also be caused by other mycobacteria e.g. *M. avium* complex in which case specialist advice on management is needed.

**Corticosteroids**  In meningeal or pericardial tuberculosis, a corticosteroid should be started at the same time as antituberculosis therapy.

**Prevention of tuberculosis**  Some individuals may develop tuberculosis owing to reactivation of previously latent disease. Chemoprophylaxis may be required in those who have evidence of latent tuberculosis and are receiving treatment with immnosuppressants (including cytotoxics and possibly long-term treatment with systemic corticosteroids). In these cases, chemoprophylaxis involves use of either isoniazid alone for 6 months or of isoniazid and rifampicin for 3 months, see Table 2, section 5.1; longer chemoprophylaxis is not recommended.

For prevention of tuberculosis in susceptible close contacts or those who have become tuberculin-positive, see Table 2, section 5.1. For advice on immunisation against tuberculosis, see section 14.4

**Monitoring**  Since isoniazid, rifampicin and pyrazinamide are associated with liver toxicity (see Appendix 2), **hepatic function** should be checked before treatment with these drugs. Those with pre-existing liver disease or alcohol dependence should have frequent checks particularly in the first 2 months. If there is no evidence of liver disease (and pre-treatment liver function is normal), further checks are only necessary if the patient develops fever, malaise, vomiting, jaundice or unexplained deterioration during treatment. In view of the need to comply fully with antituberculosis treatment on the one hand and to guard against serious liver damage on the other, patients and their carers should be informed carefully how to recognise signs of liver disorders and advised to discontinue treatment and seek immediate medical attention should symptoms of liver disease occur.

**Renal function** should be checked before treatment with antituberculosis drugs and appropriate dosage adjustments made. Streptomycin or ethambutol should preferably be avoided in patients with renal impairment, but if used, the dose should be reduced and the plasma-drug concentration monitored.

**Visual acuity** should be tested before ethambutol is used (see below).

Major causes of treatment failure are incorrect prescribing by the physician and inadequate compliance by the patient. Monthly tablet counts and urine examination (rifampicin imparts an orange-red colouration) may be useful indicators of compliance with treatment. Avoid both excessive and inadequate dosage. Treatment should be supervised by a specialist physician.

**Isoniazid** is cheap and highly effective. Like rifampicin it should always be included in any antituberculous regimen unless there is a specific contra-indication. Its only common side-effect is peripheral neuropathy which is more likely to occur where there are pre-existing risk factors such as diabetes, alcohol dependence, chronic renal failure, malnutrition and HIV infection. In these circumstances pyridoxine 10 mg daily (or 20 mg daily if suitable product not available) (section 9.6.2) should be given prophylactically from the start of treatment. Other side-effects such as hepatitis (important: see Monitoring above) and psychosis are rare.

**Rifampicin**, a rifamycin, is a key component of any antituberculous regimen. Like isoniazid it should always be included unless there is a specific contra-indication. During the first two months (‘initial phase’) of rifampicin administration transient disturbance of liver function with elevated serum transaminases is common but generally does not require interruption of treatment. Occasionally more serious liver toxicity requires a change of treatment particularly in those with pre-existing liver disease (important: see Monitoring above). On intermittent treatment six toxicity syndromes have been recognised—influenza-like, abdominal, and respiratory symptoms, shock, renal failure, and thrombocytopenic purpura—and can occur in 20 to 30% of patients.
**CAPREOMYCIN**

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** hepatic impairment; renal impairment (Appendix 3); auditory impairment; monitor renal, hepatic, auditory, and vestibular function and electrolytes; pregnancy (teratogenic in animals, Appendix 4) and breast-feeding (Appendix 5); **interactions:** Appendix 1 (capreomycin)

**Side-effects** hypersensitivity reactions including urticaria and rashes; leucocytosis or leucopenia, rarely thrombocytopenia; changes in liver function tests; nephrotoxicity, electrolyte disturbances; hearing loss with tinnitus and vertigo; neuromuscular block after large doses, pain and induration at injection site

**Dose**
- By deep intramuscular injection, 1 g daily (not more than 20 mg/kg) for 2–4 months, then 1 g 2–3 times each week

**Capastat® (King)**

**Injection** powder for reconstitution, capreomycin sulphate 1 million units (= capreomycin approx. 1 g). Net price per vial = £22.89

**CYCLOSERINE**

**Indications** in combination with other drugs, tuberculosis resistant to first-line drugs

**Cautions** reduce dose in renal impairment (avoid if creatinine clearance less than 10 mL/minute); monitor haematological, renal, and hepatic function; pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions:** Appendix 1 (cycloserine)

**Contraindications** severe renal impairment, epilepsy, depression, severe anxiety, psychotic states, alcohol dependence, acute porphyria (section 9.8.2)

**Side-effects** mainly neurological, including headache, dizziness, vertigo, drowsiness, tremor, convulsions, confusion, psychosis, depression (discontinue or reduce dose if symptoms of CNS toxicity); rashes, allergic dermatitis (discontinue or reduce dose); megaloblastic anaemia; changes in liver function tests; heart failure at high doses reported

**Dose**
- Initially 250 mg every 12 hours for 2 weeks increased according to blood concentration and response to max. 500 mg every 12 hours; **CHILD** initially 10 mg/kg daily adjusted according to blood concentration and response

**Note** Blood concentration monitoring required especially in renal impairment or if dose exceeds 500 mg daily or if signs of toxicity; blood concentration should not exceed 30 mg/litre

**Cycloserine (King)**

**Capsules** red/grey cycloserine 250 mg, net price 100-cap pack = £303.45. Label: 2, 8

**ETHAMBUTOL HYDROCHLORIDE**

**Indications** tuberculosis, in combination with other drugs

**Cautions** reduce dose in renal impairment and if creatinine clearance less than 30 mL/minute, also monitor plasma-ethambutol concentration (Appendix 3); elderly; pregnancy; test visual acuity before treatment and warn patients to report visual changes—see

Rifampicin induces hepatic enzymes which accelerate the metabolism of several drugs including oestrogens, corticosteroids, phenytoin, sulphonylear, and anticoagulants; **interactions:** Appendix 1 (rifamycins). **Important:** the effectiveness of hormonal contraceptives is reduced and alternative family planning advice should be offered (section 7.3.1).

Rifabutin, a newly introduced rifamycin, is indicated for prophylaxis against *M. avium* complex infections in patients with a low CD4 count; it is also licensed for the treatment of non-tuberculous mycobacterial disease and pulmonary tuberculosis. **Important:** as with rifampicin it induces hepatic enzymes and the effectiveness of hormonal contraceptives is reduced requiring alternative family planning methods.

Pyrazinamide [unlicensed] is a bactericidal drug only active against intracellular dividing forms of *Pyrazinamide* and pulmonary tuberculosis. **Important:** its effectiveness is reduced when first-line drugs cause unacceptable side-effects, include amikacin, capreomycin, cycloserine, newer macrolides (e.g. azithromycin and clarithromycin), moxifloxacin and protionamide (prothionamide; no longer on UK market).
notes above; young children (see notes above)—routine ophthalmological monitoring recommended

**Contra-indications** optic neuritis, poor vision

**Side-effects** optic neuritis, red/green colour blindness, peripheral neuritis, rarely rash, pruritus, urti- caria, thrombocytopenia

**Dose**
- See notes above

**Note** Peak concentration (2–2.5 hours after dose) should be 2–6 mg/litre (7–12 mcg/ml/litre); ‘trough’ (pre-dose) concentration should be less than 1 mg/litre (4 mcg/ml/litre); see Cautions above; for advice on laboratory assay of ethambutol contact the Poisons Unit at New Cross Hospital (Tel (020) 7771 5360)

**Ethambutol** (Non-proprietary)  
Tablets, ethambutol hydrochloride 100 mg (yellow), net price 56-tab pack = £11.51; 400 mg (grey), 56-tab pack = £42.74. Label: 8

**ISONIAZID**

**Indications** tuberculosis, in combination with other drugs; prophylaxis—Table 2, section 5.1

**Cautions** hepatic impairment (Appendix 2; see also below); renal impairment (Appendix 3); slow acety- lator status (increased risk of side-effects); epilepsy; history of psychosis; alcohol dependence, malnutri- tion, diabetes mellitus, HIV infection (risk of periph- eral neuritis); pregnancy (Appendix 4) and breast- feeding (Appendix 5); acute porphyria (section 9.8.2); interactions: Appendix 1 (isoniazid)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** drug-induced liver disease

**Side-effects** nausea, vomiting, constipation, dry mouth; peripheral neuritis with high doses (pyridoxine prophylaxis, see notes above), optic neuritis, convulsions, psychotic episodes, vertigo; hypersensitivity reactions including fever, erythema multiforme, purpura; blood disorders including agranulocytosis, haemolytic anaemia, aplastic anaemia; hepatitis (especially over age of 35 years); systemic lupus erythematosus-like syndrome, pellagra, hyperreflexia, difficulty with micturition, hyperglycaemia, and gynaecomastia reported; hearing loss and tinnitus (in patients with end-stage renal impairment)

**Dose**
- By mouth or by intramuscular or intravenous injection, see notes above

**Isoniazid** (Non-proprietary)  
Tablets, isoniazid 50 mg, net price 56-tab pack = £8.34; 100 mg, 28-tab pack = £8.29. Label: 8, 22

**Elixir** (BPC), isoniazid 50 mg, citric acid monohydrate 12.5 mg, sodium citrate 60 mg, concentrated anise water 0.05 mL, compound tartrazine solution 0.05 mL, glycerol 1 mL, double-strength chloroform water 2 mL, water to 5 mL. Label: 8, 22

‘Special order’ [unlicensed] product; contact Martindale, Rose- mont, or regional hospital manufacturing unit

**Injection** isoniazid 25 mg/mL, net price 2-mL amp = £11.04

**PYRAZINAMIDE**

**Indications** tuberculosis in combination with other drugs [unlicensed]

**Cautions** pregnancy (Appendix 4); hepatic impairment (monitor hepatic function, see also below and Appendix 2); diabetes; gout (avoid in acute attack); interactions: Appendix 1 (pyrazinamide)

**Hepatic disorders** Patients or their carers should be told how to recognise signs of liver disorder, and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop

**Contra-indications** acute porphyria (section 9.8.2)

**Side-effects** hepatotoxicity including fever, anorexia, hepatomegaly, splenomegaly, jaundice, liver failure; nausea, vomiting, flushing, dysuria, arthralgia, sideroblastic anaemia, rash and occasionally photo-sensitivity

**Dose**
- See notes above

**Pyrazinamide** (Non-proprietary)  
Tablets, scored, pyrazinamide 500 mg. Label: 8

Available from ‘special order’ manufacturers or specialist-importing companies, see p. 939

**RIFABUTIN**

**Indications** see under Dose

**Cautions** see under Rifampicin; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); acute porphyria (section 9.8.2)

**Side-effects** nausea, vomiting; leucopenia, thrombo- cytopenia, anaemia, rarely haemolyis; raised liver enzymes, jaundice, rarely hepatitis; uveitis following high doses or administration with drugs which raise plasma concentration—see also interactions: Appendix 1 (rifamycins); arthralgia, myalgia, influenza-like syndrome, dyspnoea; also hypersensitivity reactions including fever, rash, eosinophilia, bronchospasm, shock; skin, urine, saliva and other body secretions coloured orange-red; asymptomatic corneal opacities reported with long-term use

**Dose**
- Prophylaxis of *Mycobacterium avium* complex infec- tions in immunosuppressed patients with low CD4 count (see product literature), 300 mg daily as a single dose
- Treatment of non-tuberculous mycobacterial disease, in combination with other drugs, 450–600 mg daily as a single dose for up to 6 months after cultures nega- tive
- Treatment of pulmonary tuberculosis, in combination with other drugs, 150–450 mg daily as a single dose for at least 6 months
- **CHILD** not recommended

**Mycobutin®** (Pharmacia)  
Capsules, red-brown, rifabutin 150 mg. Net price 30- cap pack = £90.38. Label: 8, 14, counselling, lenses, see under Rifampicin

**RIFAMPICIN**

**Indications** see under Dose

**Cautions** hepatic impairment (Appendix 2; liver func- tion tests and blood counts in hepatic disorders,
alcohol dependence, and on prolonged therapy, see also below); renal impairment (if above 600 mg daily); pregnancy and breast-feeding (see notes above and Appendix 4 and Appendix 5); acute porphyria (section 9.8.2); important: advise patients on hormonal contraceptives to use additional means (see also section 7.3.1); discolour soft contact lenses; see also notes above; interactions: Appendix 1 (rifamycins) Note If treatment interrupted re-introduce with low dosage and increase gradually; discontinue permanently if serious side-effects develop; hepatic disorders Patients or their carers should be told how to recognise signs of liver disorder; and advised to discontinue treatment and seek immediate medical attention if symptoms such as persistent nausea, vomiting, malaise or jaundice develop.

Contra-indications jaundice; side-effects gastro-intestinal symptoms including anorexia, nausea, vomiting, diarrhoea (antibiotic-associated colitis reported); headache, drowsiness; those occurring mainly on intermittent therapy include influenza-like symptoms (with chills, fever, dizziness, bone pain), respiratory symptoms (including shortness of breath), collapse and shock, haemolytic anaemia, thrombocytopenic purpura, disseminated intravascular coagulation, and acute renal failure; alterations of liver function, jaundice, flushing, urticaria, and rash; other side-effects reported include oedema, psychosis, renal insufficiency, muscular weakness and myopathy, exfoliative dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, pemphigoid reactions, leucopenia, dermatitis, toxic epidermal necrolysis, Stevens-Johnson syndrome, erythema multiforme, exfoliative dermatitis, and systemic lupus erythematosus. Discontinue treatment if symptoms develop and increase gradually; discontinue permanently if serious side-effects develop.

Dose
- Brucellosis, legionnaires’ disease, endocarditis and serious staphylococcal infections, in combination with other drugs, by mouth or by intravenous infusion, 0.6–1.2 g daily (in 2–4 divided doses)
- Tuberculosis, in combination with other drugs, see notes above
- Leprosy, section 5.1.10
- Prophylaxis of meningococcal meningitis and Haemophilus influenzae (type b) infection, section 5.1, table 2

Rifampicin (Non-proprietary) Rifadin® (Aventis Pharma)

Capsules, rifampicin 150 mg, net price 20 = £4.17; 300 mg, 20 = £10.44. Label: 8, 14, 22, counselling, see lenses above

Rifadin® (Aventis Pharma) Capsules, rifampicin 150 mg (blue/red), net price 20 = £3.81; 300 mg (red), 20 = £7.62. Label: 8, 14, 22, counselling, see lenses above

Syrup, red, rifampicin 100 mg/5 mL (raspberry-flavoured). Net price 120 mL = £3.70. Label: 8, 14, 22, counselling, see lenses above

Intravenous infusion, powder for reconstitution, rifampicin. Net price 600-mg vial (with solvent) = £7.98 Electrolytes Na < 0.5 mmol/vial

Rimactane® (Sandoz) Capsules, rifampicin 150 mg (red), net price 60-cap pack = £11.35; 300 mg (red/brown), 60-cap pack = £22.69. Label: 8, 14, 22, counselling, see lenses above

Combination preparations

Rifater® (Aventis Pharma)

Tablets, pink, s/c, rifampicin 120 mg, isoniazid 50 mg, pyrazinamide 300 mg. Net price 20 = £4.39. Label: 8, 14, 22, counselling, see lenses above

Dose initial treatment of pulmonary tuberculosis, patients up to 40 kg 3 tablets daily preferably before breakfast, 40–49 kg 4 tablets daily, 50–64 kg 5 tablets daily, 65 kg or more, 6 tablets daily; not suitable for use in children

Rifinah 150® (Aventis Pharma)

Tablets, pink, s/c, rifampicin 150 mg, isoniazid 100 mg, net price 84-tab pack = £16.55. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT under 50 kg, 3 tablets daily; preferably before breakfast

Rifinah 300® (Aventis Pharma)

Tablets, orange, s/c, rifampicin 300 mg, isoniazid 150 mg, net price 56-tab pack = £21.87. Label: 8, 14, 22, counselling, see lenses above

Dose ADULT 30 kg and over, 2 tablets daily; preferably before breakfast

STREPTOMYCIN

Indications tuberculosis, in combination with other drugs; adjunct to doxycycline in brucellosis; enterococcal endocarditis (Table 1, section 5.1)

Cautions see under Aminoglycosides, section 5.1.4; interactions: Appendix 1 (aminoglycosides)

Contra-indications see under Aminoglycosides, section 5.1.4

Side-effects see under Aminoglycosides, section 5.1.4; also hypersensitivity reactions, paraesthesia of mouth

Dose
- By deep intramuscular injection, tuberculosis [unlicensed], see notes above; brucellosis, expert advice essential

Note One-hour (‘peak’) concentration should be 15–40 mg/litre; pre-dose (‘trough’) concentration should be less than 5 mg/litre (less than 1 mg/litre in renal impairment or in those over 50 years)

Streptomycin Sulphate (Non-proprietary)

Injection, powder for reconstitution, streptomycin (as sulphate), net price 1-g vial = £8.25 Available as an unlicensed preparation from UCB Pharma

5.1.10 Antileprotic drugs

Advice from a member of the Panel of Leprosy Opinion is essential for the treatment of leprosy (Hansen’s disease). Details of the Panel can be obtained from the Department of Health telephone (020) 7972 4480.

The World Health Organization has made recommendations to overcome the problem of dapsone resistance and to prevent the emergence of resistance to other antileprotic drugs. Drugs recommended are dapsone, rifampicin (section 5.1.9), and clofazimine. Other drugs with significant activity against Mycobacterium leprae include ofloxacin, minocycline and clarithromycin, but none of these are as active as rifampicin; at present they should be reserved as second-line drugs for leprosy.

A three-drug regimen is recommended for multibacillary leprosy (lepromatous, borderline-lepromatous, and border-line leprosy) and a two-drug regimen for paucibac-
**Multibacillary leprosy (3-drug regimen)**
- **Rifampicin**: 600 mg once-monthly, supervised (450 mg for adults weighing less than 35 kg)
- **Dapsone**: 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)
- **Clofazimine**: 300 mg once-monthly, supervised, and 50 mg daily (or 100 mg on alternate days), self-administered

Multibacillary leprosy should be treated for at least 2 years. Treatment should be continued unchanged during both type I (reversal) or type II (erythema nodosum lepromatum) reactions. During reversal reactions neuritic pain or weakness can herald the rapid onset of permanent nerve damage. Treatment with prednisolone (initially 40–60 mg daily) should be instituted at once. Mild type II reactions may respond to aspirin. Severe type II reactions may require corticosteroids; thalidomide (unlicensed) is also useful in men and post-menopausal women who have become corticosteroid dependent, but it should be used under specialist supervision and it should never be used in women of child-bearing potential (significant teratogenic risk—for CSM guidance on prescribing, see Current Problems in Pharmacovigilance 1994; 20, 8). Increased doses of clofazimine 100 mg 3 times daily for the first month with subsequent reductions, are also useful but may take 4–6 weeks to attain full effect.

**Paucibacillary leprosy (2-drug regimen)**
- **Rifampicin**: 600 mg once-monthly, supervised (450 mg for those weighing less than 35 kg)
- **Dapsone**: 100 mg daily, self-administered (50 mg daily or 1–2 mg/kg daily for adults weighing less than 35 kg)

Paucibacillary leprosy should be treated for 6 months. If treatment is interrupted the regimen should be recommenced where it was left off to complete the full course. Neither the multibacillary nor the paucibacillary anti-leprosy regimen is sufficient to treat tuberculosis.

**Dapsone**

**Dose**
- Leprosy. 1–2 mg/kg daily, see notes above
- Dermatitis herpetiformis, see specialist literature

**Dapsone (Non-proprietary) [NHS]**

**Tablets**, dapsone 50 mg, net price 28-tab pack = £23.01; 100 mg, 28-tab pack = £33.74. Label: 

**CLOFAZIMINE**

**Indications**
- Leprosy

**Cautions**
- Hepatic and renal impairment; pregnancy; breast-feeding (Appendix 5); may discolour soft contact lenses; avoid if persistent abdominal pain and diarrhoea

**Side-effects**
- Nausea, vomiting (hospitalise if persistent), abdominal pain; headache, tiredness; brownish-black discoloration of lesions and skin including areas exposed to light; reversible hair discoloration; dry skin; red discoloration of faeces, urine and other body fluids; also rash, pruritus, photosensitivity, acne-like eruptions, anorexia, eosinophilic enteropathy, bowel obstruction, dry eyes, dimmed vision, macular and subepithelial corneal pigmentation; elevation of blood sugar, weight loss, splenic infarction, lymphadenopathy

**Dose**
- Leprosy, see notes above
- Lepromatous leprosy reactions, dosage increased to 300 mg daily for max. of 3 months

**Clofazimine (Non-proprietary) [NHS]**

**Capsules**, clofazimine 100 mg. Label: 8, 14, 21 Available on named-patient basis

**5.1.11 Metronidazole and tinidazole**

**Metronidazole** is an antimicrobial drug with high activity against anaerobic bacteria and protozoa; indications include trichomonal vaginitis (section 5.4.3), bacterial vaginosis (notably *Gardnerella vaginalis* infections), and *Entamoeba histolytica* and *Giardia lamblia* infections (section 5.4.2). It is also used for surgical and gynaecological sepsis in which its activity against colonic anaerobes, especially *Bacteroides fragilis*, is important. Metronidazole by the rectal route is an effective alternative to the intravenous route when oral administration is not possible. Intravenous metronidazole is used for the treatment of established cases of tetanus; diazepam (section 10.2.2) and tetanus immunoglobulin (section 14.5) are also used.

Metronidazole by mouth is effective for the treatment of *Clostridium difficile* infection, see also section 1.5; it can be given by intravenous infusion if oral treatment is inappropriate.

Topical metronidazole (section 13.10.1.2) reduces the odour produced by anaerobic bacteria in fungating tumours; it is also used in the management of rosacea (section 13.6).

**Tinidazole** is similar to metronidazole but has a longer duration of action.
**Oral infections** Metronidazole is an alternative to a penicillin for the treatment of many oral infections where the patient is allergic to penicillin or the infection is due to beta-lactamase-producing anaerobes (Table 1, section 5.1). It is the drug of first choice for the treatment of acute necrotising ulcerative gingivitis (Vincent’s infection) and pericoronitis; suitable alternatives are amoxicillin (section 5.1.1.3) and erythromycin (section 5.1.5). For these purposes metronidazole in a dose of 200 mg 3 times daily for 3 days is sufficient, but the duration of treatment may need to be longer in pericoronitis. Tinidazole is licensed for the treatment of acute ulcerative gingivitis.

---

**METRONIDAZOLE**

**Indications** anaerobic infections (including dental), see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3); skin (section 13.10.1.2)

**Cautions** disulfiram-like reaction with alcohol, hepatic impairment and hepatic encephalopathy (Appendix 2); pregnancy (Appendix 4) and breast-feeding (Appendix 5); avoid in acute porphyria (section 9.8.2); clinical and laboratory monitoring advised if treatment exceeds 10 days; **interactions**: Appendix 1 (metronidazole)

**Side-effects** gastro-intestinal disturbances (including nausea and vomiting), taste disturbances, furred tongue, oral mucositis, anorexia; *very rarely* hepatitis, jaundice, pancreatitis, drowsiness, dizziness, headache, ataxia, psychic disorders, darkening of urine, thrombocytopenia, pancytopenia, myalgia, arthralgia, visual disturbances, rash, pruritus, and erythema multiforme; on prolonged or intensive therapy peripheral neuropathy, transient epileptiform seizures, and leucopenia

**Dose**
- Anaerobic infections (usually treated for 7 days and for 7–10 days in *Clostridium difficile* infection), by mouth, *either* 800 mg initially then 400 mg every 8 hours or 500 mg every 8 hours, **CHILD** 7.5 mg/kg every 8 hours; by rectum, 1 g every 8 hours for 3 days, then 1 g every 12 hours, **CHILD** every 8 hours for 3 days, then every 12 hours, age up to 1 year 125 mg, 1–5 years 250 mg, 5–10 years 500 mg, over 10 years, adult dose; by intravenous infusion over 20 minutes, 500 mg every 8 hours; **CHILD** 7.5 mg/kg every 8 hours
- Leg ulcers and pressure sores, by mouth, 400 mg every 8 hours for 7 days
- Bacterial vaginosis, by mouth, 400–500 mg twice daily for 5–7 days or 2 g as a single dose
- Pelvic inflammatory disease (see also Table 1, section 5.1), by mouth, 400 mg twice daily for 14 days
- Acute ulcerative gingivitis, by mouth, 200–250 mg every 8 hours for 3 days; **CHILD** 1–3 years 50 mg every 8 hours for 3 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Acute oral infections, by mouth, 200 mg every 8 hours for 3–7 days (see also notes above); **CHILD** 1–3 years 50 mg every 8 hours for 3–7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Surgical prophylaxis, by mouth, 400–500 mg 2 hours before surgery; up to 3 further doses of 400–500 mg may be given every 8 hours for high-risk procedures; **CHILD** 7.5 mg/kg 2 hours before surgery; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

**By rectum**, 1 g 2 hours before surgery; up to 3 further doses of 1 g may be given every 8 hours for high-risk procedures; **CHILD** 5–10 years 500 mg 2 hours before surgery; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures

**By intravenous infusion** (if rectal administration inappropriate), 500 mg at induction; up to 3 further doses of 500 mg may be given every 8 hours for high-risk procedures; **CHILD** 7.5 mg/kg at induction; up to 3 further doses of 7.5 mg/kg may be given every 8 hours for high-risk procedures

**Note** Metronidazole doses in BNF may differ from those in product literature

**Metronidazole** (Non-proprietary)
- **Tablets**, metronidazole 200 mg, net price 21-tab pack = £1.10; 400 mg, 21-tab pack = £1.29. Label: 4, 9, 21, 25, 27
- Brands include Vaginyl
- **Tablets**, metronidazole 500 mg, net price 21-tab pack = £26.79. Label: 4, 9, 21, 25, 27
- **Suspension**, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £9.07. Label: 4, 9, 23
- Brands include Norazol
- **Intravenous infusion**, metronidazole 5 mg/mL. Net price 20-mL amp = £1.56, 100-mL container = £3.41
- **Dental prescribing on NHS** Metronidazole Tablets and Oral Suspension may be prescribed

**Flagyl® (Winthrop)**
- **Tablets**, both f/c, ivory, metronidazole 200 mg, net price 21-tab pack = £4.67; 400 mg, 14-tab pack = £6.60. Label: 4, 9, 21, 25, 27
- **Suppositories**, metronidazole 500 mg, net price 10 = £15.80; 1 g, 10 = £24.00. Label: 4, 9

**Flagyl® (Aventis Pharma)**
- **Intravenous infusion**, metronidazole 5 mg/mL, net price 100-mL Viaflex® bag = £2.80
- **Electrolytes** Na 13.37 mmol/100-mL bag

**Flagyl S® (Winthrop)**
- **Suspension**, orange- and lemon-flavoured, metronidazole (as benzoate) 200 mg/5 mL. Net price 100 mL = £11.63. Label: 4, 9, 23

**Metroly® (Sandoz)**
- **Intravenous infusion**, metronidazole 5 mg/mL, net price 100-mL Steriflex® bag = £1.22
- **Electrolytes** Na 14.53 mmol/100-mL bag
- **Suppositories**, metronidazole 500 mg, net price 10 = £12.34; 1 g, 10 = £18.34. Label: 4, 9

---

**TINIDAZOLE**

**Indications** anaerobic infections, see under Dose below; protozoal infections (section 5.4.2); *Helicobacter pylori* eradication (section 1.3)

**Cautions** see under Metronidazole; pregnancy (manufacturer advises avoid in first trimester); avoid in acute porphyria (section 9.8.2); **interactions**: Appendix 1 (tinidazole)

**Side-effects** see under Metronidazole

**Dose**
- Anaerobic infections, 2 g initially, followed by 1 g daily or 500 mg twice daily, usually for 5–6 days
Fasigyn® (Pfizer)  ™  
Tablets, 1/2, tinidazole 500 mg. Net price 20-tab pack  
= £13.80. Label: 4, 9, 21, 25

## 5.1.12 Quinolones

### Nalidixic acid and norfloxacin are effective in uncomplicated urinary-tract infections.

**Ciprofloxacin** is active against both Gram-positive and Gram-negative bacteria. It is particularly active against Gram-negative bacteria, including salmonella, shigella, campylobacter, neisseria, and pseudomonas. Ciprofloxacin has only moderate activity against Gram-positive bacteria such as *Streptococcus pneumoniae* and *Enterococcus faecalis*; it should not be used for pneumococcal pneumonia. It is active against chlamydia and some mycobacteria. Most anaerobic organisms are not susceptible. Ciprofloxacin can be used for respiratory tract infections (but not for pneumococcal pneumonia), urinary-tract infections, infections of the gastro-intestinal system (including typhoid fever), bone and joint infections, gonorrhoea and septicaemia caused by sensitive organisms.

**Ofloxacin** is used for urinary-tract infections, lower respiratory-tract infections, gonorrhoea, and non-gonococcal urethritis and cervicitis.

**Levofloxacin** is active against Gram-positive and Gram-negative organisms. It has greater activity against pneumococci than ciprofloxacin. Levofloxacin is licensed for community-acquired pneumonia but it is considered to be second-line treatment for this indication.

Although ciprofloxacin, levofloxacin and ofloxacin are licensed for skin and soft-tissue infections, many staphylococci are resistant to the quinolones and their use should be avoided in MRSA infections.

**Moxifloxacin** should be reserved for the treatment of sinusitis, community-acquired pneumonia, or exacerbations of chronic bronchitis which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials. It has been associated with life-threatening hepatotoxicity. Moxifloxacin is active against Gram-positive and Gram-negative organisms. It has greater activity against Gram-positive organisms, including pneumococci, than ciprofloxacin. Moxifloxacin is not active against *Pseudomonas aeruginosa* or meticillin-resistant *Staphylococcus aureus* (MRSA).

**Anthrax** Inhalation or gastro-intestinal anthrax should be treated initially with either ciprofloxacin or doxycycline [unlicensed indication] (section 5.1.3) combined with one or two other antibacterials (such as amoxicillin, benzylpenicillin, chloramphenicol, clarithromycin, clindamyin, imipenem with cilastatin, rifampicin [unlicensed indication], and vancomycin). When the condition improves and the sensitivity of the *Bacillus anthracis* strain is known, treatment may be switched to a single antibacterial. Treatment should continue for 60 days because germination may be delayed.

**Cutaneous anthrax** should be treated with either ciprofloxacin [unlicensed indication] or doxycycline [unlicensed indication] (section 5.1.3) for 7 days. Treatment may be switched to amoxicillin (section 5.1.1.3) if the infecting strain is susceptible. Treatment may need to be extended to 60 days if exposure is due to aerosol. A combination of antibacterials for 14 days is recommended for cutaneous anthrax with systemic features, extensive oedema, or lesions of the head or neck.

Ciprofloxacin or doxycycline may be given for post-exposure prophylaxis. If exposure is confirmed, antibacterial prophylaxis should continue for 60 days. Antibacterial prophylaxis may be switched to amoxicillin after 10–14 days if the strain of *B. anthracis* is susceptible. Vaccination against anthrax (section 14.4) may allow the duration of antibacterial prophylaxis to be shortened.

**Cautions** Quinolones should be used with caution in patients with a history of epilepsy or conditions that predispose to seizures, in G6PD deficiency (section 9.1.5), myasthenia gravis (risk of exacerbation), in renal impairment (Appendix 3); pregnancy (Appendix 4), during breast-feeding (Appendix 5), and in children or adolescents (arthropathy has developed in weight-bearing joints in young animals—see below). Exposure to excessive sunlight should be avoided (discontinue if photosensitivity occurs). The CSM has warned that quinolones may induce convulsions in patients with or without a history of convulsions; taking NSAIDs at the same time may also induce them. Other interactions: Appendix 1 (quinolones).

**Use in children** Quinolones cause arthropathy in the weight-bearing joints of immature animals and are therefore generally not recommended in children and growing adolescents. However, the significance of this effect in humans is uncertain and in some specific circumstances short-term use of a quinolone in children may be justified. Nalidixic acid is used for urinary-tract infections in children over 3 months of age. Ciprofloxacin is licensed for pseudomonal infections in cystic fibrosis (for children above 5 years of age), and for treatment and prophylaxis of inhalational anthrax.

### Tendon damage

Tendon damage (including rupture) has been reported rarely in patients receiving quinolones. Tendon rupture may occur within 48 hours of starting treatment; cases have also been reported several months after stopping a quinolone. Healthcare professionals are reminded that:

- quinolones are contra-indicated in patients with a history of tendon disorders related to quinolone use;
- patients over 60 years of age are more prone to tendon damage;
- kidney, heart, or lung transplant recipients are more prone to tendon damage;
- the risk of tendon damage is increased by the concomitant use of corticosteroids;
- if tendinitis is suspected, the quinolone should be discontinued immediately.

### Side-effects

Side-effects of the quinolones include nausea, vomiting, dyspepsia, abdominal pain, diarrhoea (rarely antibiotic-associated colitis), headache, dizziness, rash (very rarely Stevens-Johnson syndrome and toxic epidermal necrolysis). Less frequent side-effects include anorexia, sleep disturbances, asthenia, confusion, anxiety, depression, hallucinations, tremor, blood disorders (including eosinophilia, leucopenia, thrombo-
cytopenia), arthralgia, myalgia, disturbances in vision and taste. Other side-effects reported rarely or very rarely include hepatic dysfunction (including jaundice and hepatitis), hypotension, vasculitis, dyspnoea (more frequent with moxifloxacin), convulsions, psychoses, paraesthesia, renal failure, interstitial nephritis, tendin inflammation and damage (see also Tendon Damage above), photosensitivity, disturbances in hearing and smell. The drug should be discontinued if psychiatric, neurological or hypersensitivity reactions (neuralgic severe rash) occur.

## Ciprofloxacin

**Indications**  
see notes above and under Dose; eye infections (section 11.3.1)

**Cautions**  
see notes above; avoid excessive alkalinity of urine and ensure adequate fluid intake (risk of crystalluria); interactions: Appendix 1 (quinolones)

Driving  
May impair performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Side-effects**  
see notes above; also flatulence, pain and phlebitis at injection site; rarely dysphagia, pancreatitis, chest pain, tachycardia, syncope, oedema, hot flushes, abnormal dreams, sweating, hyperglycaemia, and erythema nodosum; very rarely movement disorders, tinnitus, and tenosynovitis

**Dose**  
- **By mouth**, respiratory-tract infections, 250–750 mg twice daily
- Urinary-tract infections, 250–500 mg twice daily  
(100 mg twice daily for 3 days in acute uncomplicated cystitis in women)
- Chronic prostatitis, 500 mg twice daily for 28 days
- Gonorrhoea, 500 mg as a single dose
- Pseudomonal lower respiratory-tract infection in cystic fibrosis, 750 mg twice daily; **CHILD** 5–17 years (see Cautions above), up to 20 mg/kg (max. 750 mg) twice daily
- Most other infections, 500–750 mg twice daily
- Surgical prophylaxis, 750 mg 60–90 minutes before procedure
- Prophylaxis of meningococcal meningitis [not licensed], Table 2, section 5.1
- **By intravenous infusion** (over 30–60 minutes; 400 mg over 60 minutes), 200–400 mg twice daily  
Pseudomonal lower respiratory-tract infection in cystic fibrosis, 400 mg twice daily; **CHILD** 5–17 years (see Cautions above), up to 10 mg/kg (max. 400 mg) 3 times daily
- Urinary-tract infections, 100 mg twice daily
- Gonorrhoea, 100 mg as a single dose
- **CHILD** and **ADOLESCENT** not recommended (see Cautions above) but where benefit outweighs risk, **by mouth**, 5–15 mg/kg (max. 750 mg) twice daily or **by intravenous infusion**, 4–8 mg/kg (max. 400 mg) twice daily
- Anthrax (treatment and post-exposure prophylaxis, see notes above), **by mouth**, 500 mg twice daily; **CHILD** and **ADOLESCENT** 15 mg/kg (max. 500 mg) twice daily
- **By intravenous infusion**, 400 mg twice daily; **CHILD** and **ADOLESCENT** 10 mg/kg (max. 400 mg) twice daily

**Ciprofloxacin** (Non-proprietary)  
- **Tablets**, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £1.08; 250 mg, 10-tab pack = £1.12, 20-tab pack = £1.17; 500 mg, 10-tab pack = £1.19, 20-
  - **tab pack = £1.19**; 750 mg, 10-tab pack = £1.99.
  - Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate)  
2 mg/mL, net price 50-ml bottle = £8.00, 100-ml bottle = £15.00, 200-ml bottle = £22.00

**Ciproxin** *(Bayer)*  
- **Tablets**, all 1/2 c, ciprofloxacin (as hydrochloride) 100 mg, net price 6-tab pack = £2.80; 250 mg (scored), 10-tab pack = £7.50, 20-tab pack = £15.00; 500 mg (scored), 10-tab pack = £14.20, 20-tab pack = £28.40; 750 mg, 10-tab pack = £20.00. Label: 7, 9, 25, counselling, driving

**Suspension**, strawberry-flavoured, ciprofloxacin for reconstitution with diluent provided, 250 mg/5 mL, net price 100 mL = £16.50. Label: 7, 9, 25, counselling, driving

**Intravenous infusion**, ciprofloxacin (as lactate)  
2 mg/mL, in sodium chloride 0.9%, net price 50-ml bottle = £8.65, 100-ml bottle = £16.89, 200-ml bottle = £25.70

**Label**: 7, 9, 25, selling, driving

**Electrolytes**  
- **Na** 15.4 mmol/100-ml bottle

## Levofloxacín

**Indications**  
see under Dose

**Cautions**  
see notes above; predisposition to QT interval prolongation (including cardiac disease, congenital long QT syndrome, electrolyte disturbances, concomitant use with other drugs known to prolong QT interval); interactions: Appendix 1 (quinolones)

Driving  
May impair performance of skilled tasks (e.g. driving)

**Side-effects**  
see notes above; also flatulence, constipation; rarely tachycardia; very rarely pneumonitis, peripheral neuropathy, and hypoglycaemia; also reported, rhabdomyolysis and potentially life-threatening hepatic failure; local reactions and transient hypotension reported with infusion

**Dose**  
- **By mouth**, acute sinusitis, 500 mg daily for 10–14 days
- Exacerbation of chronic bronchitis, 250–500 mg daily for 7–10 days
- Community-acquired pneumonia, 500 mg once or twice daily for 7–14 days
- Urinary-tract infections, 250 mg daily for 7–10 days  
(for 3 days in uncomplicated infection)
- Chronic prostatitis, 500 mg once daily for 28 days
- Skin and soft tissue infections, 250 mg daily or 500 mg once or twice daily for 7–14 days
- **By intravenous infusion** (over at least 60 minutes for 500 mg), community-acquired pneumonia, 500 mg once or twice daily
- Complicated urinary-tract infections, 250 mg daily, increased in severe infections
- Skin and soft tissue infections, 500 mg twice daily

**Tavanic** *(Hoechst Marion Roussel)*  
- **Tablets**, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving

**Intravenous infusion**, levofloxacin 5 mg/mL, net price 100-ml bottle = £26.40

**Label**: 7, 9, 25, selling, driving

**Electrolytes**  
- **Na** 15.4 mmol/100-ml bottle

### Intravenous infusion
- **Levofloxacin**  
  - **Tablets**, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving
  - **Intravenous infusion**, levofloxacin 5 mg/mL, net price 100-ml bottle = £26.40
  
**Label**: 7, 9, 25, selling, driving

**Electrolytes**  
- **Na** 15.4 mmol/100-ml bottle

### Intravenous infusion
- **Levofloxacin**  
  - **Tablets**, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving
  - **Intravenous infusion**, levofloxacin 5 mg/mL, net price 100-ml bottle = £26.40
  
**Label**: 7, 9, 25, selling, driving

**Electrolytes**  
- **Na** 15.4 mmol/100-ml bottle

### Intravenous infusion
- **Levofloxacin**  
  - **Tablets**, yellow-red, f/c, scored, levofloxacin 250 mg, net price 5-tab pack = £7.23, 10-tab pack = £14.45; 500 mg, 5-tab pack = £12.93, 10-tab pack = £25.85. Label: 6, 9, 25, counselling, driving
  - **Intravenous infusion**, levofloxacin 5 mg/mL, net price 100-ml bottle = £26.40
  
**Label**: 7, 9, 25, selling, driving

**Electrolytes**  
- **Na** 15.4 mmol/100-ml bottle

### Intravenous infusion
**MOXIFLOXACIN**

**Indications** sinusitis, community-acquired pneumonia, or exacerbations of chronic bronchitis which have failed to respond to other antibacterials or for patients who cannot be treated with other antibacterials

**Cautions** see notes above; conditions pre-disposing to arrhythmias, including myocardial ischaemia; **interactions:** Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Contra-indications** see notes above; severe hepatic impairment; history of QT-interval prolongation, bradycardia, history of symptomatic arrhythmias, heart failure with reduced left ventricular ejection fraction, electrolyte disturbances, concomitant use with other drugs known to prolong QT-interval

**Side-effects** see notes above; also gastritis, flatulence, constipation, arrhythmias, palpitation, anemia, hypoglycaemia, altered mental state, hallucinations, hypotension, syncope, dysphagia, abnormal dreams, incoordination, amnesia, hyperglycaemia, hyperuricaemia, and stomatitis; very rarely potentially life-threatening hepatic failure

**Dose**

- 400 mg once daily for 10 days in community-acquired pneumonia, for 5–10 days in exacerbation of chronic bronchitis, for 7 days in sinusitis

**Avelox**® (Bayer)  ▼ (R)

**Tablets**, red, f/c, moxifloxacin (as hydrochloride)

400 mg, net price 5-tab pack = £11.95. Label: 6, 9, counselling, driving

**NALIDIXIC ACID**

**Indications** urinary-tract infections

**Cautions** see notes above; avoid in acute porphyria (section 9.8.2); liver disease; false positive urinary glucose (if tested for reducing substances); monitor blood counts, renal and liver function if treatment exceeds 2 weeks; **interactions:** Appendix 1 (quinolones)

**Side-effects** see notes above; also reported toxic psychosis, increased intracranial pressure, cranial nerve palsy, metabolic acidosis

**Dose**

- 900 mg every 6 hours for 7 days, reduced in chronic infections to 600 mg every 6 hours; **CHILD** over 3 months max. 50 mg/kg daily in divided doses; reduced in prolonged therapy to 30 mg/kg daily

**Uriben**® (Rosemont) ▼ (R)

**Suspension**, pink, nalidixic acid 300 mg/5 mL, net price 150 mL (raspberry- and strawberry-flavoured) = £11.42. Label: 9, 11

**Excipients** include sucrose 450 mg/5mL

**NORFLOXACIN**

**Indications** see under Dose

**Cautions** see notes above; interactions: Appendix 1 (quinolones)

**Driving** May impair performance of skilled tasks (e.g. driving)

**Side-effects** see notes above; also tinnitus, epiphora; rarely pancreatitis; very rarely arrhythmias; also reported, polyneuropathy and exfoliative dermatitis

**Dose**

- ‘Lower’ urinary-tract infections, 400 mg twice daily for 7–10 days (for 3 days in uncomplicated infections)
- Chronic relapsing ‘lower’ urinary-tract infections, 400 mg twice daily for up to 12 weeks; may be reduced to 400 mg once daily if adequate suppression within first 4 weeks
- Chronic prostatitis, 400 mg twice daily for 28 days

**Norfloxacin** (Non-proprietary) ▼ (R)

**Tablets**, norfloxacin 400 mg. net price 6-tab pack = £2.29, 14-tab pack = £3.07. Label: 7, 9, 23, counselling, driving

**Utinor**® (MSD) ▼ (R)

**Tablets**, scored, norfloxacin 400 mg. Net price 7-tab pack = £2.56, 14-tab pack = £5.11. Label: 7, 9, 23, counselling, driving

**OFLOXACIN**

**Indications** see under Dose

**Cautions** see notes above; hepatic impairment (Appendix 2); history of psychiatric illness; **interactions:** Appendix 1 (quinolones)

**Driving** May affect performance of skilled tasks (e.g. driving); effects enhanced by alcohol

**Side-effects** see notes above; also tachycardia; rarely abnormal dreams, unsteady gait, neuropathy, and extrapyramidal symptoms; very rarely changes in blood sugar; isolated cases of pneumonitis and rhabdomyolysis; on intravenous infusion, hypotension and local reactions (including thrombophlebitis)

**Dose**

- **By mouth**, urinary-tract infections, 200–400 mg daily preferably in the morning, increased if necessary in upper urinary-tract infections to 400 mg twice daily
- Chronic prostatitis, 200 mg twice daily for 28 days
- Lower respiratory-tract infections, 400 mg daily preferably in the morning, increased if necessary to 400 mg twice daily
- Skin and soft-tissue infections, 400 mg twice daily
  - Uncomplicated gonorrhoea, 400 mg as a single dose
  - Uncomplicated genital chlamydial infection, non-gonococcal urethritis, 400 mg daily in single or divided doses for 7 days
  - Pelvic inflammatory disease (see also section 5.1, table 1), 400 mg twice daily for 14 days
- **By intravenous infusion** (over at least 30 minutes for each 200 mg), complicated urinary-tract infection, 200 mg daily
- Lower respiratory-tract infection, 200 mg twice daily
- Septicaemia, 200 mg twice daily
- Skin and soft-tissue infections, 400 mg twice daily
- Severe or complicated infections, dose may be increased to 400 mg twice daily

**Ofloxacin** (Non-proprietary) ▼ (R)

**Tablets**, ofloxacin 200 mg, net price 10-tab pack = £5.56; 400 mg, 5-tab pack = £2.56, 10-tab pack = £5.42. Label: 6, 9, 11.
5.1.13 Urinary-tract infections

Urinary-tract infection is more common in women than in men; when it occurs in men there is frequently an underlying abnormality of the renal tract. Recurrent episodes of infection are an indication for radiological investigation especially in children in whom untreated pyelonephritis may lead to permanent kidney damage.

*Escherichia coli* is the most common cause of urinary-tract infection; *Staphylococcus saprophyticus* is also common in sexually active young women. Less common causes include Proteus and Klebsiella spp. *Pseudomonas aeruginosa* infections usually occur in the hospital setting and may be associated with functional or anatomical abnormalities of the renal tract. *Staphylococcus epidermidis* and *Enterococcus faecalis* infection may complicate catheterisation or instrumentation.

Uncomplicated lower urinary-tract infections often respond to trimethoprim, nitrofurantoin, amoxicillin, or nalidixic acid given for 7 days (3 days may be adequate for infections in women); those caused by fully sensitive organisms should be treated initially with an antibacterial which penetrates prostatic tissue such as trimethoprim, or some quinolones. Where infection is localised and associated with an indwelling catheter a bladder instillation is often effective (section 7.4.4).

Urinary-tract infection in pregnancy may be asymptomatic and requires prompt treatment to prevent progression to acute pyelonephritis. Penicillins and cephalosporins are suitable for treating urinary-tract infection during pregnancy. Nitrofurantoin may also be used but it should be avoided at term. Sulphonamides, quinolones, and tetracyclines should be avoided during pregnancy; trimethoprim should also preferably be avoided particularly in the first trimester.

In renal failure antibacterials normally excreted by the kidney accumulate with resultant toxicity unless the dose is reduced. This applies especially to the aminoglycosides which should be used with great caution; tetracyclines, methenamine, and nitrofurantoin should be avoided altogether.

Children

Urinary-tract infections in children require prompt antibacterial treatment to minimise the risk of renal scarring. Uncomplicated ‘lower’ urinary-tract infections in children over 3 months of age can be treated with trimethoprim, nitrofurantoin, a first generation cephalosporin (e.g. cefalexin), or amoxicillin for 3 days; children should be reassessed if they continue to be unwell 24–48 hours after the initial assessment. Amoxicillin should only be used if the organism causing the infection is sensitive to it.

Acute pyelonephritis in children over 3 months of age can be treated with a first generation cephalosporin or co-amoxiclav for 7–10 days. If the patient is severely ill, then the infection is best treated initially by injection of a broad-spectrum antibacterial such as cefotaxime or co-amoxiclav; gentamicin is an alternative.

*Children under 3 months of age* should be transferred to hospital and treated initially with intravenous antibacterial drugs such as ampicillin with gentamicin, or cefotaxime alone, until the infection responds; full doses of oral antibacterials are then given for a further period.

Recurrent episodes of infection are an indication for imaging tests. *Antibacterial prophylaxis* with low doses of trimethoprim or nitrofurantoin may be considered for children with recurrent infection, significant urinary-tract anomalies, or significant kidney damage.

---

**NITROFURANTOIN**

**Indications**

urinary-tract infections

**Cautions**

anaemia; diabetes mellitus; electrolyte imbalance; vitamin B and folate deficiency; pulmonary disease; hepatic impairment; monitor lung and liver function on long-term therapy, especially in the elderly (discontinue if deterioration in lung function); susceptibility to peripheral neuropathy; false positive urinary glucose (if tested for reducing substances); urine may be coloured yellow or brown; **interactions**: Appendix 1 (nitrofurantoin)

**Contra-indications**

renal impairment (Appendix 3); infants less than 3 months old, G6PD deficiency (including pregnancy at term, and breast-feeding of affected infants, see section 9.1.5 and Appendix 4 and Appendix 5), acute porphyria (section 9.8.2)

**Side-effects**

anorexia, nausea, vomiting, and diarrhoea; acute and chronic pulmonary reactions (pulmonary fibrosis reported; possible association with lupus erythematosus-like syndrome); peripheral
neuropathy; also reported, hypersensitivity reactions (including angioedema, anaphylaxis, sialadenitis, urticaria, rash and pruritus); rarely, cholestatic jaundice, hepatitis, exfoliative dermatitis, erythema multiforme, pancreatitis, arthralgia, blood disorders (including agranulocytosis, thrombocytopenia, and aplastic anaemia), benign intracranial hypertension, and transient alopecia.

**Dose**

- Acute uncomplicated infection, 50 mg every 6 hours with food for 7 days (3 days usually adequate in women); **CHILD** over 3 months, 3 mg/kg daily in 4 divided doses.
- Severe chronic recurrent infection, 100 mg every 6 hours with food for 7 days (dose reduced or discontinued if severe nausea).
- Prophylaxis (but see Cautions), 50–100 mg at night; **CHILD** over 3 months, 1 mg/kg at night.

**Nitrofurantoin** *(Non-proprietary)*

- **Tablets**, nitrofurantoin 50 mg, net price 28-tab pack = £1.84; 100 mg, 28-tab pack = £4.32. Label: 9, 14, 21
- **Oral suspension**, nitrofurantoin 25 mg/5 mL, net price 300 mL = £65.00. Label: 9, 14, 21

**Furadantin®** *(Goldshield)*

- **Tablets**, all yellow, scored, nitrofurantoin 50 mg, net price 20 = £1.96; 100 mg, 20 = £3.62. Label: 9, 14, 21

**Macrobid®** *(Goldshield)*

- **Capsules**, m/r, blue/yellow, nitrofurantoin 100 mg (as nitrofurantoin macrocystals and nitrofurantoin monohydrate). Net price 14-cap pack = £4.89. Label: 9, 14, 21, 25
- **Dose** uncomplicated urinary-tract infection, 1 capsule twice daily with food
- Genito-urinary surgical prophylaxis, 1 capsule twice daily on day of procedure and for 3 days after.

**Macrobidin®** *(Goldshield)*

- **Capsules**, nitrofurantoin 50 mg (yellow/white), net price 30-cap pack = £3.05; 100 mg (yellow/white), 20 = £3.84. Label: 9, 14, 21

**METHENAMINE HIPPURATE (Hexamine hippurate)**

**Indications** prophylaxis and long-term treatment of chronic or recurrent lower urinary-tract infections

**Cautions** pregnancy; avoid concurrent administration with sulphonamides (risk of crystalluria) or urinary alkalinising agents; **interactions**: Appendix 1 (methenamine)

**Contra-indications** hepatic impairment, renal impairment (avoid if creatinine clearance less than 10 mL/minute; Appendix 3), severe dehydration, gout, metabolic acidosis

**Side-effects** gastrointestinal disturbances, bladder irritation, rash

**Dose**

- 1 g every 12 hours (may be increased in patients with catheters to 1 g every 8 hours); **CHILD** 6–12 years 500 mg every 12 hours

**Hiprex®** *(SM)*

- **Tablets**, scored, methenamine hippurate 1 g. Net price 60-tab pack = £6.58. Label: 9

---

### 5.2 Antifungal drugs

#### Treatment of fungal infections

The systemic treatment of common fungal infections is outlined below; specialist treatment is required in most forms of systemic or disseminated fungal infections. For local treatment of fungal infections, see section 7.2.2 (genital), section 7.4.4 (bladder), section 11.3.2 (eye), section 12.1.1 (ear), section 12.3.2 (opharynx), and section 13.10.2 (skin).

**Aspergillosis** Aspergillosis most commonly affects the respiratory tract but in severely immunocompromised patients, invasive forms can affect the sinuses, heart, brain, and skin. **Amphotericin** (liposomal formulation preferred if toxicity or renal impairment are concerns) or **voriconazole** can be used for the treatment of aspergillosis. **Caspofungin** or **itraconazole** are alternatives in patients who are refractory to, or intolerant of amphotericin. Itraconazole is also used as an adjunct for the treatment of allergic bronchopulmonary aspergillosis [unlicensed indication]. The Scottish Medicines Consortium (March 2003) does not recommend the use of caspofungin because of a lack of robust data on efficacy and safety in the treatment of invasive aspergillosis.

**Candidiasis** Many superficial candidal infections including infections of the skin (section 13.10.2) are treated locally; widespread or intractable infection requires systemic antifungal treatment. Vaginal candidiasis (section 7.2.2) may be treated with locally acting antifungals or with fluconazole given by mouth; for resistant organisms, itraconazole can be given by mouth.

**Oropharyngeal candidiasis** generally responds to topical therapy (section 12.3.2); fluconazole is given by mouth for unresponsive infections; it is effective and is reliably absorbed. Itraconazole may be used for fluconazole-resistant infections. Topical therapy may not be adequate in immunocompromised patients and an oral triazole antifungal is preferred.

For **deep and disseminated candidiasis**, **amphotericin** can be given by intravenous infusion. **Fluconazole** is an alternative for **Candida albicans** infection in clinically stable patients who have not received an azole antifungal recently. **Caspofungin** or **voriconazole** can be used for infections caused by fluconazole-resistant **Candida** spp. that have not responded to amphotericin, or in patients intolerant of amphotericin. In refractory cases, **flucytosine** can be used with intravenous amphotericin.

**Cryptococcosis** Cryptococcosis is uncommon but infection in the immunocompromised, especially in AIDS patients, can be life-threatening; cryptococcal meningitis is the most common form of fungal meningitis. The treatment of choice in cryptococcal meningitis is **amphotericin** by intravenous infusion and **flucytosine** by intravenous infusion for 2 weeks, followed by **fluconazole** by mouth for 8 weeks or until cultures are negative. In cryptococcosis, **fluconazole** is sometimes given alone as an alternative in AIDS patients with mild, localised infections or in those who cannot tolerate...
amphotericin. Following successful treatment, fluconazole can be used for prophylaxis against relapse until immunity recovers.

**Histoplasmosis** Histoplasmosis is rare in temperate climates; it can be life-threatening, particularly in HIV-infected persons. **Itraconazole** can be used for the treatment of immunocompetent patients with indolent non-meningeal infection including chronic pulmonary histoplasmosis. **Amphotericin** by intravenous infusion is preferred in patients with fulminant or severe infections. Following successful treatment, itraconazole can be used for prophylaxis against relapse.

**Skin and nail infections** Mild localised fungal infections of the skin (including tinea corporis, tinea cruris, and tinea pedis) respond to topical therapy (section 13.10.2). Systemic therapy is appropriate if topical therapy fails, if many areas are affected, or if the site of infection is difficult to treat such as in infections of the nails (onychomycosis) and of the scalp (tinea capitis). Oral imidazole or triazole antifungals (particularly itraconazole) and **terbinafine** are used more frequently than griseofulvin because they have a broader spectrum of activity and require a shorter duration of treatment.

*Tinea capitis* is treated systemically; additional topical application of an antifungal (section 13.10.2) may reduce transmission. **Griseofulvin** is used for tinea capitis in adults and children; it is effective against infections caused by *T. tonsurans* and Microsporum spp. **Terbinafine** is used for tinea capitis caused by *T. tonsurans* [unlicensed indication]. The role of terbinafine in the management of Microsporum infections is uncertain.

**Pityriasis versicolor** (section 13.10.2) may be treated with **itraconazole** by mouth if topical therapy is ineffective; **fluconazole** by mouth is an alternative. Oral **terbinafine** is not effective for pityriasis versicolor.

Antifungal treatment may not be necessary in asymptomatic patients with tinea infection of the nails. If treatment is necessary, a systemic antifungal is more effective than topical therapy. **Terbinafine** and **itraconazole** have largely replaced griseofulvin for the systemic treatment of onychomycosis, particularly of the toenail; terbinafine is considered to be the drug of choice. Itraconazole can be administered as intermittent ‘pulse’ therapy. For the role of topical antifungals in the treatment of onychomycosis, see section 13.10.2.

**Immunocompromised patients** Immunocompromised patients are at particular risk of fungal infections and may receive antifungal drugs prophylactically; oral imidazole or triazole antifungals are the drugs of choice for prophylaxis. **Fluconazole** is more reliably absorbed than itraconazole and ketoconazole and is considered less toxic than ketoconazole for long-term use. Amphotericin by intravenous infusion is used for the empirical treatment of serious fungal infections. Fluconazole is used for treating *Candida albicans* infection. Caspofungin is licensed for the empirical treatment of systemic fungal infections (such as those involving *Candida* spp. or *Aspergillus* spp.) in patients with neutropenia.

### Drugs used in fungal infections

**Polyene antifungals** The polyene antifungals include amphotericin and nystatin; neither drug is absorbed when given by mouth. They are used for oral, oropharyngeal, and perioral infections by local application in the mouth (section 12.3.2).

**Amphotericin** by intravenous infusion is used for the treatment of systemic fungal infections and is active against most fungi and yeasts. It is highly protein bound and penetrates poorly into body fluids and tissues. When given parenterally amphotericin is toxic and side-effects are common. Lipid formulations of amphotericin (*Abelcet*, *Ambisome*, and *Amphocin*) are significantly less toxic and are recommended when the conventional formulation of amphotericin is contraindicated because of toxicity, especially nephrotoxicity or when response to conventional amphotericin is inadequate; lipid formulations are more expensive.

**Nystatin** is used principally for *Candida albicans* infections of the skin and mucous membranes, including oesophageal and intestinal candidiasis.

**Imidazole antifungals** The imidazole antifungals include clotrimazole, econazole, ketoconazole, sulconazole, and tioconazole. They are used for the local treatment of vaginal candidiasis (section 7.2.2) and for dermatophyte infections (section 13.10.2).

**Ketoconazole** is better absorbed by mouth than other imidazoles. It has been associated with fatal hepatotoxicity; the CSM has advised that prescribers should weigh the potential benefits of ketoconazole treatment against the risk of liver damage and should carefully monitor patients both clinically and biochemically. It should not be used by mouth for superficial fungal infections.

**Miconazole** (section 12.3.2) can be used locally for oral infections; it is also effective in intestinal infections. Systemic absorption may follow use of miconazole oral gel and may result in significant drug interactions.

**Triazole antifungals** Fluconazole is very well absorbed after oral administration. It also achieves good penetration into the cerebrospinal fluid to treat fungal meningitis.

**Itraconazole** is active against a wide range of dermatophytes. Itraconazole capsules require an acid environment in the stomach for optimal absorption. Itraconazole has been associated with liver damage and should be avoided or used with caution in patients with liver disease; fluconazole is less frequently associated with hepatotoxicity.

**Posaconazole** is licensed for the treatment of invasive fungal infections unresponsive to conventional treatment.

**Voriconazole** is a broad-spectrum antifungal drug which is licensed for use in life-threatening infections.

**Echinocandin antifungals** Caspofungin is active against *Aspergillus* spp. and *Candida* spp. *Anidulafungin* and *micafungin* are licensed for the treatment of invasive candidiasis.

**Other antifungals** Fluconazole is used with amphotericin in a synergistic combination. Bone marrow depression can occur which limits its use, particularly
in AIDS patients; weekly blood counts are necessary during prolonged therapy. Resistance to flucytosine can develop during therapy and sensitivity testing is essential before and during treatment.

Griseofulvin is effective for widespread or intractable dermatophyte infections but has been superseded by newer antifungals, particularly for nail infections. It is the drug of choice for trichophyton infections in children. Duration of therapy is dependent on the site of the infection and may extend to a number of months.

Terbinafine is the drug of choice for fungal nail infections and is also used for ringworm infections where oral treatment is considered appropriate.

### AMPHOTERICIN

(Amphotericin B)

**Indications** See under Dose

**Cautions** when given parenterally, toxicity common (close supervision necessary and test dose required; see Anaphylaxis below); renal impairment (Appendix 3); hepatic and renal function tests, blood counts, and plasma electrolyte (including plasma-potassium and magnesium concentration) monitoring required; corticosteroids (avoid except to control reactions); pregnancy (Appendix 4); breast-feeding (Appendix 5); avoid rapid infusion (risk of arrhythmias); interac-
tions: Appendix 1 (amphotericin)

**Anaphylaxis** The CSM has advised that anaphylaxis occurs rarely with any intravenous amphotericin product and a test dose is advisable before the first infusion; the patient should be carefully observed for at least 30 minutes after the test dose. Fungylactic antipyriotics or hydrocortisone should only be used in patients who have previously experienced acute adverse reactions (in whom continued treatment with amphotericin is essential)

**Side-effects** when given parenterally, anorexia, nausea and vomiting, diarrhoea, epigastric pain; febrile reactions, headache, muscle and joint pain; anaemia; disturbances in renal function (including hypokalaemia and hypomagnesaemia) and renal toxicity; also cardiovascular toxicity (including arrhythmias, blood pressure changes), blood disorders, neurological disorders (including hearing loss, diplopia, convulsions, peripheral neuropathy, encephalopathy), abnormal liver function (discon-
tinue treatment), rash, anaphylactoid reactions (see Anaphylaxis, above); pain and thrombophlebitis at injection site

**Dose**
- Oral and perioral infections, see section 12.3.2
- By intravenous infusion, see preparations

**Note** Different preparations of intravenous amphotericin vary in their pharmacodynamics, pharmacokinetics, dosage, and administration; these preparations should not be considered interchangeable. To avoid confusion, prescribers should specify the brand to be dispensed.

**Fungizone** (Squibb) [FWH]

**Intravenous infusion**, powder for reconstitution, amphotericin (as sodium deoxycholate complex), net price 50-mg vial = £4.12

**Dose** by intravenous infusion, systemic fungal infections, initial test dose of 1 mg over 20–30 minutes then 250 micrograms/kg daily, gradually increased over 2–4 days, if tolerated, to 1 mg/kg daily; max. (severe infection) 1.5 mg/kg daily or on alternate days

**Note** Prolonged treatment usually necessary; if interrupted for longer than 7 days recommence at 250 micrograms/kg daily and increase gradually

### Lipid formulations

**Abelcet** (Cephalon) [FWH]

**Intravenous infusion**, amphotericin 5 mg/mL as lipid complex with 1,2-dimyristoylphosphatidylcholine and 1,2-dimyristoylphosphatidylglycerol, net price 20-mL vial = £82.13 (hosp. only)

**Dose** by intravenous infusion, severe invasive candidiasis; severe systemic fungal infections in patients not responding to conventional amphotericin or to other antifungal drugs or where toxicity or renal impairment precludes conventional amphot-
ericin, including invasive aspergillosis, cryptococcal meningitis and disseminated cryptococcosis in HIV patients, ADULT and CHILD, initial test dose 1 mg over 15 minutes then 5 mg/kg once daily for at least 14 days

**AmBisome** (Gilead) [FWH]

**Intravenous infusion**, powder for reconstitution, amphotericin 50 mg encapsulated in liposomes, net price 50-mg vial = £96.69

**Electrolytes** Na < 0.5 mmol/vial

**Excipients** include sucrose 900 mg/vial

**Dose** by intravenous infusion, severe systemic or deep mycoses where toxicity (particularly nephrotoxicity) precludes use of conventional amphotericin, ADULT and CHILD initial test dose 1 mg over 10 minutes then 1 mg/kg once daily increased gradually if necessary to 3 mg/kg once daily; max. 5 mg/kg once daily [unlicensed dose]

Suspected or proven infection in febrile neutropenic patients unresponsive to broad-spectrum antibacterials, ADULT and CHILD, initial test dose 1 mg over 10 minutes then 3 mg/kg once daily until afebrile for 3 consecutive days; max. period of treatment 42 days; max. 5 mg/kg once daily [unlicensed dose]

Vesicular leishmaniasis, see section 5.4.5 and product literature

**Amphocil** (Beacon) [FWH]

**Intravenous infusion**, powder for reconstitution, amphotericin as a complex with sodium cholesteryl sulphate, net price 50-mg vial = £104.10, 100-mg vial = £190.05

**Electrolytes** Na < 0.5 mmol/vial

**Dose** by intravenous infusion, severe systemic or deep mycoses where toxicity or renal failure preclude use of conventional amphotericin, ADULT and CHILD initial test dose 2 mg over 10 minutes then 1 mg/kg once daily increased gradually if necessary to 3–4 mg/kg once daily; max. 6 mg/kg daily

### ANIDULAFUNGIN

**Indications** invasive candidiasis

**Cautions** pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** diarrhoea, nausea, vomiting; flushing; convulsion, headache; coagulopathy, hypokalaemia; raised serum creatinine; rash, pruritus; less commonly abdominal pain, cholestasis, hypertension, hyperglycaemia, urticaria, and injection-site pain; also reported, hepatitis

**Dose**
- By intravenous infusion, ADULT over 18 years, 200 mg on first day then 100 mg once daily

**Ecalta** (Pfizer) [FWH]

**Intravenous infusion**, net-price 100-mg vial = £299.99 (with solvent)

**Excipients** include alcohol 24%

### CASPOFUNGIN

**Indications** invasive aspergillosis either unresponsive to amphotericin or itraconazole or in patients intoler-
ant of amphotericin or itraconazole; invasive candidiasis (see notes above); empirical treatment of systemic fungal infections in patients with neutropaenia
Infections

**Invasive candidal infections** (including candidaemia and disseminated candidiasis) and cryptococcal meningitis (see Cryptococcosis, p. 327), adjunct to amphotericin B therapy. **Cautions** renal impairment (Appendix 3); pregnancy (Appendix 4). **Interactions:** amphotericin B, azole antifungals, itraconazole, fluconazole; coadministration may increase risk of myelotoxicity. **Signs of toxicity:** profound myelosuppression, hepatoxicity. **Preventative measures:** consider prophylactic use of one of the approved antifungal agents in severely immunocompromised patients; for 14 days in long-standing infections (see Cryptococcosis, p. 327), adjunct to amphotericin B therapy.

---

**Fluconazole**

**Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 327), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections.

**Cautions** renal impairment (Appendix 3); elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in renal impairment or blood disorders); pregnancy (Appendix 4), breastfeeding (Appendix 5); **interactions:** Appendix 1 (antifungals, antiretrovirals); coadministration may increase risk of myelotoxicity. **Signs of toxicity:** profound myelosuppression, hepatoxicity. **Preventative measures:** consider prophylactic use of one of the approved antifungal agents in severely immunocompromised patients; for 14 days in long-standing infections (see Cryptococcosis, p. 327), adjunct to amphotericin B therapy.

**Side-effects** nausea, vomiting, diarrhoea, flatulence, headache, rash (discontinue treatment or monitor closely if rash is severe or systemic); less frequently dyspepsia, vomiting, taste disturbance, hepatic disorders, hypersensitivity reactions, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome (severe cutaneous reactions more likely in patients with a history of cutaneous reactions to drugs), toxic epidermal necrolysis, Stevens-Johnson syndrome, rash, pruritus, sweating; injection-site reactions; local injection-site reactions, anaphylaxis, dizziness, seizures, alopecia, pruritus, toxic epidermal necrolysis, Stevens-Johnson syndrome, rash, pruritus, sweating.

**Dose**

- **By intravenous infusion**, **ADULT** over 18 years, 70 mg on first day then 50 mg once daily (70 mg once daily if body-weight over 80 kg).
- **Capsules**, fluconazole 50 mg (blue/white), net price 7-cap pack = £98p; 150 mg, single-capule pack = £91p; 200 mg, 7-cap pack = £2.02. Label: 9, (50 and 200 mg)
- **Oral suspension** fluconazole 50 mg, net price 7-cap pack = £98p; 150 mg, single-capule pack = £91p; 200 mg, 7-cap pack = £2.02. Label: 9, (50 and 200 mg)
- **Intravenous infusion**, fluconazole 2 mg/mL, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28
- **Diflucan**: fluconazole 50 mg (blue/white), net price 7-cap pack = £66.42. Label: 9, (50 and 200 mg)
- **Oral suspension** orange-flavoured, fluconazole for reconstitution with water, 50 mg/5 mL, net price 35 mL = £16.61; 200 mg/5 mL, 35 mL = £66.42. Label: 9, (50 and 200 mg)
- **Intravenous infusion**, fluconazole 2 mg/mL, net price 25-mL bottle = £7.32; 100-mL bottle = £29.28
- **Electrolytes** Na 15 mmol/100-mL bottle

---

**Flucytosine**

**Indications** systemic yeast and fungal infections; adjunct to amphotericin in cryptococcal meningitis (see Cryptococcosis, p. 327), adjunct to amphotericin in severe systemic candidiasis and in other severe or long-standing infections.

**Cautions** renal impairment (Appendix 3); elderly; blood disorders; liver- and kidney-function tests and blood counts required (weekly in renal impairment or blood disorders); pregnancy (Appendix 4), breastfeeding (Appendix 5); **interactions:** Appendix 1 (fluconazole, amphotericin B); consider coadministration of amphotericin B and flucytosine in severely immunocompromised patients; for 14 days in long-standing infections (see Cryptococcosis, p. 327), adjunct to amphotericin B therapy.

**Side-effects** nausea, vomiting, diarrhoea, rashes; less frequently cardiotoxicity, confusion, hallucinations, convulsions, headache, sedation, vertigo, alterations in liver function tests (hepatitis and hepatic necrosis reported), and toxic epidermal necrolysis; blood disorders; pregnancy (Appendix 4), breastfeeding (Appendix 5); **interactions:** Appendix 1 (antifungals, antiretrovirals); coadministration may increase risk of myelotoxicity. **Signs of toxicity:** profound myelosuppression, hepatoxicity. **Preventative measures:** consider prophylactic use of one of the approved antifungal agents in severely immunocompromised patients; for 14 days in long-standing infections (see Cryptococcosis, p. 327), adjunct to amphotericin B therapy.

**Dose**

- **By intravenous infusion**, **CHILD** according to response (at least 8 weeks for cryptococcal meningitis); **CHILD** 6–12 mg/kg daily (every 72 hours in **NEONATE** up to 2 weeks old, every 48 hours in **NEONATE** 2–4 weeks old); max. 800 mg daily (unlicensed dose).
- **Prevention of relapse of cryptococcal meningitis in AIDS patients after completion of primary therapy, by mouth or by intravenous infusion**, 200 mg daily.
- **Prevention of fungal infections in immunocompromised patients, by mouth or by intravenous infusion**, 50–400 mg daily adjusted according to risk; 400 mg daily if high risk of systemic infections e.g. following bone-marrow transplantation; commence treatment before anticipated onset of neutropenia and continue for 7 days after neutrophil count in desirable range; **CHILD** according to extent and duration of neutropenia, 3–12 mg/kg daily (every 72 hours in **NEONATE** up to 2 weeks old, every 48 hours in **NEONATE** 2–4 weeks old); max. 400 mg daily.
orders including thrombocytopenia, leucopenia, and aplastic anaemia reported

**Dose**
- **By intravenous infusion** over 20–40 minutes, **ADULT** and **CHILD**, 200 mg/kg daily in 4 divided doses usually for not more than 7 days; extremely sensitive organisms, 100–150 mg/kg daily may be sufficient

Cryptococcal meningitis (adjunct to amphotericin, see Cryptococcosis, p. 327) 100 mg/kg daily in 4 divided doses for 2 weeks [unlicensed duration]

**Note** For plasma concentration monitoring, blood should be taken shortly before starting the next infusion; plasma concentration for optimum response 25–50 mg/litre (200–400 micromol/litre)—should not be allowed to exceed 80 mg/litre (620 micromol/litre)

**Ancotil®** (Valeant) [PN]
- **Intravenous infusion**, flucytosine 10 mg/mL, net price 250-mL infusion bottle = £30.33 (hosp. only)
- **Electrolytes** Na 34.5 mmol/250-mL bottle

**Note** Flucytosine tablets [unlicensed] may be available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

---

**GRISEOFULVIN**

**Indications** dermatophyte infections of the skin, scalp, hair and nails with topical therapy has failed or is inappropriate

**Cautions** interactions: Appendix 1 (griseofulvin)
- **Driving** May impair performance of skilled tasks (e.g. driving); effects of alcohol enhanced

**Contra-indications** severe liver disease; systemic lupus erythematosus (risk of exacerbation); acute porphyria (section 9.8.2); pregnancy (avoid pregnancy during and for 1 month after treatment (Appendix 4); men should not father children within 6 months of treatment); breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, diarrhoea; headache; less frequently hepatotoxicity, dizziness, confusion, fatigue, sleep disturbances, impaired co-ordination, peripheral neuropathy, leucopenia, systemic lupus erythematosus, rash (including rarely erythema multiforme, toxic epidermal necrolysis), and photosensitivity

**Dose**
- Dermatophyte infections, 500 mg once daily or in divided doses; in severe infection dose may be doubled, reducing when response occurs; **CHILD** under 50 kg, 10 mg/kg once daily or in divided doses
- **Tinea capitis caused by Trichophyton tonsurans**, 1 g once daily or in divided doses; **CHILD** under 50 kg, 15–20 mg/kg once daily or in divided doses

**Note** Griseofulvin doses in BNF may differ from those in product literature

**Griseofulvin (Non-proprietary) [PN]**
- **Tablets**, griseofulvin 125 mg, net price 20 = £6.76; 500 mg, 20 = £17.52. Label: 9, 21, counselling, driving

---

**ITRACONAZOLE**

**Indications** see under Dose

**Cautions** absorption reduced in AIDS and neutropenia (monitor plasma-itraconazole concentration and increase dose if necessary); susceptibility to congestive heart failure (see also CSM advice below); renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5); interactions: Appendix 1 (antifungals, triazole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely—discontinue if signs of hepatitis develop. Avoid or use with caution if history of hepatotoxicity with other drugs or in active liver disease (Appendix 2). Monitor liver function if treatment continues for longer than one month, if receiving other hepatotoxic drugs, if history of hepatotoxicity with other drugs, or in hepatic impairment

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain or dark urine develop

---

**Contra-indications** acute porphyria (section 9.8.2)

**Side-effects** very rarely nausea, vomiting, dyspepsia, abdominal pain, diarrhoea, constipation, jaundice, hepatitis (see also Hepatotoxicity above), heart failure (see CSM advice above), pulmonary oedema, headache, dizziness, peripheral neuropathy (discontinue treatment), menstrual disorder, hypokalaemia, rash, pruritus, Stevens-Johnson syndrome, and alopecia; with intravenous injection, very rarely hypertension and hyperglycaemia

**Dose**
- **By mouth**, oropharyngeal candidiasis, 100 mg once daily (200 mg once daily in AIDS or neutropaenia) for 15 days; see also under Sporanox® oral liquid below
- **Vulvovaginal candidiasis**, 200 mg twice daily for 1 day
- **Pityriasis versicolor**, 200 mg once daily for 7 days
- **Tinea corporis and tinea cruris**, either 100 mg once daily for 15 days or 200 mg once daily for 7 days
- **Tinea pedis and tinea manicum**, either 100 mg once daily for 30 days or 200 mg twice daily for 7 days
- **Onychomycosis**, either 200 mg once daily for 3 months or course (‘pulse’) of 200 mg twice daily for 7 days, subsequent courses repeated after 21-day interval; fingernails 2 courses, toenails 3 courses

- **Histoplasmosis**, 200 mg 1–2 times daily
- **Systemic aspergillosis**, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, 200 mg once daily (candidiasis 100–200 mg once daily) increased in invasive or disseminated disease and in cryptococcal meningitis to 200 mg twice daily

- **Maintenance in AIDS patients** to prevent relapse of underlying fungal infection and prophylaxis in neutropaenia when standard therapy inappropriate, 200 mg once daily, increased to 200 mg twice daily if low plasma-itraconazole concentration (see Cautions)
- **Prophylaxis** in patients with haematological malignancy or undergoing bone-marrow transplant, see under Sporanox® oral liquid below

- **By intravenous infusion**, systemic aspergillosis, candidiasis and cryptococcosis including cryptococcal meningitis where other antifungal drugs inappropriate or ineffective, histoplasmosis, 200 mg every 12 hours for 2 days, then 200 mg once daily for max. 12 days

- **CHILD** and **ELDERLY** safety and efficacy not established
5.2 Antifungal drugs

**Sporanox®** (Janssen-Cilag)  
**Capsules**; blue/pink, enclosing coated beads, itraconazole 100 mg, net price 4-cap pack = £3.90; 15-cap pack = £20.96; 28-cap pack (Sporanox®-Pulse) = £27.30; 60-cap pack = £58.49. Label: 5, 9, 21, 25, counselling, hepatotoxicity

**Oral liquid**; sugar-free, cherry-flavoured, itraconazole 10 mg/mL, net price 150 mL (with 10-mL measuring cup) = £48.62. Label: 9, 23, counselling, administration, hepatotoxicity

**Dose** oral or oesophageal candidiasis in HIV-positive or other immunocompromised patients, 20 mL (2 measuring cups) daily in 1–2 divided doses for 1 week (continue for another week if no response)

Flucanazole-resistant oral or oesophageal candidiasis, 10–20 mL (1–2 measuring cups) twice daily for 2 weeks (continue for another 2 weeks if no response; the higher dose should not be used for longer than 2 weeks if no signs of improvement)

Prophylaxis of deep fungal infections (when standard therapy is inappropriate) in patients with haematological malignancy or undergoing bone-marrow transplantation who are expected to become neutropenic, 5 mg/kg daily in 2 divided doses; starting before transplantation or before chemotherapy (taking care to avoid interaction with cytotoxic drugs) and continued until neutrophil count recovers; CHILD and ELDERLY safety and efficacy not established

**Counselling** Do not take with food; swish around mouth and swallow, do not rinse afterwards

**Concentrate for intravenous infusion**; itraconazole 10 mg/mL. For dilution before use. Net price 25-mL amp (with infusion bag and filter) = £66.43

**Excipients** include propylene glycol

**KETOCONAZOLE**

**Indications** see CSM recommendations, p. 328; dermatophytophyes and *Malassezia* folliculitis either resistant to fluconazole, terbinafine, or itraconazole or in patients intolerant of these antifungals; chronic mucocutaneous, cutaneous, and oropharyngeal candidiasis either resistant to fluconazole or itraconazole or in patients intolerant of these antifungals

**Cautions** predisposition to adrenocortical insufficiency; pregnancy (Appendix 4); interactions: Appendix 1 (antifungals, imidazole)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported very rarely; risk of hepatotoxicity greater if given for longer than 10 days. Monitor liver function before treatment, then on weeks 2 and 4 of treatment, then every month. Avoid or use with caution if abnormal liver function tests (avoid in active liver disease) or if history of hepatotoxicity with other drugs. For CSM advice see p. 328

**Counselling** Patients should be told how to recognise signs of liver disorder and advised to seek prompt medical attention if symptoms such as anorexia, nausea, vomiting, fatigue, abdominal pain, jaundice, or dark urine develop

**Contra-indications** acute porphyria (section 9.8.2); hepatic impairment; breast-feeding

**Side-effects** nausea, vomiting, abdominal pain; pruritus; less commonly diarrhoea, headache, dizziness, drowsiness, and rash; also reported fatal liver damage (see Hepatotoxicity above), dyspepsia, raised intracranial pressure, paraesthesia, adrenocortical insufficiency, erectile dysfunction, menstrual disorders, azoospermia (with high doses), gynaecomastia, thrombocytopenia, photophobia, photosensitivity, and alopecia

**Dose**

- 200 mg once daily, increased if response inadequate to 400 mg once daily; continued until symptoms have cleared and cultures negative, but see Cautions (max. duration of treatment 4 weeks for *Malassezia* infection); CHILD body-weight 15–30 kg, 100 mg once daily; body-weight over 30 kg, adult dose

**Nizoral®** (Janssen-Cilag)  
**Tablets**; scored, ketoconazole 200 mg. Net price 30-tab pack = £14.59. Label: 5, 9, 21, counselling, hepatotoxicity

**MICAFUNGIN**

**Indications** see under Dose

**Cautions** monitor renal function; renal impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5);

**Interactions** Appendix 1 (micafungin)

**Hepatotoxicity** Potentially life-threatening hepatotoxicity reported. Monitor liver function—discontinue if significant and persistent abnormalities in liver function tests develop. Use with caution in hepatic impairment (avoid if severe; Appendix 2) or if receiving other hepatotoxic drugs. Risk of hepatic side-effects greater in children under 1 year of age

**Side-effects** nausea, vomiting, diarrhoea, abdominal pain; headache, fever; hypokalaemia, hypomagnesaemia, hypocalcaemia, leucopenia, anaemia; rash, phlebitis; less commonly dyspepsia, constipation, hepatomegaly, hepatitis and cholestasis (see also Hepatotoxicity above), taste disturbances, anorexia, tachycardia, palpitation, bradycardia, blood pressure changes, flushing, dyspnoea, sleep disturbances, anxiety, confusion, dizziness, tremor, pancytopenia, thrombocytopenia, eosinophilia, hyponatraemia, hypophosphataemia, hyperkalaemia, hyperhidrosis, and pruritus; rarely haemolytic anaemia; also reported renal failure (more frequent in children)

**Dose**

- By intravenous infusion, invasive candidiasis, ADULT, CHILD, and NEONATE, body-weight over 40 kg, 100 mg once daily (increased to 200 mg daily if inadequate response) for at least 14 days; body-weight under 40 kg, 2 mg/kg once daily (increased to 4 mg/kg daily if inadequate response) for at least 14 days Oesophageal candidiasis, ADULT and CHILD over 16 years, body-weight over 40 kg, 150 mg once daily; body-weight under 40 kg, 3 mg/kg once daily

Prophylaxis of candidiasis in patients undergoing bone-marrow transplantation or who are expected to become neutropenic for over 10 days, ADULT, CHILD, and NEONATE, body-weight over 40 kg, 50 mg once daily; body-weight under 40 kg, 1 mg/kg once daily; continue for at least 7 days after neutrophil count in desirable range

**Mycamine®** (Astellas)  
**Intravenous infusion**; powder for reconstitution, micafungin (as sodium), net price 50-mg vial = £196.08; 100-mg vial = £341.00

**NYSTATIN**

**Indications** candidiasis; oral infection (section 12.3.2); skin infection (section 13.10.2)

**Side-effects** nausea, vomiting, diarrhoea at high doses; oral irritation and sensitisation; rash (including urticaria) and rarely Stevens-Johnson syndrome reported

**Dose**

- By mouth, intestinal candidiasis 500 000 units every 6 hours, doubled in severe infection; NEONATE 100 000 units 4 times daily; CHILD 1 month–12 years, 100 000 units 4 times daily; immunocompromised children may require higher doses (e.g. 500 000 units 4 times daily)

**Note** Unlicensed for treatment of candidiasis in NEONATE.

Nystatin doses in BNF may differ from those in product literature
Nystan® (Squibb) [PHARMA]

**Tablets**, brown, s/c, nystatin 500 000 units, net price 56-tab pack = £4.37. Label: 9

**Suspension**, yellow, nystatin 100 000 units/mL, net price 30 mL with pipette = £1.91. Label: 9, counselling, use of pipette

POSACONAZOLE

**Indications** invasive aspergillosis either unresponsive to, or in patients intolerant of, amphotericin or itraconazole; fusariosis either unresponsive to, or in patients intolerant of, amphotericin; coccidiodomycosis either unresponsive to, or in patients intolerant of, amphotericin, itraconazole, or fluconazole; see also under Dose

**Cautions** cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs known to cause QT-interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function—consider discontinuing if impairment suspected (Appendix 2); pregnancy (ensure effective contraception during treatment; Appendix 4); **interactions**: Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea, dyspepsia, and flatulence); dizziness, headache, paraesthesia, drowsiness, fatigue, fever, anorexia; blood disorders (including anaemia, neutropenia, and thrombocytopenia), electrolyte disturbances; dry mouth; rash; less commonly angioedema, dizziness, malaise, paraesthesia, rash and urticaria occasionally with arthralgia or myalgia; less commonly thrombocytopenia, electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation; monitor electrolytes (including potassium, magnesium, and calcium) before and during therapy, monitor liver function—consider discontinuing if impairment suspected (Appendix 2); pregnancy (ensure effective contraception during treatment; Appendix 4); **interactions**: Appendix 1 (terbinafine)

**Dose**

- **By mouth**, 250 mg daily usually for 2–6 weeks in tinea pedis, 2–4 weeks in tinea cruris, 4 weeks in tinea corporis, 6 weeks–3 months in nail infections (occasionally longer in toenail infections); **CHILD** (unlicensed) usually for 4 weeks, tinea capitis, over 1 year, body-weight 10–20 kg, 62.5 mg once daily; body-weight 20–40 kg, 125 mg once daily; body-weight over 40 kg, 250 mg once daily

Terbinafine (Non-proprietary) [PHARMA]

**Tablets**, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £2.70, 28-tab pack = £3.43. Label: 9

Lamisil® (Novartis) [PHARMA]

**Tablets**, off-white, scored, terbinafine (as hydrochloride) 250 mg, net price 14-tab pack = £23.16, 28-tab pack = £44.66. Label: 9

VORICONAZOLE

**Indications** invasive aspergillosis; serious infections caused by *Scedosporium* spp., *Fusarium* spp., or invasive fluconazole-resistant *Candida* spp. (including *C. krusei*)

**Cautions** electrolyte disturbances, cardiomyopathy, bradycardia, symptomatic arrhythmias, history of QT interval prolongation, concomitant use with other drugs that prolong QT interval; avoid exposure to sunlight; patients at risk of pancreatitis; monitor liver function before treatment and during treatment; haematological malignancy (increased risk of hepatic reactions); hepatic impairment (Appendix 2); monitor renal function; renal impairment (Appendix 3); pregnancy (ensure effective contraception during treatment—Appendix 4); **interactions**: Appendix 1 (antifungals, triazole)

**Contra-indications** acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances (including nausea, vomiting, abdominal pain, diarrhoea), jaundice; oedema, hypotension, chest pain; respiratory distress syndrome, sinusitis; headache, dizziness, asthenia, anxiety, depression, confusion, agitation,

---

**TERBINAFINE**

**Indications** dermatophyte infections of the nails, ringworm infections (including tinea pedis, cruris, and corporis) where oral therapy appropriate (due to site, severity or extent)

**Cautions** psoriasis (risk of exacerbation); autoimmune disease (risk of lupus-erythematosus-like effect); hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (terbinafine)

---

**BNF 57**

5.2 Antifungal drugs 333
hallucinations, paraesthesia, tremor; influenza-like symptoms; hypoglycaemia; haematuria; blood disorders (including anaemia, thrombocytopenia, leucopenia, pancytopenia), acute renal failure, hypokalaemia; visual disturbances including altered perception, blurred vision, and photophobia; rash, pruritus, photosensitivity, alopecia, cheilitis; injection-site reactions; less commonly cholecystitis, pancreatitis, hepatitis, constipation, arrhythmias (including QT interval prolongation), syncope, raised serum cholesterol, hypersensitivity reactions (including flushing), ataxia, nystagmus, hypoaesthesia, adrenocortical insufficiency, arthritis, blepharitis, optic neuritis, scleritis, glossitis, gingivitis, psoriasis, and Stevens-Johnson syndrome; rarely pseudomembranous colitis, convulsions, sleep disturbances, tinnitus, hearing disturbances, extrapyramidal effects, hypertonia, hypothyroidism, hyperthyroidism, discoid lupus erythematosus, toxic epidermal necrolysis, retinal haemorrhage, optic atrophy, and taste disturbances.

Dose
- By mouth, ADULT and ADOLESCENT over 12 years, body-weight over 40 kg, 400 mg every 12 hours for 2 doses then 200 mg every 12 hours, increased if necessary to 300 mg every 12 hours; body-weight under 40 kg, 200 mg every 12 hours for 2 doses then 100 mg every 12 hours, increased if necessary to 150 mg every 12 hours; CHILD 2–12 years, (oral suspension recommended) 200 mg every 12 hours.
- By intravenous infusion, 6 mg/kg every 12 hours for 2 doses, then 4 mg/kg every 12 hours (reduced to 3 mg/kg every 12 hours if not tolerated) for max. 6 months; CHILD 2–12 years, 7 mg/kg every 12 hours (reduced to 4 mg/kg every 12 hours if not tolerated) for max. 6 months.

Vfend® (Pfizer) Tablets, I/c, voriconazole 50 mg, net price 28-tablet pack = £275.68; 200 mg, 28-tab pack = £1102.74. Label: 9, 11, 23
Oral suspension, voriconazole 200 mg/5 mL when reconstituted with water, net common price 75 mL (orange-flavoured) = £551.37. Label: 9, 11, 23
Intravenous infusion, powder for reconstitution, voriconazole, net price 200-mg vial = £77.14
Excipients include sulphobutyl ether beta cyclodextrin sodium (risk of accumulation in renal impairment)
Electrolytes Na 9.47 mmol/vial

5.3 Antiviral drugs

5.3.1 HIV infection

There is no cure for infection caused by the human immunodeficiency virus (HIV) but a number of drugs slow or halt disease progression. Drugs for HIV infection (antiretrovirals) increase life expectancy considerably but they may be associated with serious side-effects. Treatment should be undertaken only by those experienced in their use.

Principles of treatment
Treatment is aimed at reducing the plasma viral load as much as possible and for as long as possible; it should be started before the immune system is irreversibly damaged. The need for early drug treatment should, however, be balanced against the risk of toxicity. Commitment to treatment and strict adherence over many years are required; the regimen chosen should take into account convenience and patient tolerance. The development of drug resistance is reduced by using a combination of drugs; such combinations should have synergistic or additive activity while ensuring that their toxicity is not additive. It is recommended that viral sensitivity to antiretroviral drugs is established before starting treatment or before switching drugs if the infection is not responding.

Initiation of treatment
The optimum time for initiating antiretroviral treatment depends primarily on the CD4 cell count; the plasma viral load and clinical symptoms may also help. The timing and choice of treatment should also take account of the possible effects of antiretroviral drugs on factors such as the risk of cardiovascular events. Treatment includes a combination of drugs known as ‘highly active antiretroviral therapy’. Treatment is initiated with 2 nucleoside reverse transcriptase inhibitors and a non-nucleoside reverse transcriptase inhibitor; the regimen of choice contain either tenofovir, emtricitabine, and efavirenz or abacavir, lamivudine, and efavirenz. Regimens containing 2 nucleoside reverse transcriptase inhibitors and a boosted protease inhibitor are reserved for patients with resistance to first-line regimens, women wishing to become pregnant, or patients with psychiatric illness. Patients who require treatment for both HIV and chronic hepatitis B should be treated with antivirals active against both diseases (section 5.3.3).

Switching therapy
Deterioration of the condition (including clinical and virological changes) may require a change in therapy. The choice of an alternative regimen depends on factors such as the response to previous treatment, tolerance and the possibility of cross-resistance.

Pregnancy and breast-feeding
Treatment of HIV infection in pregnancy aims to reduce the risk of toxicity to the fetus (although the teratogenic potential of most antiretroviral drugs is unknown), to minimise the viral load and disease progression in the mother, and to prevent transmission of infection to the neonate. All treatment options require careful assessment by a specialist. Zidovudine monotherapy reduces transmission of infection to the neonate. However, combination antiretroviral therapy maximises the chance of preventing transmission and represents optimal therapy for the mother. Combination antiretroviral therapy may be associated with a greater risk of preterm delivery. Breast-feeding by HIV-positive mothers may cause HIV infection in the infant and should be avoided.

The majority of virus infections resolve spontaneously in immunocompetent subjects. A number of specific treatments for viral infections are available, particularly for the immunocompromised. This section includes notes on herpes simplex and varicella-zoster, human immunodeficiency virus, cytomegalovirus, respiratory syncytial virus, viral hepatitis and influenza.
Children HIV disease in children has a different natural progression to adults. Children infected with HIV should be managed within a formal paediatric HIV clinical network by specialists with access to guidelines and information on antiretroviral drugs for children.

Post-exposure prophylaxis Prophylaxis with antiretroviral drugs [unlicensed indication] may be appropriate following exposure to HIV-contaminated material. Immediate expert advice should be sought in such cases; national guidelines on post-exposure prophylaxis for healthcare workers have been developed (by the Chief Medical Officer’s Expert Advisory Group on AIDS, www.dh.gov.uk) and local ones may also be available. Antiretrovirals for prophylaxis are chosen on the basis of efficacy and potential for toxicity. Prompt prophylaxis with antiretroviral drugs [unlicensed indication] is also appropriate following potential sexual exposure to HIV; recommendations have been developed by the British Association for Sexual Health and HIV, www.bashh.org

Drugs for HIV infection Zidovudine, a nucleoside reverse transcriptase inhibitor (or ‘nucleoside analogue’), was the first anti-HIV drug to be introduced. Other nucleoside reverse transcriptase inhibitors include abacavir, didanosine, emtricitabine, lamivudine, stavudine, and tenofovir.

The protease inhibitors include atazanavir, darunavir, fosamprenavir (a pro-drug of amprenavir), indinavir, lopinavir, nelfinavir, ritonavir, saquinavir, and tipranavir. Ritonavir in low doses boosts the activity of atazanavir, darunavir, fosamprenavir, indinavir, lopinavir, saquinavir, and tipranavir increasing the persistence of plasma concentrations of these drugs; at such a low dose, ritonavir has no intrinsic antiviral activity. A combination of lopinavir with low-dose ritonavir is available. The protease inhibitors are metabolised by cytochrome P450 enzyme systems and therefore have a significant potential for drug interactions. Protease inhibitors are associated with lipodystrophy and metabolic effects (see below).

The non-nucleoside reverse transcriptase inhibitors efavirenz, etravirine, and nevirapine are active against the subtype HIV-1 but not HIV-2, a subtype that is rare in the UK. These drugs may interact with a number of drugs metabolised in the liver. Nevirapine is associated with a high incidence of rash (including Stevens-Johnson syndrome) and occasionally fatal hepatitis. Rash is also associated with efavirenz and etravirine but it is usually milder. Psychiatric or CNS disturbances are common with efavirenz. CNS disturbances are often self-limiting and can be reduced by taking the dose at bedtime (especially in the first 2–4 weeks of treatment). Efavirenz treatment has also been associated with an increased plasma cholesterol concentration. Etravirine is used in regimes containing a boosted protease inhibitor for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors.

Enfuvirtide, which inhibits HIV from fusing to the host cell, is licensed for managing infection that has failed to respond to a regimen of other antiretroviral drugs; enfuvirtide should be combined with other potentially active antiretroviral drugs.

Maraviroc is an antagonist of the CCR5 chemokine receptor. It is licensed for patients exclusively infected with CCR5-tropic HIV. The Scottish Medicines Consortium (p. 3) has advised (March 2008) that maraviroc (Celsentri®) is not recommended for use within NHS Scotland.

Raltegravir is an inhibitor of HIV integrase. It is licensed for the treatment of HIV infection resistant to multiple antiretrovirals. The Scottish Medicines Consortium (p. 3) has advised (April 2008) that raltegravir (Isentress®) is accepted for restricted use within NHS Scotland for the treatment of patients with HIV infection resistant to 3 classes of antiretrovirals.

Immune reconstitution syndrome Improvement in immune function as a result of antiretroviral treatment may provoke a marked inflammatory reaction against residual opportunistic organisms.

Lipodystrophy syndrome Metabolic effects associated with antiretroviral treatment include fat redistribution, insulin resistance and dyslipidaemia; collectively these have been termed lipodystrophy syndrome. The usual risk factors for cardiovascular disease should be taken into account before starting antiretroviral therapy and patients should be advised about lifestyle changes to reduce their cardiovascular risk. Plasma lipids and blood glucose should be measured before starting antiretroviral therapy, after 3–6 months of treatment, and then annually.

Fat redistribution (with loss of subcutaneous fat, increased abdominal fat, ‘buffalo hump’ and breast enlargement) is associated with regimens containing protease inhibitors and nucleoside reverse transcriptase inhibitors. Stavudine (especially in combination with didanosine), and to a lesser extent zidovudine, are associated with a higher risk of lipodystrophy and should be used only if alternative regimens are not suitable.

Dyslipidaemia is associated with antiretroviral treatment, particularly with protease inhibitors. Protease inhibitors and nucleoside reverse transcriptase inhibitors are associated with insulin resistance and hyperglycaemia. Of the protease inhibitors, atazanavir and darunavir are less likely to cause dyslipidaemia, while saquinavir and atazanavir are less likely to impair glucose tolerance.

Osteonecrosis Osteonecrosis has been reported in patients with advanced HIV disease or following long-term exposure to combination antiretroviral therapy.

Nucleoside reverse transcriptase inhibitors

Cautions Nucleoside reverse transcriptase inhibitors should be used with caution in patients with chronic hepatitis B or C (greater risk of hepatic side-effects), in hepatic impairment (see also Lactic Acidosis below and Appendix 2), in renal impairment (Appendix 3), and in pregnancy (see also p. 334 and Appendix 4).

Lactic acidosis Life-threatening lactic acidosis associated with hepatomegaly and hepatic steatosis has been reported with nucleoside reverse transcriptase inhibitors. They should be used with caution in patients (particularly obese women) with hepatomegaly, hepatitis (especially hepatitis C treated with interferon alfa...
and ribavirin), liver-enzyme abnormalities and with other risk factors for liver disease and hepatic steatosis (including alcohol abuse). Treatment with the nucleoside reverse transcriptase inhibitor should be discontinued in case of symptomatic hyperlactataemia, lactic acidosis, progressive hepatomegaly or rapid deterioration of liver function. Stavudine, especially with didanosine, is associated with a higher risk of lactic acidosis and should be used only if alternative regimens are not suitable.

### Side-effects

Side-effects of the nucleoside reverse transcriptase inhibitors include gastrointestinal disturbances (such as nausea, vomiting, abdominal pain, flatulence and diarrhoea), anorexia, pancreatitis, liver damage (see also Lactic Acidosis, above), dyspnœa, cough, headache, insomnia, dizziness, fatigue, blood disorders (including anaemia, neutropenia, and thrombocytopenia), myalgia, arthralgia, rash, urticaria, and fever. See notes above for metabolic effects and lipodystrophy (Lipodystrophy Syndrome), and Osteonecrosis.

**Dose**
- **ADULT** over 18 years, 1 tablet twice daily

### DIDANOSINE

**(ddI, DDI)**

| **Indications** | HIV infection in combination with other antiretroviral drugs |
| **Caution** | see notes above; also history of pancreatitis (preferably avoid, otherwise extreme caution, see also below); peripheral neuropathy or hyperuricaemia (see under Side-effects); ophthalmological examination (including visual acuity, colour vision, and dilated fundus examination) recommended annually or if visual changes occur; interactions: Appendix 1 (didanosine) |
| **Pancreatitis** | Suspend treatment if serum lipase raised (even if asymptomatic) or if symptoms of pancreatitis develop; discontinue if pancreatitis confirmed. Whenever possible avoid concomitant treatment with other drugs known to cause pancreatic toxicity (e.g. intravenous pentamidine isethionate); monitor closely if concomitant therapy unavoidable. Since significant elevations of triglycerides cause pancreatitis monitor closely if elevated |

### Contra-indications

**breast-feeding (Appendix 5)**

### Side-effects

**see notes above; also pancreatitis (see also under caution), liver failure, anaphylactic reactions, peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), diabetes mellitus, hypoglycaemia, acute renal failure, rhabdomyolysis, dry eyes, retinal and optic nerve changes, dry mouth, parotid gland enlargement, sialadenitis, alopecia, hyperuricaemia (suspend if raised significantly)**

### **Dose**

- **ADULT** under 60 kg 250 mg daily in 1–2 divided doses, 60 kg and over 400 mg daily in 1–2 divided doses; **CHILD** over 3 months (under 6 years **Videx** tablets only), 240 mg/m daily (180 mg/m daily in combination with zidovudine) in 1–2 divided doses
EMTRICITABINE

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); interactions: Appendix 1 (emtricitabine)

contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also abnormal dreams, pruritus, and hyperpigmentation

Dose

- See preparations below

Emtriva® (Gilead) Tablets, white/blue, emtricitabine 200 mg, net price 30-cap pack = £163.50; 200 mg, 30-cap pack = £81.84; 250 mg, 30-cap pack = £102.30; 400 mg, 30-cap pack = £163.68. Label: 25, counselling, administration, see below

Counselling Capsules to be taken at least 2 hours before or 2 hours after food

LAMIVUDINE (3TC)

Indications see preparations below

Cautions see notes above; interactions: Appendix 1 (lamivudine)

Chronic Hepatitis B Recurrent hepatitis in patients with chronic hepatitis B may occur on discontinuation of lamivudine. When treating chronic hepatitis B with lamivudine, monitor liver function tests every 3 months, and viral and serological markers of hepatitis B every 3–6 months, more frequently in patients with advanced liver disease or following transplantation (monitoring to continue after discontinuation)—consult product literature

contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also peripheral neuropathy, muscle disorders including rhabdomyolysis, nasal symptoms, alopecia

Dose

- See preparations below

Epivir® (GSK) Tablets, f/c, lamivudine 150 mg (scored, white), net price 60-tab pack = £152.14; 300 mg (grey), 30-tab pack = £167.21

oral solution, banana- and strawberry-flavoured, lamivudine 50 mg/5 mL, net price 240-mL pack = £41.41

Excipients include sucrose 1 g/5 mL

Dose HIV infection in combination with other antiretroviral drugs, 150 mg every 12 hours or 300 mg once daily; CHILD 3 months–12 years, 4 mg/kg (max. 150 mg) every 12 hours or body-weight 14–21 kg, 75 mg twice daily; body-weight 21–30 kg, 75 mg in the morning and 150 mg in the evening; body-weight over 30 kg, 150 mg twice daily

Stavudine (d4T)

Indications HIV infection in combination with other antiretroviral drugs

Cautions see notes above; also history of peripheral neuropathy (see under Side-effects); history of pancreatitis or concomitant use with other drugs associated with pancreatitis; interactions: Appendix 1 (stavudine)

contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; also peripheral neuropathy (switch to another antiretroviral if peripheral neuropathy develops), abnormal dreams, cognitive dysfunction, drowsiness, depression, pruritus; less commonly anxiety, gynaecomastia

Dose

- ADULT under 60 kg, 30 mg every 12 hours preferably at least 1 hour before food; 60 kg and over, 40 mg every 12 hours; NEONATE under 2 weeks, 500 micrograms/kg every 12 hours; CHILD over 2 weeks, body-weight under 30 kg, 1 mg/kg every 12 hours; body-weight 30 kg and over, adult dose

With abacavir

See under Abacavir

With zidovudine

See under Zidovudine

With abacavir and zidovudine

See under Abacavir
Zerit® (Bristol-Myers Squibb) [PH]

Capsules, stavudine 20 mg (brown), net price 56-cap pack = £148.05; 30 mg (light orange/dark orange), 56-cap pack = £155.25; 40 mg (dark orange), 56-cap pack = £159.94 (all hosp. only)

Oral solution, cherry-flavoured, stavudine for reconstitution with water, 1 mg/mL, net price 200 mL = £24.35

TENEFOVIR DISOPROXIL

Indications HIV infection in combination with other antiretroviral drugs; chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis

Cautions see notes above; also test renal function and serum phosphate before treatment, then every 4 weeks (more frequently if at increased risk of renal impairment) for 1 year and then every 3 months, interrupt treatment if renal function deteriorates or serum phosphate decreases; concomitant or recent use of nephrotoxic drugs; on discontinuation, monitor patients with hepatitis B (risk of exacerbation of hepatitis); interactions: Appendix 1 (tenofovir)

Contra-indications breast-feeding (Appendix 5)

Side-effects see notes above; hypophosphataemia; rarely renal failure; also reported nephrogenic diabetes insipidus, reduced bone density, hypokalaemia, myopathy, and rhabdomyolysis

Dose

- **ADULT** over 18 years, 245 mg once daily

Viread® (Gilead) ▼ [PH]

Tablets, f/c, blue, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £255.00. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

With emtricitabine

For cautions, contra-indications, and side-effects see under individual drugs

Truvada® (Gilead) [PH]

Tablets, blue, f/c, tenofovir disoproxil (as fumarate) 245 mg, emtricitabine 200 mg, net price 30-tab pack = £418.50. Label: 21, counselling, administration

Counselling Patients with swallowing difficulties may disperse tablet in half a glass of water, orange juice, or grape juice (but bitter taste)

Dose ADULT over 18 years, 1 tablet once daily

With efavirenz and emtricitabine

For cautions, contra-indications, and side-effects see under individual drugs

Atripla® (Gilead) [PH]

Tablets, pink, f/c, efavirenz 600 mg, emtricitabine 200 mg, tenofovir disoproxil (as fumarate) 245 mg, net price 30-tab pack = £626.90. Label: 23, 25

Dose HIV infection stabilised on antiretroviral therapy for more than 3 months, ADULT over 18 years, 1 tablet once daily

ZIDOVUDINE

(Azidothymidine, AZT)

Note The abbreviation AZT which is sometimes used for zidovudine has also been used for another drug

Indications HIV infection in combination with other antiretroviral drugs; prevention of maternal-fetal HIV transmission (see notes above under Pregnancy and Breast-feeding)

Cautions see notes above; also haematological toxicity particularly with high dose and advanced disease—monitor full blood count after 4 weeks of treatment, then every 3 months; vitamin B deficiency (increased risk of neutropenia); if anaemia or myelosuppression occur, reduce dose or interrupt treatment according to product literature, or consider other treatment; elderly; interactions: Appendix 1 (zidovudine)

Contra-indications abnormally low neutrophil counts or haemoglobin concentration (consult product literature); neonates with hyperbilirubinaemia requiring treatment other than phototherapy, or with raised transaminase (consult product literature); acute porphyria (section 9.8.2); breast-feeding (Appendix 5)

Side-effects see notes above; also anaemia (may require transfusion), taste disturbance, chest pain, influenza-like symptoms, paraesthesia, neuropathy, convulsions, dizziness, drowsiness, anxiety, depression, loss of mental acuity, myopathy, gynaecomastia, urinary frequency, sweating, pruritus, pigmentation of nails, skin and oral mucosa

Dose

- **By mouth**
  - **CHILD** 3 months–12 years, 360–480 mg/m daily in 3–4 divided doses; max. 200 mg every 6 hours
  - Prevention of maternal-fetal HIV transmission, seek specialist advice (combination therapy preferred)
  - Patients temporarily unable to take zidovudine by mouth, by intravenous infusion over 1 hour, 1–2 mg/kg every 4 hours (approximating to 1.5–3 mg/kg every 4 hours by mouth) usually for not more than 2 weeks; **CHILD** 3 months–12 years, 80–160 mg/m every 6 hours (120 mg/m every 6 hours approximates to 180 mg/m every 6 hours by mouth)

Retrovir® (GSK) [PH]

Capsules, zidovudine 100 mg (white/blue band), net price 100-cap pack = £110.98; 250 mg (blue/white/dark blue band), 40-cap pack = £110.98

Oral solution, sugar-free, strawberry-flavoured, zidovudine 50 mg/5 mL, net price 200-mL pack with 10-mL oral syringe = £22.20

Injection, zidovudine 10 mg/mL. For dilution and use as an intravenous infusion. Net price 20-mL vial = £11.14

With lamivudine

For cautions, contra-indications, and side-effects see under individual drugs

Combivir® (GSK) [PH]

Tablets, f/c, scored, zidovudine 300 mg, lamivudine 150 mg, net price 60-tab pack = £318.60

Dose ADULT and CHILD body-weight over 30 kg, 1 tablet twice daily; **CHILD** body-weight 14–21 kg, half a tablet twice daily; body-weight 21–30 kg, half a tablet in the morning and one tablet in the evening

Note Tablets may be crushed and mixed with semi-solid food or liquid just before administration

With abacavir and lamivudine

See under Abacavir
Protease inhibitors

Cautions  Protease inhibitors are associated with hyperglycaemia and should be used with caution in diabetes (see Lipodystrophy Syndrome, p. 335). Caution is also needed in patients with haemophilia who may be at increased risk of bleeding. Protease inhibitors should be used with caution in hepatic impairment (Appendix 2); the risk of hepatic side-effects is increased in patients with chronic hepatitis B or C. Atazanavir, darunavir, fosamprenavir, and tipranavir may be used at usual doses in patients with renal impairment, but other protease inhibitors should be used with caution in renal impairment (Appendix 3). Protease inhibitors should also be used with caution during pregnancy (Appendix 4).

Contra-indications  Protease inhibitors should not be given to patients with acute porphyria (section 9.8.2) or to women who are breast-feeding (Appendix 5).

Side-effects  Side-effects of the protease inhibitors include gastro-intestinal disturbances (including diarrhoea, nausea, vomiting, abdominal pain, flatulence), anorexia, hepatic dysfunction, pancreatitis; blood disorders including anaemia, neutropenia, and thrombocytopenia; sleep disturbances, fatigue, headache, dizziness, paraesthesia, myalgia, myositis, rhabdomyolysis; taste disturbances; rash, pruritus, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.

ATAZANAVIR

Indications  HIV infection in combination with other antiretroviral drugs

Cautions  see notes above; also concomitant use with drugs that prolong PR interval; cardiac conduction disorders; predisposition to QT interval prolongation (including electrolyte disturbances, concomitant use of drugs that prolong QT interval); interactions: Appendix 1 (atazanavir)

Contra-indications  see notes above

Side-effects  see notes above; also peripheral neurological symptoms; less commonly mouth ulcers, hypertension, syncope, chest pain, dyspnoea, abnormal dreams, amnesia, disorientation, depression, anxiety, weight changes, increased appetite, gynaecomastia, nephrolithiasis, urinary frequency, haematuria, proteinuria, arthralgia, and alopecia; rarely hepatosplenomegaly, oedema, palpitation, and abnormal gait; also reported, Stevens-Johnson syndrome, hypersensitivity reactions including anaphylaxis; see also notes above for lipodystrophy and metabolic effects (Lipodystrophy Syndrome), and Osteonecrosis.

Dose  With low-dose ritonavir and food, ADULT over 18 years, 300 mg once daily with ritonavir 100 mg once daily.

Reyataz® (Bristol-Myers Squibb) ▼ (H)

Capsules, atazanavir (as sulphate) 150 mg (dark blue/ light blue), net price 60-cap pack = £315.69; 200 mg (dark blue), 60-cap pack = £315.69; 300 mg (red/ blue), 30-cap pack = £315.69. Label: 5, 21

DARUNAVIR

Indications  HIV infection (that has not responded to treatment with other protease inhibitors) in combination with other antiretroviral drugs

Cautions  see notes above; also sulphonamide sensitivity; interactions: Appendix 1 (darunavir)

Contra-indications  see notes above

Side-effects  see notes above; also myocardial infarction, angina, QT interval prolongation, transient ischaemic attack, syncope, tachycardia, hypertension, flushing, peripheral oedema, dyspnoea, cough, hiccups, peripheral neuropathy, anxiety, confusion, memory impairment, depression, abnormal dreams, abnormal coordination, weight gain, hyperthermia, hypothyroidism, osteoporosis, gynaecomastia, erectile dysfunction, dysuria, polyuria, nephrolithiasis, renal failure, hyponatraemia, arthralgia, keratoconjunctivitis sicca, conjunctival hyperaemia, salivation changes, mouth ulcers, increased sweating, and alopecia.

Dose  With low-dose ritonavir, ADULT over 18 years, 600 mg twice daily

Missed dose  If a dose is more than 6 hours late, the missed dose should not be taken and the next dose should be taken at the normal time.

Prezista® (Janssen-Cilag) ▼ (H)

Tablets, orange, f/c, darunavir (as ethanolate) 300 mg, net price 120-tab pack = £446.70. Label: 21

FOSAMPRENAVIR

Note  Fosamprenavir is a pro-drug of amprenavir

Indications  HIV infection in combination with other antiretroviral drugs

Cautions  see notes above; interactions: Appendix 1 (fosamprenavir)

Rash  Rash may occur, usually in the second week of therapy; discontinue permanently if severe rash with systemic or allergic symptoms or, mucosal involvement; if rash mild or moderate, may continue without interruption—rash usually resolves within 2 weeks and may respond to antihistamines

Contra-indications  see notes above

Side-effects  see notes above; also reported, rash including rarely Stevens-Johnson syndrome (see also Rash above)

Dose  With low-dose ritonavir, ADULT over 6 years, body-weight over 39 kg, 18 mg/kg twice daily; CHILD over 6 years, body-weight 25–39 kg, 18 mg/kg twice daily.

Note  700 mg fosamprenavir is equivalent to approx. 600 mg amprenavir

Telzir® (GSK) (H)

Tablets, f/c, pink, fosamprenavir (as calcium) 700 mg, net price 60-tab pack = £274.92

Oral suspension, fosamprenavir (as calcium) 50 mg/mL, net price 225-mL pack (grape-bubblegum—and peppermint-flavoured) (with 10-mL oral syringe) = £73.31. Counselling: administration

Counselling: In adults, oral suspension should be taken on an empty stomach; in children under 18 years, oral suspension should be taken with food.
INDINAVIR

**Indications** HIV infection in combination with nucleoside reverse transcriptase inhibitors

**Cautions** see notes above; also ensure adequate hydration (risk of nephrotoxicity especially in children); patients at risk of nephrotoxicity (monitor for nephrotoxicity); **interactions:** Appendix 1 (indinavir)

**Contra-indications** see notes above

**Side-effects** see notes above; also reported, dry mouth, hypoaesthesia, dry skin, hyperpigmentation, alopecia, paronychia, interstitial nephritis (with medullary calcification and cortical atrophy in asymptomatic severe leucocyturia), nephrotoxicity (may require interruption or discontinuation; more frequent in children), dysuria, haematuria, crystalluria, proteinuria, pyuria (in children), pyelonephritis; haemolytic anaemia

**Dose**
- 800 mg every 8 hours; **CHILD** and **ADOLESCENT** 4–17 years, 500 mg/m² every 8 hours (max. 800 mg every 8 hours); **CHILD** under 4 years, safety and efficacy not established

**Crixivan**

**Capsules** (MSD) Indinavir (as sulphate), 200 mg, net price 360-cap pack = £226.28; 400 mg, 90-cap pack = £113.15, 180-cap pack = £226.28. Label: 27, counselling, administration

**Counselling** Administer 1 hour before or 2 hours after a meal; may be administered with a low-fat light meal; in combination with didanosine tablets, allow 1 hour between each drug (antacids in didanosine tablets reduce absorption of indinavir); in combination with low-dose ritonavir, give with food

**Note** Dispense in original container (contains desiccant)

NELFINAVIR

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; **interactions:** Appendix 1 (nelfinavir)

**Contra-indications** see notes above

**Side-effects** see notes above; also reported, fever

**Dose**
- 1.25 g twice daily or 750 mg 3 times daily; **CHILD** 3–13 years, initially 50–55 mg/kg twice daily (max. 1.25 g twice daily) or 25–30 mg/kg 3 times daily (max. 750 mg 3 times daily)

**Viracept** (Roche) Nelfinavir (as mesilate) 250 mg, net price 300-tab pack = £273.16. Label: 21

**ITRANAVIR WITH RITONAVIR**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; concomitant use with drugs that prolong QT or PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (lopinavir, ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

**Contra-indications** see notes above

**Side-effects** see notes and Cautions above; also electrolyte disturbances in children; less commonly dysphagia, appetite changes, weight changes, cholecystitis, hypertension, myocardial infarction, palpitation, thrombophlebitis, vasculitis, chest pain, oedema, dyspnoea, cough, agitation, anxiety, amnesia, ataxia, hypertonia, confusion, depression, abnormal dreams, extrapyramidal effects, neuropathy, influenza-like syndrome, Cushing’s syndrome, hypothyroidism, menorrhagia, amenorrhoea, sexual dysfunction, breast enlargement, dehydration, nephritis, hypercalciuria, lactic acidosis, arthralgia, hyperuricaemia, abnormal vision, otitis media, tinnitus, dry mouth, sialadenitis, mouth ulceration, periodontitis, acne, alopecia, dry skin, sweating, skin discoloration, nail disorders, rarely prolonged PR interval

**Dose**
- See preparations below

**Lopinavir with ritonavir**

**Indications** HIV infection in combination with other antiretroviral drugs

**Cautions** see notes above; concomitant use with drugs that prolong PR interval; cardiac conduction disorders, structural heart disease; pancreatitis (see below); **interactions:** Appendix 1 (ritonavir)

**Pancreatitis** Signs and symptoms suggestive of pancreatitis (including raised serum lipase) should be evaluated—discontinue if pancreatitis diagnosed

**Contra-indications** see notes above

**Side-effects** see notes and Cautions above; also diarrhoea (may impair absorption—close monitoring required), vasodilatation, cough, throat irritation, anxiety, perioral and peripheral paraesthesia, hypercholesterolaemia, fever, decreased blood thyroxine concentration, electrolyte disturbances, raised uric acid, dry mouth, mouth ulcers, and sweating; less commonly increased prothrombin time and dehydration; syncope, postural hypotension, seizures, menorrhagia, and renal failure also reported

**Dose**
- Initially 300 mg every 12 hours for 3 days, increased in steps of 100 mg every 12 hours over not longer than 14 days to 600 mg every 12 hours; **CHILD** over 2 years initially 250 mg/m² every 12 hours, increased by 50 mg/m² at intervals of 2–3 days to 350 mg/m² every 12 hours (max. 600 mg every 12 hours)
- Low-dose booster to increase effect of other protease inhibitors, 100–200 mg once or twice daily
Non-nucleoside reverse transcriptase inhibitors

**EFAVIRENZ**

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions**  chronic hepatitis B or C (greater risk of hepatic side-effects), hepatic impairment (avoid if severe; Appendix 2); severe renal impairment (Appendix 3); pregnancy (Appendix 4); elderly; history of mental illness or seizures; **interactions:** Appendix 1 (efavirenz)

**Rash**  Rash, usually in the first 2 weeks, is the most common side-effect; discontinue if severe rash with blistering, desquamation, mucosal involvement or fever; if rash mild or moderate, may continue without interruption—rash usually resolves within 1 month

**Psychiatric disorders**  Patients or their carers should be advised to seek immediate medical attention if symptoms such as severe depression, psychosis or suicidal ideation occur

**Contra-indications**  acute porphyria (section 9.8.2); breastfeeding (Appendix 5)

**Side-effects**  rash including Stevens-Johnson syndrome (see Rash above); abdominal pain, diarrhoea, nausea, vomiting; anxiety, depression, sleep disturbances, abnormal dreams, dizziness, headache, fatigue, impaired concentration (administration at bedtime especially in first 2–4 weeks reduces CNS effects); pruritus; *less commonly* pancreatitis, hepatitis, psychosis, mania, suicidal ideation, amnesia, ataxia, convulsions, and blurred vision; also reported hepatic failure, raised serum cholesterol (see Lipodystrophy Syndrome, p. 335), gynaecomastia, photosensitivity; see also Osteonecrosis, p. 335

**Dose**

- See preparations below

**Sustiva®**  (Bristol-Myers Squibb)  Tablets, efavirenz 50 mg (yellow/white), net price 30–cap pack = £17.41; 200 mg (yellow), 90–cap pack = £208.40. Label: 23

**Dose**

- ADULT and CHILD over 3 years, body-weight 13–14 kg, 200 mg once daily; body-weight 15–19 kg, 250 mg once daily, body-weight 20–24 kg, 300 mg once daily, body-weight 25–32.4 kg, 350 mg once daily, body-weight 32.5–39 kg, 400 mg once daily; body-weight 40 kg and over, 600 mg once daily

**Oral solution**, sugar-free, strawberry and mint flavour, efavirenz 30 mg/mL, net price 180–mL pack = £56.02

**Dose**

- ADULT and CHILD over 5 years, body-weight 13–14 kg, 270 mg once daily; body-weight 15–19 kg, 300 mg once daily, body-weight 20–24 kg, 360 mg once daily, body-weight 25–32.4 kg, 400 mg once daily, body-weight 32.5–39 kg, 510 mg once daily; body-weight 40 kg and over, 720 mg once daily, CHILD 3–4 years, body-weight 13–14 kg, 360 mg once daily; body-weight 15–19 kg, 390 mg once daily, body-weight 20–24 kg, 450 mg once daily, body-weight 25–32.4 kg, 510 mg once daily

**Note**  The bioavailability of Sustiva oral solution is lower than that of the capsules and tablets; the oral solution is not interchangeable with either capsules or tablets on a milligram-for-milligram basis

**With emtricitabine and tenofovir**

See under Tenofovir

---

**TIPRANAVIR**

**Indications**  HIV infection resistant to other protease inhibitors, in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

**Cautions**  see notes above; also patients at risk of increased bleeding from trauma, surgery or other pathological conditions; concomitant use of drugs that increase risk of bleeding; **interactions:** Appendix 1 (tipranavir)

**Hepatotoxicity**  Potentially life-threatening hepatotoxicity reported; monitor liver function before treatment then every 2 weeks for 1 month, then every 3 months. Discontinue if signs or symptoms of hepatitis develop or if liver-function abnormality develops (consult product literature)

**Contra-indications**  see notes above

**Side-effects**  see notes above; also dyspnoea, anorexia, peripheral neuropathy, influenza-like symptoms, renal impairment and photosensitivity; rarely dehydration

**Dose**

- With low-dose ritonavir, ADULT over 18 years, 500 mg twice daily

**Aptivus®**  (Boehringer Ingelheim)  Capsules, pink, tipranavir 250 mg, net price 120–cap pack = £490.00. Label: 5, 21

---

**Norvir®**  (Abbott)  Capsules, ritonavir 100 mg, net price 84-cap pack = £94.35. Label 21

**Exipients** include alcohol 12%

**Oral solution**, sugar-free, ritonavir 400 mg/5 mL, net price 5 × 90–mL packs (with measuring cup) = £403.20. Label: 21, counselling, administration

**Counselling**  Oral solution contains 43% alcohol; bitter taste can be masked by mixing with chocolate milk; do not mix with water, measuring cup must be dry

**With lopinavir**

See under Lopinavir with ritonavir

**SAQUINAVIR**

**Indications**  HIV infection in combination with other antiretroviral drugs

**Cautions**  see notes above; also dyspnoea, increased appetite, peripheral neuropathy, convulsions, changes in libido, renal impairment, dry mouth, and alopecia

**Dose**

- With low-dose ritonavir, ADULT and ADOLESCENT over 16 years, 1 g every 12 hours

**Invirase®**  (Roche)  Capsules, brown/green, saquinavir (as mesilate) 200 mg, net price 270–cap pack = £240.06. Label: 21

**Tablets**, orange, f/c, saquinavir (as mesilate) 500 mg, net price 120–tab pack = £286.73. Label: 21

---

**With emtricitabine and tenofovir**

See under Tenofovir

---

5 Infections

5.3.1 HIV infection 341
ETRAVIRINE

Indications in combination with other antiretroviral drugs (including a boosted protease inhibitor) for HIV infection resistant to other non-nucleoside reverse transcriptase inhibitors and protease inhibitors

Cautions chronic hepatitis B or C (greater risk of hepatic side-effects); hepatic impairment (avoid if severe; Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (etravirine)

Rash Rash, usually in the second week, is the most common side-effect and appears more frequently in women; discontinue if severe rash; if rash mild or moderate, may continue without interruption—rash usually resolves within 2 weeks

Contra-indications acute porphyria (section 9.8.2); breast-feeding (Appendix 5); severe hepatic impairment; post-exposure prophylaxis

Side-effects rash including Stevens-Johnson syndrome, p. 335; rarely including toxic epidermal necrolysis (see also Cautions above); nausea, hepatitis (see also Hepatic Disease above), headache; commonly vomiting, abdominal pain, fatigue, fever, and myalgia; rarely diarrhoea, angioedema, anaphylaxis, hypersensitivity reactions (may involve hepatic reactions and rash, see Hepatic Disease above), arthralgia, anaemia, and granulocytopenia (more frequent in children); very rarely neuroendocrine reactions; see also Osteonecrosis, p. 335

Dose • ADULT over 18 years, 200 mg once daily for first 14 days then (if no rash present) 200 mg twice daily; NEONATE and CHILD under 8 years, 150 mg/m² (max. 200 mg) once daily for first 14 days, then (if no rash present) 150 mg/m² (max. 200 mg) twice daily or 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 7 mg/kg (max. 200 mg) twice daily; CHILD 8–16 years, 150 mg/m² (max. 200 mg) once daily for first 14 days then (if no rash present) 150 mg/m² (max. 200 mg) twice daily or 4 mg/kg (max. 200 mg) once daily for first 14 days then (if no rash present) 4 mg/kg (max. 200 mg) twice daily

Note Dose titration should be repeated if treatment interrupted for more than 7 days

Viramune® (Boehringer Ingelheim) Tablets, nevirapine 200 mg, net price 60-tab pack = £160.00. Counselling, hypersensitivity reactions

Suspension, nevirapine 50 mg/5 mL, net price 240-mL pack = £50.40. Counselling, hypersensitivity reactions

NEVIRAPINE

Indications HIV infection in combination with other antiretroviral drugs

Cautions hepatic impairment (see below and Appendix 2); chronic hepatitis B or C, high CD4 cell count, and women (all at greater risk of hepatic side-effects—manufacturer advises avoid in women with CD4 cell count greater than 250 cells/mm³ or in men with CD4 cell count greater than 400 cells/mm³ unless potential benefit outweighs risk); pregnancy (Appendix 4); interactions: Appendix 1 (nevirapine)

Hepatic disease Potentially life-threatening hepatotoxicity including fatal fulminant hepatitis reported usually in first 6 weeks; close monitoring required during first 18 weeks; monitor liver function before treatment then every 2 weeks for 2 months then after 1 month and then regularly; discontinue permanently if abnormalities in liver function tests accompanied by hypersensitivity reaction (rash, fever, arthralgia, myalgia, lymphadenopathy; hepatitis, renal impairment, eosinophilia, granulocytopenia); suspend if severe abnormalities in liver function tests but no hypersensitivity reaction—discontinue permanently if significant liver function abnormalities recur; monitor patient closely if mild to moderate abnormalities in liver function tests with no hypersensitivity reaction

Rash Rash, usually in first 6 weeks, is most common side-effect; incidence reduced if introduced at low dose and dose increased gradually; monitor closely for skin reactions during first 18 weeks; discontinue permanently if severe rash or if rash accompanied by blistering, oral lesions, conjunctivitis, facial oedema, general malaise or hypersensitivity reactions; if rash mild or moderate may continue without interruption but dose should not be increased until rash resolves

Counselling Patients should be told how to recognise hypersensitivity reactions and advised to discontinue treatment and seek immediate medical attention if severe skin reaction, hypersensitivity reactions, or symptoms of hepatitis develop

Contra-indications acute porphyria (section 9.8.2); breast-feeding (Appendix 5); severe hepatic impairment; post-exposure prophylaxis

Side-effects rash including Stevens-Johnson syndrome and rarely, toxic epidermal necrolysis (see also Cautions above); nausea, hepatitis (see also Hepatic Disease above), headache, less commonly vomiting, abdominal pain, fatigue, fever, and myalgia; rarely diarrhoea, angioedema, anaphylaxis, hypersensitivity reactions (may involve hepatic reactions and rash, see Hepatic Disease above), arthralgia, anaemia, and granulocytopenia (more frequent in children); very rarely neuroendocrine reactions; see also Osteonecrosis, p. 335

Other antiretrovirals

ENFUVIRTIDE

Indications HIV infection in combination with other antiretroviral drugs for resistant infection or for patients intolerant to other antiretroviral regimens

Cautions chronic hepatitis B or C (possibly greater risk of hepatic side-effects); hepatic impairment (Appendix 2); pregnancy (Appendix 4)

Hypersensitivity reactions Hypersensitivity reactions including rash, fever, nausea, vomiting, chills, rigors, low blood pressure, respiratory distress, glomerulonephritis, and raised liver enzymes reported; discontinue immediately if any signs or symptoms of systemic hypersensitivity develop and do not rechallenge

Counselling Patients should be told how to recognise signs of hypersensitivity, and advised to discontinue treatment and seek immediate medical attention if symptoms develop

Contra-indications breast-feeding (Appendix 5)

Side-effects injection-site reactions; pancreatitis, gastro-oesophageal reflux disease, anorexia, weight loss; hypertriglyceridaemia; peripheral neuropathy, asthenia, tremor, anxiety, nightmares, irritability,
impacted concentration, vertigo; pneumonia, sinusitis, influenza-like illness; diabetes mellitus; haematuria; renal calculi, lymphadenopathy; myalgia; conjunctivitis; dry skin, acne, erythema, skin papilloma; less commonly hypersensitivity reactions (see Cautions); see also Osteonecrosis, p. 335

**Dose**

- **By subcutaneous injection,** ADULT and ADOLESCENT over 16 years, 90 mg twice daily; CHILD 6–15 years, 2 mg/kg twice daily (max. 90 mg twice daily)

**Fuzeon** (Roche) *(V)*

*Injection,* powder for reconstitution, enfuvirtide 108 mg (= enfuvirtide 90 mg/mL when reconstituted with 1 mL Water for Injections), net price 108 mg vial = £19.13 (with solvent, syringe, and alcohol swabs). Counselling, hypersensitivity reactions

### Maraviroc

**Indications** CCR5-tropic HIV infection in combination with other antiretroviral drugs in patients previously treated with antiretrovirals

**Cautions** cardiovascular disease; chronic hepatitis B or C; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); interactions: Appendix 1 (maraviroc)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** nausea, vomiting, abdominal pain, dyspepsia, constipation, diarrhoea; cough; dizziness, paraesthesia, asthenia, sleep disturbances, headache, weight loss; muscle spasms, back pain; taste disturbances; rash, pruritus. less commonly pancreaticitis, hepatic cirrhosis, rectal bleeding, myocardial infarction, myocardial ischaemia, bronchospasm, seizures, hallucinations, loss of consciousness, polyneuropathy, pancytopenia, neutropenia, lymphadenopathy, renal failure, polyuria, and myositis; see also Osteonecrosis, p. 335

**Dose**

- **ADULT** over 18 years, 300 mg twice daily

**Celsentri** *(Pfizer)* *(V)*

*Tablets,* blue, f/c, maraviroc, 150 mg, net-price 60-tab pack = £551.10; 300 mg, 60-tab pack = £551.10

### Raltegravir

**Indications** in combination with other antiretroviral drugs for HIV infection resistant to multiple antiretrovirals

**Cautions** risk factors for myopathy or rhabdomyolysis; chronic hepatitis B or C (greater risk of hepatic side-effects); hepatic impairment (Appendix 2); pregnancy (Appendix 4); interactions: Appendix 1 (raltegravir)

**Contra-indications** breast-feeding (Appendix 5)

**Side-effects** abdominal pain, flatulence, constipation, lipodystrophy (see Lipodystrophy Syndrome, p. 335); dizziness, asthenia; arthralgia; pruritus, hyperhidrosis; less commonly vomiting, gastritis, hepatitis, myocardial infarction, hypertriglyceridaemia, allodynia, headache, renal failure, anaemia, neutropenia, and muscle spasm; also reported rash (including Stevens-Johnson syndrome); see also Osteonecrosis, p. 335

**Dose**

- **ADULT** and **CHILD** over 16 years, 400 mg twice daily

**Isentress** *(MSD)* *(V)*

*Tablets,* pink, f/c, raltegravir (as potassium salt) 400 mg, net price 60-tab pack = £647.29. Label: 25

### Herpes Simplex and Varicella-Zoster Infections

#### Herpes Simplex Infections

Herpes infection of the mouth and lips and in the eye is generally associated with herpes simplex virus serotype 1 (HSV-1); other areas of the skin may also be infected, especially in immunodeficiency. Genital infection is most often associated with HSV-2 and also HSV-1. Treatment of herpes simplex infection should start as early as possible and usually within 5 days of the appearance of the infection. In individuals with good immune function, mild infection of the eye (ocular herpes, section 11.3.3) and of the lips (herpes labialis or cold sores, section 13.10.3) is treated with a topical antiviral drug. Primary herpetic gingivostomatitis is managed by changes to diet and with analgesics (section 12.3.2). Severe infection, neonatal herpes infection or infection in immunocompromised individuals requires treatment with a systemic antiviral drug. Primary or recurrent genital herpes simplex infection is treated with an antiviral drug given by mouth. Persistence of a lesion or recurrence in an immunocompromised patient may signal the development of resistance.

Specialist advice should be sought for systemic treatment of herpes simplex infection in pregnancy.

#### Varicella-Zoster Infections

Regardless of immune function and the use of any immunoglobulins, neonates with chickenpox should be treated with a parenteral antiviral to reduce the risk of severe disease. Chickenpox in otherwise healthy children between 1 month and 12 years is usually mild and antiviral treatment is not usually required.

Chickenpox is more severe in adolescents and adults than in children; antiviral treatment started within 24 hours of the onset of rash may reduce the duration and severity of symptoms in otherwise healthy adults and adolescents. Antiviral treatment is generally recommended in immunocompromised patients and those at special risk (e.g. because of severe cardiovascular or respiratory disease or chronic skin disorder); in such cases, an antiviral is given for 10 days with at least 7 days of parenteral treatment.

Pregnant women who develop severe chickenpox may be at risk of complications, especially varicella pneumonia. Specialist advice should be sought for the treatment of chickenpox during pregnancy.

Those who have been exposed to chickenpox and are at special risk of complications may require prophylaxis...
with varicella-zoster immunoglobulin (see under Specific Immunoglobulins, section 14.5).

In herpes zoster (shingles) systemic antiviral treatment can reduce the severity and duration of pain, reduce complications, and reduce viral shedding. Treatment with the antiviral should be started within 72 hours of the onset of rash and is usually continued for 7–10 days. Immunosuppressed patients at high risk of disseminated or severe infection should be treated with a parenteral antiviral drug.

Chronic pain which persists after the rash has healed or associated or severe infection should be treated with a par-...
Contraindications
- pregnancy (Appendix 4)
- renal impairment (Appendix 3); history of

Cautions
- Indications
- see under Dose

Genital herpes, Herpes zoster, 250 mg 3 times daily for 7 days

Dose
- Side-effects
- rarely

Intravenous infusion, aciclovir (as sodium salt), 25 mg/mL, net price 10-mL (250-mg) vial = £10.37; 20-mL (500-mg) vial = £19.21; 40-mL (1-g) vial = £40.44

Electrolytes Na 1.1 mmol/250-mg vial

Zovirax® (GSK) [H1]
- Tablets, all dispersible, f/c, aciclovir 200 mg, net price 25-tab pack = £18.80; 400 mg, 56-tab pack = £68.98; 800 mg (scored, Shingles Treatment Pack), 35-tab pack = £69.85. Label: 9
- Suspension, both off-white, sugar-free, aciclovir 200 mg/5 mL (banana-flavoured), net price 125 mL = £29.53; 400 mg/5 mL (Double Strength Suspension, orange-flavoured) 100 mL = £33.01. Label: 9
- Dental prescribing on NHS May be prescribed as Aciclovir 200 mg/5 mL oral Suspension

Intravenous infusion, powder for reconstitution, aciclovir (as sodium salt). Net price 250-mg vial = £10.15; 500-mg vial = £18.81

Electrolytes Na 1.1 mmol/250-mg vial

FAMCICLOVIR

Note Famiciclovir is a pro-drug of penciclovir

Indications treatment of herpes zoster, acute genital herpes simplex and suppression of recurrent genital herpes

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4) and breast-feeding (Appendix 5); interactions: Appendix 1 (famciclovir)

Side-effects rarely nausea, headache, confusion; very rarely vomiting, jaundice, dizziness, drowsiness, hallucinations, rash, and pruritus; abdominal pain and fever have been reported in immunocompromised patients

Dose
- Herpes zoster, 250 mg 3 times daily for 7 days or 750 mg once daily for 7 days (in immunocompromised, 500 mg 3 times daily for 10 days)
- Genital herpes, first episode, 250 mg 3 times daily for 5 days (longer if new lesions appear during treatment or if healing incomplete); recurrent infection, 125 mg twice daily for 5 days (in immunocompromised or HIV-positive patients, all episodes, 500 mg twice daily for 5–10 days)
- Genital herpes, suppression, 250 mg twice daily (in HIV patients, 500 mg twice daily) interrupted every 6–12 months
- CHILD not recommended

Famvir® (Novartis) [H1]
- Tablets, all f/c, famciclovir 125 mg, net price 10-tab pack = £37.12; 250 mg, 15-tab pack = £111.35, 21-tab pack = £155.87; 56-tab pack = £415.67; 500 mg, 14-tab pack = £207.86, 30-tab pack = £445.28, 56-tab pack = £831.46; 750 mg, 7-tab pack = £148.79. Label: 9

Valaciclovir is a pro-drug of aciclovir

Indications treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following renal transplantation

Cautions see under Aciclovir; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Side-effects see under Aciclovir but neurological reactions more frequent with high doses

Dose
- Herpes zoster, 1 g 3 times daily for 7 days; CHILD 12–18 years, see BNF for Children
- Herpes simplex, first episode, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days for genital herpes in immunocompromised or HIV-positive patients); recurrent infection, 500 mg twice daily for 5 days (1 g twice daily for 5–10 days for genital herpes in immunocompromised or HIV-positive patients); CHILD 12–18 years, see BNF for Children
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); CHILD 12–18 years, see BNF for Children
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following renal transplantation (preferably starting within 72 hours of transplantation), ADULT and CHILD over 12 years, 2 g 4 times daily usually for 90 days

INOSINE PRANOBEKX
(Inosine acedoben dimepranol)

Indications see under Dose

Cautions renal impairment (Appendix 3); history of gout or hyperuricaemia

Contra-indications pregnancy

Side-effects reversible increase in serum and urinary uric acid; less commonly nausea, vomiting, epigastric discomfort, headache, vertigo, fatigue, arthralgia, rashes and itching; rarely diarrhoea, constipation, anxiety, sleep disturbances, and polyuria

Dose
- Mucocutaneous herpes simplex, 1 g 4 times daily for 7–14 days
- Adjunctive treatment of genital warts, 1 g 3 times daily for 14–28 days
- Subacute sclerosing panencephalitis, 50–100 mg/kg daily in 6 divided doses

Imunovir® (Ardern) [H1]
- Tablets, scored, inosine pranobex 500 mg. Net price 100-tab pack = £39.50. Label: 9

VALACICLOVIR

Note Valaciclovir is a pro-drug of aciclovir

Indications treatment of herpes zoster; treatment of initial and suppression of recurrent herpes simplex infections of skin and mucous membranes including initial and recurrent genital herpes; reduction of transmission of genital herpes; prevention of cytomegalovirus disease following renal transplantation

Cautions see under Aciclovir; hepatic impairment (Appendix 2); renal impairment (Appendix 3)

Side-effects see under Aciclovir but neurological reactions more frequent with high doses

Dose
- Herpes zoster, 1 g 3 times daily for 7 days; CHILD 12–18 years, see BNF for Children
- Herpes simplex, first episode, 500 mg twice daily for 5 days, longer if new lesions appear during treatment or if healing incomplete (1 g twice daily for 10 days for genital herpes in immunocompromised or HIV-positive patients); recurrent infection, 500 mg twice daily for 5 days (1 g twice daily for 5–10 days for genital herpes in immunocompromised or HIV-positive patients); CHILD 12–18 years, see BNF for Children
- Herpes simplex, suppression, 500 mg daily in 1–2 divided doses (in immunocompromised or HIV positive patients, 500 mg twice daily); CHILD 12–18 years, see BNF for Children
- Reduction of transmission of genital herpes, seek specialist advice, 500 mg once daily to be taken by the infected partner
- Prevention of cytomegalovirus disease following renal transplantation (preferably starting within 72 hours of transplantation), ADULT and CHILD over 12 years, 2 g 4 times daily usually for 90 days

Valtrex® (GSK) [H1]
- Tablets, f/c, valaciclovir (as hydrochloride) 250 mg, net price 60-tab pack = £130.87; 500 mg, 10-tab pack = £21.86, 42-tab pack = £91.61. Label: 9

5.3.2 Cytomegalovirus infection

Recommendations for the optimum maintenance therapy of cytomegalovirus (CMV) infections and the duration of treatment are subject to rapid change.

Ganciclovir is related to aciclovir but it is more active against cytomegalovirus; it is also much more toxic than aciclovir and should therefore be prescribed only when
the potential benefit outweighs the risks. Ganciclovir is administered by intravenous infusion for the initial treatment of CMV infection. Ganciclovir causes profound myelosuppression when given with zidovudine; the two should not normally be given together particularly during initial ganciclovir therapy. The likelihood of ganciclovir resistance increases in patients with a high viral load or in those who receive the drug over a long duration; cross-resistance to cidofovir is common.

Valaciclovir (see p. 345) is licensed for prevention of cytomegalovirus disease following renal transplantation.

Valganciclovir is an ester of ganciclovir which is licensed for the initial treatment and maintenance treatment of CMV retinitis in AIDS patients. Valganciclovir is also licensed for preventing CMV disease following solid organ transplantation from a cytomegalovirus-positive donor.

Foscarnet is also active against cytomegalovirus; it is toxic and can cause renal impairment.

Cidofovir is given in combination with probenecid for CMV retinitis in AIDS patients when ganciclovir and foscarnet are contra-indicated. Cidofovir is nephrotoxic.

For local treatment of CMV retinitis, see section 11.3.3.

### Cidofovir

**Indications** cytomegalovirus retinitis in AIDS patients for whom other drugs are inappropriate

**Cautions** monitor renal function (serum creatinine and urinary protein) and neutrophil count within 24 hours before each dose; co-treatment with probenecid and prior hydration with intravenous fluids necessary to minimise potential nephrotoxicity (see below); diabetes mellitus (increased risk of ocular hypotony); interactions: Appendix 1 (cidofovir)

Nephrotoxicity Do not initiate treatment in renal impairment (assess creatinine clearance and proteinuria—consult product literature); discontinue treatment and give intravenous fluids if renal function deteriorates—consult product literature

Ocular disorders Regular ophthalmological examinations recommended; iritis and uveitis have been reported which may respond to a topical corticosteroid with or without a cycloplegic drug—discontinue cidofovir if no response to topical corticosteroid or if condition worsens, or if iritis or uveitis recurs after successful treatment

Contra-indications renal impairment (creatinine clearance 55 mL/minute or less); concomitant administration of potentially nephrotoxic drugs; discontinuation of potentially nephrotoxic drugs at least 7 days before starting cidofovir; pregnancy (avoid pregnancy during and for 1 month after treatment, men should not father a child during or within 3 months of treatment; Appendix 4); breast-feeding (Appendix 5)

Side-effects nephrotoxicity (see Cautions above); nausea, vomiting; dysphagia, abdominal pain, constipation, flatulence, dyspepsia, abdominal pain, constipation, flatulence, dyspepsia, headache, fever, asthenia; neutropenia; decreased intra-ocular pressure, iritis, uveitis (see Cautions above); alopecia, rash; less commonly Fanconi syndrome; also reported, hearing impairment and pancreatitis

**Dose**

- Initial (induction) treatment, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once weekly for 2 weeks (give probenecid and intravenous fluids with each dose, see below)
- Maintenance treatment, beginning 2 weeks after completion of induction, ADULT over 18 years, by intravenous infusion over 1 hour, 5 mg/kg once every 2 weeks (give probenecid and intravenous fluids with each dose, see below)

**Probenecid co-treatment** By mouth (preferably after food), probenecid 2 g 3 hours before cidofovir infusion followed by probenecid 1 g at 2 hours and 1 g at 8 hours after the end of cidofovir infusion (total probenecid 4 g); for cautions, contra-indications and side-effects of probenecid see section 10.1.4

**Prior hydration** Sodium chloride 0.9%, by intravenous infusion, 1 litre over 1 hour immediately before cidofovir infusion (if tolerated an additional 1 litre may be given over 1–3 hours, starting at the same time as the cidofovir infusion or immediately afterwards)

**Vistide®** (Pfizer) [TML] Intravenous infusion, cidofovir 75 mg/mL, net price £653.22

**Caution in handling** Cidofovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with water

### Vistide®

**Indications** life-threatening or sight-threatening cytomegalovirus infections in immunocompromised patients only; prevention of cytomegalovirus disease during immunosuppressive therapy following organ transplantation; local treatment of CMV retinitis (section 11.3.3)

**Cautions** close monitoring of full blood count (severe deterioration may require correction and possibly treatment interruption); history of neutropenia; low platelet count; potential carcinogen and teratogen; renal impairment (Appendix 3); radiotherapy; ensure adequate hydration during intravenous administration; vesicant—infuse into vein with adequate flow preferably using plastic cannula; children (possible risk of long-term carcinogenic or reproductive toxicity—not for neonatal or congenital cytomegalovirus disease); interactions: Appendix 1 (ganciclovir)

**Contra-indications** pregnancy (ensure effective contraception during treatment and barrier contraception for men during and for at least 90 days after treatment; Appendix 4); breastfeeding; hypersensitivity to ganciclovir or aciclovir; abnormally low hae-moglobin, neutrophil, or platelet counts (consult product literature)

### Side-effects
diarrhoea, nausea, vomitina, dyspepsia, abdominal pain, constipation, flatulence, dysphagia, hepatic dysfunction; dysphagia, chest pain, cough; headache, insomnia, convulsions, dizziness, neuropathy, depression, anxiety, confusion, abnormal thinking, fatigue, weight loss, anorexia; infection, fever, night sweats; anaemia, leukopenia, thrombocytopenia, pancytopenia, renal impairment; myalgia, arthralgia; macular oedema, retinal detachment, vitreous floaters, eye pain; ear pain, taste disturbance; dermatitis, pruritus; injection-site reactions; less commonly mouth ulcers, pancreatitis, arrhythmias, hypotension, anaphylactic reactions, psychosis, tremor, male infertility, haematuria, disturbances in hearing and vision, and alopecia

**Dose**

- By intravenous infusion, initially (induction) 5 mg/kg every 12 hours for 14–21 days for treatment or for 7–14 days for prevention; maintenance (for patients at risk of relapse of retinitis) 6 mg/kg daily on
5 days per week or 5 mg/kg daily until adequate recovery of immunity; if retinitis progresses initial induction treatment may be repeated

**Cymevene** (Roche) [NF]

Intravenous infusion, powder for reconstitution, ganciclovir (as sodium salt). Net price 500-mg vial = £31.60

Electrolytes Na 2 mmol/500-mg vial

Caution in handling Ganciclovir is toxic and personnel should be adequately protected during handling and administration; if solution comes into contact with skin or mucosa, wash off immediately with soap and water

**FOSCARNET SODIUM**

**Indications**
cytomegalovirus retinitis in AIDS patients; mucocutaneous herpes simplex virus infections unresponsive to aciclovir in immunocompromised patients

**Cautions**
renal impairment (reduce dose; consult product literature); monitor electrolytes, particularly calcium and magnesium; monitor serum creatinine every second day during induction and every week during maintenance; ensure adequate hydration; avoid rapid infusion; interactions: Appendix 1 (foscarnet)

**Contra-indications**
pregnancy; breast-feeding (Appendix 5)

**Side-effects**
nausea, vomiting, diarrhoea (occasionally constipation and dyspepsia), abdominal pain, anorexia, changes in blood pressure and ECG; headache, fatigue, mood disturbances (including psychosis), asthena, paraesthesia, convulsions, tremor, dizziness, and other neurological disorders; rash; impairment of renal function including acute renal failure; hypocalcaemia (sometimes symptomatic) and other electrolyte disturbances; abnormal liver function tests; decreased haemoglobin concentration, leucopenia, granulocytopenia, thrombocytopenia; thrombophlebitis if given undiluted by peripheral vein; genital irritation and ulceration (due to high concentrations excreted in urine); isolated reports of pancreatitis

**Dose**
- CMV retinitis, by intravenous infusion, induction 60 mg/kg every 8 hours for 2–3 weeks then maintenance, 60 mg/kg daily, increased to 90–120 mg/kg if tolerated; if retinitis progresses on maintenance dose, repeat induction regimen
- Mucocutaneous herpes simplex infection, by intravenous infusion, 40 mg/kg every 8 hours for 2–3 weeks or until lesions heal

**Foscavir** (AstraZeneca) [NF]

Intravenous infusion, foscarnet sodium hexahydrate 24 mg/mL, net price 250-mL bottle = £34.49

**VALGANCICLOVIR**

**Note** Valganciclovir is a pro-drug of ganciclovir

**Indications** induction and maintenance treatment of cytomegalovirus retinitis in AIDS patients; prevention of cytomegalovirus disease following solid organ transplantation from a cytomegalovirus-positive donor.

**Cautions** see under Ganciclovir

**Side-effects** see under Ganciclovir

**Dose**
- CMV retinitis, induction, 900 mg twice daily for 21 days then 900 mg once daily; induction regimen may be repeated if retinitis progresses
- Prevention of cytomegalovirus disease following solid organ transplantation (starting within 10 days of transplantation), 900 mg once daily for 100 days
- CHILD under 18 years not recommended

**Note** Oral valganclovir 900 mg twice daily is equivalent to intravenous ganciclovir 5 mg/kg twice daily

**Valcyte** (Roche) [NF]

Tablets, pink, f/c, valganclovir (as hydrochloride) 450 mg, net price 60-tab pack = £1148.05. Label: 21

Caution in handling Valganclovir is a potential teratogen and carcinogen and caution is advised for handling of broken tablets; if broken tablets come into contact with skin or mucosa, wash off immediately with water

**5.3.3 Viral hepatitis**

Treatment for viral hepatitis should be initiated by a specialist. The management of uncomplicated acute viral hepatitis is largely symptomatic. Early treatment of acute hepatitis C with interferon alfa [unlicensed indication] may reduce the risk of chronic infection. Hepatitis B and hepatitis C viruses are major causes of chronic hepatitis. For details on immunisation against hepatitis A and B infections, see section 14.4 (active immunisation) and section 14.5 (passive immunisation).

**Chronic Hepatitis B** Peginterferon alfa-2a (section 8.2.4) is an option for the initial treatment of chronic hepatitis B (see NICE guidance below) and may be preferable to interferon alfa. The use of peginterferon alfa-2a and interferon alfa is limited by a response rate of 30–40% and relapse is frequent. Treatment should be discontinued if no improvement occurs after 4 months. The manufacturers of peginterferon alfa-2a and interferon alfa contraindicate use in decompensated liver disease but low doses can be used with great caution in these patients. Although interferon alfa is contraindicated in patients receiving immunosuppressant treatment (or who have received it recently), cautious use of peginterferon alfa-2a may be justified in some cases.

Adefovir dipivoxil, entecavir, lamivudine (see p. 337), telbivudine, or tenofovir disoproxil (see p. 338) are licensed for the treatment of chronic hepatitis B. Lamivudine or adefovir can also be used in patients with decompensated liver disease. Hepatitis B viruses with reduced susceptibility to lamivudine have emerged following extended therapy. Adefovir is effective in lamivudine-resistant chronic hepatitis B but telbivudine should not be used because cross-resistance may occur (see also NICE guidance below). Entecavir is effective in patients not previously treated with nucleoside analogues (see NICE guidance below). Resistance to entecavir can occur in patients who have received lamivudine.

If there is no toxicity or loss in efficacy, treatment with adefovir, entecavir, lamivudine, telbivudine, or tenofovir is usually continued until 6 months after adequate seroconversion has occurred. Treatment with lamivudine or adefovir is continued long-term in patients with decompensated liver disease.
Tenofvir, or a combination of tenofovir with either emtricitabine or lamivudine may be used with other antiretrovirals, as part of 'highly active antiretroviral therapy' (section 5.3.1) in patients who require treatment for both HIV and chronic hepatitis B. If patients infected with both HIV and chronic hepatitis B only require treatment for chronic hepatitis B, they should receive antivirals that are not active against HIV, such as peginterferon alfa-2a. Management of these patients should be co-ordinated between HIV and hepatology specialists.

NICE guidance

Adefovir dipivoxil and peginterferon alfa-2a for chronic hepatitis B (February 2006)

Peginterferon alfa-2a is an option for the initial treatment of chronic hepatitis B.

Adefovir dipivoxil is recommended as an option for the treatment of chronic hepatitis B if:

- treatment with interferon alfa or peginterferon alfa-2a has been unsuccessful, or
- a relapse occurs after successful initial therapy, or
- treatment with interferon alfa or peginterferon alfa-2a is poorly tolerated or contra-indicated.

Adefovir dipivoxil should not be given before treatment with lamivudine. It may be used either alone or in combination with lamivudine when treatment with lamivudine has resulted in viral resistance, or if lamivudine resistance is likely to occur rapidly and adversely affect the outcome.

NICE guidance

Entecavir and telbivudine for chronic hepatitis B (August 2008)

Entecavir is an option for the treatment of chronic hepatitis B.

Telbivudine is not recommended for the treatment of chronic hepatitis B. Patients currently receiving telbivudine can continue treatment until they and their clinician consider it appropriate to stop.

Chronic Hepatitis C

Before starting treatment, the genotype of the infecting hepatitis C virus should be determined and the viral load measured as this may affect the choice and duration of treatment. A combination of ribavirin (see p. 351) and peginterferon alfa (section 8.2.4) is used for the treatment of chronic hepatitis C (see NICE guidance, below). The combination of ribavirin and interferon alfa is less effective than the combination of peginterferon alfa and ribavirin. Peginterferon alfa alone should be used if ribavirin is contra-indicated or not tolerated. Ribavirin monotherapy is ineffective.

NICE guidance

Peginterferon alfa and ribavirin for mild chronic hepatitis C (August 2006)

The combination of peginterferon alfa and ribavirin can be used for treating mild chronic hepatitis C in patients over 18 years. Alternatively, treatment can be delayed until the disease has reached a moderate stage ('watchful waiting'). Peginterferon alfa alone can be used if ribavirin is contra-indicated or not tolerated.
Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, vomiting, dyspepsia, diarrhoea, raised serum amylase and lipase; headache, fatigue, dizziness, sleep disturbances; less commonly thrombocytopenia; also reported, rash

Dose
- ADULT over 18 years, not previously treated with nucleoside analogues, 500 micrograms once daily
- ADULT over 18 years with lamivudine-resistant chronic hepatitis B, 1 mg once daily

Counselling To be taken at least 2 hours before or 2 hours after food

Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

TELBIVUDINE

Indications chronic hepatitis B infection with compensated liver disease, evidence of viral replication, and histologically documented active liver inflammation or fibrosis

Cautions monitor liver function tests every 3 months and viral and serological markers of hepatitis B every 3–6 months; discontinue if deterioration in liver function, hepatic steatosis, progressive hepatomegaly or unexplained lactic acidosis; hepatitis may recur on discontinuation; renal impairment (Appendix 3); pregnancy (Appendix 4). Interactions: Appendix 1 (telbivudine)

Counselling Patients should be advised to promptly report unexplained muscle pain, tenderness, or weakness, or numbness, tingling or burning sensations

Contra-indications breast-feeding (Appendix 5)

Side-effects nausea, diarrhoea, abdominal pain, raised serum amylase and lipase; cough; dizziness, headache, fatigue; rash; less commonly peripheral neuropathy, arthralgia, myalgia, and myopathy

Dose
- ADULT and CHILD over 16 years, 600 mg once daily

Sebivo® (Novartis) Tablets, If/c, telbivudine 600 mg, net price 28-tab pack = £290.33. Counselling, muscle effects, peripheral neuropathy

5.3.4 Influenza

For advice on immunisation against influenza, see section 14.4.

Oseltamivir and zanamivir reduce replication of influenza A and B viruses by inhibiting viral neuraminidase. They are most effective for the treatment of influenza if started within a few hours of the onset of symptoms; they are licensed for use within 48 hours (within 36 hours for zanamivir in children) of the first symptoms. In otherwise healthy individuals they reduce the duration of symptoms by about 1–1.5 days. Oseltamivir or zanamivir can reduce the risk of complications from influenza in the elderly and in patients with chronic disease (see also NICE guidance, p. 350).

Oseltamivir and zanamivir are licensed for post-exposure prophylaxis of influenza when influenza is circulating in the community (see also NICE guidance, below). Oseltamivir and zanamivir are also licensed for use in exceptional circumstances (e.g. when vaccination does not cover the infecting strain) to prevent influenza in an epidemic.

NICE guidance Oseltamivir, zanamivir, and amantadine for prophylaxis of influenza (September 2008)
The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza.

- Amantadine is not recommended for prophylaxis of influenza.
- Oseltamivir and zanamivir are not recommended for seasonal prophylaxis against influenza.
- When influenza is circulating in the community, either oseltamivir or zanamivir are recommended (in accordance with UK licensing) for post-exposure prophylaxis in at-risk patients who are not effectively protected by influenza vaccine, and who have been in close contact with someone suffering from influenza-like illness in the same household or residential setting. Oseltamivir should be given within 48 hours of exposure to influenza while zanamivir should be given within 36 hours of exposure to influenza. National surveillance schemes, including those run by the Health Protection Agency, should be used to indicate when influenza is circulating in the community.
- During local outbreaks of influenza-like illness, when there is a high level of certainty that influenza is present, either oseltamivir or zanamivir may be used for post-exposure prophylaxis in at-risk patients (regardless of influenza vaccination) living in long-term residential or nursing homes.

At risk patients include those aged over 65 years or those who have one or more of the following conditions:
- chronic respiratory disease (including asthma treated with continuous or repeated use of inhaled or systemic corticosteroids or asthma with previous exacerbations requiring hospital admission);
- chronic heart disease;
- chronic renal disease;
- chronic liver disease;
- chronic neurological disease;
- immunosuppression;
- diabetes mellitus.

2. The NICE guidelines on

1. The NICE guidelines on

Influenza A (see also notes above), Side-effects see section 4.9.1
Contra-indications see section 4.9.1
Cautions

350 5.3.4 Influenza BNF 57

NICE guidance
Oseltamivir, zanamivir, and amantadine for treatment of influenza (February 2003)
The drugs described here are not a substitute for vaccination, which remains the most effective way of preventing illness from influenza. When influenza A or influenza B is circulating in the community:

- amantadine is not recommended for treatment of influenza;
- oseltamivir or zanamivir are not recommended for treatment of otherwise healthy individuals with influenza;
- oseltamivir and zanamivir are recommended (in accordance with UK licensing) to treat at-risk adults who can start treatment within 48 hours of the onset of symptoms; oseltamivir is recommended for at-risk children who can start treatment within 48 hours of the onset of symptoms.

At-risk patients include those aged over 65 years or those who have one or more of the following conditions:

- chronic respiratory disease (including chronic obstructive pulmonary disease and asthma);
- significant cardiovascular disease (excluding hypertension);
- chronic renal disease;
- immunosuppression;
- diabetes mellitus.

Community-based virological surveillance schemes including those run by the Health Protection Agency and the Royal College of General Practitioners should be used to indicate when influenza is circulating in the community.

Amantadine is licensed for prophylaxis and treatment of influenza A but it is no longer recommended (see NICE guidance).

Information on pandemic influenza and avian influenza may be found at www.dh.gov.uk/pandemicflu and at www.hpa.org.uk

AMANTADINE HYDROCHLORIDE

Indications see under Dose; parkinsonism (section 4.9.1)
Cautions see section 4.9.1
Contra-indications see section 4.9.1
Side-effects see section 4.9.1

Dose

- Influenza A (see also notes above), ADULT and CHILD over 10 years, treatment, 100 mg daily for 4–5 days; prophylaxis, 100 mg daily usually for 6 weeks or with influenza vaccination for 2–3 weeks after vaccination

1. The NICE guidelines on Prophylaxis of Influenza (September 2008) also include patients with chronic liver disease or chronic neurological disease in the at-risk group.
2. The NICE guidelines on Prophylaxis of Influenza (September 2008) include patients with chronic heart disease in the at-risk group.

Lysovir® (Alliance) Capsules, red-brown, amantadine hydrochloride 100 mg, net price 5-cap pack = £2.40, 14-cap pack = £4.80. Counselling, driving

Symmetrel® (Alliance) Section 4.9.1

OSEL TAMIVIR

Indications see notes above
Cautions renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)
Side-effects nausea, vomiting, abdominal pain, diarrhoea; headache; conjunctivitis; less commonly rash; also reported, hepatitis, arrhythmias, neuropsychiatric disorders (in children and adolescents), visual disturbances, Stevens-Johnson syndrome, and toxic epidermal necrolysis

Dose

- Prevention of influenza, ADULT and ADOLESCENT over 13 years, 75 mg once daily for 10 days for post-exposure prophylaxis; for up to 6 weeks during an epidemic; CHILD 1–13 years, body-weight under 15 kg, 30 mg once daily, body-weight 15–23 kg, 45 mg once daily, body-weight 23–40 kg, 60 mg once daily, body-weight over 40 kg, adult dose
- Treatment of influenza, ADULT and ADOLESCENT over 13 years, 75 mg every 12 hours for 5 days; CHILD 1–13 years, body-weight under 15 kg, 30 mg every 12 hours, body-weight 15–23 kg, 45 mg every 12 hours, body-weight 23–40 kg, 60 mg every 12 hours, body-weight over 40 kg, adult dose

1 Tamiflu® (Roche) Capsules, oseltamivir (as phosphate) 30 mg (yellow), net price 10-cap pack = £8.18; 45 mg (grey), 10-cap pack = £16.36; 75 mg (grey-yellow), 10-cap pack = £16.36. Label: 9
Suspension, sugar-free, tutti-frutti-flavoured, oseltamivir (as phosphate) for reconstitution with water, 60 mg/5 mL, net price 75 mL = £16.36. Label: 9
Excipients include sorbitol 1.7 g/5 mL

1. except for the treatment and prophylaxis of influenza as indicated in the notes above and NICE guidance; endorse prescription ‘SLS’

ZANAMIVIR

Indications see notes above
Cautions asthma and chronic pulmonary disease (risk of bronchospasm—short-acting bronchodilator should be available; avoid in severe asthma unless close monitoring possible and appropriate facilities available to treat bronchospasm); uncontrolled chronic illness; other inhaled drugs should be administered before zanamivir; pregnancy (Appendix 4)
Contra-indications breast-feeding (Appendix 5)
Side-effects very rarely, bronchospasm, respiratory impairment, angioedema, urticaria, and rash; also reported, neuropsychiatric disorders (especially in children and adolescents)
Side-effects

- fever, injection-site reactions, nervousness; less commonly diarrhoea, vomiting, constipation, haemorrhage, rhinitis, cough, wheeze, pain, drowsiness, asthenia, hyperkinesia, leucopenia, and rash; rarely apnoea, hypersensitivity reactions (including anaphylaxis)

Dose

- By intramuscular injection (preferably in anterolateral thigh), 15 mg/kg once a month during season of RSV risk (child undergoing cardiac bypass surgery, 15 mg/kg as soon as stable after surgery, then once a month during season of risk); injection volume over 1 mL should be divided between more than one site

- By inhalation of powder, post-exposure prophylaxis of influenza, ADULT and CHILD over 5 years, 10 mg once daily for 10 days

Prevention of influenza during an epidemic, ADULT and CHILD over 12 years, 10 mg once daily for up to 28 days

Treatment of influenza, ADULT and CHILD over 5 years, 10 mg twice daily for 5 days

Relenza® (GSK)

Dry powder for inhalation disks containing 4 blisters of zanamivir 5 mg/blister, net price 5 disks with Diskhaler® device = £16.36

Synagis® (Abbott)

Injection, powder for reconstitution, palivizumab, net price 50-mg vial = £360.40; 100-mg vial = £663.11

Ribavirin (tribavirin)

Indications severe respiratory syncytial virus bronchiolitis in infants and children; in combination with peginterferon alfa or interferon alfa for chronic hepatitis C in patients without liver decompensation (see also section 5.3.3)

Cautions

Specific cautions for inhaled treatment Maintain standard supportive respiratory and fluid management therapy; monitor electrolytes closely; monitor equipment for precipitation; pregnant women (and those planning pregnancy) should avoid exposure to aerosol

Specific cautions for oral treatment Exclude pregnancy before treatment; effective contraception essential during treatment and for 4 months after treatment in women and for 7 months after treatment in men; routine monthly pregnancy tests recommended; condoms must be used if partner of male patient is pregnant (ribavirin excreted in semen); renal impairment (Appendix 3); cardiac disease (assessment including ECG recommended before and during treatment—discontinue if deterioration); gout; determine full blood count, platelets, electrolytes, serum creatinine, liver function tests and uric acid before starting treatment and then on weeks 2 and 4 of treatment, then as indicated clinically—adjust dose if adverse reactions or laboratory abnormalities develop; consult product literature; eye examination recommended before treatment; eye examination also recommended during treatment if pre-existing ophthalmological disorder deteriorates or if new ophthalmological disorder develops; test thyroid function before treatment and then every 3 months in children

Contra-indications pregnancy (important teratogenic risk: see Cautions and Appendix 4); breastfeeding

Specific contra-indications for oral treatment Severe cardiac disease, including unstable or uncontrolled cardiac disease in previous 6 months; haemoglobinopathies; severe debilitating medical conditions; severe hepatic dysfunction or decompensated cirrhosis (Appendix 2); autoimmune disease (including autoimmune hepatitis); uncontrolled severe psychiatric condition; history of severe psychiatric condition in children

Side-effects Specific side-effects for inhaled treatment Worsening respiration, bacterial pneumonia, and pneumothorax reported; rarely non-specific anaemia and haemolysis

Specific side-effects for oral treatment Haemolytic anaemia (anaemia may be improved by epoetin); also (in combination with peginterferon alfa or interferon alfa) nausea, vomiting, dyspepsia, abdominal pain, peptic ulcer,

5.4.1 Antimalarials

**Recommendations on the prophylaxis and treatment of malaria reflect guidelines agreed by UK malaria specialists.**

The centres listed above should be consulted for advice on special problems.

**Treatment of malaria**

If the infective species is not known, or if the infection is mixed, initial treatment should be as for *falciparum malaria* with quinine, Malarone® (proguanil with atova-quine), or Riamet® (artemether with lumefantrine). Falciparum malaria can progress rapidly in unprotected individuals and antimalarial treatment should be considered in those with features of severe malaria and possible exposure, even if the initial blood tests for the organism are negative.
Falciparum malaria (treatment)

Falciparum malaria (malignant malaria) is caused by Plasmodium falciparum. In most parts of the world P. falciparum is now resistant to chloroquine which should not therefore be given for treatment.

Quinine, Malarone® (proguanil with atovaquone), or Riamet® (artemether with lumefantrine) can be given by mouth if the patient can swallow and retain tablets and there are no serious manifestations (e.g. impaired consciousness); quinine should be given by intravenous infusion (see below) if the patient is seriously ill or unable to take tablets. Mefloquine is now rarely used for treatment because of concerns about resistance.

Oral. The adult dosage regimen for quinine by mouth is:

- 600 mg (of quinine salt\(^1\)) every 8 hours for 5–7 days together with or followed by either doxycycline 200 mg once daily for 7 days or clindamycin 450 mg every 8 hours for 7 days [unlicensed indication].

If the parasite is likely to be sensitive, pyrimethamine 75 mg with sulfadoxine 1.5 g may be given as a single dose [unlicensed] together with or after a course of quinine.

Alternatively, Malarone® or Riamet® may be given instead of quinine. It is not necessary to give doxycycline, clindamycin or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment.

The adult dose of Malarone® by mouth is:

- 4 (‘standard’) tablets once daily for 3 days.

The dose of Riamet® by mouth for adult with body-weight over 35 kg is:

- 4 tablets initially, followed by 5 further doses of 4 tablets each given at 8, 24, 36, 48, and 60 hours (total 24 tablets over 60 hours).

Parenteral. If the patient is seriously ill or unable to take tablets, quinine should be given by intravenous infusion [unlicensed]. The adult dosage regimen for quinine by infusion is:

- loading dose\(^2\) of 20 mg/kg\(^3\) (up to maximum 1.4 g) of quinine salt\(^2\) infused over 4 hours then 8 hours after the start of the loading dose, maintenance dose of 10 mg/kg\(^2\) (up to maximum 700 mg) of quinine salt\(^2\) infused over 4 hours every 8 hours (until patient can swallow tablets to complete the 7-day course together with or followed by either doxycycline or clindamycin as above).

Specialist advice should be sought in difficult cases (e.g. very high parasite count, deterioration on oral treatment doses of quinine, infection acquired in quinine-resistant areas of south east Asia) because intravenous artesunate may be available for ‘named-patient’ use.

1. Valid for quinine hydrochloride, dihydrochloride, and sulphate; not valid for quinine biallate which contains a correspondingly smaller amount of quinine.
2. In intensive care units the loading dose can alternatively be given as quinine salt\(^1\) 7 mg/kg infused over 30 minutes followed immediately by 10 mg/kg over 4 hours then (after 8 hours) maintenance dose as described.
3. Important: the loading dose of 20 mg/kg should not be used if the patient has received quinine or mefloquine during the previous 12 hours.
4. Maintenance dose should be reduced to 5–7 mg/kg of salt in patients with severe renal impairment, severe hepatic impairment, or if parenteral treatment is required for more than 48 hours.

Children

Oral. Quinine is well tolerated by children although the salts are bitter. The dosage regimen for quinine by mouth for children is:

- 10 mg/kg (of quinine salt\(^1\)) every 8 hours for 7 days together with or followed by Clindamycin 7–13 mg/kg [max. 450 mg] every 8 hours for 7 days [unlicensed indication] or in children over 12 years, doxycycline 200 mg once daily for 7 days

or if the parasite is likely to be sensitive, pyrimethamine with sulfadoxine as a single dose [unlicensed]: up to 4 years and body-weight over 5 kg, pyrimethamine 12.5 mg with sulfadoxine 250 mg; 5–6 years, pyrimethamine 25 mg with sulfadoxine 500 mg; 7–9 years, pyrimethamine 37.5 mg with sulfadoxine 750 mg; 10–14 years, pyrimethamine 50 mg with sulfadoxine 1 g; 14–18 years, pyrimethamine 75 mg with sulfadoxine 1.5 g

Alternatively, Malarone® or Riamet® may be given instead of quinine; it is not necessary to give clindamycin, doxycycline, or pyrimethamine with sulfadoxine after Malarone® or Riamet® treatment. The dose regimen for Malarone® by mouth for children over 40 kg is the same as for adults (see above); the dose regimen for Malarone® for smaller children is reduced as follows:

- body-weight 5–8 kg, 2 ‘paediatric’ tablets once daily for 3 days; body-weight 9–10 kg, 3 ‘paediatric’ tablets once daily for 3 days; body-weight 11–20 kg, 1 ‘standard’ tablet once daily for 3 days; body-weight 21–30 kg, 2 ‘standard’ tablets once daily for 3 days; body-weight 31–40 kg, 3 ‘standard’ tablets once daily for 3 days.

The dose regimen of Riamet® by mouth for children over 12 years and body-weight over 35 kg is the same as for adults (see above). The dose regimen for Riamet® for children under 12 years is as follows:

- body-weight 5–15 kg: 1 tablet initially, followed by 5 further doses of 1 tablet each given at 8, 24, 36, 48, and 60 hours (total 6 tablets over 60 hours); body-weight 15–25 kg: 2 tablets initially, followed by 5 further doses of 2 tablets each given at 8, 24, 36, 48, and 60 hours (total 12 tablets over 60 hours);
- body-weight 25–35 kg: 3 tablets initially, followed by 5 further doses of 3 tablets each given at 8, 24, 36, 48, and 60 hours (total 18 tablets over 60 hours)

Parenteral. The dose regimen for quinine by intravenous infusion for children is calculated on a mg/kg basis as for adults (see above).

Pregnancy

Falciparum malaria is particularly dangerous in pregnancy, especially in the last trimester. The adult treatment doses of oral and intravenous quinine given above (including the loading dose) can safely be given to pregnant women. Clindamycin 450 mg every 8 hours for 7 days [unlicensed indication] should be given with or after quinine. Doxycycline should be avoided in pregnancy (affects teeth and skeletal development); pyrimethamine with sulfadoxine, Malarone®, and Riamet® are also best avoided until more information is available.
Benign malarias (treatment)

Benign malaria is usually caused by *Plasmodium vivax* and less commonly by *P. ovale* and *P. malariae*. Chloroquine is the drug of choice for the treatment of benign malaria (but chloroquine-resistant *P. vivax* infection has been reported from Indonesia, New Guinea and some adjacent islands).

The adult dosage regimen for chloroquine by mouth is:

1. initial dose of 620 mg of base then
   2. a single dose of 310 mg of base after 6 to 8 hours then
   3. a single dose of 310 mg of base daily for 2 days

(approximate total cumulative dose of 25 mg/kg of base)

Chloroquine alone is adequate for *P. malariae* infections but in the case of *P. vivax* and *P. ovale*, a radical cure (to destroy parasites in the liver and thus prevent relapses) is required. This is achieved with primaquine [unlicensed] given after chloroquine; in *P. vivax* infection primaquine is given in an adult dosage of 30 mg daily for 14 days and for *P. ovale* infection it is given in an adult dosage of 15 mg daily for 14 days.

Children The dosage regimen of chloroquine for benign malaria in children is:

1. initial dose of 10 mg/kg of base (max. 620 mg) then
2. a single dose of 5 mg/kg of base (max. 310 mg) after 6–8 hours then
3. a single dose of 5 mg/kg of base (max. 310 mg) daily for 2 days

For a radical cure, primaquine [unlicensed] is then given to children over 6 months of age; specialist advice should be sought for children under 6 months of age. In *P. vivax* infection primaquine is given in a dose of 500 micrograms/kg (max. 30 mg) daily for 14 days, and for *P. ovale* infection it is given in a dose of 250 micrograms/kg (max. 15 mg) daily for 14 days.

Pregnancy The adult treatment doses of chloroquine can be given for benign malaria. In the case of *P. vivax* or *P. ovale*, however, the radical cure with primaquine should be postponed until the pregnancy is over; instead chloroquine should be continued at a dose of 310 mg each week during the pregnancy.

Prophylaxis against malaria

The recommendations on prophylaxis reflect guidelines agreed by UK malaria specialists; the advice is aimed at residents of the UK who travel to endemic areas. The choice of drug for a particular individual should take into account:

- risk of exposure to malaria;
- extent of drug resistance;
- efficacy of the recommended drugs;
- side-effects of the drugs;
- patient-related factors (e.g. age, pregnancy, renal or hepatic impairment, compliance with prophylactic regimen).

Protection against bites Prophylaxis is not absolute, and breakthrough infection can occur with any of the drugs recommended. Personal protection against being bitten is very important. Mosquito nets impregnated with permethrin provide the most effective barrier protection against insects; mats and vapourised insecticides are also useful. Diethyltoluamide (DEET) 20–50% in lotions, sprays, or roll-on formulations is safe and effective when applied to the skin of adults and children over 2 months of age. It can also be used during pregnancy and breast-feeding. The duration of protection varies according to the concentration of DEET and is longest for DEET 50%. Long sleeves and trousers worn after dusk also provide protection.

Length of prophylaxis In order to determine tolerance and to establish habit, prophylaxis should generally be started one week (preferably 2–3 weeks in the case of mefloquine) before travel into an endemic area (or if not possible at earliest opportunity up to 1 or 2 days before travel); Malarone or doxycycline prophylaxis should be started 1–2 days before travel. Prophylaxis should be continued for 4 weeks after leaving (except for Malarone prophylaxis which should be stopped 1 week after leaving).

In those requiring long-term prophylaxis, chloroquine and proguanil may be used for periods of over 5 years. Mefloquine is licensed for up to 1 year (although it has been used for up to 3 years without undue problems). Doxycycline can be used for up to 2 years. Malarone is licensed for use up to 28 days but can be used for up to 1 year (and possibly longer) with caution. Specialist advice should be sought for long-term prophylaxis.

Return from malarial region It is important to be aware that any illness that occurs within 1 year and especially within 3 months of return might be malaria even if all recommended precautions against malaria were taken. Travellers should be warned of this and told that if they develop any illness particularly within 3 months of their return they should go immediately to a doctor and specifically mention their exposure to malaria.

Children Prophylactic doses are based on guidelines agreed by UK malaria experts and may differ from advice in product literature. Weight is a better guide than age. If in doubt telephone centres listed on p. 352.

Epilepsy Both chloroquine and mefloquine are unsuitable for malaria prophylaxis in individuals with a his-
During pregnancy unless there is no suitable alternative. INR should be checked at regular intervals. After completing the course. For prolonged stays, the starting chemoprophylaxis, 7 days after starting, and stable before departure. It should be measured before for mefloquine before departure. The INR should be begun chemoprophylaxis at least 1 week (2–3 weeks contra-indicated during pregnancy. Malarone® should be avoided during pregnancy unless there is no suitable alternative. Pregnancy Travel to malarious areas should be avoided during pregnancy; if travel is unavoidable, effective prophylaxis must be used. Chloroquine and proguanil can be given in the usual doses during pregnancy, but these drugs are not appropriate for most areas because their effectiveness has declined, particularly in Sub-Saharan Africa; in the case of proguanil, folic acid 5 mg daily should be given. The centres listed on p. 352 should be consulted for advice on prophylaxis in chloroquine-resistant areas. The manufacturer advises that prophylaxis with mefloquine should be avoided as a matter of principle but studies of mefloquine in pregnancy (including use in the first trimester) indicate that it can be considered for travel to chloroquine-resistant areas. Doxycycline is contra-indicated during pregnancy. Malarone® should be avoided during pregnancy unless there is no suitable alternative.

Breast-feeding Prophylaxis is required in breast-fed infants; although antimalarials are present in milk, the amounts are too variable to give reliable protection.

Anticoagulants Travellers taking warfarin should begin chemoprophylaxis at least 1 week (2–3 weeks for mefloquine) before departure. The INR should be stable before departure. It should be measured before starting chemoprophylaxis, 7 days after starting, and after completing the course. For prolonged stays, the INR should be checked at regular intervals.

Specific recommendations

Where a journey requires two regimens, the regimen for the higher risk area should be used for the whole journey. Those travelling to remote or little-visited areas may require expert advice.

Risk may vary in different parts of a country—check under all risk levels

Important Settled immigrants (or long-term visitors) to the UK may be unaware that they will have lost some of their immunity and also that the areas where they previously lived may now be malarious.

North Africa, the Middle East, and Central Asia

**Very low risk** Risk very low in Algeria, Egypt (but low risk in El Faiyum, see below), Georgia (south-east, July–October), Kyrgyzstan (but low risk in south-west, see below), Libya, rural Morocco, most tourist areas of Turkey (but low risk in Adana and border with Syria, see below), Uzbekistan (extreme south-east only):

- chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

**Low risk** Risk low in Armenia (June–October), Azerbaijan (southern border areas, June–September), Egypt (El Faiyum only, June–October), Iran (northern border with Azerbaijan, May–October; variable risk in rural south-east provinces; see below), rural north Iraq (May–November), Kyrgyzstan (south-west, May–October), north border of Syria (May–October), Turkey (plain around Adana and east of there, border with Syria, March–November), Turkmenistan (south-east only, June–October):

- preferably chloroquine or (if chloroquine not appropriate) proguanil hydrochloride

- chloroquine or (if chloroquine not appropriate) proguanil hydrochloride

**Variable risk** Risk variable and chloroquine resistance present in Afghanistan (below 2000 m, May–November), Iran (rural south-east provinces, March–November, see also Low risk above), Oman (remote rural areas only), Saudi Arabia (south-west and rural areas of western region; no risk in Mecca, Medina, Jeddah, or high-altitude areas of Asir Province), Tajikistan (June–October), Yemen (no risk in Sana’a):

- chloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) doxycycline

Sub-Saharan Africa

No chemoprophylaxis recommended for Cape Verde (some risk on São Tiago) and Mauritius (but avoid mosquito bites and consider malaria if fever presents)

**Very high risk** Risk very high (or locally very high) and chloroquine resistance very widespread in Angola, Benin, Botswana (northern half, November–June), Burkina Faso, Burundi, Cameroon, Central African Republic, Chad, Comoros, Congo, Democratic Republic of the Congo (formerly Zaïre), Djibouti, Equatorial Guinea, Eritrea, Ethiopia (below 2000 m; no risk in Addis Ababa), Gabon, Gambia, Ghana, Guinea, Guinea-Bissau, Ivory Coast, Kenya, Liberia, Madagascar, Malawi, Mali, Mauritania (all year in south, July–October in north), Mozambique, Namibia (all year along Kavango and Kunene rivers; November–June in...
Infections

5

5.4.1 Antimalarials

Note In Zimbabwe and neighbouring countries, pyrimethamine with dapsone (also known as Deltaprim®) prophylaxis is used by local residents (sometimes with chloroquine)—this regimen is not recommended.

South Asia

Low risk Risk low in Bangladesh (but high risk in Chittagong Hill Tracts, see below), India (Kerala [southern states], Tamil Nadu, Karnataka, Southern Andhra Pradesh [including Hyderabad and Mumbai], Rajasthan [including Jaipur], Uttar Pradesh [including Aggra], Haraya, Uttarakanch, Himachal Pradesh, Jammu, Kashmir, Punjab, Delhi; variable risk in other areas, see below; high risk in Assam), Sri Lanka (but variable risk north of Vavuniya, see below):

Variable risk Risk variable and chloroquine resistance usually moderate in southern districts of Bhutan, India (low risk in some areas, see above; high risk in Assam, see below), Nepal (below 1500 m, especially Terai districts; no risk in Kathmandu), Pakistan (below 2000 m), Sri Lanka (north of Vavuniya; low risk in other areas, see above):

Variable to low risk in Singapore (below 1500 m), Thailand (except rural areas in western provinces of Thailand), Vietnam (south of Hanoi, and Mekong River until close to Cambodian border; substantial risk in other areas, see below):

chemoprophylaxis not recommended but avoid mosquito bites and consider malaria if fever presents

Variable risk Risk variable and some chloroquine resistance in Indonesia (very low risk in Bali, and cities but substantial risk in Irian Jaya [West Papua] and Lombok, see below), rural Philippines below 600 m (no risk in cities, Cebu, Bohol, and Catanduanes), deep forests of peninsular Malaysia and Sarawak (but substantial risk in Sabah, see below):

choloroquine + proguanil hydrochloride or (if chloroquine + proguanil not appropriate) mefloquine or doxycycline or Malarone®

Substantial risk Risk substantial and drug resistance common in Cambodia (no risk in Phnom Penh; for western provinces, see below), China (Yunnan and Hainan; chloroquine prophylaxis appropriate for other remote areas; see also Very low risk above), East Timor, Irian Jaya [West Papua], Laos (no risk in Vientiane), Lombok, Malaysia (Sabah; see also Very low risk and Variable risk above), Myanmar (formerly Burma; see also Great risk below), Vietnam (very low risk in some areas, see above):

mefloquine or doxycycline or Malarone®

Great risk and drug resistance present Risk great and widespread chloroquine and mefloquine resistance present in western provinces of Cambodia, borders of Thailand with Cambodia, Laos and Myanmar (very low risk in Chang Ri and Kwai Bridge, see above), Myanmar (eastern Shan State):

doxycycline or Malarone®

Oceania

Risk Risk high and chloroquine resistance high in Papua New Guinea (below 1800 m), Solomon Islands, Vanuatu:

doxycycline or mefloquine or Malarone®

Central and South America and the Caribbean

Variable to low risk Risk variable to low in Argentina (rural areas along northern borders only), rural Belize (except Belize district), Costa Rica (Limon Province except Puerto Limon and northern canton of Pococci), Dominican Republic, El Salvador (Santa Ana province in west), Guatemala (below 1500 m), Haiti, Honduras,
Artemether with lumefantrine

Artemether with lumefantrine is licensed for the treatment of acute uncomplicated falciparum malaria.

### ARTEMETHER WITH LUMEFANTRINE

**Indications** treatment of acute uncomplicated falciparum malaria; treatment of benign malaria [unlicensed indication]

**Cautions** electrolyte disturbances, concomitant use with other drugs known to cause QT-interval prolongation; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); monitor patients unable to take food (greater risk of recrudescence); **interactions**: Appendix 1 (artemether with lumefantrine)

**Driving** Dizziness may affect performance of skilled tasks (e.g. driving)

**Contra-indications** history of arrhythmias, of clinically relevant bradycardia, and of congestive heart failure accompanied by reduced left ventricular ejection fraction; family history of sudden death or of congenital QT interval prolongation; breast-feeding (Appendix 5)

**Side-effects** abdominal pain, anorexia, diarrhoea, vomiting, nausea; palpitation; cough; headache, dizziness, sleep disturbances, asthenia, paraesthesia; arthralgia, myalgia; pruritus, rash; less commonly ataxia, hypoaesthesia

**Dose**
- Treatment of malaria, see p. 353

**Riamet** (Novartis) ▼

Tablets, yellow, artemether 20 mg, lumefantrine 120 mg, net price 24-tab pack = £22.50. Label: 21, counselling, driving

**Note** Tablets may be crushed just before administration

### Chloroquine

Chloroquine is used for the prophylaxis of malaria in areas of the world where the risk of chloroquine-resistant falciparum malaria is still low. It is also used with proguanil when chloroquine-resistant falciparum malaria is present but this regimen may not give optimal protection (see specific recommendations by country, p. 355).

Chloroquine is no longer recommended for the treatment of falciparum malaria owing to widespread resistance, nor is it recommended if the infective species is not known or if the infection is mixed; in these cases treatment should be with quinine, Malarone®, or Riamet® (for details, see p. 352). It is still recommended for the treatment of benign malarial (for details, see p. 354).

### CHLOROQUINE

**Indications** chemoprophylaxis and treatment of malaria; rheumatoid arthritis and lupus erythematosus (section 10.1.3)

**Cautions** moderate or severe hepatic impairment; renal impairment (see notes above); pregnancy (but for malaria benefit outweighs risk, see Appendix 4, Antimalarials); may exacerbate psoriasis; neurological disorders (avoid for prophylaxis if history of
5.4.1 Antimalarials

Mefloquine

Mefloquine is used for the prophylaxis of malaria in areas of the world where there is a high risk of chloroquine-resistant *falciparum malaria* (for details, see specific recommendations by country, p. 355).

Mefloquine is now rarely used for the treatment of *falciparum malaria* because of increased resistance. It is rarely used for the treatment of benign malarial because better tolerated alternatives are available. Mefloquine should not be used for treatment if it has been used for prophylaxis.

The CSM has advised that travellers should be informed about adverse reactions of mefloquine and, if they occur, medical advice should be sought on alternative antimalarials before the next dose is due; the patient information leaflet, which describes adverse reactions should always be provided when dispensing mefloquine.

### MEFLOQUINE

#### Indications
chemoprophylaxis of malaria, treatment of malaria, see notes above

#### Cautions
pregnancy (see notes under Prophylaxis against malaria; Appendix 4)—manufacturer advises avoid pregnancy during and for 3 months after; breast-feeding (Appendix 5); avoid for chemoprophylaxis in severe hepatic impairment; cardiac conduction disorders; epilepsy (avoid for prophylaxis); not recommended in infants under 3 months (5 kg).

#### Interactions
Appendix 1 (mefloquine)

#### Driving
Dizziness or a disturbed sense of balance may affect performance of skilled tasks (e.g. driving); effects may persist for up to 3 weeks

#### Contra-indications
hypersensitivity to quinine; avoid for prophylaxis if history of psychiatric disorders (including depression) or convulsions

#### Side-effects
nausea, vomiting, diarrhoea, abdominal pain; dizziness, loss of balance, headache, sleep disorders (insomnia, drowsiness, abnormal dreams); less commonly neuropsychiatric reactions (including sensorimotor neuropathies, tremor, ataxia, anxiety, depression, panic attacks, agitation, hallucinations, psychosis, convulsions), tinnitus and vestibular disorders, visual disturbances, circulatory disorders (hypotension and hypertension), chest pain, tachycardia, palpitation, Bradycardia, cardiac conduction disorders, dyspnoea, muscle weakness, myalgia, arthralgia, rash (including Stevens-Johnson syndrome), urticaria, pruritus, alopecia, asthenia, malaise, fatigue, fever, loss of appetite, leucopenia or leucocytosis, thrombocytopenia; rarely suicidal ideation; very rarely AV block, pneumonitis, and encephalopathy

#### Dose

- **Prophylaxis of malaria, preferably started 2½ weeks before entering endemic area and continued for 4 weeks after leaving (see notes above), 310 mg once weekly; **infant up to 12 weeks body-weight under 6 kg, 37.5 mg once weekly; 12 weeks–1 year body-weight 6–10 kg, 75 mg once weekly; **child 1–4 years body-weight 10–16 kg, 112.5 mg once weekly; 4–8 years body-weight 16–25 kg, 150 mg once weekly; 8–13 years body-weight 25–45 kg, 225 mg once weekly; over 13 years body-weight over 45 kg, adult dose
  - Treatment of benign malarial, see p. 354

#### Counselling
Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above

Note: Chloroquine doses in BNF may differ from those in product literature

1. **Avloclor® (AstraZeneca)**
   - Tablets, scored, chloroquine phosphate 250 mg (= chloroquine base 155 mg). Net price 20-tab pack = £1.22. Label: 5, counselling, prophylaxis, see above

2. **Malarivon®**
   - Wallace Mfg)

3. **Nivaquine®**
   - Sanofi-Aventis)

4. With proguanil
   - For cautions and side-effects of proguanil see Proguanil; for dose see Chloroquine and Proguanil

5. **Paludrine/Avloclor®**
   - AstraZeneca

   - Tablets, travel pack of 14 tablets of chloroquine phosphate 250 mg (= chloroquine base 155 mg) and 98 tablets of proguanil hydrochloride 100 mg, net price 112-tab pack = £8.79. Label: 5, 21, counselling, prophylaxis, see above

1. Can be sold to the public provided it is licensed and labelled for the prophylaxis of malaria. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials are prescribed

2. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed
of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above.

Note: Mefloquine doses in BNF may differ from those in product literature.

1 Lariam® (Roche) Tablets, scored, mefloquine (as hydrochloride) 250 mg. Net price 8-tab pack = £14.53. Label: 21, 25, 27, counselling, driving, prophylaxis, see above.

Note: Tablet may be crushed and mixed with food such as jam or honey just before administration.

### Primquine

Primquine is used to eliminate the liver stages of *P. vivax* or *P. ovale* following chloroquine treatment (for details, see p. 354).

#### PRIMAQUINE

**Indications** adjunct in the treatment of *Plasmodium vivax* and *P. ovale* malaria (eradication of liver stages)

**Cautions** G6PD deficiency (test blood, see under Benign Malaria treatment, p. 354); systemic diseases associated with granulocytopenia (e.g. rheumatoid arthritis, lupus erythematosus); pregnancy (Appendix 4) and breast-feeding; **interactions**: Appendix 1 (primquine)

**Side-effects** nausea, vomiting, anorexia, abdominal pain; less commonly methaemoglobinemia, haemolytic anaemia especially in G6PD deficiency, leucopenia

**Dose**

- Treatment of benign malarial, see p. 354

**Primquine** (Non-proprietary)

- **Tablets**, primquine (as phosphate) 7.5 mg or 15 mg
  - Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

**Proguanil**

Proguanil is used (usually with chloroquine, but occasionally alone) for the prophylaxis of malaria, (for details, see specific recommendations by country, p. 355).

Proguanil used alone is not suitable for the treatment of malaria; however, Malarone® (a combination of atovaquone with proguanil) is licensed for the treatment of acute uncomplicated falciparum malaria. Malarone® is also used for the prophylaxis of falciparum malaria in areas of widespread mefloquine or chloroquine resistance. Malarone® is also used as an alternative to mefloquine or doxycycline. Malarone® is particularly suitable for short trips to highly chloroquine-resistant areas because it needs to be taken only for 7 days after leaving an endemic area.

#### PROGUANIL HYDROCHLORIDE

**Indications** chemoprophylaxis of malaria

**Cautions** renal impairment (see notes under Prophylaxis against malaria and Appendix 3); pregnancy (Appendix 4); **interactions**: Appendix 1 (proguanil)

**Side-effects** mild gastric intolerance, diarrhoea, and constipation; occasionally mouth ulcers and stomatitis; very rarely cholestasis, vasculitis, skin reactions, and hair loss

1 Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed

### Mefloquine

**Dose**

- Prophylaxis of malaria, preferably started 1 week before entering endemic area and continued for 4 weeks after leaving (see notes above), 200 mg once daily; INFANT up to 12 weeks body-weight under 6 kg, 25 mg once daily; 12 weeks–1 year body-weight 6–10 kg, 50 mg once daily; CHILD 1–4 years body-weight 10–16 kg, 75 mg once daily; 4–8 years body-weight 16–25 kg, 100 mg once daily; 8–13 years, body-weight 25–45 kg, 150 mg once daily; over 13 years body-weight over 45 kg, adult dose

**Counselling** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above.

**Note** Mefloquine doses in BNF may differ from those in product literature.

1 Paludrine® (AstraZeneca) Tablets, scored, proguanil hydrochloride 100 mg. Net price 98-tab pack = £7.43. Label: 21, counselling, prophylaxis, see above

**Note** Tablet may be crushed and mixed with food such as milk, jam, or honey just before administration.

### With chloroquine

See under Chloroquine

#### PROGUANIL HYDROCHLORIDE WITH ATOVAQUONE

**Indications** treatment of acute uncomplicated falciparum malaria and prophylaxis of falciparum malaria, particularly where resistance to other antimalarial drugs suspected; treatment of benign malaria (unlicensed indication)

**Cautions** diarrhoea or vomiting (reduced absorption of atovaquone); efficacy not evaluated in cerebral or complicated malaria (including hyperparasitaemia, pulmonary oedema or renal failure); renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: see Appendix 1 (proguanil, atovaquone)

**Side-effects** abdominal pain, nausea, vomiting, diarrhoea; cough; headache, dizziness, insomnia, abnormal dreams, depression, anorexia; fever; rash, pruritus; less frequently mouth ulcers, stomatitis, anxiety, blood disorders, hyponatraemia, palpitation, and hair loss; also reported, hepatitis, cholestasis, tachycardia, hallucinations, and vasculitis

**Dose**

- See preparations

**Counselling** Warn travellers about importance of avoiding mosquito bites, importance of taking prophylaxis regularly, and importance of immediate visit to doctor if ill within 1 year and especially within 3 months of return. For details, see notes above.

1 Malarone® (GSK) Tablets (‘standard’), pink, f/c, proguanil hydrochloride 100 mg, atovaquone 250 mg. Net price 12-tab pack = £25.21. Label: 21, counselling, prophylaxis, see above

**Dose**

- Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving, ADULT and CHILD over 40 kg, 1 tablet daily

Treatment of malaria, ADULT and CHILD body-weight over 40 kg, 4 tablets once daily for 3 days; CHILD body-weight 11–21 kg 1 tablet daily for 3 days; body-weight 21–31 kg 2 tablets once daily for 3 days; body-weight 31–40 kg 3 tablets once daily for 3 days
Malarone® Paediatric (GSK)  
Paediatric tablets, pink, f/c proguanil hydrochloride 25 mg, atovaquone 62.5 mg, net price 12-tab pack = £6.26. Label: 21, counselling, prophylaxis, see above

Dose: prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 1 week after leaving. CHILD body-weight 11–21 kg, 1 tablet once daily; body-weight 21–31 kg, 2 tablets once daily; body-weight 31–40 kg, 3 tablets once daily; body-weight over 40 kg use Malarone® ‘(standard)’ tablets

Treatment of malaria, CHILD body-weight 5–9 kg, 2 tablets once daily for 3 days; body-weight 9–11 kg, 3 tablets once daily for 3 days; body-weight 11 kg and over use Malarone® ‘(standard)’ tablets

Note: Tablets may be crushed and mixed with food or milky drink just before administration

Pyrimethamine

Pyrimethamine should not be used alone, but is used with sulfadoxine.

Pyrimethamine with sulfadoxine is not recommended for the prophylaxis of malaria, but it can be used in the treatment of falciparum malaria with (or following) quinine.

PYRIMETHAMINE

Indications: malaria (but used only in combined preparations incorporating sulfadoxine); toxoplasmosis—section 5.4.7

Cautions: hepatic or renal impairment, pregnancy (Appendix 4); breast-feeding (Appendix 5); blood counts required with prolonged treatment; history of seizures—avoid large loading doses; interactions: Appendix 1 (pyrimethamine)

Side-effects: depression of haemopoiesis with high doses, rashes, insomnia

Dose:

- Malaria, no dose stated because not recommended alone, see Pyrimethamine with Sulfadoxine below
- Toxoplasmosis, section 5.4.7

Daraprim® (GSK)  
Tablets, scored, pyrimethamine 25 mg. Net price 30-tab pack = £2.17

PYRIMETHAMINE WITH SULFADOXINE

Indications: adjunct to quinine in treatment of Plasmodium falciparum malaria; not recommended for prophylaxis

Cautions: see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); pregnancy (Appendix 4); breast-feeding (Appendix 5); not recommended for prophylaxis (severe side-effects on long-term use); interactions: Appendix 1 (pyrimethamine, sulphonamides)

Contra-indications: see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); sulphonamide allergy

Side-effects: see under Pyrimethamine and under Co-trimoxazole (section 5.1.8); pulmonary infiltrates (e.g. eosinophilic or allergic alveolitis) reported—discontinue if cough or shortness of breath

Dose:

- Treatment of malaria, see p. 353
- Prophylaxis, not recommended by UK malaria experts

Pyrimethamine with sulfadoxine (Non-proprietary)

Tablets, scored, pyrimethamine 25 mg, sulfadoxine 500 mg, net price 3-tab pack = 74p

Note: Also known as Fansidar

Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

Quinine

Quinine is not suitable for the prophylaxis of malaria. Quinine is used for the treatment of falciparum malaria or if the infective species is not known or if the infection is mixed (for details see p. 352).

QUININE

Indications: falciparum malaria; nocturnal leg cramps, see section 10.2.2

Cautions: cardiac disease (including atrial fibrillation, conduction defects, heart block), elderly—monitor ECG during parenteral treatment; renal impairment (Appendix 3); pregnancy (but appropriate for treatment of malaria; Appendix 4); monitor blood glucose and electrolyte concentration during parenteral treatment; G6PD deficiency (see section 9.1.5); interactions: Appendix 1 (quinine)

Contra-indications: haemoglobinuria, myasthenia gravis, optic neuritis, tinnitus

Side-effects: cinchonism, including tinnitus, headache, hot and flushed skin, nausea, abdominal pain, rashes, visual disturbances (including temporary blindness), confusion; cardiovascular effects (see Cautions); hypersensitivity reactions including angioedema; hypoglycaemia (especially after parenteral administration); blood disorders (including thrombocytopenia and intravascular coagulation); acute renal failure; photosensitivity; very toxic in overdosage—immediate advice from poisons centres essential (see also p. 32)

Dose:

- Treatment of malaria, see p. 353

Note: Quinine (anhydrous base) 100 mg = quinine bisulphate 169 mg = quinine dihydrochloride 122 mg = quinine hydrochloride 122 mg = quinine sulphate 121 mg. Quinine bisulphate 300-mg tablets are available but provide less quinine than 300 mg of the dihydrochloride, hydrochloride, or sulphate

Quinine Sulphate (Non-proprietary)

Tablets, coated, quinine sulphate 200 mg, net price 28-tab pack = £1.95; 300 mg, 28-tab pack = £1.88

Quinine Dihydrochloride (Non-proprietary)

Injection, quinine dihydrochloride 300 mg/mL. For dilution and use as an infusion. 1- and 2-mL amps Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

Note: Intravenous injection of quinine is so hazardous that it has been superseded by infusion

1. Drugs for malaria prophylaxis not prescribable on the NHS; health authorities may investigate circumstances under which antimalarials prescribed
Tetracyclines

Doxycycline (section 5.1.3) is used for the prophylaxis of malaria in areas of widespread mefloquine or chloroquine resistance. Doxycycline is also used as an alternative to mefloquine or Malarone® (for details, see specific recommendations by country, p. 355).

Doxycycline is also used as an adjunct to quinine in the treatment of falciparum malaria (for details see p. 353).

DOXYCYCLINE

Indications  prophylaxis of malaria; adjunct to quinine in treatment of Plasmodium falciparum malaria; see also section 5.1.3

Cautions  section 5.1.3

Contra-indications  section 5.1.3

Side-effects  section 5.1.3

Dose

- Prophylaxis of malaria, started 1–2 days before entering endemic area and continued for 4 weeks after leaving (see notes above), 100 mg once daily
- Treatment of falciparum malaria, see p. 353

Preparations

Section 5.1.3

5.4.2 Amoebicides

Metronidazole is the drug of choice for acute invasive amoebic dysentery since it is very effective against vegetative forms of Entamoeba histolytica in faeces; it is given in an adult dose of 800 mg three times daily for 5 days. Tinidazole is also effective. Metronidazole and tinidazole are also active against amoebae which may have migrated to the liver. Treatment with metronidazole (or tinidazole) is followed by a 10-day course of diloxanide furoate.

Diloxanide furoate is the drug of choice for asymptomatic patients with E. histolytica cysts in the faeces; metronidazole and tinidazole are relatively ineffective. Diloxanide furoate is relatively free from toxic effects and the usual course is of 10 days, given alone for chronic infections or following metronidazole or tinidazole treatment.

For amoebic abscesses of the liver metronidazole is effective; tinidazole is an alternative. Aspiration of the abscess is indicated where it is suspected that it may rupture or where there is no improvement after 72 hours of metronidazole; the aspiration may need to be repeated. Aspiration aids penetration of metronidazole and, for abscesses with more than 100 mL of pus, if carried out in conjunction with drug therapy, may reduce the period of disability.

Diloxanide furoate is not effective against hepatic amoebiasis, but a 10-day course should be given at the completion of metronidazole or tinidazole treatment to destroy any amoebae in the gut.

DILOXANIDE FUROATE

Indications  see notes above; chronic amoebiasis and as adjunct to metronidazole or tinidazole in acute amoebiasis

Contra-indications  pregnancy (Appendix 4), breastfeeding (Appendix 5)

Side-effects  flatulence, vomiting, urticaria, pruritus

Dose

- 500 mg every 8 hours for 10 days; CHILD over 25 kg, 20 mg/kg daily in 3 divided doses for 10 days

See also notes above

Diloxanide (Sovereign) Tablets, diloxanide furoate 500 mg, net price 30-tab pack = £42.95. Label: 9

METRONIDAZOLE

Indications  see under Dose below; anaerobic infections, section 5.1.11

Cautions  section 5.1.11

Side-effects  section 5.1.11

Dose

- By mouth, invasive intestinal amoebiasis, 800 mg every 8 hours for 5 days; CHILD 1–3 years 200 mg every 8 hours; 3–7 years 200 mg every 6 hours; 7–10 years 400 mg every 8 hours
- Extra-intestinal amoebiasis (including liver abscess), 400–800 mg every 8 hours for 5–10 days; CHILD 1–3 years 100–200 mg every 8 hours; 3–7 years 100–200 mg every 6 hours; 7–10 years 200–400 mg every 8 hours
- Urogenital trichomoniasis, 200 mg every 8 hours for 7 days or 400–500 mg every 12 hours for 5–7 days, or 2 g as a single dose; CHILD 1–3 years 50 mg every 8 hours for 7 days; 3–7 years 100 mg every 12 hours; 7–10 years 100 mg every 8 hours
- Giardiasis, 2 g daily for 3 days or 400 mg 3 times daily for 5 days or 500 mg twice daily for 7–10 days; CHILD 1–3 years 500 mg daily for 3 days; 3–7 years 600–800 mg daily; 7–10 years 1 g daily

Preparations

Section 5.1.11

TINIDAZOLE

Indications  see under Dose below; anaerobic infections, section 5.1.11

Cautions  section 5.1.11

Side-effects  section 5.1.11

Dose

- Intestinal amoebiasis, 2 g daily for 2–3 days; CHILD 50–60 mg/kg daily for 3 days
- Amoebic involvement of liver, 1.5–2 g daily for 3–6 days; CHILD 50–60 mg/kg daily for 5 days
- Urogenital trichomoniasis and giardiasis, single 2 g dose; CHILD single dose of 50–75 mg/kg (repeated once if necessary)

Preparations

Section 5.1.11

5.4.3 Trichomonacides

Metronidazole (section 5.4.2) is the treatment of choice for Trichomonas vaginalis infection. Contact tracing is recommended and sexual contacts should be treated simultaneously. If metronidazole is ineffective, tinidazole (section 5.4.2) may be tried.
5.4.4 Antigiardial drugs

Metronidazole (section 5.4.2) is the treatment of choice for *Giardia lamblia* infections. Alternative treatments are tinidazole (section 5.4.2) or mecaprine hydrochloride.

MECAPRINE HYDROCHLORIDE

**Indications** giardiasis; discoid lupus erythematosus (Antimalarials, section 10.1.3)

**Cautions** hepatic impairment, elderly, history of psychosis; avoid in psoriasis; **Interactions**: Appendix 1 (mepacrine)

**Side-effects** gastro-intestinal disturbances; dizziness, headache; with large doses nausea, vomiting and occasionally transient acute toxic psychosis and CNS stimulation; on prolonged treatment yellow discoloration of skin and urine, chronic dermatoses (including severe exfoliative dermatitis), hepatitis, aplastic anaemia; also reported blue/black discoloration of palate and nails and cornal deposits with visual disturbances

**Dose**
- Giardiasis [unlicensed], 100 mg every 8 hours for 5–7 days

Mepacrine Hydrochloride

**Tablets**, mecaprine hydrochloride 100 mg. Label: 4, 9, 14, 21

Available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939

5.4.5 Leishmaniacides

Cutaneous leishmaniasis frequently heals spontaneously but if skin lesions are extensive or unsightly, treatment is indicated, as it is in visceral leishmaniasis (kala-azar). Leishmaniasis should be treated under specialist supervision.

Sodium stibogluconate, an organic pentavalent antimony compound, is used for visceral leishmaniasis. The dose is 20 mg/kg daily (max. 850 mg) by intramuscular or intravenous injection for 28 days in visceral leishmaniasis and for 20 days in cutaneous infection; the dosage varies with different geographical regions and expert advice should be obtained. Some early non-inflamed lesions of cutaneous leishmaniasis can be treated with intralesional injections of sodium stibogluconate under specialist supervision.

Amphotericin is used with or after an antimony compound for visceral leishmaniasis unresponsive to the antimonial alone; side-effects may be reduced by using liposomal amphotericin (*Ambisome*—section 5.2) at a dose of 1–3 mg/kg daily for 10–21 days to a cumulative dose of 21–30 mg/kg, or at a dose of 3 mg/kg for 5 consecutive days followed by a single dose of 3 mg/kg 6 days later. Other lipid formulations of amphotericin (*Abelcet* and *Amphocil*) are also likely to be effective but less information is available.

Pentamidine isethionate (pentamidine isethionate) (section 5.4.8) has been used in antimony-resistant visceral leishmaniasis, but although the initial response is often good, the relapse rate is high; it is associated with serious side-effects. Other treatments include paromomycin [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939).

SODIUM STIBOGLUCONATE

**Indications** leishmaniasis

**Cautions** intravenous injections must be given slowly over 5 minutes (to reduce risk of local thrombosis) and stopped if coughing or substernal pain; mucocutaneous disease (see below); monitor ECG before and during treatment; heart disease (withdraw if conduction disturbances occur); treat intercurrent infection (e.g. pneumonia); hepatic impairment; pregnancy (Appendix 4); breast-feeding (Appendix 5)

Mucocutaneous disease Successful treatment of mucocutaneous leishmaniasis may induce severe inflammation around the lesions (may be life-threatening if pharyngeal or tracheal involvement)—may require corticosteroid

**Contra-indications** significant renal impairment

**Side-effects** anorexia, nausea, vomiting, abdominal pain, diarrhoea; ECG changes; coughing (see Cautions); headache, lethargy; arthralgia, myalgia; rarely jaundice, flushing, bleeding from nose or gum, subternal pain (see Cautions), vertigo, fever, sweating, and rash; also reported pancreatitis and anaphylaxis; pain and thrombosis on intravenous administration, intramuscular injection also painful

**Dose**
- See notes above

Pentostam® (GSK)

**Injection**, sodium stibogluconate equivalent to pentavalent antimony 100 mg/mL. Net price 100-mL bottle = £66.43

**Note** Injection should be filtered immediately before administration using a filter of 5 microns or less

5.4.6 Trypanocides

The prophylaxis and treatment of trypanosomiasis is difficult and differs according to the strain of organism. Expert advice should therefore be obtained.

5.4.7 Drugs for toxoplasmosis

Most infections caused by *Toxoplasma gondii* are self-limiting, and treatment is not necessary. Exceptions are patients with eye involvement (toxoplasma choroidoretinitis), and those who are immunosuppressed. Toxoplasmic encephalitis is a common complication of AIDS. The treatment of choice is a combination of pyrimethamine and sulfadiazine (sulphadiazine), given for several weeks (expert advice essential). Pyrimethamine is a folate antagonist, and adverse reactions to this combination are relatively common (folic acid supplements and weekly blood counts needed). Alternative regimens use combinations of pyrimethamine with clindamycin or clari thromycin or azithromycin. Long-term secondary prophylaxis is required after treatment of toxoplasmosis in immunocompromised patients; prophylaxis should continue until immunity recovers.

If toxoplasmosis is acquired in pregnancy, transplacental infection may lead to severe disease in the fetus. Spiramycin [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) may reduce the risk of transmission of maternal infection to the fetus.
### 5.4.8 Drugs for pneumocystis pneumonia

Pneumonia caused by *Pneumocystis jiroveci* (*Pneumocystis carinii*) occurs in immunosuppressed patients; it is a common cause of pneumonia in AIDS. Pneumocystis pneumonia should generally be treated by those experienced in its management. Blood gas measurement is used to assess disease severity.

#### Treatment

**Mild to moderate disease** Co-trimoxazole (section 5.1.8) in high dosage is the drug of choice for the treatment of mild to moderate pneumocystis pneumonia.

Atovaquone is licensed for the treatment of mild to moderate pneumocystis infection in patients who cannot tolerate co-trimoxazole. A combination of dapsone 100 mg daily (section 5.1.10) with trimethoprim 5 mg/kg every 6–8 hours (section 5.1.8) is given by mouth for the treatment of mild to moderate disease [unlicensed indication].

A combination of clindamycin 600 mg by mouth every 8 hours (section 5.1.6) and primaquine 30 mg daily by mouth (section 5.4.1) is used in the treatment of mild to moderate disease [unlicensed indication]; this combination is associated with considerable toxicity.

Inhaled pentamidine isetionate is sometimes used for mild disease. It is better tolerated than parenteral pentamidine but systemic absorption may still occur.

**Severe disease** Co-trimoxazole (section 5.1.8) in high dosage, given by mouth or by intravenous infusion, is the drug of choice for the treatment of severe pneumocystis pneumonia. Pentamidine isetionate given by intravenous infusion is an alternative for patients who cannot tolerate co-trimoxazole, or who have not responded to it. Pentamidine isetionate is a potentially toxic drug that can cause severe hypotension during or immediately after infusion.

Corticosteroid treatment can be lifesaving in those with severe pneumocystis pneumonia (see Adjunctive Therapy below).

**Adjunctive therapy** In moderate to severe infections associated with HIV infection, prednisolone 50–80 mg daily is given by mouth for 5 days (alternatively, hydrocortisone may be given parenterally); the dose is then reduced to complete 21 days of treatment. Corticosteroid treatment should ideally be started at the same time as the anti-pneumocystis therapy and certainly no later than 24–72 hours afterwards. The corticosteroid should be withdrawn before anti-pneumocystis treatment is complete.

**Prophylaxis**

Prophylaxis against pneumocystis pneumonia should be given to all patients with a history of the infection. Prophylaxis against pneumocystis pneumonia should also be considered for severely immunocompromised patients. Prophylaxis should continue until immunity recovers sufficiently. It should not be discontinued if the patient has oral candidiasis, continues to lose weight, or is receiving cytotoxic therapy or long-term immunosuppressant therapy.

**Co-trimoxazole** by mouth is the drug of choice for prophylaxis against pneumocystis pneumonia. It is given in a dose of 960 mg daily or 960 mg on alternate days (3 times a week); the dose may be reduced to co-trimoxazole 480 mg daily to improve tolerance.

Intermittent inhalation of pentamidine isetionate is used for prophylaxis against pneumocystis pneumonia in patients unable to tolerate co-trimoxazole. It is effective but patients may be prone to extrapulmonary infection. Alternatively, dapsone 100 mg daily (section 5.1.10) can be used. Atovaquone 750 mg twice daily has also been used for prophylaxis [unlicensed indication].

### ATOVAQUONE

**Indications** treatment of mild to moderate *Pneumocystis jiroveci* (*Pneumocystis carinii*) pneumonia in patients intolerant of co-trimoxazole

**Cautions** initial diarrhoea and difficulty in taking with food may reduce absorption (and require alternative therapy); other causes of pulmonary disease should be sought and treated; elderly; hepatic impairment (Appendix 2); renal impairment (Appendix 3); pregnancy (Appendix 4); avoid breast-feeding (Appendix 5); **interactions**: Appendix 1 (atovaquone)

**Side-effects** nausea, diarrhoea, vomiting; headache; insomnia; fever; anaemia, neutropenia, hyponatraemia; rash, pruritus; also reported Stevens-Johnson syndrome

**Dose**

- 750 mg twice daily with food (particularly high fat) for 21 days; CHILD not recommended

**Wellvone® (GSK)**

**Suspension**, sugar-free, atovaquone 750 mg/5 mL, net price 210 mL (tutti-frutti-flavoured) = £405.31. Label: 21

**With proguanil hydrochloride**

See section 5.4.1

### PENTAMIDINE ISETIONATE

**Indications** see under Dose (should only be given by specialists)

**Cautions** risk of severe hypotension following administration (establish baseline blood pressure and administer with patient lying down; monitor blood pressure closely during administration, and at regular intervals, until treatment concluded); hypokalaemia, hypomagnesaemia, coronary heart disease, bradycardia, history of ventricular arrhythmias, concomitant use with other drugs which prolong QT-interval; hypertension or hypotension; hyperglycaemia or hypoglycaemia; leucopenia, thrombocytopenia, or anaemia; carry out laboratory monitoring according to product literature; care required to protect personnel during handling and administration; hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5); **interactions**: Appendix 1 (pentamidine isetionate)

**Side-effects** severe reactions, sometimes fatal, due to hypotension, hyperglycaemia, pancreatitis, and arrhythmias; also leucopenia, thrombocytopenia, acute
5 Infections

5.5 Anthelmintics

5.5.1 Drugs for threadworms (pinworms, Enterobius vermicularis)

Anthelmintics are effective in threadworm infections, but their use needs to be combined with hygienic measures to break the cycle of auto-infection. All members of the family require treatment.

Adult threadworms do not live for longer than 6 weeks and for development of fresh worms, ova must be swallowed and exposed to the action of digestive juices in the upper intestinal tract. Direct multiplication of worms does not take place in the large bowel. Adult female worms lay ova on the perianal skin which causes pruritus; scratching the area then leads to ova being transmitted on fingers to the mouth, often via food eaten with unwashed hands. Wasing hands and scrubbing nails before each meal and after each visit to the toilet is essential. A bath taken immediately after rising will remove ova laid during the night.

Mebendazole is the drug of choice for treating threadworm infection in patients of all ages over 2 years. It is given as a single dose; as reinfection is very common, a second dose may be given after 2 weeks.

Piperazine is available in combination with sennosides as a single-dose preparation.

Mebendazole

Indications threadworm, roundworm, whipworm, and hookworm infections

Cautions pregnancy (toxicity in rats); breast-feeding (Appendix 5); interactions: Appendix 1 (mebendazole)

Note The package insert in the Vermox pack includes the statement that it is not suitable for women known to be pregnant or children under 2 years

Side-effects very rarely abdominal pain, diarrhoea, convulsions (in infants) and rash (including Stevens-Johnson syndrome and toxic epidermal necrolysis)

Dose

Threadworms, ADULT and CHILD over 2 years, 100 mg as a single dose; if reinfection occurs second dose may be needed after 2 weeks; CHILD under 2 years, see BNF for Children

Whipworms, ADULT and CHILD over 2 years, 100 mg twice daily for 3 days; CHILD under 2 years, see BNF for Children

Roundworms—section 5.5.2

Hookworms—section 5.5.4

1 Mebendazole (Non-proprietary) Tablets, chewable, mebendazole 100 mg

Mebendazole tablets can be sold to the public if supplied for oral use in the treatment of enterobiasis in adults and children over 2 years provided its container or package is labelled to show a max. single dose of 100 mg and it is supplied in a container or package containing not more than 800 mg

Vermox (Janssen-Cilag) Tablets, orange, scored, chewable, mebendazole 100 mg. Net price 6-tab pack = £1.42

Suspension, mebendazole 100 mg/5 mL. Net price 30 mL = £1.65

5.5 Anthelmintics

5.5.1 Drugs for threadworms

5.5.2 Ascaricides

5.5.3 Drugs for tapeworm infections

5.5.4 Drugs for hookworms

5.5.5 Schistosomicides

5.5.6 Filaricides

5.5.7 Drugs for cutaneous larva migrans

5.5.8 Drugs for strongyloidiasis

Advice on prophylaxis and treatment of helminth infections is available from:

Birmingham (0121) 424 0357
Scottish Centre for Infection and Environmental Health (registered users of Travax only) (0141) 300 1100 (weekdays 2–4 p.m. only)
Liverpool (0151) 708 9393
London (020) 7387 9300 (treatment)

renal failure, hypocalcaemia; also reported: azotaemia, abnormal liver-function tests, anaemia, hyperkalaemia, nausea and vomiting, dizziness, syncope, flushing, hyperglycaemia, rash, and taste disturbances; Stevens-Johnson syndrome reported; on inhalation, bronchoconstriction (may be prevented by prior use of bronchodilators), cough, and shortness of breath; discomfort, pain, induration, abscess formation, and muscle necrosis at injection site

Dose

• Pneumocystis jiroveci (Pneumocystis carinii) pneumonia, by intravenous infusion, 4 mg/kg once daily for at least 14 days (reduced according to product literature in renal impairment)

By inhalation of nebulised solution (using suitable equipment—consult product literature) 600 mg pentamidine isetionate once daily for 3 weeks; secondary prevention, 300 mg every 4 weeks or 150 mg every 2 weeks

• Visceral leishmaniasis (kala-azar, section 5.4.5), by deep intramuscular injection, 3–4 mg/kg on alternate days to max. total of 10 injections; course may be repeated if necessary

• Cutaneous leishmaniasis, by deep intramuscular injection, 3–4 mg/kg once or twice weekly until condition resolves (but see also section 5.4.5)

• Trypanosomiasis, by deep intramuscular injection or intravenous infusion, 4 mg/kg daily or on alternate days to total of 7–10 injections

Note Direct intravenous injection should be avoided whenever possible and never given rapidly; intramuscular injections should be deep and preferably given into the buttock

Pentacarinat® (Sanofi-Aventis) (Appendix 5); interactions:

Injection, powder for reconstitution, pentamidine isetionate, net price 300-mg vial = £30.45

Nebuliser solution, pentamidine isetionate, net price 300-mg bottle = £32.15

Caution in handling Pentamidine isetionate is toxic and personnel should be adequately protected during handling and administration—consult product literature

364 5.5 Anthelmintics

BNF 57

364 5.5 Anthelmintics

BNF 57
PIPERAZINE

Indications threadworm and roundworm infections

Cautions hepatic impairment (Appendix 2); renal impairment (Appendix 3); epilepsy; pregnancy (Appendix 4); packs on sale to the general public carry a warning to avoid in epilepsy, or in liver or kidney disease, and to seek medical advice in pregnancy; breast-feeding (Appendix 5)

Side-effects nausea, vomiting, colic, diarrhoea, allergic reactions including urticaria, bronchospasm, and rare reports of arthralgia, fever, Stevens-Johnson syndrome and angioedema; rarely dizziness, muscular incoordination (‘worm wobble’); drowsiness, nystagmus, vertigo, blurred vision, confusion and clonic contractions in patients with neurological or renal abnormalities

Dose
- See under Preparation, below

With sennosides
For cautions, contra-indications, side-effects of senna see section 1.6.2

Pripsen® (Thornton & Ross)
Oral powder, piperazine phosphate 4 g, total sennosides (calculated as sennoside B) 15.3 mg/sachet. Net price two-dose sachet pack = £1.53. Label: 13

Dose threadworms, stirred into milk or water; ADULT over 6 years, content of 1 sachet as a single dose (bedtime in adults or morning in children), repeated after 14 days; CHILD over 6 years, content of 1 sachet as a single dose (bedtime in adults or morning in children), repeated after 14 days; CHILD 1–6 years, 1 level 5-mL spoonful in the morning, repeated after 14 days
Roundworms, first dose as for threadworms; repeat at monthly intervals for up to 3 months if reinfection risk

5.5.2 Ascaricides
(common roundworm infections)

Mebendazole (section 5.5.1) is effective against Ascaris lumbricoides and is generally considered to be the drug of choice; the usual dose is 100 mg twice daily for 3 days.

Levamisole [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is an alternative. It is very well tolerated; mild nausea or vomiting has been reported in about 1% of treated patients; it is given as a single dose of 120–150 mg in adults.

Piperazine may be given in a single adult dose, see Piperazine, above.

5.5.3 Drugs for tapeworm infections

Taenicides

Niclosamide [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is the most widely used drug for tapeworm infections and side-effects are limited to occasional gastro-intestinal upset, lightheadedness, and pruritus; it is not effective against larval worms. Fears of developing cysticercosis in Taenia solium infections have proved unfounded. All the same, an antiemetic can be given before treatment and a laxative can be given 2 hours after niclosamide.

Praziquantel [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is as effective as niclosamide and is given as a single dose of 5–10 mg/kg after a light breakfast (a single dose of 25 mg/kg for Hymenolepis nana).

Hydatid disease

Cysts caused by Echinococcus granulosus grow slowly and asymptomatic patients do not always require treatment. Surgical treatment remains the method of choice in many situations. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is used in conjunction with surgery to reduce the risk of recurrence or as primary treatment in inoperable cases. Alveolar echinococcosis due to E. multilocularis is usually fatal if untreated. Surgical removal with albendazole cover is the treatment of choice, but where effective surgery is impossible, repeated cycles of albendazole (for a year or more) may help. Careful monitoring of liver function is particularly important during drug treatment.

5.5.4 Drugs for hookworms
(ancylostomiasis, necatoriasis)

Hookworms live in the upper small intestine and draw blood from the point of their attachment to their host. An iron-deficiency anaemia may occur and, if present, effective treatment of the infection requires not only expulsion of the worms but treatment of the anaemia.

Mebendazole (section 5.5.1) has a useful broad-spectrum activity, and is effective against hookworms; the usual dose is 100 mg twice daily for 3 days. Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) given as a single dose of 400 mg, is an alternative.

5.5.5 Schistosomicides
(bilharziasis)

Adult Schistosoma haematobium worms live in the genito-urinary veins and adult S. mansoni in those of the colon and mesentry. S. japonicum is more widely distributed in veins of the alimentary tract and portal system.

Praziquantel [unlicensed] is available from Merck (Cysticide®) and is effective against all human schistosomes. The dose is 20 mg/kg followed after 4–6 hours by one further dose of 20 mg/kg (60 mg/kg in 3 divided doses on one day for S. japonicum infections). No serious adverse effects have been reported. Of all the available schistosomicides, it has the most attractive combination of effectiveness, broad-spectrum activity, and low toxicity.

Hycanthone, lucanthone, niridazole, oxamniquine, and sodium stibogluconate have now been superseded.
5.5.6 Filaricides

Diethylcarbamazine [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is effective against microfilariae and adults of *Loa loa*, *Wuchereria bancrofti*, and *Brugia malayi*. To minimise reactions treatment is commenced with a dose of diethylcarbamazine citrate 1 mg/kg on the first day and increased gradually over 3 days to 6 mg/kg daily in divided doses (up to 9 mg/kg daily in divided doses for *Loa loa*); this dosage is maintained for a further period. Close medical supervision is necessary particularly in the early phase of treatment.

In heavy infections there may be a febrile reaction, and in heavy *Loa loa* infection there is a small risk of encephalopathy. In such cases treatment must be given under careful in-patient supervision and stopped at the first sign of cerebral involvement (and specialist advice sought).

Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is very effective in onchocerciasis and it is now the drug of choice. A single dose of 150 micrograms/kg by mouth produces a prolonged reduction in microfilarial levels. Retreatment at intervals of 6 to 12 months depending on symptoms must be given until the adult worms die out. Reactions are usually slight and most commonly take the form of temporary aggravation of itching and rash. Diethylcarbamazine or suramin should no longer be used for onchocerciasis because of their toxicity.

5.5.7 Drugs for cutaneous larva migrans
(creeeping eruption)

Dog and cat hookworm larvae may enter human skin where they produce slowly extending itching tracks usually on the foot. Single tracks can be treated with topical thiabendazole (no commercial preparation available). Multiple infections respond to ivermectin, albendazole or thiabendazole (thiabendazole) by mouth [all unlicensed] and available from ‘special-order’ manufacturers or specialist importing companies, see p. 939).

5.5.8 Drugs for strongyloidiasis

Adult *Strongyloides stercoralis* live in the gut and produce larvae which penetrate the gut wall and invade the tissues, setting up a cycle of auto-infection. Ivermectin [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) in a dose of 200 micrograms/kg daily for 2 days is the treatment of choice for chronic *Strongyloides* infection.

Albendazole [unlicensed] (available from ‘special-order’ manufacturers or specialist-importing companies, see p. 939) is an alternative given in a dose of 400 mg twice daily for 3 days, repeated after 3 weeks if necessary.
Diabetes mellitus occurs because of a lack of insulin or resistance to its action. It is diagnosed by measuring fasting or random blood-glucose concentration (and occasionally by oral glucose tolerance test). Although there are many subtypes, the two principal classes of diabetes are type 1 diabetes and type 2 diabetes.

**Type 1 diabetes** (formerly referred to as insulin-dependent diabetes mellitus (IDDM)), occurs as a result of a deficiency of insulin following autoimmune destruction of pancreatic beta cells. Patients with type 1 diabetes require administration of insulin.

**Type 2 diabetes** (formerly referred to as non-insulin-dependent diabetes (NIDDM)), is due either to reduced secretion of insulin or to peripheral resistance to the action of insulin. Although patients may be controlled on diet alone, many also require oral antidiabetic drugs or insulin (or both) to maintain satisfactory control. In overweight individuals, type 2 diabetes may be prevented by losing weight and increasing physical activity; use of drugs such as orlistat (section 4.5.1) or sibutramine (section 4.5.2) may be considered in obese patients.

**Treatment of diabetes** Treatment of all forms of diabetes should be aimed at alleviating symptoms and minimising the risk of long-term complications (see below); tight control of diabetes is essential.
Diabetes is a strong risk factor for cardiovascular disease (section 2.12). Other risk factors for cardiovascular disease such as smoking (section 4.10), hypertension (section 2.5), obesity (section 4.5), and hyperlipidaemia (section 2.12) should be addressed. Cardiovascular risk in patients with diabetes can be further reduced by the use of an ACE inhibitor (section 2.5.5.1), low-dose aspirin (section 2.9) and a lipid-regulating drug (section 2.12).

Prevention of diabetic complications Optimal glycaemic control in both type 1 diabetes and type 2 diabetes reduces, in the long term, the risk of microvascular complications including retinopathy, development of proteinuria and to some extent neuropathy. However, a temporary deterioration in established diabetic retinopathy may occur when normalising blood-glucose concentration. For reference to the use of an ACE inhibitor or an angiotensin-II receptor antagonist in the management of diabetic nephropathy, see section 6.1.5.

A measure of the total glycated (or glycosylated) haemoglobin (HbA1c) or a specific fraction (HbA1c) provides a good indication of glycaemic control over the previous 2–3 months. The ideal HbA1c concentration is between 6.5 and 7.5% but this cannot always be achieved, and those on insulin may have significantly increased risks of severe hypoglycaemia. Tight control of blood pressure in hypertensive patients with type 2 diabetes reduces mortality and protects visual acuity (by reducing considerably the risks of maculopathy and retinal photo-coagulation) (see also section 2.5).

Driving Drivers with diabetes are required to notify the Driver and Vehicle Licensing Agency (DVLA) of their condition if they are treated with insulin or if they are treated with oral antidiabetic drugs and also have complications. Detailed guidance on eligibility to drive is available from the DVLA (www.dvla.gov.uk/medical.aspx). Driving is not permitted when hypoglycaemic awareness is impaired or frequent hypoglycaemic episodes occur.

Drivers need to be particularly careful to avoid hypoglycaemia (see also above) and should be warned of the problems. Drivers treated with insulin should normally check their blood-glucose concentration before driving and, on long journeys, at 2-hour intervals; these precautions may also be necessary for drivers taking oral antidiabetic drugs who are at particular risk of hypoglycaemia. Drivers treated with insulin should ensure that a supply of sugar is always available in the vehicle and they should avoid driving if their meal is delayed. If hypoglycaemia occurs, or warning signs develop, the driver should:
- stop the vehicle in a safe place;
- switch off the ignition;
- eat or drink a suitable source of sugar;
- wait until recovery is complete before continuing journey; recovery may take 15 minutes or longer and should preferably be confirmed by checking blood-glucose concentration.

Insulin plays a key role in the regulation of carbohydrate, fat, and protein metabolism. It is a polypeptide hormone of complex structure. There are differences in the amino-acid sequence of animal insulins, human insulins and the human insulin analogues. Insulin may be extracted from pork pancreas and purified by crystallisation; it may also be extracted from beef pancreas, but beef insulins are now rarely used. Human sequence insulin may be produced semisynthetically by enzymatic modification of porcine insulin (emp) or biosynthetically by recombinant DNA technology using bacteria (crb, prb) or yeast (pyr).

All insulin preparations are to a greater or lesser extent immunogenic in man but immunological resistance to insulin action is uncommon. Preparations of human sequence insulin should theoretically be less immunogenic, but no real advantage has been shown in trials. Insulin is inactivated by gastro-intestinal enzymes, and must therefore be given by injection; the subcutaneous route is ideal in most circumstances. Insulin is usually injected into the upper arms, thighs, buttocks, or abdomen; absorption from a limb site may be increased if the limb is used in strenuous exercise after the injection. Generally subcutaneous insulin injections cause few problems; fat hypertrophy does, however, occur but can be minimised by using different injection sites in rotation. Local allergic reactions are rare.

Insulin is needed by all patients with ketoacidosis, and it is likely to be needed by most patients with:
- rapid onset of symptoms;
- substantial loss of weight;
- weakness;
- ketonuria;
- a first-degree relative who has type 1 diabetes.

Insulin is required by almost all children with diabetes. It is also needed for type 2 diabetes when other methods have failed to achieve good control, and temporarily in the presence of intercurrent illness or peri-operatively. Pregnant women with type 2 diabetes may be treated with insulin when diet alone fails. For advice on use of oral antidiabetic drugs in the management of diabetes in pregnancy, see section 6.1.2.

Management of diabetes with insulin The aim of treatment is to achieve the best possible control of blood-glucose concentration without making the patient obsessional and to avoid disabling hypoglycaemia; close co-operation is needed between the patient and the medical team because good control reduces the risk of complications.

Mixtures of insulin preparations may be required and appropriate combinations have to be determined for the individual patient. For patients with acute-onset diabetes, treatment should be started with a short-acting insulin (e.g. soluble insulin, insulin aspart) given 3 times daily with intermediate-acting insulin at bedtime. For those less severely ill, treatment is usually started with a mixture of premixed short- and intermediate-acting
insulins (most commonly in a proportion of 30% soluble insulin and 70% isophane insulin) given twice daily; 8 units twice daily is a suitable initial dose for most ambulant patients. The proportion of the short-acting soluble component can be increased in those with excessive postprandial hyperglycaemia.

The dose of insulin is increased gradually, taking care to avoid troublesome hypoglycaemic reactions.

Insulin preparations can be divided into 3 types:

- those of short duration which have a relatively rapid onset of action, namely soluble insulin, insulin lispro and insulin aspart;
- those with an intermediate action, e.g. isophane insulin and insulin zinc suspension; and
- those whose action is slower in onset and lasts for long periods, e.g. insulin zinc suspension.

The duration of action of a particular type of insulin varies considerably from one patient to another, and needs to be assessed individually.

Examples of recommended insulin regimens

- Short-acting insulin mixed with intermediate-acting insulin: twice daily (before meals)
- Short-acting insulin mixed with intermediate-acting insulin: before breakfast
- Short-acting insulin: before evening meal
- Intermediate-acting insulin: at bedtime
- Short-acting insulin: three times daily (before breakfast, midday, and evening meal)
- Intermediate-acting insulin: at bedtime
- Intermediate-acting insulin with or without short-acting insulin: once daily either before breakfast or at bedtime suffices for some patients with type 2 diabetes who need insulin

Insulin requirements may be increased by infection, stress, accidental or surgical trauma, and during pregnancy. Requirements may be decreased in patients with renal impairment (Appendix 3) or hepatic impairment and in those with some endocrine disorders (e.g. Addison’s disease, hypopituitarism) or coeliac disease.

Pregnancy and breast-feeding During pregnancy and breast-feeding, insulin requirements may alter and doses should be assessed frequently by an experienced diabetes physician. The dose of insulin generally needs to be increased in the second and third trimesters of pregnancy. The short-acting insulin analogues, insulin aspart and insulin lispro, are not known to be harmful, and may be used during pregnancy and lactation. The safety of long-acting insulin analogues in pregnancy has not been established, therefore isophane insulin is recommended where longer-acting insulins are needed.

**NICE guidance**

**Continuous subcutaneous insulin infusion for the treatment of diabetes mellitus (type 1) (July 2008)**

Continuous subcutaneous insulin infusion is recommended as an option in adults and children over 12 years with type 1 diabetes:

- who suffer repeated or unpredictable hypoglycaemia, whilst attempting to achieve optimal glycaemic control with multiple-injection regimens, or
- whose glycaemic control remains inadequate (HbA over 8.5%) despite optimised multiple-injection regimens (including the use of long-acting insulin analogues where appropriate).

Continuous subcutaneous insulin infusion is also recommended as an option for children under 12 years with type 1 diabetes for whom multiple-injection regimens are considered impractical or inappropriate. Children on insulin pumps should undergo a trial of multiple-injection therapy between the ages of 12 and 18 years.

Soluble insulin by the intravenous route is reserved for urgent treatment, and for fine control in serious illness and in the peri-operative period (see under Diabetes and Surgery, below).

**Units** The word ‘unit’ should not be abbreviated.

**Monitoring** Many patients now monitor their own blood-glucose concentrations (section 6.1.6). Since blood-glucose concentrations vary substantially throughout the day, ‘normoglycaemia’ cannot always be achieved throughout a 24-hour period without causing damaging hypoglycaemia. It is therefore best to recommend that patients should maintain a blood-glucose concentration of between 4 and 9 mmol/litre for most of the time (4–7 mmol/litre before meals and less than 9 mmol/litre after meals), while accepting that on occasions, for brief periods, it will be above these values; strenuous efforts should be made to prevent the blood-glucose concentration from falling below 4 mmol/litre. Patients should be advised to look for ‘peaks’ and ‘troughs’ of blood glucose, and to adjust their insulin dosage only once or twice weekly. Overall it is ideal to aim for an HbA (glycosylated haemoglobin) concentration of 6.5–7.5% or less (reference range 4–6%) but this is not always possible without causing disabling hypoglycaemia; in those at risk of arterial disease, the aim should be to maintain the HbA concentration at 6.5% or less. HbA should be measured every 3–6 months. Fructosamine can also be used for assessment of control; this is simpler and cheaper but the measurement of HbA is generally a more reliable method.

**Insulin administration** Insulin is generally given by subcutaneous injection. Injection devices (‘pens’) (section 6.1.1.3), which hold the insulin in a cartridge and meter the required dose, are convenient to use. The conventional syringe and needle is still preferred by many and is also required for insulins not available in cartridge form.

For intensive insulin regimens multiple subcutaneous injections (3 to 4 times daily) are usually recommended. Short-acting injectable insulins (soluble insulin, insulin aspart, insulin glulisine, and insulin lispro) can also be given by continuous subcutaneous infusion using a portable infusion pump. This device delivers a continuous basal insulin infusion and patient-activated bolus doses at meal times. This technique is appropriate only for patients who suffer recurrent hypoglycaemia or marked morning rise in blood-glucose concentration despite optimised multiple-injection regimens. Patients on subcutaneous insulin infusion must be highly motivated, able to monitor their blood-glucose concentration, and have expert training, advice and supervision from an experienced healthcare team.
The intake of energy and of simple and complex carbohydrates should be adequate to allow normal growth and development but obesity must be avoided. The carbohydrate intake needs to be regulated and should be distributed throughout the day. Fine control of plasma glucose can be achieved by moving portions of carbohydrate from one meal to another without altering the total intake.

**Hypoglycaemia** Hypoglycaemia is a potential problem with insulin therapy. All patients must be carefully instructed on how to avoid it.

Loss of warning of hypoglycaemia is common among insulin-treated patients and can be a serious hazard, especially for drivers and those in dangerous occupations. Very tight control of diabetes lowers the blood-glucose concentration needed to trigger hypoglycaemic symptoms; increase in the frequency of hypoglycaemic episodes reduces the warning symptoms experienced by the patient. Beta-blockers can also blunt hypoglycaemic awareness (and also delay recovery).

To restore the warning signs, episodes of hypoglycaemia must be minimised; this involves appropriate adjustment of insulin type, dose and frequency together with suitable timing and quantity of meals and snacks.

Some patients have reported loss of hypoglycaemia warning after transfer to human insulin. Clinical studies do not confirm that human insulin decreases hypoglycaemia awareness. If a patient believes that human insulin is responsible for the loss of warning it is reasonable to revert to animal insulin and essential to educate the patient about avoiding hypoglycaemia. Great care should be taken to specify whether a human or an animal preparation is required.

Few patients are now treated with beef insulins; when undertaking conversion from beef to human insulin, the total dose should be reduced by about 10% with careful monitoring for the first few days. When changing between pork and human-sequence insulins, a dose change is not usually needed, but careful monitoring is still advised.

**Diabetes and surgery** The following regimen is suitable when surgery in a patient with type 1 diabetes requires intravenous infusion of insulin for 12 hours or longer.

- Give an injection of the patient’s usual insulin on the night before the operation.
- Early on the day of the operation, start an intravenous infusion of glucose 5% or 10% containing potassium chloride 10 mmol/litre (provided that the patient is not hyperkalaemic) and infuse at a constant rate appropriate to the patient’s fluid requirements (usually 125 mL per hour); make up a solution of soluble insulin 1 unit/mL in sodium chloride 0.9% and infuse intravenously using a syringe pump piggy-backed to the intravenous infusion.
- The rate of the insulin infusion should normally be: Blood glucose < 4 mmol/litre, give 0.5 units/hour Blood glucose 4–15 mmol/litre, give 2 units/hour Blood glucose 15–20 mmol/litre, give 4 units/hour Blood glucose > 20 mmol/litre, review.
- In resistant cases (such as patients who are in shock or severely ill or those receiving corticosteroids or sympathomimetics) 2–4 times these rates or even more may be needed.

If a syringe pump is not available soluble insulin 16 units/litre should be added to the intravenous infusion of glucose 5% or 10% containing potassium chloride 10 mmol per litre (provided the patient is not hyperkalaemic) and the infusion run at the rate appropriate to the patient’s fluid requirements (usually 125 mL per hour) with the insulin dose adjusted as follows:

- Blood glucose < 4 mmol/litre, give 8 units/litre
- Blood glucose 4–15 mmol/litre, give 16 units/litre
- Blood glucose 15–20 mmol/litre, give 32 units/litre
- Blood glucose > 20 mmol/litre, review.

The rate of intravenous infusion depends on the volume depletion, cardiac function, age, and other factors. Blood-glucose concentration should be measured pre-operatively and then hourly until stable, thereafter every 2 hours. The duration of action of intravenous insulin is only a few minutes and the infusion must not be stopped unless the patient becomes overtly hypoglycaemic (blood glucose < 3 mmol/litre) in which case it should be stopped for up to 30 minutes. The amount of potassium chloride required in the infusion needs to be assessed by regular measurement of plasma electrolytes. Sodium chloride 0.9% infusion should replace glucose 5% or 10% if the blood glucose is persistently above 15 mmol/litre.

Once the patient starts to eat and drink, give subcutaneous insulin before breakfast and stop intravenous insulin 30 minutes later; the dose may need to be 10–20% more than usual if the patient is still in bed or unwell. If the patient was not previously receiving insulin, an appropriate initial dose is 30–40 units daily in four divided doses using soluble insulin before meals and intermediate-acting insulin at bedtime and the dose adjusted from day to day. Patients with hyperglycaemia often relapse after conversion back to subcutaneous insulin calling for one of the following approaches:

- additional doses of soluble insulin at any of the four injection times (before meals or bedtime) or
- temporary addition of intravenous insulin infusion (while continuing the subcutaneous regimen) until blood-glucose concentration is satisfactory or
- complete reversion to the intravenous regimen (especially if the patient is unwell).

### 6.1.1 Short-acting insulins

**Soluble insulin** is a short-acting form of insulin. For maintenance regimens it is usual to inject it 15 to 30 minutes before meals.

Soluble insulin is the most appropriate form of insulin for use in diabetic emergencies e.g. diabetic ketoacidosis (section 6.1.3) and at the time of surgery. It can be given intravenously and intramuscularly, as well as subcutaneously.

When injected subcutaneously, soluble insulin has a rapid onset of action (30 to 60 minutes), a peak action between 2 and 4 hours, and a duration of action of up to 8 hours.

When injected intravenously, soluble insulin has a very short half-life of only about 5 minutes and its effect disappears within 30 minutes.

The human insulin analogues, insulin aspart, insulin glulisine, and insulin lispro have a faster onset and
shorter duration of action than soluble insulin; as a result, compared to soluble insulin, fasting and preprandial blood-glucose concentration is a little higher, postprandial blood-glucose concentration is a little lower, and hypoglycaemia occurs slightly less frequently. Subcutaneous injection of insulin analogues may be convenient for those who wish to inject shortly before or, when necessary, shortly after a meal. They can also help those susceptible to hypoglycaemia before lunch and those who eat late in the evening and are prone to nocturnal hypoglycaemia. They can also be administered intravenously and can be used as alternatives to soluble insulin for diabetic emergencies and at the time of surgery.

**INSULIN**
(Insulin Injection; Neutral Insulin; Soluble Insulin)
A sterile solution of insulin (i.e. bovine or porcine) or of human insulin; pH 6.6–8.0

**Indications**
diabetes mellitus; diabetic ketoacidosis (section 6.1.3)

**Cautions**
see above; pregnancy (Appendix 4); reduce dose in renal impairment (Appendix 3); interactions: Appendix 1 (antidiabetics)

**Side-effects**
see notes above; transient oedema; local

**Dose**
- By subcutaneous, intramuscular or intravenous injection or intravenous infusion, according to requirements
- Highly purified animal
- Counselling Show container to patient and confirm that patient is expecting the version dispensed

**Hypurin**
Bovine Neutral (Wockhardt) (BN)
Injection, soluble insulin (bovine, highly purified)
100 units/mL. Net price 10-mL vial = £18.48; cartridges (for Autopen® Classic) 5 × 3 mL = £27.72

**Hypurin**
Porcine Neutral (Wockhardt) (BN)
Injection, soluble insulin (porcine, highly purified)
100 units/mL. Net price 10-mL vial = £16.80; cartridges (for Autopen® Classic) 5 × 3 mL = £25.20

**Human sequence**
- Counselling Show container to patient and confirm that patient is expecting the version dispensed

**Actrapid**
(Noovo Nordisk) (BN)
Injection, soluble insulin (human, por) 100 units/mL.
Net price 10-mL vial = £7.48
- Note Not recommended for use in subcutaneous insulin infusion pumps—may precipitate in catheter or needle

**Humulin S**
( Lilly) (BN)
Injection, soluble insulin (human, prb) 100 units/mL.
Net price 10-mL vial = £16.50; 5 × 3 mL cartridge (for most Autopen® Classic or Humulin®) = £28.12

**Insumin Rapid**
(Aventis Pharma) (BN)
Injection, soluble insulin (human, crb) 100 units/mL, net price 5 × 3-mL cartridge (for OptiPen® Pro I) = £23.43; 5 × 3-mL Insumin® Rapid OptiSet® prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90
- Note Not recommended for use in subcutaneous insulin infusion pumps

**Mixed preparations**
- See Biphasic Isophane Insulin (section 6.1.1.2)

**INSULIN ASPART**
(Recombinant human insulin analogue)

**Indications**
diabetes mellitus

**Cautions**
see under Insulin; children (use only if benefit likely compared to soluble insulin)

**Side-effects**
see under Insulin

**Dose**
- By subcutaneous injection, immediately before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, intravenous injection or intravenous infusion, according to requirements

**NovoRapid**
(Noovo Nordisk) (BN)
Injection, insulin aspart (recombinant human insulin analogue) 100 units/mL. Net price 10-mL vial = £17.27; Penfill® cartridge (for NovoPen® devices) 5 × 3 mL = £29.45; 5 × 3 mL FlexPen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £32.00

**Counselling**
Show container to patient and confirm that patient is expecting the version dispensed

**INSULIN GLULISINE**
(Recombinant human insulin analogue)

**Indications**
diabetes mellitus

**Cautions**
see under Insulin

**Side-effects**
see under Insulin

**Dose**
- By subcutaneous injection, ADULT and CHILD over 6 years, immediately before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, ADULT and CHILD over 6 years, according to requirements

**Apidra**
(Sanoﬁ-Aventis) ▼ (BN)
Injection, insulin glulisine (recombinant human insulin analogue) 100 units/mL. Net price 10-mL vial = £17.27; 5 × 3 mL cartridge (for OptiPen® Pro I and Autopen® 2d) = £29.45; 5 × 3 mL OptiClik® cartridge (for OptiClik® Pen) = £31.50; 5 × 3 mL Apidra® Optiset® prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £29.45; 5 × 3 mL Apidra® SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £25.00

**Counselling**
Show container to patient and confirm that patient is expecting the version dispensed
- Note The Scottish Medicines Consortium (p. 3) has advised (October 2008) that Apidra is accepted for restricted use within NHS Scotland for the treatment of adults and children over 6 years with diabetes mellitus in whom the use of a short-acting insulin analogue is appropriate

**INSULIN LISPRO**
(Recombinant human insulin analogue)

**Indications**
diabetes mellitus

**Cautions**
see under Insulin; children (use only if benefit likely compared to soluble insulin)
**Endocrine system**

**Humalog® (Lilly) (R)**

Injection, insulin lispro (recombinant human insulin analogue) 100 units/mL. Net price 10-mL vial = £17.28; 5 × 3-mL cartridge (for OptiPen® Classic or HumaPen®) = £29.46; 5 × 3-mL Humalog®-Pen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46; 5 × 3-mL Humalog® KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

**Counselling**

Show container to patient and confirm that patient is expecting the version dispensed

---

**6.1.1 Insulins**

**Humalog® (Lilly)**

Injection, insulin lispro (recombinant human insulin analogue) 100 units/mL. Net price 10-mL vial = £17.28; 5 × 3-mL cartridge (for OptiPen® Classic or HumaPen®) = £29.46; 5 × 3-mL Humalog®-Pen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46; 5 × 3-mL Humalog® KwikPen prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46

**Counselling**

Show container to patient and confirm that patient is expecting the version dispensed

---

**INSULIN DETEMIR**

(Recombinant human insulin analogue—long acting)

**Indications**

diabetes mellitus

**Cautions**

see under Insulin (section 6.1.1.1); pregnancy (Appendix 4)

**Side-effects**

see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, ADULT and CHILD over 6 years, according to requirements

**Levemir® (Novo Nordisk)**

Injection, insulin detemir (recombinant human insulin analogue) 100 units/mL. Net price 5 × 3-mL cartridge (for NovoPen® devices) = £39.00; 5 × 3-mL FlexPen® prefilled disposable injection device (range 1–60 units, allowing 1-unit dosage adjustment) = £39.00; 5 × 3-mL Levemir InnoLet® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £44.85

**Counselling**

Show container to patient and confirm that patient is expecting the version dispensed

---

**INSULIN GLARGINE**

(Recombinant human insulin analogue—long acting)

**Indications**

diabetes mellitus

**Cautions**

see under Insulin (section 6.1.1.1); pregnancy (Appendix 4)

**Side-effects**

see under Insulin (section 6.1.1.1)

**Dose**

- By subcutaneous injection, ADULT and CHILD over 6 years, according to requirements

**Lantus® (Aventis Pharma)**

Injection, insulin glargine (recombinant human insulin analogue) 100 units/mL. Net price 10-mL vial = £26.00; 5 × 3-mL cartridge (for OptiPen® Pro 1 and Autopen® 24) = £39.00; 5 × 3-mL Opticlik® cartridge (for Opticlik® Pen®) = £42.00; 5 × 3-mL Lantus® OptiSet® prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £39.00; 5 × 3-mL Lantus® SoloStar® prefilled disposable injection devices (range 1–80 units, allowing 1-unit dosage adjustment) = £42.00

**Note**

The Scottish Medicines Consortium (p. 3) has advised (October 2002) that insulin glargine is accepted for restricted use within NHS Scotland for the treatment of type 1 diabetes:

- in those who are at risk of or experience unacceptable frequency or severity of nocturnal hypoglycaemia on attempting to achieve better hypoglycaemic control during treatment with other insulins
- as a once daily insulin therapy for patients who require a carer to administer their insulin.

It is not recommended for routine use in patients with type 2 diabetes unless they suffer from recurrent episodes of hypoglycaemia or require assistance with their insulin injections.

**Counselling**

Show container to patient and confirm that patient is expecting the version dispensed

---

**Side-effects**

see under Insulin

**Dose**

- By subcutaneous injection shortly before meals or when necessary shortly after meals, according to requirements
- By subcutaneous infusion, or intravenous injection, or intravenous infusion, according to requirements

- who would otherwise need twice-daily basal insulin injections in combination with oral antidiabetic drugs.

A trial of insulin glargine may be offered to those who have experienced significant nocturnal hypoglycaemia when treated with isophane insulin.
INSULIN ZINC SUSPENSION

(In insulin Zinc Suspension (Mixed)—long acting)

A sterile neutral suspension of bovine and/or porcine insulin or of human insulin in the form of a complex obtained by the addition of a suitable zinc salt; consists of rhombohedral crystals (10–40 microns) and of particles of no uniform shape (not exceeding 2 microns).

Indications  diabetes mellitus
Cautions  see under Insulin (section 6.1.1.1)
Side-effects  see under Insulin (section 6.1.1.1)

Dose  • By subcutaneous injection, according to requirements

Highly purified animal

Hypurin® Bovine Lente (Wockhardt) (Insulatard
Injection  insulin suspension (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £18.48
Counselling  Show container to patient and confirm that patient is expecting the version dispensed

ISOPHANE INSULIN

(Inophane Insulin Injection; Isophane Protamine Suspension; Isophane Insulin (NPH)—intermediate acting)

A sterile suspension of bovine or porcine insulin or of human insulin in the form of a complex obtained by the addition of protamine sulphate or another suitable protamine.

Indications  diabetes mellitus
Cautions  see under Insulin (section 6.1.1.1)
Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose  • By subcutaneous injection, according to requirements

Highly purified animal

Counselling  Show container to patient and confirm that patient is expecting the version dispensed

Hypurin® Bovine Insophane (Wockhardt) (Humulin I-Pen
Injection  isophane insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £18.48
Counselling  Show container to patient and confirm that patient is expecting the version dispensed

Hypurin® Porcine Insophane (Wockhardt) (Humulin I-Pen
Injection  isophane insulin (porcine, highly purified) 100 units/mL. Net price 10-mL vial = £16.80; cartridges (for Autopen® Classic) 5 x 3 mL = £25.20

Human sequence

Counselling  Show container to patient and confirm that patient is expecting the version dispensed

Insulatard® (Novo Nordisk) (Insulatard
Injection  insophane insulin (human, pyr) 100 units/mL. Net price 10-mL vial = £7.48; Insulatard Penfil® cartridge (for Novopen® devices) 5 x 3 mL = £20.08; 5 x 3 mL Insulatard InnoLet® prefilled disposable injection devices (range 1–50 units, allowing 1-unit dosage adjustment) = £20.40

Humulin I® (Lilly) (Humulin I-Pen
Injection  insophane insulin (human, prb) 100 units/mL. Net price 10-mL vial = £16.50; 5 x 3 mL cartridge (for Autopen® Classic or HumaPen®) = £29.94; 5 x 3 mL Humulin I-Pen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.94

Insuman® Basal (Aventis Pharma) (Insulatard InnoLet
Injection  isophane insulin (human, crb) 100 units/mL. Net price 5-mL vial = £5.84; 5 x 3-mL cartridge (for OptiPen® Pro I) = £23.43; 5 x 3-mL Insuman® Basal OptiSet® prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

Mixed preparations

See Biphasic Isophane Insulin (p. 374)

PROTAMINE ZINC INSULIN

(Protamine Zinc Insulin Injection—long acting)

A sterile suspension of insulin in the form of a complex obtained by the addition of a suitable protamine and zinc chloride; this preparation was included in BP 1980 but is not included in BP 1988

Indications  diabetes mellitus
Cautions  see under Insulin (section 6.1.1.1); see also notes above
Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose  • By subcutaneous injection, according to requirements

Hypurin® Bovine Protamine Zinc (Wockhardt) (Insulatard Protamine Zinc Injection—long acting)
Injection  protamine zinc insulin (bovine, highly purified) 100 units/mL. Net price 10-mL vial = £18.48
Counselling  Show container to patient and confirm that patient is expecting the version dispensed

Biphasic insulins

BIPHASIC INSULIN ASPART

(Intermediate-acting insulin)

Indications  diabetes mellitus
Cautions  see under Insulin and Insulin Aspart (section 6.1.1.1)
Side-effects  see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

Dose  • By subcutaneous injection, up to 10 minutes before or soon after a meal, according to requirements

NovoMix® 30 (Novo Nordisk) (Insulatard Protamine Zinc Injection, biphasic insulin aspart (recombinant human insulin analogue), 30% insulin aspart, 70% insulin aspart protamine, 100 units/mL. Net price 5 x 3 mL Penfil® cartridges (for Novopen® devices) = £29.43; 5 x 3 mL FlexPen® prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £32.00
Counselling  Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)
6.1.1 Insulins

**BIPHASIC INSULIN LISPRO**
(Intermediate-acting insulin)

**Indications** diabetes mellitus

**Cautions** see under Insulin and Insulin Lispro (section 6.1.1.1)

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

**Dose**
- By subcutaneous injection, up to 15 minutes before or soon after a meal, according to requirements

**Humalog® Mix25** *(Lilly)*

**Injection**, biphasic insulin lispro (recombinant human insulin analogue), 25% insulin lispro, 75% insulin lispro protamine, 100 units/mL, net price 5 × 3-mL cartridge *(for Autopen® Classic or HumaPen®)* = £29.46; 5 × 3-mL prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98. **Humalog® Mix25 KwikPen** prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

**Humalog® Mix50** *(Lilly)*

**Injection**, biphasic insulin lispro (recombinant human insulin analogue), 50% insulin lispro, 50% insulin lispro protamine, 100 units/mL, net price 5 × 3-mL cartridge *(for Autopen® Classic or HumaPen®)* = £29.46; 5 × 3-mL prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £29.46; 5 × 3-mL **Humalog® Mix50 KwikPen** prefilled disposable injection devices (range 1–60 units, allowing 1-unit dosage adjustment) = £30.98

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

**BIPHASIC ISOPHANE INSULIN**
(Biphasic Isophane Insulin Injection—intermediate acting)

A sterile buffered suspension of either porcine or human insulin complexed with protamine sulphate (or another suitable protamine) in a solution of insulin of the same species

**Indications** diabetes mellitus

**Cautions** see under Insulin (section 6.1.1.1)

**Side-effects** see under Insulin (section 6.1.1.1); protamine may cause allergic reactions

**Dose**
- By subcutaneous injection, according to requirements

**Highly purified animal**

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

**Hyypurin® Porcine 30/70 Mix** *(Wockhardt)*

**Injection**, biphasic isophane insulin (porcine, highly purified), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £16.80; cartridges *(for Autopen® Classic)* 5 × 3 mL = £25.20

**Human sequence**

**Counselling** Show container to patient and confirm that patient is expecting the version dispensed; the proportions of the two components should be checked carefully (the order in which the proportions are stated may not be the same in other countries)

**Mixtard® 30** *(Novo Nordisk)*

**Injection**, biphasic isophane insulin (human, pyr), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £7.48; **Mixtard 30 Penfill® cartridge** *(for Novopen® devices)* 5 × 3 mL = £20.08; 5 × 3-mL **Mixtard 30 InnoLet®** prefilled disposable injection devices (range 1–50 units allowing 1-unit dosage adjustment) = £19.87

**Humulin M3®** *(Lilly)*

**Injection**, biphasic isophane insulin (human, prb), 30% soluble, 70% isophane, 100 units/mL. Net price 10-mL vial = £16.50; 5 × 3-mL cartridge *(for most Autopen® Classic or HumaPen®)* = £28.12

**Insuman® Comb 15** *(Aventis Pharma)*

**Injection**, biphasic isophane insulin (human, crb), 15% soluble, 85% isophane, 100 units/mL, net price 5 × 3-mL **Insuman® Comb 15 OptiSet®** prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

**Insuman® Comb 25** *(Aventis Pharma)*

**Injection**, biphasic isophane insulin (human, crb), 25% soluble, 75% isophane, 100 units/mL, net price 5-mL vial = £8.94; 5 × 3-mL cartridge *(for OptiPen® Pro I)* = £23.43; 5 × 3-mL **Insuman® Comb 25 OptiSet®** prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

**Insuman® Comb 50** *(Aventis Pharma)*

**Injection**, biphasic isophane insulin (human, crb), 50% soluble, 50% isophane, 100 units/mL, net price 5 × 3-mL cartridge *(for OptiPen® Pro I)* = £23.43; 5 × 3-mL **Insuman® Comb 50 OptiSet®** prefilled disposable injection devices (range 2–40 units, allowing 2-unit dosage adjustment) = £27.90

**6.1.1.3 Hypodermic equipment**

Patients should be advised on the safe disposal of lancets, single-use syringes, and needles. Suitable arrangements for the safe disposal of contaminated waste must be made before these products are prescribed for patients who are carriers of infectious diseases.

**Injection devices**

**Autopen** *(Owen Mumford)*

**Injection device**, Autopen 24 *(for use with Sanofi-Aventis 3-mL insulin cartridges)*, allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (both) = £15.55; **Autopen Classic** *(for use with Lilly and Wockhardt 3-mL insulin cartridges)*, allowing 1-unit dosage adjustment, max. 21 units (single-unit version) or 2-unit dosage adjustment, max. 42 units (2-unit version), net price (all) = £15.79

**HumaPen Luxura** *(Lilly)*

**Injection device**, for use with **Humulin** and **Humalog** 3-mL cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £26.36 (available in burgundy and champagne)
HumaPen Luxura HD (Lilly) Injection device, for use with Humulin and Humalog 3-mL cartridges, allowing 0.5-unit dosage adjustment, max. 30 units, net price = £26.36

mhi-500 (Medical House) Needle-free insulin delivery device for use with any 10-mL vial or any 3-mL cartridge of insulin (except the Novo Nordisk 3 mL penfills), allowing 0.5-unit dosage adjustment, max. 50 units, net price 3-month consumables pack for 10-mL adapter (13 nozzles, 5 insulin vial adaptors) = £23.43, for 3-mL adapter (13 nozzles, 5 insulin cartridge adaptors) = £35.81; vial adapter pack (6 insulin vial adaptors) = £7.66, cartridge adapter pack (6 insulin cartridge adaptors) = £7.87; nozzle pack (6 nozzles) = £7.81

NovoPen (Novo Nordisk) Injection device, for use with Penfill insulin cartridges; NovoPen Junior (for 3-mL cartridges), allowing 0.5-unit dosage adjustment, max. 35 units, net price = £25.02; NovoPen 4 (for 3-mL cartridges), allowing 1-unit dosage adjustment, max. 60 units, net price = £26.36 (available in silver and blue)

OptiClik (Sanofi-Aventis) Injection device, for use with Lantus OptiClik or Apidra Opticlutch insulin cartridges, allowing 1-unit dosage adjustment, max. 80 units, net price = £20.13 (available in blue and grey)

OptiPen Pro 1 (Aventis Pharma) Injection device, for use with Insuman insulin cartridges; allowing 1-unit dosage adjustment, max. 60 units, net price = £22.00

SQ-PEN (Medical House) Needle-free insulin delivery device for use with any 10-mL vial or any 3-mL cartridge of insulin, allowing 1-unit dosage adjustment, max. 50 units, net price starter pack (SQ-PEN device, 1 practice nozzle, 1 nozzle, 1 3-mL adapter, 1 10-mL adapter) = £147.83, 3-month consumables pack for 10-mL adapter (7 nozzles, 5 × 10-mL insulin vial adaptors) = £18.08, for 3-mL adapter (7 nozzles, 15 × 3-mL insulin cartridge adaptors) = £30.82; vial adapter pack (6 insulin vial adaptors) = £7.66, cartridge adapter pack (6 insulin cartridge adaptors) = £7.66; nozzle pack (6 nozzles) = £10.03

Needle Clipping (Chopping) Device (Drug Tariff) Consisting of a clipper to remove needle from its hub and container from which cut-off needles cannot be retrieved; designed to hold 1500 needles, not suitable for use with lancets. Net price = £1.32

Sharpguard (Drug Tariff) Net price 1-litre sharpsbin = 85p

6.1.2 Antidiabetic drugs

6.1.2.1 Sulphonylureas

6.1.2.2 Biguanides

6.1.2.3 Other antidiabetic drugs

Oral antidiabetic drugs are used for the treatment of type 2 diabetes mellitus. They should be prescribed only if the patient fails to respond adequately to at least 3 months’ restriction of energy and carbohydrate intake and an increase in physical activity. They should be used to augment the effect of diet and exercise, and not to replace them.

For patients not adequately controlled by diet and oral hypoglycaemic drugs, insulin may be added to the treatment regimen or substituted for oral therapy. When insulin is added to oral therapy, it is generally given as twice-daily injections of a biphasic insulin (or insophane insulin mixed with soluble insulin). Weight gain and hypoglycaemia may be complications of insulin therapy but weight gain may be reduced if the insulin is given in combination with metformin.

Pregnancy and breast-feeding During pregnancy, women with either pre-existing or gestational diabetes may be treated with metformin [unlicensed use], either alone or in combination with insulin (section 6.1.1). Women with gestational diabetes should discontinue
hypoglycaemic treatment during breast-feeding for those with pre-existing diabetes.

Other oral hypoglycaemic drugs, including sulphonylureas, are contra-indicated in pregnancy (see also Appendix 4) and in breast-feeding (Appendix 5).

### 6.1.2 Sulphonylureas

The sulphonylureas act mainly by augmenting insulin secretion and consequently are effective only when some residual pancreatic beta-cell activity is present; during long-term administration they also have an extrapancreatic action. All may cause hypoglycaemia but this is uncommon and usually indicates excessive dosage. Sulphonylurea-induced hypoglycaemia may persist for many hours and must always be treated in hospital.

Sulphonylureas are considered for patients who are not overweight, or in whom metformin is contra-indicated or not tolerated. Several sulphonylureas are available and choice is determined by side-effects and the duration of action as well as the patient’s age and renal function. The long-acting sulphonylureas chlorpropamide and glibenclamide are associated with a greater risk of hypoglycaemia; for this reason they should be avoided in the elderly and shorter-acting alternatives, such as glipizide or tolbutamide, should be used instead. Chlorpropamide also has more side-effects than the other sulphonylureas (see below) and therefore it is no longer recommended.

When the combination of strict diet and sulphonylurea treatment fails other options include:

- combining with metformin (section 6.1.2.2) (reports of increased hazard with this combination remain unconfirmed);
- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with pioglitazone or rosiglitazone, but see section 6.1.2.3;
- combining with bedtime isophane insulin (section 6.1.1) but weight gain and hypoglycaemia can occur.

Insulin therapy should be instituted temporarily during intercurrent illness (such as myocardial infarction, coma, infection, and trauma). Sulphonylures should be omitted on the morning of surgery; insulin is required because of the ensuing hyperglycaemia in these circumstances.

**Contra-indications** Sulphonylureas should be avoided where possible in severe hepatic impairment (Appendix 2) and in acute porphyria (section 9.8.2). They should not be used during pregnancy (Appendix 4) and while breast-feeding (Appendix 5)—see section 6.1.2. Sulphonylureas are contra-indicated in the presence of ketoadiotosis.

**Side-effects** Side-effects of sulphonylureas are generally mild and infrequent and include gastro-intestinal disturbances such as nausea, vomiting, diarrhoea and constipation.

Chlorpropamide has appreciably more side-effects, mainly because of its very prolonged duration of action and the consequent hazard of hypoglycaemia and it should no longer be used. It may also cause facial flushing after drinking alcohol; this effect does not normally occur with other sulphonylureas. Chlorpropamide may also enhance anti-diuretic hormone secretion and very rarely cause hyponatraemia (hyponatraemia is also reported with glimepiride and glipizide).

Sulphonylureas can occasionally cause a disturbance in liver function, which may rarely lead to cholestatic jaundice, hepatitis and hepatic failure. Hypersensitivity reactions can occur, usually in the first 6–8 weeks of therapy, they consist mainly of allergic skin reactions which progress rarely to erythema multiforme and exfoliative dermatitis, fever and jaundice; photosensitiv-ity has rarely been reported with chlorpropamide and glipizide. Blood disorders are also rare but may include leucopenia, thrombocytopenia, agranulocytosis, panc- topenia, haemolytic anaemia, and aplastic anaemia.

### CHLORPROPAMIDE

**Indications** type 2 diabetes mellitus (for use in dia-betes insipidus, see section 6.5.2)

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above; **Side-effects** see notes above

**Dose**

- Initially 250 mg daily with breakfast (ELDERLY 100–125 mg but avoid—see notes above), adjusted according to response; max. 500 mg daily

**Chlorpropamide** (Non-proprietary) Tablets, chlorpropamide 100 mg, net price 20 = £1.70; 250 mg, 20 = £2.00. Label: 4

---

**GLIBENCAMIDE**

**Indications** type 2 diabetes mellitus

**Cautions** see notes above; **interactions:** Appendix 1 (antidiabetics)

**Contra-indications** see notes above; **Side-effects** see notes above
Dose
- Initially 5 mg daily with or immediately after breakfast; dose adjusted according to response in elderly; avoid, see notes above; max. 15 mg daily

Glibenclamide (Non-proprietary) (EH)
Tablets, glibenclamide 2.5 mg, net price 28-tab pack = £85p; 5 mg, 28-tab pack = £88p

Euglucon® (Aventis Pharma) (FH)
Tablets, glibenclamide 2.5 mg, net price 28-tab pack = £1.72

Gliclazide (Non-proprietary) (EH)
Indications type 2 diabetes mellitus
Cautions see notes above; interactions: Appendix 1 (antidiabetics)
Contra-indications see notes above
Side-effects see notes above
Dose
- Initially, 40–80 mg daily, adjusted according to response; up to 160 mg as a single dose; higher doses divided; max. 320 mg daily

GlaxoSmithKline
Tablets, scored, gliclazide 80 mg, net price 28-tab pack = £1.71

Note: DIAGLYK

Glucotrol
Tablets, scored, gliclazide 80 mg, net price 60-tab pack = £4.56

Modifed release

Diamicron® (Servier) (FH)
Tablets, m/r, gliclazide 30 mg, net price 28-tab pack = £3.08, 56-tab pack = £6.16. Label: 25

Dose
- Initially 30 mg daily with breakfast, adjusted according to response every 4 weeks (after 2 weeks if no decrease in blood glucose); max. 120 mg daily

Glibenclamide (Non-proprietary) (EH)
Tablets, scored, glibenclamide 2.5 mg, net price 28-tab pack = £1.48, 5 mg (scored), 28-tab pack = £1.26

Tolbutamide (Non-proprietary) (EH)
Tablets, tolbutamide 500 mg. Net price 28-tab pack = £1.51

6.1.2.2 Biguanides

Metformin, the only available biguanide, has a different mode of action from the sulphonylureas, and is not interchangeable with them. It exerts its effect mainly by decreasing gluconeogenesis and by increasing peripheral utilisation of glucose; since it acts only in the presence of endogenous insulin it is effective only if there are some residual functioning pancreatic islet cells.

Metformin is the drug of first choice in overweight patients in whom strict dieting has failed to control diabetes, if appropriate it may also be considered as an option in patients who are not overweight. It is also used when diabetes is inadequately controlled with sulphonylurea treatment. When the combination of strict diet and metformin treatment fails, other options include:

- combining with acarbose (section 6.1.2.3), which may have a small beneficial effect, but flatulence can be a problem;
- combining with insulin (section 6.1.1) but weight gain and hypoglycaemia can be problems (weight gain minimised if insulin given at night);
- combining with a sulphonylurea (section 6.1.2.1) (reports of increased hazard with this combination remain unconfirmed);
METFORMIN HYDROCHLORIDE

Indications diabetes mellitus (see notes above); polycystic ovary syndrome [unlicensed indication]; it improves insulin sensitivity, may aid weight reduction, helps to normalise menstrual cycle (increasing the rate of spontaneous ovulation), and may improve hirsutism.

Caution very rarely, metformin can provoke lactic acidosis which is most likely to occur in patients with renal impairment, see Lactic Acidosis below.

Lactic acidosis Metformin should be used cautiously in renal impairment because of the increased risk of lactic acidosis: it is contra-indicated in patients with significant renal impairment. NICE recommends that the dose of metformin should be reviewed if estimated glomerular filtration rate (eGFR) falls below 45 mL/minute/1.73 m² and to avoid if eGFR less than 30 mL/minute/1.73 m². To reduce the risk of lactic acidosis, metformin should be stopped temporarily withdrawn in those at risk of tissue hypoxia or sudden deterioration in renal function, such as those with dehydration, severe infection, shock, sepsis, acute heart failure, respiratory failure or hepatic impairment (Appendix 2), or those who have recently had a myocardial infarction.

Contra-indications ketoacidosis, see also Lactic Acidosis above; use of iodine-containing X-ray contrast media (do not restart metformin until renal function returns to normal) and use of general anaesthesia (suspend metformin on the morning of surgery and restart when renal function returns to normal); pregnancy (Appendix 4); breast-feeding (Appendix 5).

Side-effects anorexia, nausea, vomiting, diarrhoea (usually transient), abdominal pain, taste disturbance, rarely lactic acidosis (withdraw treatment), decreased vitamin-B₁₂ absorption, erythema, pruritus and urticaria; hepatitis also reported.

Dose
- Diabetes mellitus, ADULT and CHILD over 10 years initially 500 mg with breakfast for at least 1 week then 500 mg with breakfast and evening meal for at least 1 week then 500 mg with breakfast, lunch and evening meal; usual max. 2 g daily in divided doses.
- Polycystic ovary syndrome [unlicensed], initially 500 mg with breakfast for 1 week, then 500 mg with breakfast and evening meal for 1 week, then 1.5–1.7 g daily in 2–3 divided doses.

Note Metformin doses in the BNF may differ from those in the product literature.

Oral solution, sugar-free, metformin hydrochloride 500 mg/5 mL, net price 100 mL = £62.41. Label: 21.

Brands include Metol.

Glucophage® (Merck) Tablets, 1/2c, metformin hydrochloride 500 mg, net price 84-tab pack = £2.88; 850 mg, 56-tab pack = £3.20. Label: 21.

Modified release

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal, if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets.

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of Bolamyn SR, not suitable if dose of standard-release tablets more than 2 g daily.

Dose initially 500 mg once daily, increased every 10–15 days, max. 2 g once daily with evening meal, if control not achieved, use 1 g twice daily with meals, and if control still not achieved change to standard-release tablets.

Note Patients taking up to 2 g daily of the standard-release metformin may start with the same daily dose of Glucophage SR, not suitable if dose of standard-release tablets more than 2 g daily.

The Scottish Medicines Consortium has advised (December 2005) that Glucophage SR is not recommended for the treatment of type 2 diabetes.

With pioglitazone See section 6.1.2.3.

With rosiglitazone See section 6.1.2.3.

With vildagliptin See section 6.1.2.3.

6.1.2.3 Other antidiabetic drugs

Acarbos, an inhibitor of intestinal alpha glucosidases, delays the digestion and absorption of starch and sucrose; it has a small but significant effect in lowering blood glucose. Use of acarbose is usually reserved for when other oral hypoglycaemics are not tolerated and are contra-indicated. Postprandial hyperglycaemia in type 1 diabetes can be reduced by acarbose, but it has been little used for this purpose. Flatulence deters some from using acarbose although this side-effect tends to decrease with time.

Nateglinide and repaglinide stimulate insulin release. Both drugs have a rapid onset of action and short duration of activity, and should be administered shortly before each main meal. Repaglinide may be given as...
monotherapy for patients who are not overweight or for those in whom metformin is contra-indicated or not tolerated, or it may be given in combination with metformin. Nateglinide is licensed only for use with metformin.

The thiazolidinediones, pioglitazone and rosiglitazone, reduce peripheral insulin resistance, leading to a reduction of blood-glucose concentration. Either drug can be used alone or in combination with metformin or with a sulphonylurea (if metformin inappropriate); the combination of a thiazolidinedione plus metformin is preferred to a thiazolidinedione plus sulphonylurea, particularly for obese patients. Inadequate response to a combination of metformin and sulphonylurea may indicate failing insulin release; the introduction of pioglitazone or rosiglitazone has a limited role in these circumstances and the initiation of insulin is often more appropriate. Blood-glucose control may deteriorate temporarily when a thiazolidinedione is substituted for an oral antidiabetic drug that is being used in combination with another. Long-term benefits of the thiazolidinediones have not yet been demonstrated. NICE (May 2008) has recommended that, when glycaemic control is inadequate with existing treatment, a thiazolidinedione can be added to:

- a sulphonylurea, if metformin is not tolerated
- metformin, if risks of hypoglycaemia with sulphonylurea are unacceptable
- combination of metformin and a sulphonylurea, if human insulin is likely to be unacceptable because of lifestyle or other personal issues, or the patient is obese or has metabolic syndrome.

The Scottish Medicines Consortium accepts use of a thiazolidinedione (rosiglitazone (June 2006), pioglitazone (February 2007)) with metformin and a sulphonylurea, for patients (especially if overweight) whose glycaemic control is inadequate despite the use of 2 oral hypoglycaemic drugs and who are unable or unwilling to take insulin; treatment should be initiated and monitored by an experienced diabetes physician.

**MHRA/CHM advice**

Rosiglitazone and pioglitazone cardiovascular safety (December 2007 and February 2008)

Rosiglitazone and pioglitazone should not be used in patients with heart failure or history of heart failure; incidence of heart failure is increased when rosiglitazone or pioglitazone is combined with insulin. Rosiglitazone should not be used in patients with acute coronary syndrome. Patients should be closely monitored for signs of heart failure. Rosiglitazone may be associated with a small increased risk of cardiac ischaemia particularly in combination with insulin. Rosiglitazone is not recommended for use in patients with ischaemic heart disease or peripheral arterial disease; in patients with history of ischaemic heart disease rosiglitazone should only be used after careful evaluation of the patient’s individual risk. The combination of rosiglitazone and insulin should be used only in exceptional cases, and under close supervision.

Sitagliptin and vildagliptin inhibit dipeptidylpeptidase-4 to increase insulin secretion and lower glucagon secretion. Both drugs are licensed for use in type 2 diabetes in combination with metformin or a sulphonylurea (if metformin inappropriate) or a thiazolidinedione, when treatment with either metformin or a sulphonylurea or a thiazolidinedione fails to achieve adequate glycaemic control. Sitagliptin is also licensed for use in combination with both metformin and a sulphonylurea when dual therapy with these drugs fails to achieve adequate glycaemic control.

The Scottish Medicines Consortium (p. 3) has advised (March 2008) that vildagliptin (Galvus®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in combination with metformin when addition of a sulphonylurea is inappropriate.

Exenatide, a synthetic form of exendin-4, is an incretin mimetic which increases insulin secretion, suppresses glucagon secretion, and slows gastric emptying. It is given by subcutaneous injection for the treatment of type 2 diabetes in combination with metformin or a sulphonylurea, or both, in patients who have not achieved adequate glycaemic control with these drugs alone or in combination. Exenatide use is associated with the prevention of weight gain and possible promotion of weight loss which can be beneficial in overweight patients.

The Scottish Medicines Consortium (p. 3) has advised (June 2007) that exenatide (Byetta®) is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes in combination with metformin or sulphonylurea (or both), as an alternative to treatment with insulin in patients where treatment with metformin or sulphonylurea (or both) at maximally tolerated doses has been inadequate, and treatment with insulin would be the next option.

**ACARBOSE**

**Indications** diabetes mellitus inadequately controlled by diet or by diet with oral antidiabetic drugs

**Cautions** monitor liver function; may enhance hypoglycaemic effects of insulin and sulphonylureas (hypoglycaemic episodes may be treated with oral glucose but not with sucrose); interactions: Appendix 1 (antidiabetics)

**Contra-indications** inflammatory bowel disease, predisposition to partial intestinal obstruction; hernia, previous abdominal surgery; hepatic impairment; renal impairment (Appendix 3); pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** flatulence, soft stools, diarrhoea (may need to reduce dose or withdraw), abdominal distention and pain; rarely, nausea, abnormal liver function tests and skin reactions; very rarely ileus, oedema, jaundice, and hepatitis

**Note** Antacids unlikely to be beneficial for treating side-effects

**Dose**

- Initially 50 mg daily increased to 50 mg 3 times daily, then increased if necessary after 6–8 weeks to 100 mg 3 times daily; max. 200 mg 3 times daily; CHILD and ADOLESCENT under 18 years not recommended

**Counselling** Tablets should be chewed with first mouthful of food or swallowed whole with a little liquid immediately before food. To counteract possible hypoglycaemia, patients receiving insulin or a sulphonylurea as well as acarbose need to carry glucose (not sucrose—acarbose interferes with sucrose absorption)
Glucobay® (Bayer) FILM TABLETS
Tablets, acarbose 50 mg, net price 90-tab pack = £6.60; 100 mg (scored), 90-tab pack = £12.51. Counselling, administration

EXENATIDE
Indications type 2 diabetes mellitus in combination with metformin or sulphonylurea (or with both) when metformin or a sulphonylurea or both inadequate
Cautions elderly; renal impairment (Appendix 3—avoid if creatinine clearance less than 30 mL/minute); pancreatitis (see below); interactions: Appendix 1 (antidiabetics)
Pancreatitis Severe pancreatitis (sometimes fatal), including haemorrhagic or necrotising pancreatitis, has been reported rarely. Patients or their carers should be told how to recognise signs and symptoms of pancreatitis and advised to seek prompt medical attention if symptoms such as abdominal pain, nausea, and vomiting develop; discontinue permanently if pancreatitis is diagnosed
Contra-indications ketoacidosis; severe gastro-intestinal disease; pregnancy (Appendix 4); breast-feeding (Appendix 5)
Side-effects gastro-intestinal disturbances including nausea, vomiting, diarrhoea, dyspepsia, abdominal pain and distension, gastro-oesophageal reflux disease, decreased appetite; headache, dizziness, asthenia; hypoglycaemia; increased sweating, injection-site reactions; antibody formation; very rarely anaphylactic reactions; also reported constipation, flatulence, dehydration, taste disturbance, renal impairment, pancreatitis (see Cautions above), drowsiness, rash, pruritus, urticaria, and angioedema
Dose
• By subcutaneous injection, ADULT over 18 years, initially 5 micrograms twice daily within 1 hour before 2 main meals (at least 6 hours apart), increased if necessary after at least 1 month to max. 10 micrograms twice daily Counselling If a dose is missed, continue with the next scheduled dose—do not administer after a meal. Some oral medications should be taken at least 1 hour before or 4 hours after exenatide injection—consult product literature for details
Byetta® (Lilly) FILM TABLETS
Injection, exenatide 250 micrograms/mL, net price 5 microgram/dose prefilled pen (60 doses) = £68.24, 10 microgram/dose prefilled pen (60 doses) = £88.24. Counselling, administration

NATEGLINIDE
Indications type 2 diabetes mellitus in combination with metformin (section 6.1.2.2) when metformin alone inadequate
Cautions substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit nateglinide on morning of surgery and recommence when eating and drinking normally); elderly, debilitated and malnourished patients; moderate hepatic impairment (avoid if severe—Appendix 2); interactions: Appendix 1 (antidiabetics)
Contra-indications ketoacidosis; pregnancy (Appendix 4) and breast-feeding (Appendix 5)
Side-effects hypoglycaemia; hypersensitivity reactions including pruritus, rashes and urticaria
Dose
• Initially 60 mg 3 times daily within 30 minutes before main meals, adjusted according to response up to max. 180 mg 3 times daily; CHILD and ADOLESCENT under 18 years not recommended
Starlix® (Novartis) FILM TABLETS
Tablets, f/c, nateglinide 60 mg (pink), net price 84-tab pack = £22.71; 120 mg (yellow), 84-tab pack = £25.88; 180 mg (red), 84-tab pack = £25.88

PIOGLITAZONE
Indications type 2 diabetes mellitus (alone or combined with metformin or a sulphonylurea, or with both, or with insulin—see also notes above)
Cautions monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure—see MHRA/CHM advice p. 379); substitute insulin during peri-operative period (omit pioglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fractures in females in feet, lower leg, hands, and lower arms; interactions: Appendix 1 (antidiabetics)
Liver toxicity Rare reports of liver dysfunction; monitor liver function before treatment, and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue and dark urine develop; discontinue if jaundice occurs
Contra-indications hepatic impairment, history of heart failure, pregnancy (Appendix 4), breast-feeding (Appendix 5)
Side-effects gastro-intestinal disturbances, weight gain, oedema, anaemia, headache, visual disturbances, dizziness, arthralgia, hypoesthesia, haematuria, impotence; less commonly hypoglycaemia, fatigue, insomnia, vertigo, sweating, altered blood lipids, proteinuria; see also Liver Toxicity above
Dose
• Initially 15–30 mg once daily increased to 45 mg once daily according to response
Actos® (Takeda) FILM TABLETS
Tablets, pioglitazone (as hydrochloride) 15 mg, net price 28-tab pack = £24.14; 30 mg, 28-tab pack = £33.54; 45 mg, 28-tab pack = £36.96
With metformin For cautions, contra-indications, and side-effects of metformin, see section 6.1.2.2
Competact® (Takeda) FILM TABLETS
Tablets, f/c, pioglitazone (as hydrochloride) 15 mg, metformin hydrochloride 850 mg, net price 56-tab pack = £31.56, Label: 21
Dose type 2 diabetes not controlled by metformin alone, 1 tablet twice daily. CHILD and ADOLESCENT under 18 years not recommended
Note Titration with the individual components (pioglitazone and metformin) desirable before initiating Competact

REPAGLINIDE
Indications type 2 diabetes mellitus (as monotherapy or in combination with metformin when metformin alone inadequate)
Cautions substitute insulin during intercurrent illness (such as myocardial infarction, coma, infection, and trauma) and during surgery (omit repaglinide on morning of surgery and recommence when eating and
drinking normally); debilitated and malnourished patients; renal impairment; interactions: Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis; severe hepatic impairment; pregnancy (Appendix 4) and breastfeeding (Appendix 5)

**Side-effects** abdominal pain, diarrhoea, constipation, nausea, vomiting; rarely hypoglycaemia, hypersensitivity reactions including pruritis, rashes, vasculitis, urticaria, and visual disturbances

**Dose**
- Initially 500 micrograms within 30 minutes before main meals (1 mg if transferring from another oral hypoglycaemic), adjusted according to response at intervals of 1–2 weeks; up to 4 mg may be given as a single dose, max. 16 mg daily; CHILD and ADOLESCENT under 18 years and ELDERLY over 75 years, not recommended

**Prandin** (Daichi Sankyo)  
Tablets, repaglinide 500 micrograms, net price 30-tab pack = £3.92, 90-tab pack = £11.76; 1 mg (yellow), 30-tab pack = £3.92, 90-tab pack = £11.76; 2 mg (peach), 90-tab pack = £11.76

Formerly marketed as NovoNorm

### ROSIGLITAZONE

**Indications** type 2 diabetes mellitus (alone or combined with metformin or with a sulphonylurea or with both—see also notes above)

**Cautions** monitor liver function (see below); cardiovascular disease or in combination with insulin (risk of heart failure and ischaemic heart disease—see MHRA/CHM advice p. 379); substitute insulin during peri-operative period (omit rosiglitazone on morning of surgery and recommence when eating and drinking normally); increased risk of bone fracture in females in feet, hands, and upper arms; renal impairment (Appendix 3); interactions: Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction reported; monitor liver function before treatment and periodically thereafter; advise patients to seek immediate medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, anorexia and dark urine develop; discontinue if jaundice occurs or liver enzymes significantly raised

**Contra-indications** hepatic impairment, history of heart failure or acute coronary syndrome, pregnancy (Appendix 4), breastfeeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances, cardiac ischaemia, headache, anaemia, altered blood lipids, weight gain, oedema, hypoglycaemia, bone fracture; less commonly increased appetite, heart failure, fatigue, paraesthesia, alopecia, dyspnoea; rarely pulmonary oedema, onset or worsening of macular oedema; very rarely angioedema, urticaria; see also Liver Toxicity above

**Dose**
- Initially 4 mg daily; may be increased after 8 weeks to 8 mg daily (in 1–2 divided doses) according to response; CHILD and ADOLESCENT under 18 years not recommended

**Avandia** (GSK)  
Tablets, f/c, rosiglitazone (as maleate) 4 mg (orange), net price 28-tab pack = £24.14, 56-tab pack = £48.28; 8 mg (red/brown), 28-tab pack = £36.96

### With metformin

For cautions, contra-indications, and side-effects of metformin, see section 6.1.2.2

**Avandamet** (GSK)  
Avandamet® 2 mg/500 mg tablets, f/c, pink, rosiglitazone (as maleate) 2 mg, metformin hydrochloride 500 mg, net price 112-tab pack = £36.96. Label: 21

**Avandamet® 2 mg/1 g tablets, f/c, yellow, rosiglitazone (as maleate) 2 mg, metformin hydrochloride 1 g, net price 56-tab pack = £24.14. Label: 21

**Avandamet® 4 mg/1 g tablets, f/c, pink, rosiglitazone (as maleate) 4 mg, metformin hydrochloride 1 g, net price 56-tab pack = £36.96. Label: 21

**Dose** type 2 diabetes mellitus not controlled by metformin alone, initially one Avandamet 2 mg/1 g tablet twice daily, increased after 8 weeks according to response to two Avandamet 2 mg/500 mg tablets twice daily or one Avandamet 4 mg/1 g tablet twice daily; max. 8 mg rosiglitazone and 2 g metformin hydrochloride daily; CHILD and ADOLESCENT under 18 years not recommended

**Note** Titration with the individual components (rosiglitazone and metformin) desirable before initiating Avandamet

### SITAGLIPTIN

**Indications** type 2 diabetes mellitus (in combination with metformin or with a thiazolidinedione or with a sulphonylurea or with metformin and a sulphonylurea—see notes above)

**Cautions** renal impairment (Appendix 3); interactions: Appendix 1 (antidiabetics)

**Contra-indications** ketoacidosis; pregnancy (Appendix 4); breast-feeding (Appendix 5)

**Side-effects** gastro-intestinal disturbances; peripheral oedema; upper respiratory tract infection, nasopharyngitis; pain; osteoarthrits; less commonly anorexia, headache, drowsiness, dizziness, hypoglycaemia, osteoarthris

**Dose**
- ADULT over 18 years, 100 mg once daily

**Note** Dose of concomitant sulphonylurea may need to be reduced

**Januvia** (MSD)  
Tablets, beige, f/c, sitagliptin (as phosphate) 100 mg, net price 28-tab pack = £33.26

### VILDAGLIPTIN

**Indications** type 2 diabetes mellitus (in combination with metformin or with a sulphonylurea or with a thiazolidinedione—see also notes above)

**Cautions** elderly; monitor liver function (see below); heart failure (avoid if moderate or severe); renal impairment (avoid if creatinine clearance less than 50 mL/minute; Appendix 3); interactions: Appendix 1 (antidiabetics)

**Liver toxicity** Rare reports of liver dysfunction; monitor liver function before treatment and periodically thereafter; advise patients to seek prompt medical attention if symptoms such as nausea, vomiting, abdominal pain, fatigue, anorexia and dark urine develop; discontinue if jaundice or other signs of liver dysfunction occur

**Contra-indications** ketoacidosis; hepatic impairment (Appendix 2); pregnancy (Appendix 4); breastfeeding (Appendix 5)

**Side-effects** nausea; peripheral oedema; headache, tremor, asthenia, dizziness; less commonly constipation; hypoglycaemia; rarely hepatic dysfunction (see
also Liver Toxicity above); very rarely nasopharyngitis; upper respiratory tract infection and arthralgia also reported

**Dose**
- **ADULT** over 18 years, in combination with metformin or a thiazolidinedione, 50 mg twice daily; in combination with a sulphonylurea, 50 mg daily in the morning

**Galvus®** (Novartis) ▼ (p48)
- Tablets, pale yellow, vildagliptin 50 mg, net price 56-tab pack = £31.76

**With metformin**
For cautions, contra-indications, and side-effects of metformin, see section 6.1.2.2

**Eucreas®** (Novartis) ▼ (p48)
- **Eucreas®** 50 mg/850 mg tablets, f/c, yellow, vildagliptin 50 mg, metformin hydrochloride 850 mg, net price 60-tab pack = £31.76. Label: 21
- **Eucreas®** 50 mg/1 g tablets, f/c, dark yellow, vildagliptin 50 mg, metformin hydrochloride 1 g, net price 60-tab pack = £31.76. Label: 21

**Dose**
- type 2 diabetes mellitus not controlled by metformin alone, **ADULT** over 18 years, 1 Eucreas® tablet twice daily (based on patient’s current metformin dose)

The Scottish Medicines Consortium (p. 3) has advised (June 2008) that Eucreas® is accepted for restricted use within NHS Scotland for the treatment of type 2 diabetes mellitus in patients unable to achieve adequate glycaemic control with metformin alone or those already treated with vildagliptin and metformin as separate tablets

**6.1.3 Diabetic ketoacidosis**

Soluble insulin, used intravenously, is the most appropriate form of insulin for the management of diabetic ketoacidotic and hyperosmolar non-ketotic coma. It is preferable to use the type of soluble insulin that the patient has been using previously. It is necessary to achieve and to maintain an adequate plasma-insulin concentration until the metabolic disturbance is brought under control.

Insulin is best given by intravenous infusion, using an infusion pump, and diluted to 1 unit/mL (care in mixing, see Appendix 6). Adequate plasma-insulin concentration can usually be maintained with infusion rates of 6 units/hour for adults and 0.1 units/kg/hour for children. Blood glucose is expected to decrease by about 5 mmol/litre/hour; if the response is inadequate the infusion rate can be doubled or quadrupled. When the blood-glucose concentration has fallen to 10 mmol/litre the infusion rate can be reduced to 3 units/hour for adults (about 0.05 units/kg/hour for children) and continued until the patient is ready to take food by mouth. The insulin infusion should not be stopped before subcutaneous insulin has been started.

No matter how large, a bolus intravenous injection of insulin can provide an adequate plasma concentration for a short time only; therefore if facilities for intravenous infusion are not available the insulin is given by intramuscular injection. An initial loading dose of 20 units intramuscularly is followed by 6 units intramuscularly every hour until the blood-glucose concentration falls to 10 mmol/litre; intramuscular injections are then given every 2 hours. Although absorption of insulin is usually rapid after intramuscular injection, it may be impaired in the presence of hypotension and poor tissue perfusion; moreover insulin may accumulate during treatment and late hypoglycaemia should be watched for and treated appropriately.

Intravenous replacement of fluid and electrolytes (section 9.2.2) with sodium chloride intravenous infusion is an essential part of the management of ketoacidosis; potassium chloride is included in the infusion as appropriate to prevent the hypokalaemia induced by the insulin. Sodium bicarbonate infusion (1.26% or 2.74%) is used only in cases of extreme acidosis and shock since the acid-base disturbance is normally corrected by the insulin. When the blood glucose has fallen to approximately 10 mmol/litre glucose 5% is infused (maximum 2 litres in 24 hours), but insulin infusion must continue.

**6.1.4 Treatment of hypoglycaemia**

Initially glucose 10–20 g is given by mouth either in liquid form or as granulated sugar or sugar lumps. Approximately 10 g of glucose is available from 2 teaspoons of sugar, 3 sugar lumps. Glucophage® (formerly known as Hypostop Gel® glucose 10 g/25 g tube, available from BBI Healthcare), and non-diet versions of Lucozade® Energy Original 55 mL, Coca-Cola® 90 mL, Ribena® Original 15 mL (to be diluted). If necessary this may be repeated in 10–15 minutes. After initial treatment, a snack providing sustained availability of carbohydrate (e.g. a sandwich, fruit, milk, and biscuits) or the next meal, if it is due, can prevent blood-glucose concentration from falling again.

Hypoglycaemia which causes unconsciousness is an emergency. Glucagon, a polypeptide hormone produced by the alpha cells of the islets of Langerhans, increases plasma-glucose concentration by mobilising glycogen stored in the liver. In hypoglycaemia, if sugar cannot be given by mouth, glucagon can be given by injection. Carbohydrates should be given as soon as possible to restore liver glycogen; glucagon is not appropriate for chronic hypoglycaemia. It may be issued to close relatives of insulin-treated patients for emergency use in hypoglycaemic attacks. It is often advisable to prescribe on an ‘if necessary’ basis to hospitalised insulin-treated patients, so that it may be given rapidly by the nurses during an hypoglycaemic emergency. If not effective in 10 minutes intravenous glucose should be given.

Alternatively, 50 mL of glucose intravenous infusion 20% (section 9.2.2) may be given intravenously into a large vein through a large-gauge needle; care is required since this concentration is irritant especially if extravasation occurs. Alternatively, 25 mL of glucose intravenous infusion 50% may be given, but this higher concentration is more irritant and viscous making administration difficult. Glucose intravenous infusion 10% may also be used but larger volumes are needed. Close monitoring is necessary in the case of an overdose with a long-acting insulin because further administration of glucose may be required. Patients whose hypoglycaemia is caused by an oral anti-diabetic drug should be transferred to hospital because the hypoglycaemic effects of these drugs may persist for many hours.

For advice on the emergency management of hypoglycaemia in dental practice, see p. 23
GLUCAGON

Indications see notes above and under Dose

Cautions see notes above, insulinoma, glucagonoma; ineffective in chronic hypoglycaemia, starvation, and adrenal insufficiency

Contra-indications phaeochromocytoma

Side-effects nausea, vomiting, abdominal pain, hypokalaemia, hypotension, rarely hypersensitivity reactions

Dose
- Insulin-induced hypoglycaemia, by subcutaneous, intramuscular, or intravenous injection, ADULT and CHILD over 8 years (or body-weight over 25 kg), 1 mg; CHILD under 8 years (or body-weight under 25 kg), 500 micrograms; if no response within 10 minutes intravenous glucose must be given
- Diagnostic aid, consult product literature
- Beta-blocker poisoning, see p. 32
- Note 1 unit of glucagon = 1 mg of glucagon

1 Glucagen® HypoKit (Novo Nordisk) injection, powder for reconstitution, glucagon (rbs) as hydrochloride with lactose, net price 1-mg vial with prefilled syringe containing water for injection = £11.52

Chronic hypoglycaemia

Diazoxide, administered by mouth, is useful in the management of patients with chronic hypoglycaemia from excess endogenous insulin secretion, either from an islet cell tumour or islet cell hyperplasia. It has no place in the management of acute hypoglycaemia.

DIAZOXIDE

Indications chronic intractable hypoglycaemia (for use in hypertensive crisis see section 2.5.1)

Cautions ischaemic heart disease, pregnancy (Appendix 4), labour, impaired renal function (Appendix 3); monitor blood pressure; during prolonged use monitor white cell and platelet count, and in children, regularly assess growth, bone, and psychological development; interactions Appendix 1 (diazoxide)

Side-effects anorexia, nausea, vomiting, hyperuricemia, hypotension, oedema, tachycardia, arrhythmias, extrapyramidal effects; hypertrichosis on prolonged treatment

Dose
- By mouth, ADULT and CHILD, initially 5 mg/kg daily in 2–3 divided doses

Eudemine® (UCB Pharma) tablets, diazoxide 50 mg. Net price 20 = £9.29

Injection, see section 2.5.1

Diabetic neuropathy

Regular review of diabetic patients should include an annual test for urinary protein (using Albustix®) and serum creatinine measurement. If the urinary protein test is negative, the urine should be tested for microalbuminuria (the earliest sign of nephropathy). If reagent strip tests (Micro-Test II® or Micrubumintest®) are used and prove positive, the result should be confirmed by laboratory analysis of a urine sample. Provided there are no contra-indications, all diabetic patients with nephropathy causing proteinuria or with established microalbuminuria (at least 3 positive tests) should be treated with an ACE inhibitor (section 2.5.5.1) or an angiotensin-II receptor antagonist (section 2.5.5.2) even if the blood pressure is normal; in any case, to minimise the risk of renal deterioration, blood pressure should be carefully controlled (section 2.5).

ACE inhibitors can potentiate the hypoglycaemic effect of insulin and oral antidiabetic drugs; this effect is more likely during the first weeks of combined treatment and in patients with renal impairment.

For the treatment of hypertension in diabetes, see section 2.5.
**6.1.6 Diagnostic and monitoring agents for diabetes mellitus**

### Blood monitoring

Blood glucose monitoring using a meter gives a direct measure of the glucose concentration at the time of the test and can detect hypoglycaemia as well as hyperglycaemia. Patients should be properly trained in the use of blood glucose monitoring systems and to take appropriate action on the results obtained. Inadequate understanding of the normal fluctuations in blood glucose can lead to confusion and inappropriate action.

For patients treated with insulin, it is ideal to observe the ‘peaks’ and ‘troughs’ of blood glucose over 24 hours and make adjustments to their insulin no more than once or twice weekly. Daily alterations to the insulin dose are highly undesirable (except during illness).

Self-monitoring of blood-glucose concentration is appropriate for patients with type 2 diabetes:

- who are treated with insulin;
- who are treated with oral hypoglycaemic drugs e.g. sulphonylureas, to provide information on hypoglycaemia;
- to monitor changes in blood-glucose concentration resulting from changes in lifestyle or medication, and during intercurrent illness;
- to ensure safe blood-glucose concentration during activities, including driving.

**Note** In the UK blood-glucose concentration is expressed in mmol/litre and Diabetes UK advises that these units should be used for self-monitoring of blood glucose. In other European countries units of mg/100 mL (or mg/dL) are commonly used. It is advisable to check that the meter is pre-set in the correct units.

If the patient is unwell and diabetic ketoacidosis is suspected, blood ketones should be measured according to local guidelines (section 6.1.3). Patients and their carers should be trained in the use of blood ketone monitoring systems and to take appropriate action on the results obtained, including when to seek medical attention.

#### Test strips

**Active** (Roche Diagnostics)
- **Reagent strips**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with Glucotrend and Accu-Chek Active meters only. Net price 50-strip pack = £14.76

**Advantage Plus** (Roche Diagnostics)
- **Sensor strips**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with Accu-Chek Advantage meter only. Net price 50-strip pack = £14.76

**Ascensia Autodiost (Bayer Diabetes Care)**
- **Sensor discs**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with Ascensia Breeze and Ascensia Esprit meters only. Net price 5 × 10-disc pack = £14.62

**Aviva (Roche Diagnostics)**
- **Sensor strips**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with Accu-Chek Aviva meter only. Net price 50-strip pack = £14.49

**BM-Accutest** (Roche Diagnostics)
- **Reagent strips**, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with Accu-Chek Accutest meters only. Net price 50-strip pack = £14.31

**Breeze 2** (Bayer Diabetes Care)
- **Sensor discs**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with the Breeze 2 meter only. Net price 5 × 10-disc pack = £14.34

**Compact** (Roche Diagnostics)
- **Reagent strips**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with Accu-Chek Compact and Accu-Chek Compact Plus meters only. Net price 3 × 17-strip pack = £14.88

**Contour** (Bayer Diabetes Care)
- **Sensor strips**, for blood glucose monitoring, range 0.6–33.3 mmol/litre, for use with Contour meter only. Net price 50-strip pack = £14.74

**Note** Formerly Ascensia Microfil

**FreeStyle** (Abbott)
- **Sensor strips**, for blood glucose monitoring, range 1.1–27.8 mmol/litre, for use with FreeStyle meter only. Net price 50-strip pack = £14.62

**Freestyle Lite** (Abbott)
- **Sensor strips**, for blood glucose monitoring, range 1.1–27.8 micromol/litre, for use with Freestyle Lite meter only. Net price 50-strip pack = £14.62

**GlucoMen** (Menarini Diagnostics)
- **Sensor strips**, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with GlucoMen Glyco and Glucomen PC meters only. Net price 50-strip pack = £13.67

**GlucoMen LX** (Menarini Diagnostics)
- **Sensor strips**, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with GlucoMen LX meter only. Net price 50-strip pack = £14.33

**GlucoMen Visio Sensor** (Menarini Diagnostics)
- **Sensor strips**, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with GlucoMen Visio meter. Net price 50-strip pack = £14.33

**Hypoguard Supreme** (Hypoguard)
- **Reagent strips**, for blood glucose monitoring, range 2.2–27.7 mmol/litre, for use with Hypoguard Supreme meter. Net price 50-strip pack = £12.00

---

**Endocrine system**

- **phate** (section 1.4.2) is the best drug, but other anti-diarrhoeal preparations can be tried. An antiemetic which promotes gastric transit, such as metoclopramide or domperidone (section 4.8), is helpful for gastroparesis. In rare cases when an antiemetic does not help, erythromycin (especially when given intravenously) may be beneficial but this needs confirmation.

For the management of erectile dysfunction, see section 7.4.5.

In *neuropathic postural hypotension* increased salt intake and the use of the mineralocorticoid fludrocortisone 100–400 micrograms daily [unlicensed use] (section 6.3.1) help by increasing plasma volume, but uncomfortable oedema is a common side-effect. Fludrocortisone can also be combined with *flurbiprofen* (section 10.1.1) and *ephrinephrine hydrochloride* (section 3.1.1.2) [both unlicensed]. Midodrine [unlicensed], an alpha agonist, may also be useful in postural hypotension.

*Gustatory sweating* can be treated with an anti-muscarinic such as propantheline bromide (section 1.2); side-effects are common. For the management of hyperhidrosis, see section 13.12.

In some patients with *neuropathic oedema*, *ephrinephrine hydrochloride* [unlicensed use] 30–60 mg 3 times daily offers effective relief.
**BNF 57**

6.1.6 Diagnostic and monitoring agents for diabetes mellitus

---

**GlucoMen Visio** (Menarini Diagnostics)

**GlucoMen LX** (Menarini Diagnostics)

**Abbott**

**Contour** (Roche Diagnostics)

**Accu-Chek Compact Plus** (Roche Diagnostics)

**TRUETrack** (Home Diagnostics)

**TRUEone** (LifeScan)

**Prestige** (LifeScan)

**Optium Plus** (LifeScan)

---

**BNF 57 6.1.6 Diagnostic and monitoring agents for diabetes mellitus385**

£14.53

---

**PocketScan** (LifeScan)

---

**MediSense G2** (Abbott)

Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with MediSense Precision QID, meter only. Net price 50-strip pack = £13.67

- **MediSense Soft-Sense Plus** (Abbott)
  - Sensor strips, for blood glucose monitoring, range 1.7–25 mmol/litre, for use with Optium Xceed meter only. Net price 50-strip pack = £14.52

- **One Touch** (LifeScan)
  - Reagent strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with One Touch II, Profile and Basic meters only. Net price 50-strip pack = £14.37

- **One Touch Ultra** (LifeScan)
  - Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with One Touch Ultra, One Touch Ultra 2, One Touch Ultra Smart, and One Touch UltraEasy meters only. Net price 50-strip pack = £14.53

- **One Touch Vita** (LifeScan)
  - Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre for use with One Touch Vita meter only. Net price 50-strip pack = £14.59

- **Optium β-ketone test strips** (Abbott)
  - Reagent Strips, for blood ketone monitoring, range 0–8 mmol/litre, for use with Optium or Optium Xceed meters only. Net price 10-strip pack = £19.55

- **Optium Plus** (Abbott)
  - Sensor strips (formerly MediSense Optium Plus), for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with Optium Xceed meter only. Net price 50-strip pack = £14.53

- **PocketScan** (LifeScan)
  - Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with PocketScan meter only. Net price 50-strip pack = £14.19

- **Prestige** (Home Diagnostics)
  - Reagent strips, for blood glucose monitoring, range 1.4–33.3 mmol/litre, for use with Prestige meter only. Net price 50-strip pack = £14.51

- **TRUEone** (Home Diagnostics)
  - Sensor strips with meter, for blood glucose monitoring, range 1.1–33.3 mmol/litre. Meter built into top of sensor strip pot. Net price 50-strip and meter pack = £14.25

- **TRUETrack** (Home Diagnostics)
  - Sensor strips, for blood glucose monitoring, range 1.1–33.3 mmol/litre, for use with TRUETrack meter only. Net price 50-strip pack = £14.25

---

**Meters**

- **Accu-Chek Aviva** (Roche Diagnostics)
  - Meter, for blood glucose monitoring (for use with Aviva test strips). Accu-Chek Aviva system = £12.99

- **Accu-Chek Compact Plus** (Roche Diagnostics)
  - Meter, for blood glucose monitoring (for use with Compact test strips). Accu-Chek Compact Plus system = £12.99

- **Breeze 2** (Bayer Diabetes Care)
  - Meter, for blood glucose monitoring (for use with Breeze 2 Sensor discs) = £10.29

- **Contour** (Bayer Diabetes Care)
  - Meter, for blood glucose monitoring (for use with Ascensia Microfill sensor strips) = £10.29

- **Freestyle** (Abbott)
  - Meters, for blood glucose monitoring (for use with Freestyle and Freestyle Lite test strips). Freestyle Lite meter = £7.79; Freestyle Freedom Lite meter = £5.99

- **GlucoMen LX** (Menarini Diagnostics)
  - Meter, for blood glucose monitoring (for use with GlucoMen LX sensor strips) = £12.99

- **GlucoMen Visio** (Menarini Diagnostics)
  - Meter, for blood glucose monitoring (for use with GlucoMen Visio Sensor strips) = £12.99

- **Optium Plus** (LifeScan)
  - Meter, for blood glucose monitoring (for use with Medisense Optium Plus, and Optium Optium Xceed meter only. Net price 50-strip pack = £14.53

---

**Urinalysis**

Tests for glucose range from reagent strips specific to glucose to reagent tablets which detect all reducing sugars. Few patients still use Clinistix®; Clinistix® is suitable for screening purposes only. Tests for ketones by patients are rarely required unless they become unwell—see section 6.1.6. Microalbuminuria can be detected with Microlab Test IP® or Microalbumintest®, but this should be followed by confirmation in the laboratory, since false positive results are common.

- **Glucose**
  - **Clinistix** (Bayer Diabetes Care)
    - Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £3.25

- **Clinitest** (Bayer Diabetes Care)
  - Reagent tablets, for detection of glucose and other reducing substances in urine. Net price 36-tab pack = £2.00

- **Diabur-Test 5000** (Roche Diagnostics)
  - Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.79

- **Diastix** (Bayer Diabetes Care)
  - Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.76

- **Medi-Test Glucose** (BHR)
  - Reagent strips, for detection of glucose in urine. Net price 50-strip pack = £2.30

- **Ketones**
  - **Ketostix** (Bayer Diabetes Care)
    - Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.92

- **Ketur Test** (Roche Diagnostics)
  - Reagent strips, for detection of ketones in urine. Net price 50-strip pack = £2.68
6.2 Thyroid and antithyroid drugs

6.2.1 Thyroid hormones

Thyroid hormones are used in hypothyroidism (myxoedema), and also in diffuse non-toxic goitre, Hashimoto’s thyroiditis (lymphadenoid goitre), and thyroid carcinoma. Neonatal hypothyroidism requires prompt treatment for normal development. Levothyroxine sodium (thyroxine sodium) is the treatment of choice for maintenance therapy.

In infants and children with congenital hypothyroidism and juvenile myxoedema, the dose of levothyroxine should be titrated according to clinical response, growth assessment, and measurements of plasma thyroxine and thyroid-stimulating hormone. See BNF for Children (section 6.2.1) for suitable dosage regimens.

Liothyronine sodium has a similar action to levothyroxine but is more rapidly metabolised and has a more rapid effect; 20 micrograms is equivalent to 100 micrograms of levothyroxine. Its effects develop after a few hours and disappear within 24 to 48 hours of discontinuing treatment. It may be used in severe hypothyroid states when a rapid response is desired.

Liothyronine by intravenous injection is the treatment of choice in hypothyroid coma. Adjunctive therapy includes intravenous fluids, hydrocortisone, and treatment of infection; assisted ventilation is often required.

6.2.2 Antithyroid drugs

Indications hypothyroidism; see also notes above

Cautions panhypopituitarism or predisposition to adrenal insufficiency (initiate corticosteroid therapy before starting levothyroxine), elderly, cardiovascular disorders (including hypertension, myocardial insufficiency or myocardial infarction, see Initial Dosage below), long-standing hypothyroidism, diabetes insipidus, diabetes mellitus (dose of antidiabetic drugs including insulin may need to be increased); pregnancy (Appendix 4); interactions: Appendix 1 (thyroid hormones)

Initial dosage Baseline ECG is valuable because changes induced by hypothyroidism can be confused with ischaemia. If metabolism increases too rapidly (causing diarrhoea, nervousness, rapid pulse, insomnia, tremors and sometimes anginal pain where there is latent myocardial ischaemia), reduce dose or withhold for 1–2 days and start again at a lower dose

Contra-indications thyrotoxicosis

Side-effects usually at excessive dosage (see Initial Dosage above) include diarrhoea, vomitings, anginal pain, arrhythmias, palpitation, tachycardia, tremor, restlessness, excitability, insomnia, headache, flushing, sweating, fever, heat intolerance, weight-loss, muscle cramp, and muscular weakness; transient hair loss in children; hypersensitivity reactions including rash, pruritus and oedema also reported

Dose

- ADULT, initially 50–100 micrograms once daily, preferably before breakfast, adjusted in steps of 25–50 micrograms every 3–4 weeks according to response (usual maintenance dose 100–200 micrograms once daily); in cardiac disease, severe hypothyroidism, and patients over 50 years, initially 25 micrograms once daily, adjusted in steps of 25 micrograms every 4 weeks according to response; usual maintenance dose 50–200 micrograms once daily;
- CHILD under 12 years see BNF for Children (section 6.2.1)

Levothyroxine (Non-proprietary)

Tablets, levothyroxine sodium 25 micrograms, net price 28-tab pack = £1.80; 50 micrograms, 28-tab pack = £1.10; 100 micrograms, 28-tab pack = £1.22

Brands include Eltroxin

Oral solution, levothyroxine sodium 25 micrograms/5 mL, net price 100 mL = £44.90; 100 micrograms/5 mL, 100 mL = £52.75

Brands include Eutrox (sugar-free)
Antithyroid drugs

Antithyroid drugs are used for hyperthyroidism either to prepare patients for thyroidectomy or for long-term management. In the UK carbimazole is the most commonly used drug. Propylthiouracil may be used in patients who suffer sensitivity reactions to carbimazole as sensitivity is not necessarily displayed to both drugs. Both drugs act primarily by interfering with the synthesis of thyroid hormones.

**LIOTHYRONINE SODIUM**
(=Tri-iodothyronine sodium)

**Indications** see notes above

**Cautions** see under Levothyroxine Sodium; pregnancy (Appendix 4); breast-feeding (Appendix 5); interactions: Appendix 1 (thyroid hormones)

**Contra-indications** see under Levothyroxine Sodium

**Side-effects** see under Levothyroxine Sodium

**Dose**
- By mouth, initially 10–20 micrograms daily gradually increased to 60 micrograms daily in 2–3 divided doses; ELDERLY smaller initial doses; CHILD, adult dose reduced in proportion to body-weight
- By slow intravenous injection, hypothyroid coma, 5–20 micrograms repeated every 12 hours or as often as every 4 hours if necessary; alternatively 50 micrograms initially then 25 micrograms every 8 hours reducing to 25 micrograms twice daily

Liothyronine sodium (Goldshield) ¶¶

Tablets, scored, liothyronine sodium 20 micrograms, net price 28-tab pack = £20.00

Triiodothyronine (Goldshield) ¶¶

Injection, powder for reconstitution, liothyronine sodium (with dextran). Net price 20-microgram amp = £37.92

6.2.2 Antithyroid drugs

Antithyroid drugs only need to be given once daily because of their prolonged effect on the thyroid. Over-treatment can result in the rapid development of hypothyroidism and should be avoided particularly during pregnancy because it can cause fetal goitre.

A combination of carbimazole, 40 to 60 mg daily with levothyroxine, 50 to 150 micrograms daily; may be used in a blocking-replacement regimen; therapy is usually given for 18 months. The blocking-replacement regimen is not suitable during pregnancy.

**Iodine** has been used as an adjunct to antithyroid drugs for 10 to 14 days before partial thyroidectomy; however, there is little evidence of a beneficial effect. Iodine should not be used for long-term treatment because its antithyroid action tends to diminish.

Radioactive sodium iodide (I) solution is used increasingly for the treatment of thyrotoxicosis at all ages, particularly where medical therapy or compliance is a problem, in patients with cardiac disease, and in patients who relapse after thyroidectomy.

**Propranolol** is useful for rapid relief of thyrotoxic symptoms and may be used in conjunction with antithyroid drugs or as an adjunct to radioactive iodine. Beta-blockers are also useful in neonatal thyrotoxicosis and in supraventricular arrhythmias due to hyperthyroidism. Propranolol has been used in conjunction with iodine to prepare mildly thyrotoxic patients for surgery but it is preferable to make the patient euthyroid with carbimazole. Laboratory tests of thyroid function are not altered by beta-blockers. Most experience in treating thyrotoxicosis has been gained with propranolol but nadolol is also used. For doses and preparations of beta-blockers see section 2.4.

**Thyrotoxic crisis** (‘thyroid storm’) requires emergency treatment with intravenous administration of fluids, propranolol (5 mg) and hydrocortisone (100 mg every 6 hours, as sodium succinate), as well as oral iodine solution and carbimazole or propylthiouracil which may need to be administered by nasogastric tube.

**Pregnancy and breast-feeding** Radioactive iodine therapy is contra-indicated during pregnancy. Propylthiouracil and carbimazole can be given but the blocking-replacement regimen (see above) is not suitable. Both propylthiouracil and carbimazole cross the placenta and in high doses may cause fetal goitre and hypothyroidism—the lowest dose that will control the hyperthyroid state should be used (requirements in Graves’ disease tend to fall during pregnancy). Rarely, carbimazole has been associated with congenital defects, including aplasia cutis of the neonate.

Carbimazole and propylthiouracil appear in breast milk but this does not preclude breast-feeding as long as neonatal development is closely monitored and the lowest effective dose is used.
CARBIMAZOLE

Indications hyperthyroidism

Cautions hepatic impairment (avoid if severe; Appendix 2); pregnancy and breast-feeding (see notes above)

Contra-indications severe blood disorders

Side-effects nausea, mild gastro-intestinal disturbances, taste disturbance, headache; fever, malaise; rash, pruritus, arthralgia; rarely myopathy, alopecia, bone marrow suppression (including pancytopenia and agranulocytosis, see CSM warning above), and jaundice

Counselling Warn patient to tell doctor immediately if sore throat, mouth ulcers, bruising, fever, malaise, or non-specific illness develops

Dose

• See notes above

Carbimazole (Non-proprietary) Tablets, carbimazole 5 mg, net price 100-tab pack = £5.51; 20 mg, 100-tab pack = £19.12. Counselling, blood disorder symptoms

Neo-Mercazole® (Amidpharm) Tablets, both pink, carbimazole 5 mg, net price 100-tab pack = £5.15; 20 mg, 100-tab pack = £19.12. Counselling, blood disorder symptoms

IODINE AND IODIDE

Indications thyrotoxicosis (pre-operative)

Cautions pregnancy, children; not for long-term treatment

Contra-indications breast-feeding

Side-effects hypersensitivity reactions including cor- yza-like symptoms, headache, lacrimation, conjunctivitis, pain in salivary glands, laryngitis, bronchitis, rashes; on prolonged treatment depression, insomnia, impotence; goitre in infants of mothers taking iodides

Dose

• See under preparation

Aqueous Iodine Oral Solution (Lugol’s Solution), iodine 5%, potassium iodide 10% in purified water, freshly boiled and cooled, total iodine 130 mg/mL. Net price 100 mL = £1.19. Label: 27

Dose 0.1–0.3 mL 3 times daily well diluted with milk or water

PROPYLTHIOURACIL

Indications hyperthyroidism

Cautions see under Carbimazole; hepatic impairment (Appendix 2), renal impairment (Appendix 3)

Side-effects see under Carbimazole; leucopenia; rarely cutaneous vasculitis, thrombocytopenia, aplastic anaemia, hypoprothrombinaemia, hepatitis, encephalopathy, hepatic necrosis, nephritis, lupus erythematosus-like syndromes

Dose

• See notes above

Propylthiouracil (Non-proprietary) Tablets, propylthiouracil 50 mg. Net price 56-tab pack = £34.85

6.3 Corticosteroids

6.3.1 Replacement therapy

The adrenal cortex normally secretes hydrocortisone (cortisol) which has glucocorticoid activity and weak mineralocorticoid activity. It also secretes the mineralocorticoid aldosterone.

In deficiency states, physiological replacement is best achieved with a combination of hydrocortisone (section 6.3.2) and the mineralocorticoid fludrocortisone; hydrocortisone alone does not usually provide sufficient mineralocorticoid activity for complete replacement.

In Addison’s disease or following adrenalectomy, hydrocortisone 20 to 30 mg daily by mouth is usually required. This is given in 2 doses, the larger in the morning and the smaller in the evening, mimicking the normal diurnal rhythm of cortisol secretion. The optimum daily dose is determined on the basis of clinical response. Glucocorticoid therapy is supplemented by fludrocortisone 50 to 300 micrograms daily.

In acute adrenocortical insufficiency, hydrocortisone is given intravenously (preferably as sodium succinate) in doses of 100 mg every 6 to 8 hours in sodium chloride intravenous infusion 0.9%.

In hypopituitarism glucocorticoids should be given as in adrenocortical insufficiency, but since production of aldosterone is also regulated by the renin-angiotensin system a mineralocorticoid is not usually required. Additional replacement therapy with levotyroxine (section 6.2.1) and sex hormones (section 6.4) should be given as indicated by the pattern of hormone deficiency.

FLUDROCORTISONE ACETATE

Indications mineralocorticoid replacement in adre- nocortical insufficiency

Cautions section 6.3.2; interactions: Appendix 1 (corticosteroids)

Contra-indications section 6.3.2

Side-effects section 6.3.2

Dose

• 50–300 micrograms daily; CHILD 5 micrograms/kg daily

Florinef® (Squibb) Tablets, scored, fludrocortisone acetate 100 micro- grams. Net price 100-tab pack = £5.36. Label: 10, steroid card

6.3.2 Glucocorticoid therapy

In comparing the relative potencies of corticosteroids in terms of their anti-inflammatory (glucocorticoid) effects it should be borne in mind that high glucocorticoid activity in itself is of no advantage unless it is accom- panied by relatively low mineralocorticoid activity (see Disadvantages of Corticosteroids below). The minera-
locorticoid activity of fludrocortisone (section 6.3.1) is so high that its anti-inflammatory activity is of no clinical relevance. The table below shows equivalent anti-inflammatory doses.

### Equivalent anti-inflammatory doses of corticosteroids

This table takes no account of mineralocorticoid effects, nor does it take account of variations in duration of action.

The relatively high mineralocorticoid activity of cortisone and hydrocortisone, and the resulting fluid retention, make them unsuitable for disease suppression on a long-term basis. However, they can be used for adrenal replacement therapy (section 6.3.1); hydrocortisone is preferred because cortisone requires conversion in the liver to hydrocortisone. Hydrocortisone is used on a short-term basis by intravenous injection for the emergency management of some conditions. The relatively moderate anti-inflammatory potency of hydrocortisone also makes it a useful topical corticosteroid for the management of inflammatory skin conditions because side-effects (both topical and systemic) are less marked (section 13.4); cortisone is not active topically.

Prednisolone has predominantly glucocorticoid activity and is the corticosteroid most commonly used by mouth for long-term disease suppression.

Betamethasone and dexamethasone have very high glucocorticoid activity in conjunction with insignificant mineralocorticoid activity. This makes them particularly suitable for high-dose therapy in conditions where fluid retention would be a disadvantage.

Betamethasone and dexamethasone also have a long duration of action and this, coupled with their lack of mineralocorticoid action, makes them particularly suitable for conditions which require suppression of corticotropin (corticotrophin) secretion (e.g. congenital adrenal hyperplasia). Some esters of betamethasone and of beclometasone (beclomethasone) exert a considerably more marked topical effect (e.g. on the skin or the lungs) than when given by mouth; use is made of this to obtain topical effects whilst minimising systemic side-effects (e.g. for skin applications and asthma inhalations).

Deflazacort has a high glucocorticoid activity; it is derived from prednisolone.

### Use of corticosteroids

Dosages of corticosteroids vary widely in different diseases and in different patients. If the use of a corticosteroid can save or prolong life, as in exfoliative dermatitis, pemphigus, acute leukaemia or acute transplant rejection, high doses may need to be given, because the complications of therapy are likely to be less serious than the effects of the disease itself.

When long-term corticosteroid therapy is used in some chronic diseases, the adverse effects of treatment may become greater than the disabilities caused by the disease. To minimise side-effects the maintenance dose should be kept as low as possible.

When potentially less harmful measures are ineffective corticosteroids are used topically for the treatment of inflammatory conditions of the skin (section 13.4). Corticosteroids should be avoided or used only under specialist supervision in psoriasis (section 13.5).

Corticosteroids are used both topically (by rectum) and systemically (by mouth or intravenously) in the management of ulcerative colitis and Crohn’s disease (section 1.5). They are also included in locally applied creams for haemorrhoids (section 1.7.2).

Use can be made of the mineralocorticoid activity of fludrocortisone to treat postural hypotension in autonomic neuropathy (section 6.1.5).

High-dose corticosteroids should be avoided for the management of septic shock. However, there is evidence that administration of lower doses of hydrocortisone (50 mg intravenously every 6 hours) and fludrocortisone (50 micrograms daily by mouth) is of benefit in adrenocortical insufficiency resulting from septic shock.

Dexamethasone and betamethasone have little if any mineralocorticoid action and their long duration of action makes them particularly suitable for suppressing corticotropin secretion in congenital adrenal hyperplasia where the dose should be tailored to clinical response and by measurement of adrenal androgens and 17-hydroxyprogesterone. In common with all glucocorticoids their suppressive action on the hypothalamic-pituitary-adrenal axis is greatest and most prolonged when they are given at night. In most individuals a single dose of 1 mg of dexamethasone at night, is sufficient to inhibit corticotropin secretion for 24 hours. This is the basis of the ‘overnight dexamethasone suppression test’ for diagnosing Cushing’s syndrome.

Betamethasone and dexamethasone are also appropriate for conditions where water retention would be a disadvantage.

A corticosteroid may be used in the management of raised intracranial pressure or cerebral oedema that occurs as a result of malignancy (see also p. 16); high doses of betamethasone or dexamethasone are generally used. However, a corticosteroid should not be used for the management of head injury or stroke because it is unlikely to be of benefit and may even be harmful.

In acute hypersensitivity reactions such as angioedema of the upper respiratory tract and anaphylactic shock, corticosteroids are indicated as an adjunct to emergency treatment with adrenaline (epinephrine) (section 3.4.3). In such cases hydrocortisone (as sodium succinate) by intravenous injection in a dose of 100 to 300 mg may be required.

Corticosteroids are preferably used by inhalation in the management of asthma (section 3.2) but systemic therapy in association with bronchodilators is required for the emergency treatment of severe acute asthma (section 3.1.1).

Corticosteroids may also be useful in conditions such as autoimmune hepatitis, rheumatoid arthritis and sarcoidosis; they may also lead to remissions of acquired haemolytic anaemia (section 9.1.3), and some cases of the nephrotic syndrome (particularly in children) and thrombocytopenic purpura (section 9.1.4).
Corticosteroids can improve the prognosis of serious conditions such as systemic lupus erythematosus, temporal arteritis, and polyarteritis nodosa; the effects of the disease process may be suppressed and symptoms relieved, but the underlying condition is not cured, although it may ultimately remit. It is usual to begin therapy in these conditions at fairly high dose, such as 40 to 60 mg prednisolone daily, and then to reduce the dose to the lowest commensurate with disease control.

For other references to the use of corticosteroids see Prescribing in Palliative Care, section 8.2.2 (immunosuppression), section 10.1.2 (rheumatic diseases), section 11.4 (eye), section 12.1.1 (otitis externa), section 12.2.1 (allergic rhinitis), and section 12.3.1 (aphthous ulcers).

**Administration**

Whenever possible local treatment with creams, intra-articular injections, inhalations, eye-drops, or enemas should be used in preference to systemic treatment. The suppressive action of a corticosteroid on cortisol secretion is least when it is given as a single dose in the morning. In an attempt to reduce pituitary-adrenal suppression further, the total dose for two days can sometimes be taken as a single dose on alternate days; alternate-day administration has not been very successful in the management of asthma (section 3.2). Pituitary-adrenal suppression can also be reduced by means of intermittent therapy with short courses. In some conditions it may be possible to reduce the dose of corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

**Cautions and contra-indications of corticosteroids**

**Adrenal Suppression**

During prolonged therapy with corticosteroids, adrenal atrophy develops and can persist for years after stopping. Abrupt withdrawal after a prolonged period can lead to acute adrenal insufficiency, hypotension or death (see Withdrawal of Corticosteroids, below). Withdrawal can also be associated with fever, myalgia, arthralgia, rhinitis, conjunctivitis, painful itchy skin nodules and weight loss.

To compensate for a diminished adrenocortical response caused by prolonged corticosteroid treatment, any significant intercurrent illness, trauma, or surgical procedure requires a temporary increase in corticosteroid dose, or if already stopped, a temporary reintroduction of corticosteroid treatment. To avoid a precipitous fall in blood pressure during anaesthesia or in the immediate postoperative period, anaesthetists must know whether a patient is taking or has been taking a corticosteroid by adding a small dose of an immunosuppressive drug (section 8.2.1).

- **Minor surgery under general anaesthesia**—usual oral corticosteroid dose on the morning of surgery or hydrocortisone 25–50 mg (usually the sodium succinate) intravenously at induction; the usual oral corticosteroid dose is recommenced after surgery.

- **Moderate or major surgery**—usual oral corticosteroid dose on the morning of surgery and hydrocortisone 25–50 mg intravenously at induction, followed by hydrocortisone 25–50 mg 3 times a day by intravenous injection for 24 hours after moderate surgery or for 48–72 hours after major surgery; the usual pre-operative oral corticosteroid dose is recommenced on stopping hydrocortisone injections.

Patients on long-term corticosteroid treatment should carry a Steroid Treatment Card (see p. 392) which gives guidance on minimising risk and provides details of prescriber, drug, dosage and duration of treatment.

**Infections**

Prolonged courses of corticosteroids increase susceptibility to infections and severity of infections; clinical presentation of infections may also be atypical. Serious infections e.g. septicaemia and tuberculosis may reach an advanced stage before being recognised, and amoebiasis or strongyloidiasis may be activated or exacerbated (exclude before initiating a corticosteroid in those at risk or with suggestive symptoms). Fungal or viral ocular infections may also be exacerbated (see also section 11.4.1).

**Chickenpox**

Unless they have had chickenpox, patients receiving oral or parenteral corticosteroids for purposes other than replacement should be regarded as being at risk of severe chickenpox (see Steroid Treatment Card). Manifestations of fulminant illness include pneumonia, hepatitis and disseminated intravascular coagulation; rash is not necessarily a prominent feature. Passive immunisation with varicella-zoster immunoglobulin (section 14.5) is needed for exposed non-immune patients receiving systemic corticosteroids or for those who have used them within the previous 3 months. Confirmed chickenpox warrants specialist care and urgent treatment (section 5.3.2.1). Corticosteroids should not be stopped and dosage may need to be increased.

Topical, inhaled or rectal corticosteroids are less likely to be associated with an increased risk of severe chickenpox.

**Measles**

Patients taking corticosteroids should be advised to take particular care to avoid exposure to measles and to seek immediate medical advice if exposure occurs. Prophylaxis with intramuscular normal immunoglobulin (section 14.5) may be needed.

**Withdrawal of corticosteroids**

The CSM has recommended that gradual withdrawal of systemic corticosteroids should be considered in those whose disease is unlikely to relapse and have:

- recently received repeated courses (particularly if taken for longer than 3 weeks);
- taken a short course within 1 year of stopping long-term therapy;
- other possible causes of adrenal suppression;
- received more than 40 mg daily prednisolone (or equivalent);
- been given repeat doses in the evening;
- received more than 3 weeks’ treatment.

Systemic corticosteroids may be stopped abruptly in those whose disease is unlikely to relapse and who have...
received treatment for 3 weeks or less and who are not included in the patient groups described above.

During corticosteroid withdrawal the dose may be reduced rapidly down to physiological doses (equivalent to prednisolone 7.5 mg daily) and then reduced more slowly. Assessment of the disease may be needed during withdrawal to ensure that relapse does not occur.

Psychiatric reactions

Systemic corticosteroids, particularly in high doses, are linked to psychiatric reactions including euphoria, nightmares, insomnia, irritability, mood lability, suicidal thoughts, psychotic reactions, and behavioural disturbances. A serious paranoid state or depression with risk of suicide can be induced, particularly in patients with a history of mental disorder. These reactions frequently subside on reducing the dose or discontinuing the corticosteroid but they may also require specific management. Patients should be advised to seek medical advice if psychiatric symptoms (especially depression and suicidal thoughts) occur and they should also be alert to the rare possibility of such reactions during withdrawal of corticosteroid treatment.

Systemic corticosteroids should be prescribed with care in those predisposed to psychiatric reactions, including those who have previously suffered corticosteroid-induced psychosis, or who have a personal or family history of psychiatric disorders.

Pregnancy and breast-feeding

Following a review of the data on the safety of systemic corticosteroids used in pregnancy and breast-feeding the CSM has concluded:

- corticosteroids vary in their ability to cross the placenta; betamethasone and dexamethasone cross the placenta readily while 88% of prednisolone is inactivated as it crosses the placenta;
- there is no convincing evidence that systemic corticosteroids increase the incidence of congenital abnormalities such as cleft palate or lip;
- when administration is prolonged or repeated during pregnancy, systemic corticosteroids increase the risk of intra-uterine growth restriction; there is no evidence of intra-uterine growth restriction following short-term treatment (e.g. prophylactic treatment for neonatal respiratory distress syndrome);
- any adrenal suppression in the neonate following prenatal exposure usually resolves spontaneously after birth and is rarely clinically important;
- prednisolone appears in small amounts in breast milk but maternal doses of up to 40 mg daily are unlikely to cause systemic effects in the infant; infants should be monitored for adrenal suppression if the mothers are taking a higher dose.

See also Appendix 4 and Appendix 5.

Other cautions and contra-indications

Other cautions include: children and adolescents (growth restriction possibly irreversible), elderly (close supervision required particularly on long-term treatment); frequent monitoring required if history of tuberculosis (or X-ray changes), hypertension, recent myocardial infarction (rupture reported), congestive heart failure, hepatic impairment (Appendix 2), renal impairment, diabetes mellitus including family history, osteoporosis (post-menopausal women at special risk), glaucoma (including family history), ocular herpes simplex—risk of corneal perforation, severe affective disorders (particularly if history of steroid-induced psychosis—see also Psychiatric Reactions, above), epilepsy, peptic ulcer, hypothroidism, history of steroid myopathy, ulcerative colitis, diverticulitis, recent intestinal anastomoses,
thromboembolic disorders; myasthenia gravis; interactions: Appendix 1 (corticosteroids)

Other contra-indications include: systemic infection (unless specific therapy given); avoid live virus vaccines in those receiving immunosuppressive doses (serum antibody response diminished)

Side-effects of corticosteroids

Overdosage or prolonged use can exaggerate some of the normal physiological actions of corticosteroids leading to mineralocorticoid and glucocorticoid side-effects.

Mineralocorticoid side-effects include hypertension, sodium and water retention, and potassium and calcium loss. They are most marked with fludrocortisone, but are significant with cortisone, hydrocortisone, corticotropin, and tetracosactide (tetracosactrin). Mineralocorticoid actions are negligible with the high potency glucocorticoids, betamethasone and dexamethasone, and occur only slightly with methylprednisolone, prednisolone, and triamcinolone.

Glucocorticoid side-effects include diabetes and osteoporosis (section 6.6), which is a danger, particularly in the elderly, as it can result in osteoporotic fractures for example of the hip or vertebrae; in addition high doses are associated with avascular necrosis of the femoral head. Muscle wasting (proximal myopathy) can also occur. Corticosteroid therapy is also weakly linked with peptic ulceration and perforation (the potential advantage of soluble or enteric-coated preparations to reduce the risk is speculative only). See also Psychiatric Reactions, p. 391.

High doses of corticosteroids can cause Cushing’s syndrome, with moon face, striae, and acne; it is usually reversible on withdrawal of treatment, but this must always be gradually tapered to avoid symptoms of acute adrenal insufficiency (important: see also Adrenal Suppression, p. 390).

In children, administration of corticosteroids may result in suppression of growth. For the effect of corticosteroids given in pregnancy, see Pregnancy and Breastfeeding, p. 391.

Side-effects can be minimised by using lowest effective dose for minimum period possible.
